CHEMIST AND DRUGGIST.

POPULAR MEDICINES.

ALBADERMINE.—A process of removing "tan" and the milder variety of "freckles." (*Solution A.*) Potass. iodid., 2 dr.; iodine, pur., 6 gr.; glycerine, 3 dr.; infus. rosæ, 4 oz; dissolve the iodide of potassium in a small quantity of the infusion and a dr. of the glycerine; with this fluid moisten the iodine in a glass mortar and rub it down, gradually adding more liquid until complete solution has been obtained; then stir in the remainder of the ingredients, and bottle the mixture.—(*Solution B.*) Sodæ hyposulph. thiosulphate, 1 oz. iss.; aqua rosæ exot., 1 pt.; dissolve and filter. With a small camel's hair pencil or piece of fine sponge apply a little of "Albadermine A" to the tanned or freckled surface, until a slight but uniform brownish yellow skin has been produced; at the expiration of fifteen or twenty minutes moisten a piece of cambric, lint or soft rag with "B," and lay it upon the affected part, removing, squeezing away the liquid, soaking it afresh, and again applying until the iodine stain has disappeared. Repeat the entire process thrice daily, but diminish the frequency of the application if tenderness be produced. In the course of three to four days to as many weeks the freckles will either have disappeared entirely or their intensity will be greatly diminished. "Summer freckles" yield very speedily to this treatment.

ALUM GARGLE.—1. Powdered oak bark, 1 oz.; water, 1½ pt.; boil to a pt.; filter, cool, and add of alum, ½ dr., and of brandy, 2 fl. oz.; in inflammation of the mouth and throat.—2. Alum, 3 dr.; water, 6 fl. oz.; dissolve; used in offensive breath.—3. Alum and nitre, of each 3 oz.; cream of tartar, 4 oz.; dilute acetic acid, 4 lbs.; dissolve, evaporate to dryness, and powder the residuum. For use, ½ oz. of the powder is dissolved in water, 8 fl. oz.; recommended in inflammation of the fauces and tonsils.

AMANDINE, For the Skin.—1.(*Opaque.*) White soft soap, 3 oz.; gum mucilage, thick, clear, 4 oz.; pale honey, finest, 6 oz.; mix in a marble mortar; add the yelks of 5 large eggs, previously beaten and strained through gauze; and again thoroughly mix; next add, very gradually, oil of almonds, 2½ lb.; scented with half of the preceding oils, etc., or at will; when the whole is perfectly blended, further add pistachio milk (thick, rich), ½ pt., and triturate until the union is complete.—2. (*Glycerinated*) As the preceding, but adding, with the soap, ¾ to 1 oz. of glycerine for every pound of oil intended to be added. In use, a portion of amandine, about half the size of a small filbert, is rubbed with a few drops of warm water, and the resulting rich white lather applied to the hands, arms, face and neck. In a short time, and while the water on it is still milky, the skin is gently wiped with a soft napkin.—3. Almond oil, 3½ lb.; simple sirup, 2 oz. (made by dissolving 1¾ lb. sugar in 1 pt. water, boil and strain); soft soap (use the very best), 1½ oz.; otto of almonds and bergamot, ½ oz. each; otto of cloves, ¼ oz.; mix the soap and sirup, and mix in the oil gradually; put the perfumes into the almond oil. Great care should be taken in mixing in the oil. For use, make a lather with hot water.

BALSAM, Pectoral. — Tincture of tolu and compound tincture of benzoin, of each, 2 oz.; rectified spirit, 4 oz.; mix. Use as a pectoral in coughs and colds; dose, a teaspoonful.

BEEF, IRON AND WINE.—Liebig's extract of beef, ½ oz. av.; ammonio-citrate of iron, 256 gr.; spirit of orange, ½ fl. oz.; distilled water, 1½ fl. oz.; sherry wine sufficient to make 16 fl. oz.; dissolve the ammonio-citrate of iron in the water, dissolve the extract of beef in the sherry wine, add the spirit of orange and mix the solutions.

BEEF TEA.—(*Bouillon, for Dispensing.*) Concentrated extract of beef, 12 oz.; table salt, 3 oz.; essence or tincture of celery, 1½ oz. or 3 oz. respectively; powdered arrow-root, 1½ oz.; essence of orange or lemon, 1½ oz.; hot water, 3 qts.; if desired, about 1½ dr. of tincture of capsicum may be added; dissolve the extract of beef, arrow-root and salt in hot water; the other ingredients may then be added. Only a small quantity should be prepared at a time.

BRANDRETH'S PILLS.—1. Aloes, 2 lb.; gamboge, 1 lb.; extract of colocynth, 4 oz.; castile soap, ½ lb.; oil of peppermint, 2 fl. dr.; and cinnamon, 1 fl. dr.; mix and form into pills.—2. Gamboge, podophyllin, inspissated juice of phytolacca, saffron adulterated with yellow root, pulverized cloves and oil of peppermint.

BROWN'S BRONCHIAL TROCHES.—Take ½ lb. of pulverized extract of licorice; ¾ of a lb. of pulverized sugar; 2 oz. each pulverized cubebs and gum Arabic; add ½ oz. of pulverized extract of conium.

CAMPHORATED OIL.—Get the common cottonseed table oil, which is sold for sweet oil; half fill a 6-oz. bottle with gum camphor, then fill with oil, and let it stand in a very warm place over night; the oil will take up only so much of camphor, and when it is used off fill with oil again, repeating the process until the camphor is dissolved. This is cheap and clean, and will not soil clothing. It will often entirely dissipate symptoms of an influenza cold, to which persons who have had grip seem peculiarly liable; rub across the forehead, over and between the eyes. It is a relief, too, for the pains in the legs, which remain long after the attack is over; rub with it around the muscles and knee joints, over and under.

CALISAYA CORDIAL.—1. Elixir of calisaya, 1 oz.; orange sirup, 3 oz.—2. Quinine sulphate, 72 gr.; cinchonine sulphate, 24 gr.; quinidine sulphate, 20 gr.; cinchonidine sulphate, 12 gr.; elixir orange, 128 fl. oz.; caramel sufficient to color; triturate the mixed sulphates with 1 pt. of the elixir of orange; pour the mixture into a glass flask, and heat on a water bath till solution is effected; when still hot, add remainder of elixir and caramel; filter when cold.

CATARRH REMEDIES.—1. (*Dr. Sage's*). Carbolic acid, 0·5 grm.; camphor, 0·5 grm.; common salt, 10 grm., which are to be dissolved in 4-7 liter of water and injected into the nostrils. It appears very probable that the wide reputation of this remedy is a deserved one, and the publication of its constituents will rather increase than retard its sale.—2. (*Hall's*). Take of potassium iodide, 1 dr.; comp. tinct. cardamom, 4 fl. oz.; comp. tinct. gentian, 12 fl. oz.; caramel, enough.

CHELTENHAM SALTS.—1. Glauber salts, Epsom salts, common salts, equal parts; powder; mix; dose, ½ oz.—2. (*Effervescing Cheltenham Salts.*) Tartaric acid, dried, 25 parts; tartrate of iron, 1 part; seidlitz salt, 120 parts; mix; dose, a teaspoonful in a glass of water.

CHOLERA MIXTURE.—1. The following is published as the "Cholera Mixture of the British Army": Oil of anise seed, 3 dr.; oil of cajeput, 3 dr.; oil of juniper, 3 dr.; ether, 8 dr.; liquor acid of Haller, 1 dr.; tincture of cinnamon, 4 oz.; mix; dose, 10 drops every quarter of an hour in a tablespoonful of water.—2. A mixture which has accomplished wonders in the writer's hands is this: Acid. tannici, 1 dr.; æth. chlor. (1 in 10), 2 dr.; ac. sulph. dil. 1½ dr.; tinct. zingib., 3 dr.; aq. menth. pip. ad. 8 oz.; mix; one-sixth every two or three hours. See also *Diarrhœa.*

CLOVE LOZENGES.—Cloves (powdered along with sugar), 2 oz., or essential oil, 1 fl. dr., to each lb. of sugar. Carminative and stomachic; also used as a restorative after fatigue; added to chocolate to improve its flavor, and sucked to sweeten the breath.

COCA AND CALISAYA.—Coca wine, 1 oz.; calisaya elixir, 1 oz.; orange sirup, 6 oz.

COD LIVER OIL MIXTURE.—It makes a really delicious emulsion. Yelks of 2 eggs; powdered sugar, 4 oz.; essence oil of almonds. 2 drops; orange flower water, 2 oz.; mix carefully, and add an equal bulk of cod liver oil.

COOK'S PILLS.—Powdered aloes, 100 gr.; powdered rhubarb, 100 gr.; calomel, 75 gr.; powdered castile soap, 25 gr.; make into 100 pills. Dose, 1 to 4 pills.

CORN PLASTERS.—1. (*Anodyne.*) Galbanum plaster or resin plaster, or the product of either Nos. 6 or 7, to each oz. of which 1 dr. of opium, in fine powder has been added. Recommended for painful corns and bunions.—2. (*Argentine.*) Resin plaster, 7 parts; fused nitrate of silver (in fine powder), 1 part; cut into pieces of appropriate size and "put up" in small flat boxes. Intended as a substitute for the direct application of lunar caustic, and to be applied to the corn only.—3. (*Beamish's.*) Said to consist of about equal parts of resin plaster and galbanum plaster, melted together by a gentle heat.—4. (*De Gros'.*) Resin plaster (recent), 5 dr.; melt it with a gentle heat; stir in of sal ammoniæ (in fine powder), 1 dr.; and at once spread it on linen or soft leather. The next day, lightly brush over the surface with strong tincture of benzoin.—5. (*Dupret's.*) Resin plaster (recent), 2 oz.; beeswax (genuine), ½ oz.; olive oil, ½ oz.; melt, stir in of croton oil, ¼ oz., and spread before it cools.

CUCUMBER OINTMENT.—Oil of sweet almonds, 7 fl. oz.; spermaceti, 18 dr.; white wax, 5 dr.; glycerine, 1 fl. oz.; green cucumbers, 4 lbs.; cut the cucumbers in small pieces; mash them in a Wedgewood mortar; let them macerate in their own liquor for 12 hours; express and strain; melt the almond oil, spermaceti and wax together, by means of a water-bath; add to it the strained liquor, stirring constantly, so as to incorporate the whole together; set aside in a cool place till it becomes hard; then beat with a wooden spoon, so as to separate the watery portion of the cucumbers from the ointment; pour off the liquor thus obtained, and mix the glycerine with the ointment, without the aid of heat, by working it with the hands until it becomes thoroughly incorporated; put up in 4 oz. jars; cover with a layer of rose water, and set aside in a cool place. The ointment prepared in this way will keep sweet for 12 months.

DANDELION, Infusion of.—Bruised root of dandelion, 2 oz.; boiling water, 1 pt.; steep 2 hours, and strain. Dose, a wineglassful 3 times a day. It is stimulant, resolvent and tonic.

DIARRHŒA MIXTURE.—1. (*Loomis'.*) Tincture of opium, ½ fl. oz.; tincture of rhubarb, ½ fl. oz.; compound tincture of catechu (U. S. P.), 1 fluid oz.; oil of sassafras, 20 min.;

compound tincture of lavender, enough to make 4 fl. oz.—2. (*Squibb's.*) Tincture of opium, 1 fl. oz.; tincture of capsicum, 1 fl. oz.; spirit of camphor, 1 fl. oz.; purified chloroform, 180 min.; alcohol, enough to make 5 fl. oz.—3. (*Thielemann's.*) Wine of opium, 1 fl. oz.; tincture of valerian, 1½ fl. oz.; ether, ½ fl. oz.; oil of peppermint, 60 min.. fluid extract of ipecac, 15 min.; alcohol, enough to make 4 fl. oz. This preparation is practically identical with the "Mixtura Thielemanni" of the Swedish Pharm. —4. (*Velpeau's.*) Tincture of opium, compound tincture of catechu (U. S. P.), spirit of camphor, each equal volumes.

DIGESTIVE PASTILLES.—(*Borivent's.*) Bismuth subnitrate, 20 parts; calcium phosphate, 30 parts; sodium bicarbonate, 10 parts; magnesium carbonate, 200 parts; iron carbonate, 50 parts; sugar, 1,000 parts; flavor with essence of peppermint, anise or orange flowers. Make into pastilles of 1 grm. each, of which 3 to 12 may be taken daily.

DR. PIERCE'S GOLDEN MEDICAL DISCOVERY.—A $1 bottle holds 220 gr. of a brownish colored clear liquid, consisting of 15 gr. pure honey, 1 gr. extract of poisonous or acrid lettuce, 2 gr. laudanum, 100 gr. dilute alcohol (64 per cent), tasting like fusel oil and wood spirit, with 105 gr. of water.

EFFERVESCING DRAUGHT.—Sesquicarbonate of soda, 30 gr.; water, or peppermint water, 1½ fl. oz.; sirup of orange peel, 2 fl. dr.; tincture of calumba, ½ fl. dr.; tartaric or citric acid, 25 gr.; add the acid last, and drink while effervescing. This is stomachic, tonic and anti-emetic; in acidity, dyspepsia, etc.

FRUIT SALT.—Carbonate of soda, citric acid, fine white sugar and powdered ginger. It makes a pleasant drink, and is an excellent antagonist to indigestion. Ginger is a carminative, and the carbonate of soda destroys the acidity which occasions flatulency. Lamplough's pyretic saline is a mixture of carbonate of soda and tartaric acid, with 2 per cent potassium chlorate.

HOARHOUND SIRUP.—1. Dried hoarhound, 1 oz.; hoarhound water, 2 lb.; digest in a water-bath for 2 hours; strain and add of white sugar, 4 lb.—2. White hoarhound, 1 lb.; boiling water, 1 gal.; infuse for 2 hours; press out the liquor, filter, and add of sugar, q. s. This is a good remedy in coughs and diseases of the lungs. Dose, a tablespoonful at pleasure.

HOLLOWAY'S PILLS.—Albes, 4 parts; jalap, ginger and myrrh, of each 2 parts; made into a mass with mucilage, and divided into 2 gr. pills.

HOOPER'S FEMALE PILLS.—1. Sulphate of iron, 8 oz.; water, 8 oz.; dissolve and add Barbadoes aloes, 40 oz.; canella, 6 oz.; myrrh, 2 oz.; opoponax, ½ oz.; make a mass.—2. Sulphate of iron, 2 oz.; powder of aloes, with canella, 16 oz.; mucilage of tragacanth and tincture of aloes, q. s. to form a mass; divide 60 gr. into 18 pills. According to recent analysis, the iron is in a peroxidized state; probably the sulphate is partially calcined.—3. Barbadoes aloes, 8 oz.; dried sulphate of iron, 2 oz. and 1½ dr.; extract of black hellebore, 2 oz.; myrrh and soap, of each, 2 oz.; cancella, 1 oz.; ginger, 1 oz.; water, q. s. to form a mass; divide into pills of 2½ gr. each.

HYDROKINONE, Wash for the Skin.—Hydrokinone, 48 gr.; acid phosphoric gac, 30 gr.; glycerine, 2 dr.; aqua dest., 6 oz.; misce. This lotion is stated to give excellent results. It has to be applied to the skin of the face, etc., in the usual way, at least twice in the course of 24 hours, after it has been washed and dried carefully. If the skin be of the nature known as "greasy," a preliminary wash with tepid water containing a few drops sal volatile or liq. ammon. fort. is advisable.

ITCH LOTION.—Sulphuret of potassium, 1 dr.; soft soap, 2 dr.; water, 8 fl. oz.; dissolve. This is an excellent remedy for the itch. It leaves little smell behind, and does not soil the linen.

ITCH OINTMENT.—1 Unsalted butter, 1 lb.; burgundy pitch, 2 oz.; spirits turpertine, 2 oz.; red precipitate, pulverized, 1½ oz.; melt the pitch and add the butter, stirring well together; then remove from the fire, and when a little cool, add the spirits of turpentine, and lastly the precipitate, and stir until cold.—2. Alum, nitre and sulphate of zinc, of each, in very fine powder, 1½ oz.; vermillion, ½ oz.; mix; add gradually of sweet oil, ½ pt.; triturate together until perfectly mixed; then further add of lard, 1 lb., with oils of aniseed, lavender and origanum, q. s. to perfume.—3. Carbonate of potassa, ½ oz.; rose water, 1 fl. oz.; red sulphuret of mercury, 1 dr.; oil of bergamot, ½ fl. dr.; sublimed sulphur and hog's lard, of each 11 oz.; mix them.—4. Chloride of lime, 1 dr.; rectified spirit, 2 fl. dr.; sweet oil, ½ fl. oz.; common salt and sulphur, of each 1 oz.; soft soap, 2 oz.; oil of lemon, 20 drops. Cheap, effectual and inoffensive.

LINSEED MEAL POULTICE.—Linseed meal, 4 oz., olive oil, ½ fl. oz.; mix, and add, gradually and constantly stirring, of boiling water, ½ pt. This is the formula of the new British Ph. Emollient, soothing and calefacient. Used to promote the suppuration and ripening of tumors, to allay pain, inflammation, irritation, etc.; applied warm. This is the common emollient and suppurative poultice of both private and hospital surgeons.

LIP SALVES.—1. (*Creme de Psyche.*) White wax, 1 oz.; spermaceti, 1 oz.; oil of sweet almonds, 5 oz.; mecca balsam, 1 dr.; pulverized acetate of lead, ½ dr.; prepare and add, while the mixture is warm, the balsam, and when it is cooled the sugar of lead.—2. (*Cerat d'Amour.*) Spermaceti, 2 oz.; oil of sweet almonds, 4 oz.; milk of roses, 1 dr.; powdered roses, 3 dr.; manipulate after the usual method.

MAGNOLIA BALM.—Florida water, 1 oz.; alcohol, 1 oz.; rose water, 2 oz.; glycerine, ¼ oz.; prep. chalk, 2 oz.; zinc oxide, 1 oz.; soft water, 2 oz.; tint with carmine, if desired.

MONOBROMATED CAMPHOR, Elixir of.—Monobromated camphor, 3 parts; alcohol (90 per cent), 120 parts; orange flower water, 80 parts; glycerine, 100 parts; mix alcohol and

glycerine; dissolve the monobromated camphor by use of heat; add the orange flower water. This solution contains 1 per cent of monobromated camphor.

MUSTARD POULTICES.—Dry mustard; cold water; mix enough cold water with the mustard to make it into a thick paste; when quite smooth, spread it upon a piece of thin old linen, or cotton; sew it round so as to form a bag. Be careful not to make the poultice larger than required; hold it to the fire for a few minutes, so as not to chill your patient; time, from 15 to 30 minutes; have ready a piece of clean soft cotton, or a piece of clean wadding, and when you take off the mustard poultice, put on the wadding or the cotton.

OXIDE OF ZINC OINTMENT.—1. Oxide of zinc, 1 oz.; lard, 6 oz.; mix them together.—2. A very mild oxide of zinc ointment is prepared with the following articles: Olive oil, 2 lb.; spermaceti, 12 oz.; white wax, 9 oz.; white oxide of zinc, 4 oz.; acid, benzoric, 2 dr.; sulphate of morphia, 2 dr.; otto of roses, 20 drops.—3. Oxide of zinc, 1 oz.; simple liniment, 6 oz. These are astringent, desiccative and stimulant; and are useful in excoriations, burns, various skin diseases attended by profuse discharges; in chronic inflammation of the eyes depending on relaxation of the vessels; in sore nipples, indolent sores, ringworm of the scalp, etc.

PAIN-KILLER.—Spirit of camphor, 2 oz.; tincture of capsicum, 1 oz.; tincture of guaiac, ½ oz.; tincture of myrrh, ½ oz.; alcohol; 4 oz.

PEPPERMINT, Infusion of.—Peppermint, 3 dr.; boiling water, ½ pt.; steep 15 minutes, and strain. In flatulence, colic, griping, etc., and as a vehicle for other medicines.

PERUVIAN BARK, Decoction of.—1.—Yellow cinchona of calisaya bark (bruised), 1¼ oz.; distilled water, 1 pt.; boil for 10 minutes in a lightly covered vessel, and when cold, strain, and pour on the bark sufficient water to make up 1 pt.—2. Brown, grey, yellow or red cinchona (bruised), 1 oz.; water, 24 fl. oz.; boil for 10 minutes; when cold, filter the liquor and evaporate it to 16 fl. oz. Dose, 1 to 2 fl. oz., 3 or 4 times daily, as a tonic, stomachic and febrifuge, when the stomach will not bear the administration of bark in powder; in fevers, dyspepsia, convalescence, etc.

PERUVIAN BARK, Infusion of.—Yellow cinchona bark, in coarse powder, 1 oz.; boiling distilled water, 1 pt.; infuse for 2 hours in a covered vessel, and strain. It is a tonic and stomachic, and in very large doses, febrifuge. It is a useful medicine in dyspepsia, debility and during convalescences, and is often a valuable adjunct to more active remedies. Dose, 1 to 3 fl. oz.

PHENOL SODIQUE.—This preparation of carbolic acid is deservedly quite popular with the medical and dental professions, but its composition has not been made public. The following formula is the result of numerous experiments, and will give an article that will compare favorably with the best French phenol sodique: Carbolic acid, in crystals, 188 gr.; caustic soda, 31 gr.; pure water, 4 fl. oz.; mix. The carbolic acid should be free from offensive odor, such as is prepared for medicinal purposes. When first mixed, it is nearly colorless, but in time assumes a wine color; does not deposit any tarry residue, as is too often found in the commercial article. Carbolic acid has a feeble action as an acid, combining definitely with a very small portion of alkali. When the quantity of soda used was just sufficient to neutralize the carbolic acid, the compound did not appear to be as efficient as the one resulting from the above formula.

PHILOCOME, Friend to the Hair.—1. White wax, 10 oz.; fresh rose oil, 1 lb.; acacia oil, ½ lb.; jasmine oil, ½ lb.; fleur d'orange oil, 1 lb.; tuberose oil, 1 lb.; melt the wax in the oils by a water-bath at the lowest possible temperature. Stir the mixture as it cools; do not pour out until it is nearly cool enough to set. Let the jars be slightly warmed.—2. (*Second quality.*) White wax, 5 oz.; almond oil, 2 lb.; otto bergamot, 1 oz.; otto of lemon, ½ oz.; otto of lavender, 2 dr.; otto of cloves, 1 dr.

PICK-ME-UP.—There is no general formula for this. A pick-me-up is simply a tonic draught, somewhat like a liquor.—1. The following is good: Essence of ginger, 10 drops; aromatic spirit of ammonia, ½ dr.; tincture of gentian, 1½ dr.; compound tincture of cardamoms, 3 dr.; sirup, ½ oz.; chloroform water, to 2 oz.; mix, and take as a draught.—2. (*For Dispensing.*) To ½ gal. of sirup, add ¼ oz. soluble extract of ginger, 1 oz. curacoa essence, 1 dr. sulphate of quinine, dissolved in the essence; ½ oz. fruit acid solution; color as desired.

PILE OINTMENT.—1 Burnt alum and oxide of zinc, of each, ½ dr.; lard, 7 dr.—2. Morphia, 8 gr.; melted spermaceti ointment, 1 oz.; triturate together until solution is complete; then add of finely powdered galls, 1½ dr.; essential oil of almonds, 12 to 15 drops, and stir until the mass concretes. This is useful in painful piles, prolapsus, etc.; it does not soil the linen as most other ointments.

POMADES.—1. (*Pommade Divine*) Refined beef marrow, 1 lb.; cypress wood (rasped), 1 oz.; orris root (in coarse powder), 1 oz.; liquid styrax, 1 oz.; cinnamon (powdered, but not dusty), ½ oz.; cloves (well bruised), ½ oz.; nutmegs (well bruised or grated), ¼ oz.; digest by the heat of a water-bath, in a covered vessel, for 5 or 6 hours, and then strain through flannel. Very fine, and much esteemed for the hair, and also as an occasional skin cosmetic.—2. Plain pomade (or soft beef fat), 1 lb.; melt by a very gentle heat, and stir in: Essence of violets, 2 fl. dr.; huile au jasmine, 1½ fl. dr.; oil of bergamot, 1 fl. dr.; oil of lemon, 1 fl. dr.; oil of lavender, ½ fl. dr.; oil of origanum, ½ fl. dr.; neroli, oil of cassia, oil of cloves, oil of verbena, 6 or 8 drops of each. Delightfully and powerfully fragrant, but apparently unnecessarily complicated. The product of the first is, however, the genuine pommade divine. In second and ordinary qualities, double the above proportion of fat is usually employed.

RADWAY'S READY RELIEF LINIMENT.—Soap liniment, 1½ fl. oz.; tincture of capsicum, 1 fl. oz.; water of ammonia, ½ fl. oz.; alcohol, ½ fl. oz.; mix thoroughly.

SAGE'S CATARRH REMEDY.—Powdered yellow root, 5 dr.; indigo, ½ dr.; powdered camphor, 2 dr.; carbolic acid, 2 dr.; common salt, 5) dr.; powder the camphor by means of alcohol, and mix with the salt (previously reduced to a fine powder). Rub the indigo and carbolic acid together, mix with the salt and camphor, and add the powdered yellow root; mix intimately, without pressure, in a mortar.

SALVE FOR PILES.—Cocaine hydrochloride, 20 gr.; morphine sulphate, 5 gr.; atropine sulphate, 4 gr.; tannin, 20 gr.; vaseline, 1 oz.; rose water, sufficient. Apply after each evacuation of the bowels, contents of which should of course be kept in solubie condition.

SARSAPARILLA.—1. Sassafras bark, bruised, 1 lb.; liecrice root, bruised, 7 oz.; water, 2½ gal.; oil of sassafras, 1½ dr.; oil of wintergreen, 2 dr.; alcohol, 95 per cent, 2 oz.; boil the sassafras and liecrice in the water half an hour; strain through flannel, then add the sirup; dissolve the oils in the alcohol, and add them to the sirup; agitate the mixture freely.—2. (*Ayer's.*) Fluid extract of sarsaparilla, 3 oz.; fluid extract stillingia, 3 oz.; fluid extract yellow dock, 2 oz.; fluid extract May apple, 2 oz.; sugar, 1 oz.; potassium iodide, 90 gr.; iron iodide, 10 gr.; mix them.

SEA FOAM, For Barbers.—Dissolve in 8 oz. alcohol, 2 oz. castor oil, 1 oz. ammonia; add this mixture to 1 qt. water.

SEIDLITZ POWDERS.—Rochelle salts, 2 dr.; bicarb. soda, 2 so.; put these into a blue paper; and 35 gr. tartaric acid into a white paper. To use, put each into different tumblers; fill half with water, adding a little loaf sugar to the acid; then pour together and drink quickly.—2. In one bottle: Potassio-tartrate of soda, 12 oz.; bicarbonate of soda, 4 oz.; tartaric acid, 3½ oz.; white sugar, 1 lb. (all in fine powder); dry separately by a gentle heat; add essence of lemon, ½ dr.; mix well; pass the mixture through a sieve, and put it at once in clean, dry bottles. A dessertspoonful or more to a tumblerful of water.—3. Cut blue and white paper to form powders. Into the blue papers, put 1 dr. bicarbonate of soda and 2 dr. Rochelle salts, intimately mixed; the white powder contains ½ dr. tartaric acid. For use, dissolve a powder each in half a tumbler of water; mix and drink while it effervesces.

SIMMON'S LIVER REGULATOR.—Liverwort, 1 oz.; Culver's physic, 1 oz.; Virginia snakeroot, 1 oz.; senna, 1½ oz.; water, 2½ pts.; whisky, ½ pt.; bring the water to a boil, and pour over the drugs; let stand one day; strain, and add the whisky.

ST. JACOB'S OIL.—Oil of sassafras, ½ oz.; oil of origanum, 1 oz.; chloroform, 1 oz.; sulph. ether, 1 oz.; chloral hydrate, 1 oz.; tincture of opium, ½ oz.; gum camphor, 1 oz.; alcohol, ½ gal.; dissolve the camphor in a portion of the alcohol, and rub thoroughly in a mortar; add other ingredients and mix; used externally and internally. Dose, ½ teaspoonful when needed.

STRENGTHENING PLASTER.—Litharge plaster, 24 parts; white resin, 6 parts; yellow wax and olive oil, of each, 3 parts; and red oxide of iron, 8 parts; let the oxide be rubbed with the oil, and the other ingredients added melted, and mix the whole well together. The plaster, after being spread over leather, should be cut into strips 2 inches wide, and strapped firmly around the joint.

SUN CHOLERA MIXTURE.—This medicine has stood the test of experience as a fine remedy for looseness of the bowels. It is claimed that no one who has this by him, and takes it in time, will ever have the cholera. Even when no cholera is anticipated, it is an excellent thing for the ordinary summer complaints—colic, diarrhœa, dysentery, etc. Take equal parts of tincture of cayenne, tincture of rhubard, essence of peppermint and spirits of camphor; mix well. Dose, 15 to 30 drops in a wineglass of water, according to age and violence of the attack. Repeat every 15 or 20 minutes until relief is obtained.

SULPHUR OINTMENT.—1. Flour of sulphur, 8 oz.; white precipitate, ½ oz.; red sulphuret of mercury, ½ oz.; mix well, and add olive oil, 4 oz.; lard, 1 lb.; creosote, 20 drops. Used for the cure of itch, ringworm and other obstinate skin diseases.—2. Flour of sulphur, 8 oz.; oil of bergamot, 2 dr.; lard, 1 lb.; rub freely 3 times a day for itch.

TAR OINTMENT.—1. Tar and suet, of each 1 lb.; melt them together, and press the mixture through a linen cloth.—2. Tar, 5 oz.; beeswax, 2 oz.; melt together, and stir the mixture briskly until it concretes.—3. Tar, ½ pt.; yellow wax, 4 oz.; as the last. A detergent application in ringworm, scald-head, scabby eruptions, foul ulcers, etc.; at first diluted with ½ its weight lard or oil.

THOMPSON'S EYE WATER.—Sulphate of copper, 10 gr.; sulphate of zinc, 40 gr.; rose water, 2 pt.; tincture of saffron, 4 dr.; tincture of camphor, 4 dr.; mix and filter.

TOOTHACHE DROPS.—(*Boerhaave's Odontalgic.*) Opium, ½ dr. troy; camphor (powdered), 4 or 5 dr. avdps.; oil of cloves, 2 fl. dr.; alcohol (90 per cent), 1½ fl. oz.; agitate the mixture occasionally for a week, and, after repose, pour off the clear portion. Often serviceable, and much esteemed by some persons, as toothache drops.—2. Hydrochlorate of morphia, 30 gr.; concentrated tincture of pellitory (made with 90 per cent alcohol), 2½ fl. oz.; oil of cloves, ½ fl. oz.; chloroform, ½ fl. oz.; agitate them together until mixed. Used as toothache drops, observing to shake the bottle well before use, and to keep it closely corked or stopped in a cool place. An excellent remedy.

TOOTHWASH.—(*Eau Odontalgique of Dr. O'Meara, Paris.*) Vitivert of India, 1 dr.; pyrethrum root, ½ oz.; cloves, 6 gr.; orris root, 12 gr.; coriander, 12 gr.; alkanct, 12 gr.; essence of mint (English), 12 drops; essence of bergamot, 6 drops; alcohol (36°), 2 oz.; bruise the solid materials in a mortar and place them, together with the alcohol and essences, in a tightly covered vessel. Macerate for eight or ten days, stirring frequently during the interval, and at the end of that time decant and filter the liquor.—2. (*Odontine.*) Cuttle fish bone, 1 part; castile soap, 1 part; red coral, 1 part; tincture of cochineal (to color), q. s.; honey (to mix), q. s.;

essential oil (to aromatize), q. s.—3. (*Sozodont.*) The reddish liquid consists of a solution of 5 grm. oil soap in 6 grm. glycerine; 30 grm. spirits, 20 grm. water, perfumed with a few drops of oil of peppermint, oil of cloves, oil of cinnamon and oil of anise, and colored with cochineal. The powder is a mixture of carbonate of lime, magnesia and Florentine orris root. None of the ingredients can be considered objectionable.

TURPENTINE LINIMENT.—Oil of turpentine, 16 parts; camphor, 1 part; soft soap, 2 parts; dissolve the camphor in the turpentine; then add the soap; rub till thoroughly mixed.

UNCLE SAM'S NERVE AND BONE LINIMENT.—Oil of origanum, 4 oz.; oil of rosemary. 4 oz.; oil of amber, 4 oz.; oil of hemlock, 4 oz.; turpentine, 4 pts.; oil of linseed, 6 pts.; mix. For external use only.

VICHY SALTS.—Bicarbonate of soda, 2½ oz.; muriate of soda, 22½ gr.; effloresced sulphate of soda, 1½ dr.; effloresced sulphate of magnesia, 1½ scr.; dry tartarized sulphate of iron, 1½ gr.; dry tartaric acid, or dry bisulphate of soda, 1½ oz.; mix the powders, previously dried, and keep in a well-corked bottle.

WEBSTER'S DINNER PILLS.—Powdered socotrine aloes, 360 gr.; powdered mastic, 120 gr.; powdered red rose leaves, 120 gr.; make 200 pills. Dose, 1 to 3.

WRIGHT'S PEARL OINTMENT.—Take of white precipitate, 8 oz.; Goulard's extract, 1 pt.; rub them to a cream, and add the mixture to white wax, 7 lbs., and olive oil, 10 lbs., previously melted together by a gentle heat; lastly, stir the whole until it is nearly cold. Found of great value.

WORM LOZENGES.—Most of the advertised nostrums under this name have a basis of calomel, and require to be followed by a purge a few hours afterwards.—1. Ethereal extract of wormseed, 1 dr.; jalap, starch and sugar, of each, 2 dr.; mucilage of gum tragacanth, q. s.; divide into 60 lozenges.—2. Wormseed, 1 oz.; ethiops mineral and jalap, of each, 3 dr.; cinnamon, 2 dr.; sugar, 7 oz.; rose water, q. s. A very good remedy.

INKS.

WRITING INKS.

REMARKS.—A good ink should be so thin as to flow freely from the pen, and yet should possess sufficient depth of color to retain its blackness for many years. Much of the permanency of ink depends on the material upon which it is written. Ink may consist of either a clear solution of any dye-stuff, or a finely divided insoluble precipitate suspended in water. The principal ingredients which enter into the composition of most black inks are gall-nuts, green vitriol and gum. The gall-nuts should be crushed to a coarse powder and boiled in water, or digested for several hours at a temperature near the boiling point, and the gum and green vitriol added to the filtered decoction in solution. The most permanent writing is done with India ink, because the black coloring matter of this ink consists of finely divided carbon, which is unaffected by chemical reagents. For ordinary use, such ink is recommended as consists either of pure galls and iron, or of some mixture in which these are the chief ingredients. The quantity of sulphate of iron (green vitriol) should not exceed ½ part that of the galls, by which an excess of astringent vegetable matter, which is necessary for the durability of the color, is preserved in the liquid. Gum, by shielding the writing from the action of the air, tends to preserve the color; but if much is employed, the ink flows languidly from the pen. The addition of sugar increases the flowing property, but makes it dry more slowly, and frequently to pass into an acetous state, in which condition it acts injuriously on the pen. Vinegar rapidly softens quill or horn, and corrodes iron and steel. To insure the permanency of the color of the tanno-gallic inks, the best Aleppo or blue nut-galls must alone be used; no second or inferior quality should be employed. Inks depending chiefly on logwood for color, are not considered by ink makers very reliable. Yet some very good logwood inks are made by combination with other chemicals. The quality of aniline inks is steadily improving with the progress of discoveries in aniline colors; so that the prejudice against them is not always warranted.

ALIZARINE BLACK.—Powdered nut-galls, 40 parts; solution of acetate of iron, 15 parts; gum Arabic, 10 parts; wood vinegar, 10 parts; indigo-carmine, 5 parts; water, 100 parts; prepare the solution of acetate of iron by pouring a sufficient quantity of wood-vinegar upon scrap-iron contained in a cask, and allow it to act upon the iron for eight days; macerate the powdered nut-galls for 8 days with the 100 parts of water mixed with the 10 parts of wood-vinegar; before mixing the strained liquid obtained from the nut-galls with the iron solution, in order to ascertain whether the quantity of acetic acid present is sufficient to keep the ferrous acetate in solution, mix 10 volumes of the liquid nut-gall extract with 1 volume of the iron solution; if a clear mixture results of a dark green color in thin layers, the liquid contains enough acid; but if a black, opaque liquid results, add very gradually more wood-vinegar from a measured volume, until the liquid is clear and dark green; add this requisite amount of acid to the extract of nut-galls; dissolve the gum Arabic in the latter; add the iron solution, then the indigo-carmine, or as much as may be required to produce the desired tint.—2. Digest 24 parts of Aleppo galls with 3 parts of Dutch madder, and 120 parts of warm water; filter; mix 1.2 parts of solution of indigo; 5.2 parts of sulphate of iron; and 2 parts

of crude acetate of iron solution. Alizarine ink may be evaporated to dryness and formed into cakes; 1 part, mixed with 6 of hot water, will then form an excellent writing fluid.

ANILINE BLACK is now made almost exclusively from nigrosine dissolved in soft water; about 130 gr. to the qt. is a good proportion. It makes an excellent ink.

BLACK (Elderberries).—Place bruised elderberries in an earthen vessel, and keep in a warm place for 3 days; press out and filter; add to $12\frac{1}{2}$ oz. of this, 1 oz. of sulphate of iron and the same quantity of pyroligneous acid. This ink is violet at first and afterwards becomes black.

BLACK (Logwood).—1. Extract of logwood, 100 parts; lime water, 800 parts; carbolic acid, 3 parts; common hydrochloric acid, 25 parts; distilled water, 600 parts; gum Arabic, 30 parts; bichromate of potassium, 3 parts; and a sufficient quantity of distilled water to bring the whole to a total of 1,800 parts; dissolve the logwood in the lime water over a steam-bath, using a porcelain or thoroughly enamelled iron vessel, and stir frequently; add the carbolic and hydrochloric acids; after heating half an hour over the steam-bath, let the mixture cool and then strain; add the bichromate of potassium and the gum, each separately dissolved in a considerable quantity of distilled water; and then add enough water to make up 1,800 parts. This ink writes red, but soon changes to a deep black.—2. Chipped logwood, 8 lbs; water, 8 gals.; boil $\frac{3}{4}$ of an hour, and add 2 oz. of bichromate of potassa. Cheapest black ink that can be made.—3. Dissolve 15 parts of extract of logwood in 900 parts of water; allow it to deposit; heat to boiling, and add 4 parts of crystallized sodium carbonate; dissolve in 100 parts of water, 1 part of yellow potassium chromate, and add this drop by drop, with constant stirring, to the logwood solution; after standing for a few hours, the ink will have assumed a full bluish-black color.

BLACK (Nut-galls and Iron).—1. Aleppo galls, well bruised, 4 oz.; clean soft water, 1 qt.; macerate in a corked bottle for 10 days, or longer, with frequent agitation; then add of gum Arabic, dissolved in a wineglassful of water, $1\frac{1}{2}$ oz.; lump sugar, $\frac{1}{2}$ oz.; mix well; add sulphate of iron, $1\frac{1}{2}$ oz.; agitate occasionally for 2 or 3 days, when the ink may be poured off for use. Or the ingredients may at once be put into a bottle and agitated daily until the ink is made; boiling water instead of cold being used.—2. Bruised Aleppo nut-galls, 1 lb.; sulphate of iron or copperas, 4 oz.; sulphate of copper, $\frac{1}{2}$ oz.; burnt sugar, 3 oz.; gum Arabic, 4 oz.; perchloride of mercury, 10 gr.; rain water, 1 gal.; mix; macerate 2 weeks; stir occasionally, and filter.—3. Digest for 24 hours with gentle heat, $62\frac{1}{2}$ dr. powdered nut-galls, with 17 oz. of alcohol of 82°; and in another vessel, $22\frac{1}{2}$ dr. of ferrous sulphate, and $22\frac{1}{2}$ dr. of gum Arabic, with 17 oz. of distilled water; mix the two liquids slowly; allow it to stand for 8 days; strain, and add 3 or 4 drops of vanadic acid.—4. Extract of logwood, 4 oz.; sulphate of copper, 1 oz.; nutgalls, 15 oz.; sulphate of iron, 6 oz.; gum Arabic, 6 oz.; cloves, 2 oz.; rain water, $3\frac{1}{2}$ qts.; vinegar, 4 oz.; pyroligneous acid, 8 oz.; add a little carbolic acid; this, with the pyroligneous acid, will prevent the ink from mildewing.—5. Bruised Aleppo nut-galls, 2 lbs.; water, 1 gal.; boil in a copper vessel for 1 hour, adding water to make up for that lost by evaporation; strain, and again boil the gall with 1 gal. of water, and strain; mix the liquors, and add 10 oz. of copperas, in coarse powder, and 8 oz. of gum Arabic; agitate until solution of the latter is effected; add a few drops of a solution of potassium permanganate; strain through a piece of hair cloth, and, after permitting it to settle, bottle.—6. 8 oz. of galls, in coarse powder; 4 oz. of logwood, in thin chips; boil in 12 pts. of rain water for 1 hour; strain the liquor; add 4 oz. of green copperas; 3 oz. of powdered gum Arabic; 1 oz. of blue vitriol; and 1 oz. of coarse sugar; stir until the whole is dissolved; then let it settle for 24 hours, and strain for use.—7. Gall-nuts, broken, 1 lb.; sulphate of iron, $\frac{1}{2}$ lb.; gum acacia and sugar candy, of each, $\frac{1}{4}$ lb.; water, 8 qts.; place the whole of these ingredients in a vessel where they can be agitated once a day; after standing for 14 or 21 days, the ink is ready for use.—8. Powdered galls, 42 oz.; Senegal, powdered, 15 oz.; distilled, or rain water, 18 qts.; sulphate of iron (free from copper), 18 oz.; liquor of ammonia, 3 dr.; spirit of wine, 24 oz.; mix in an open vessel, stirring frequently until the ink attains the desired blackness.—9. Bruised galls, 1 lb.; to this add 1 gal. of boiling water; $5\frac{1}{2}$ oz. of sulphate of iron in solution; 3 oz. of gum Arabic, previously dissolved; a few bruised cloves, or a few drops of crcosote or carbolic acid, dissolved in methylated spirit; allow the galls to macerate for 24 hours, then strain the infusion, and add the other ingredients.—10. Tannic acid and gallic acid, of each 20 gr.; dissolve in 2 oz. of water; crystallized sulphate of iron, and crystallized subsulphate of iron, of each 15 gr.; dissolve in 2 oz. of water; mix the 2 solutions; and add $2\frac{1}{2}$ fl. dr. of mucilage, and 2 drops of oil of cloves.—11. (*Asiatic.*) Logwood shavings and powdered galls, of each, 2 lbs.; green vitriol, 1 lb.; gum, $\frac{1}{2}$ lb.; pomegranate bark, $\frac{1}{4}$ lb.; water, 1 gal.; infuse 14 days with frequent agitation, or boil.

BLACK (Nut-galls and Iron Dissolved in Sulphate of Indigo).—This new form of the old nut-gall and iron ink, is one of the greatest discoveries ever made in the manufacture of inks. It is the basis of the famous Arnold's and Carter's writing fluids. Its peculiarity lies in the nut-gall and iron ink, which is an imperfect solution, being entirely dissolved in dilute sulphate of indigo, making the most perfectly fluid ink known. This action makes the ink write a pale bluish green, which, however, turns, after some hours, to a deep black.—1. 15 parts of bruised gall-nuts and 200 parts of water; boil for about an hour; strain; and then add to the liquor 5 parts of sulphate of iron, 4 parts of fine iron shavings, and a solution of $\frac{1}{2}$ pt. of powdered indigo in 3 parts of sulphuric acid. This ink writes green, but turns black after a few days.—2. Aleppo galls, bruised, $4\frac{1}{2}$ oz.; bruised cloves, 1 dr.; cold water, 40 oz.; sulphate of iron, $1\frac{1}{2}$ oz.; sulphuric acid, 35 min.; sulphate

of indigo, in thin paste, ¼ oz.; place the galls with the cloves in a 50 oz. bottle; pour upon them the water, and digest, shaking often for a fortnight; press, and filter through paper into another 50 oz. bottle; next, put in the iron, dissolved completely and filtered; then the acid, and shake briskly; lastly, add the indigo, and thoroughly mix by shaking; filter again through paper; no gum or sugar is required, and on no account must the acid be omitted.

BLACK (Waterproof).—Shellac, 4 oz.; borax, 2 oz.; water, 1 qt; boil till dissolved; add 2 oz. gum Arabic, dissolved in a little hot water; boil, and add enough of a well-triturated mixture of equal parts of indigo and lampblack, to produce the proper color; after standing several hours, draw off and bottle. Nearly indelible, but too gummy, and not a clear solution.

BLUE.—1. Aniline blue (of which there are many kinds), dissolved in soft water. Cotton blue will do.—2. Prussian blue, 6 parts; oxalic acid, 1 part; mix with water to a smooth paste; dilute with rain water.—3. Dissolve 2 or 3 oz. of sulphate of indigo in 1 gal. of water; or rub together 1 oz. of oxalic acid and 2 oz. of fine Prussian blue; to this add 1 qt. of boiling water; the excess of iron in the Prussian blue must be first removed by a strong mineral acid, then wash in rain water.—4. Soluble indigo of commerce makes a good blue ink, when slightly diluted with hot water.—5. Dissolve 10 parts of yellow prussiate of potassa in 160 parts of pure distilled water; gradually, and while stirring, add to that solution a mixture of 5 parts of a solution of perchloride of iron, and 160 parts of water; collect the precipitate on a filter, and wash with distilled water until the water begins to assume a blue color; dissolve the precipitate, which will then have become soluble in distilled water, in 400 parts of that liquid.—6. Prepare a solution from iodine, iron and water; add to the solution ½ as much iodine as first used; pour this solution into a semi-saturated solution of ferro-prussiate of potash, containing nearly as much of the salt as the whole weight of iodine; collect the precipitate, wash it, and finally dissolve it in water, to form the blue ink.—7. Chinese blue (ferro-cyanide of iron) is ground in water with binoxalate of potash and gum Arabic, in the following proportions: 7 oz. of water to 3 dr. of Chinese blue, 1 dr. of binoxalate of potash, and 1 dr. of gum Arabic.

BROWN.—1. Boil ½ oz. of catechu with 8 oz. of water until dissolved, and strain; dissolve 60 gr. of bichromate of potash in 1½ oz. of water; add it gradually to the solution of catechu until the desired shade is obtained.—2. Add to violet ink, finely powdered bichromate of potash, in the proportion of from 15 to 30 gr. to 1 oz.; various shades of brown and snuff color are obtained.—3. Mix a strong decoction of logwood with a very little bichromate of potash.

COPYING, Black. — Add a little sugar, or other saccharine matter, glycerine, or soluble gum, to any ordinary black ink, which, for this purpose, should be rich in color. Railroad, or multiple copying inks, capable of producing several copies from one writing, are simply inks loaded with extra color and more glycerine or sugar than are put in an ordinary copying ink. Writing executed with this ink may be copied even after many hours, by passing it through a copying press, in contact with thin, unsized paper, slightly dampened, inclosed between 2 sheets of thick oiled or waxed paper, when a reversed transcript will be obtained, which can be read in proper order when the back of the copy is turned upwards. In the absence of a press, a copy may be taken (when the ink is

Copying Press.

good and the writing very recent) by rolling the sheets, duly arranged on a ruler, over the surface of a smooth, flat table, employing as much force as possible, and avoiding any slipping or crumpling of the paper; or by passing a warm flat-iron over the paper laid upon the writing.—1. Mix 30 gr. of extract of logwood, 7 gr. of crystal soda, and ½ oz. of water; boil till dissolved; then, while stirring well, add 30 gr. of glycerine, 1 gr. of chromate of potash, previously dissolved, and 4 gr. of powdered gum Arabic. This receipt requires no press, but the writing may be copied by placing a damp sheet of copying-paper on the writing intended to be copied; above this sheet of copying-paper a sheet of ordinary writing paper must be placed, and then pressed with a paper-knife.—2. Dissolve ½ oz. of gum and 20 gr. of Spanish licorice in 13 dr. of water; add to it 1 dr. of lampblack, previously mixed with 1 teaspoonful of sherry; if the lampblack is greasy, it should be heated to redness in a covered crucible.—3. Malt wort, 1 pt.; evaporate it to the consistence of a syrup; then dissolve it in good black ink, 1½ pts.—4. Solazza juice, 2 oz.; mild ale, ½ pt.; dissolve, strain, and triturate with lampblack (previously heated to dull redness in a covered vessel), ¼ oz.; when the mixture is complete, add of strong black ink, 1½ pts.; mix well; in 2 or 3 hours decant the clear.

COPYING-PAD INK.—This is simply aniline violet ink, of 10 to 15 times the ordinary strength, with a little alcohol added to assist the keeping of so much aniline in solution. Take 40 gr. of methyl violet, BB; dissolve it in 2 oz. of hot rain water; add 2 teaspoonfuls of alcohol; bottle, and keep stopped tight when not in use. If too much alcohol is put in, the ink will spread on the paper, and some of the spirit should be allowed to evaporate. Other

aniline colors can be similarly used, but none give the satisfaction of violet.

COPYING, Red.—Treat a solution of campeachy-wood with 1 per cent. alum and 1 per cent. lime-water, so as to get a permanent precipitate; add a few drops of weak calcium chloride, the fluid becoming a blue-black; into this drop hydrochloric acid until the fluid turns red; add a little gum Arabic and ½ per cent. of glycerine.

COPYING, Violet.—For blue violet, dissolve in 300 parts of boiling water methyl violet, 5B; or Hofmann violet, 3B; or gentiana violet, B; for reddish violet, dissolve in a similar quantity of water methyl violet, RR. A small quantity of sugar added to these inks improves their copying qualities. If the writing, when dry, retains a bronzy appearance, more water must be added.

FADED BLACK INK, To Restore.—1. Cover the letters with a solution of ferrocyanide of potassium, with the addition of diluted muriatic acid; upon the application of which the letters will change to a deep blue color. To prevent the color from spreading, the ferrocyanide should be put on first and the dilute acid added upon it.—2. Dampen a piece of soft white paper; lay it on the faded writing; press it down closely; put a tablespoonful of spirits of hartshorn in a tin vessel with a candle or lamp under it; hold the soft damp paper over it, so as to receive the fumes of the hartshorn; if the writing is not exhibited on the soft paper plain enough, dampen it again and repeat the whole process until it is plain enough.—3. Faded ink on old parchments may be restored so as to render the writing perfectly legible by moistening the paper with water, and then passing over the lines in writing a brush which has been dipped in a solution of sulphide ammonia. The writing will immediately appear quite dark in color, and this color, in the case of parchment, it will preserve. On paper, the color gradually fades again; but it may be restored at leisure by the application of the sulphide.

DRAWING.—1. Dissolve shellac in a hot water solution of borax and rub up in this solution a fine quality of India ink; after using, dip the drawing pen in alcohol and wipe dry, to keep it clean and bright.—2. The addition of 1 part of carbolic acid to 80 parts of the fluid India ink, causes it to dry rapidly even in heavy lines, so that they can be varnished over. The proper amount of carbolic acid to be added may be ascertained by adding, drop by drop, the ordinary apothecary's solution of it in alcohol until varnishing does not affect the definition of a test line by causing it to run. The addition of too much carbolic acid is indicated by the transparency of the line and the inability to draw fine lines, which may be remedied by adding more fluid ink.

GILDING WRITING, Methods of. — Letters written on vellum or paper are gilded in three ways: 1. A little size is mixed with the ink, and the letters are written as usual; when they are dry a slight degree of stickiness is produced by breathing on them, upon which the gold leaf is immediately applied, and by a little pressure may be made to adhere with sufficient firmness.—2. Some white lead or chalk is ground up with strong size and the letters are made with this by means of a brush; when the mixture is almost dry, the gold leaf may be laid on and afterwards burnished.—3. Mix up some gold powder with size, and make the letters of this by means of a brush.

GLASS, Ink for Writing on.—Mix barium sulphate, 3 parts; ammonium fluoride, 1 part; and sulphuric acid, sufficient quantity to decompose the ammonium fluoride and make the mixture of a semi-fluid consistency; prepare in a leaden dish, and keep in a gutta-percha or leaden bottle.

GLUTEN.—Dissolve wheat gluten, free from starch, in weak acetic acid, of the strength of common vinegar; mix 10 gr. of lampblack, and 2 gr. of indigo, with 4 oz. of the solution, and a drop or two of the oil of cloves. Almost indelible.

GOLD.—1. Gold, 24 leaves; bronze gold, ½ oz.; spirits of wine, 30 drops; best honey, 30 gr.; gum Arabic, 4 dr.; rain water, 4 oz.; rub the gold with the honey and gum, and having mixed it with the water, add the spirit.—2. Mix fine bronze powder or gold leaf, ground with a little sulphate of potash, and washed from the salt, with water and a sufficient quantity of gum.—3. Rub genuine gold leaf with honey or thick gum water, on a plate of agate or ground glass, by means of a flat pestle, until the whole presents a uniform mass in which no distinct particles of gold can be recognized; remove this mass carefully into a vessel with water, which will dissolve the honey and leave the gold in a finely divided state behind; renew the water 2 or 3 times, until all the saccharine matter is washed away; mix the remaining gold with a sufficient quantity of a solution of gum Arabic, shaken well. The writing is to be rubbed after drying, with a flat piece of ivory, when it will present the lustre of pure gold.—4. Gold, 1 part; nitro-hydrochloric acid, 3 parts; mix and evaporate until chlorine in vapor is given off; cool, and mix with ether by shaking well together; thicken with naphtha or any essential oil.—5. Rub scales of iodide of lead with mucilage; if it is not dark enough, add a little iodine; shake well before using.

GREEN.—Dissolve 180 gr. bichromate of potassa in 1 fl. oz. of water; add while warm ½ oz. spirit of wine; decompose the mixture with concentrated sulphuric acid until it assumes a brown color; evaporate this liquor until its quantity is reduced to ½; dilute it with 2 oz. distilled water; filter; add ½ oz. alcahol, followed by a few drops of strong sulphuric acid; let it stand, and after a time it will assume a beautiful green color; add a small quantity of gum Arabic and it is ready for use.—2. 2 parts acetate of copper; 1 part carbonate of potash; 8 parts water; boil till half is evaporated, and filter.—3. Crystallized acetate of copper, 1 oz.; soft water, 1 pt.; mix.—4. A solution of verdigris in vinegar.—5. Rub 3½ drs. of Prussian blue and 3 dr. of gamboge, with 2 oz. of mucilage; add ½ pt. of water.—6. Calcine aceto-nitrate of chrome; dilute the green powder with sufficient

water.—7. Mix good clear blue and yellow inks in the proportions necessary to give the desired tint.—8. Verdigris, 2 oz.; cream of tartar 1 oz.; water ½ pt.; boil to ½, and filter. 9. Dilute a solution of recently precipitated hydrated oxide of chromium in liquor of ammonia, with distilled water.—10. Dissolve sap green with a little alum.—11. Galls (in powder), 50 parts; hot water, 800 parts; digest 24 hours; strain, and add of green sulphate of iron and gum Arabic, of each 25 parts; when dissolved, add the following solution and mix well: Sal ammoniac, 8 parts; gum, 2 parts; oil of lavender, 1 part; boiling water, 16 parts.—12. Digest 1 part of gamboge with from 7 to 10 parts of the blue ink.—13. To powdered bichromate of potassa, 8 parts, contained in a porcelain dish, add oil of vitriol, 8 parts, previously diluted with 64 of water; then heat, while evaporating, add gradually 24 parts of alcohol, and reduce to 56 parts, which filter, and in the clear liquor dissolve 8 parts of gum Arabic.

HORTICULTURAL, For Tree Labels.—1. Dissolve muriate of ammonia and crude sal ammoniac in strong vinegar; this is to be used with quill pens only.—2. For large labels, dip your pen in concentrated sulphuric acid, and write on the zinc, previously greased; a sharp point of copper wire is better than a pen; quench in water; wash thoroughly from fluid when your writing is plain enough.—3. First let the label oxidize a little by dipping it in water for a day or two before using; then write with a common lead-pencil.—4. Dissolve a small quantity of chloride of platinum in hot distilled water, adding a very few drops of aqua regia. The liquid should be of a pale amber color; for zinc tree labels.—5. Dissolve 1 part of copper in 10 parts of nitric acid; dilute with 10 parts of water.—6. Squeeze the juice out of a lemon into a pot; put into it a small piece of copper; let it stand for a day or two; write with a quill pen.

INCORRODIBLE.—This name has been given to preparations of a resinous character, capable of resisting the action of damp and acids. They are employed for writing labels on bottles containing strong acids and alkaline solutions. They are better employed with stamps, types or stencil plates, by which greater neatness will be secured than can be obtained with either a brush or pen. (See *Black Waterproof*, also *Indestructible* Inks.)—1. Boiled linseed oil, ground with a sufficient quantity of lampblack and Prussian blue to impart a deep black color; thin with oil of turpentine.—2. Genuine asphaltum, 1 part; oil of turpentine, 4 parts; dissolve, and add lampblack or black lead to bring it to a proper consistence.—3. Cobalt (in powder), 25 gr.; oil of lavender, 200 gr.; dissolve by a gentle heat; add of lampblack, 3 gr.; indigo, 1 gr. (both in impalpable powder); or sufficient vermilion.

INDESTRUCTIBLE.—1. Dissolve 25 gr. of powdered gum copal in 200 gr. of lavender oil by the aid of a gentle heat; add 2½ gr. of lampblack, and ½ gr. of powdered indigo.—2. In 18 oz. of water, boil shellac, 2 oz., and borax, 1 oz.; when cold, filter and mix with 1 oz. gum Arabic dissolved in 2 oz. of water; to this add powdered indigo and lampblack to color.—3. Dissolve real India ink in common black ink; or add a small quantity of lampblack previously heated to redness, and ground perfectly smooth, with a small portion of the ink.—4. Dissolve 20 gr. of sugar in 30 gr. of water; add to the solution a few drops of concentrated sulphuric acid; heat the mixture, when the sugar will carbonize by the action of the acid.—5. (*Hausmann's.*) Mix 1 part genuine Trinidad asphaltum with 4 parts oil of turpentine; color with a sufficiency of plumbago for black, or vermilion for red ink.—6. (*Stephen's.*) Mix common soda of commerce with resinous matters (as shellac or resin), in about equal parts by weight; add water according to the strength required; boil the solution until the resin has become dissolved; mix in a mortar with the requisite quantity of fine lampblack, and add any suitable colored solution.

INDIA.—1. Grind lampblack (finest) to a paste with very weak liquor of potassa; diffuse this paste through water slightly alkalized with potassa; after which collect it; wash with clean water, and dry; rub the dry powder to a smooth stiff paste, with a strong filtered decoction of Carrageen or Irish moss, or of quince seed; add a few drops of essence of musk, and about half as much essence of ambergris towards the end of the process; mold the mass into cakes, and ornament with Chinese characters and devices as soon as they are dry and hard.—2. Purify fine lampblack by washing it with a solution of caustic soda; dry, and make into a thick paste with a weak solution of gelatine; containing a few drops of musk essence and about half as much ambergris; mold and dry. Instead of gelatine the following solution may be used: seed lac, 1 oz.; borax, ¼ oz.; water, 1 pt.; boil until a solution is effected, and make up with water to ¾ pt.—3. Mix pure lampblack with asses' skin glue, and scent with musk.—4. Calcined lampblack, 100 parts; boghead shale black, in impalpable powder, 50 parts; indigo-carmine in cakes, 10 parts; carmine lake, 5 parts; gum Arabic (best quality) 10 parts; purified ox-gall, 20 parts; alcoholic extract of musk, 5 parts; dissolve the gum in 50 to 60 parts of pure water; filter through a cloth; mix the indigo, carmine, lake, lampblack, and shale black with the liquid and grind the whole on a slab with a muller like ordinary colors, but much longer; add the ox-gall and ext. of musk slowly, grinding well in; next dry in the air away from dust; mold into cakes and dry again; when quite firm, compress into bronze molds with any desired design; wrap up in tin foil and again in gilt paper.—5. Dissolve horn strip with caustic kali root till it is melted; boil the brown liquid in an iron kettle until it is thick; then pour on it boiling water, double its weight, and precipitate it with dissolved alum; dry; grind; mix it with gum water and pour it in a mold; a few drops of essence of musk, or of ambergris, may be added as perfume.—6. Boil a weak solution of fine gelatine at a high temperature in a Papin's digester for two hours, and then in an open vessel for one hour more; filter the liquid and evaporate to a

proper consistence, either in a steam or salt-water bath; lastly, make into a paste, with pure lampblack which has previously been heated to dull redness in a well-closed crucible. This will not gelatinize in cold weather, like the ordinary imitations.—7. Dissolve superfine glue in water; add a strong solution of nut-galls; wash the precipitate in hot water; then dissolve it in a fresh solution of glue; filter; evaporate to a proper thickness, and form it into a paste with purified lampblack.—8. Horse-beans or the kernels of the stones of apricots; burn in an oven till perfectly black; grind to a fine powder, and make into a paste with a solution of gum Arabic; then form into cakes.—9. Boil parchment slips or cuttings of glove leather in water till it forms a size, which, when cool, becomes of the consistence of jelly; then having blackened an earthen plate, by holding it over the flame of a candle, mix up, with a camel-hair pencil, the fine lampblack thus obtained, with some of the above size, while the plate is still warm. This black requires no grinding, and produces a perfectly transparent ink, which works freely with the pencil.

JAPAN.—Dissolve in ½ a pt. of soft water ⅜ oz. of potassium bichromate; add the solution to 6 oz. of logwood extract; dissolve in 1 gal. of water; then dissolve in 1 gal. of water by continued boiling, borax, 6 oz., shellac, 1½ oz.; mix all together while warm, and add 3 oz. of ammonia. Distinguished for its gloss after writing. But any ink may be made quite glossy by adding a large proportion of gum Arabic or yellow dextrine.

LUMINOUS.—Phosphorus, ½ dr.; oil of cinnamon, ½ oz.; mix in a vial; cork tightly; heat it slowly until mixed. A letter written in this ink can only be read in a dark room, when the writing will have the appearance of fire.

METALS, Ink for Writing on.—1. Verdigris and sal ammoniac, of each, ½ oz.; levigated lampblack, ½ oz.; common vinegar, ½ pt.; mix thoroughly. This may be used on either zinc, iron or steel.—2, Mix 1 oz. of powdered sulphate of copper and ½ oz. of powdered sal ammoniac with 2 oz. of diluted acetic acid, adding lampblack or vermilion.—3. See *Horticultural Ink*, no. 5. The above receipts will answer for writing on steel, tin plate or sheet zinc.—4. For writing on zinc, see *Horticultural Ink*, nos. 1 and 2.

MOLDINESS IN INK, To Prevent.—1. Add a few bruised cloves, a little oil of cloves, a few grains of corrosive sublimate, or a few drops of carbolic acid or creosote.—2. A small quantity of salicylic acid, ½ gramme to the liter, will prevent ink from molding even when kept in open bottles.

PARCHMENT.—1. ½ lb. each, of pulverized copperas and Honduras logwood; 1 lb. of best Aleppo nutgalls; 4 oz. of gum Arabic, and 2 gal. of rain water; first boil the galls in the water until the strength is out; then add and boil the other articles; add as much additional water as the mixture will bear; let it settle, and strain before bottling.—2. Galls, 1 lb.; gum Arabic, 6 oz.; alum, 2 oz.; green vitriol, 7 oz.; kino, 3 oz.; logwood raspings, 4 oz.; soft water, 1 gal.; mix, and macerate all thoroughly.

POWDERS, Black.—1. 1 lb. nut-galls; 7 oz. copperas and 7 oz. gum Arabic; pulverize and mix. This amount of ink powder will make 1 gal. of good black ink. 2 or 3 powdered cloves should be mixed with each lb. of powder to prevent molding.—2. Take 100 parts dry extract of logwood, well mixed and ground with 1 part fine bichromate of potash. ½ oz. is sufficient to change a whole pt. of water into a beautiful black ink.—3. Gallic acid, 2 lbs.; sulphate of iron (copperas), 1 lb.; gum Arabic, ½ lb.; powder as finely as possible; rub all together, adding a few grains of powdered cloves; dissolve in hot or cold water.—4. Reduce best quality of the aniline nigrosine to powder by grinding. The powder dissolves in water, forming an excellent ink.

POWDERS, Colored.—Any of the best qualities of soluble aniline dyes make good ink powders.

PURPLE.—1. Add to a decoction of 12 parts Campeachy wood in 120 parts of water, 1 part subacetate of copper, 1¼ parts alum, and 4 parts gum Arabic; let stand for 4 or 5 days.—2. Boil 1 oz. of ground logwood in 1½ pts. of soft water, with ½ oz. of pulverized alum; boil 20 minutes; strain, and bottle for use. Exclude the air, and it will keep a long time.—3. 40 gr. methyl or Hoffmann's violet RRR to 1 qt. soft water.

RED.—1. Boil Brazil wood, 2 oz., in 32 oz. of water; to this add, after the decoction has been strained, ½ oz. of chloride of tin, and 1 dr. of powdered gum Arabic; then evaporate to 16 fl. oz.—2. Brazil wood, ground, 4 oz.; white wine vinegar, hot, 1½ pts.; digest in glass or a well-tinned copper or enamel saucepan, until the next day; then gently simmer for half an hour; add towards the end gum Arabic and alum, of each, ½ oz.—3. Boil 2 oz. of good Brazil wood; ½ oz. of alum, and ½ oz. of cream of tartar, in 16 oz. of rain water, till reduced to ½; strain, and dissolve in it ½ oz. of gum Arabic; add a tincture made with 1½ drs. of cochineal in 1½ oz. of spirits of wine.—4. 4 oz. of ground Brazil wood and 3 pts. of vinegar; boil till reduced to 1½ pts.; add 3 oz. of powdered rock alum.—5. Tincture of red sanders, with a solution of rock alum; mix.—6. Triturate 1 dr. of cochineal and 1 dr. of carbonate of potash, with a little boiling water; add 1 dr. of burnt alum, 2 drs. of cream of tartar, and water to bring it to the desired color.—7. Cochineal (in powder), 1 oz.; hot water, ½ pt.; digest, and when quite cold, add of spirits of hartshorn, ½ pt. or liquor of ammonia, 1 oz., diluted with 3 or 4 oz. of water; macerate for a few days longer; then decant the clear.—8. Dissolve 25 parts, by weight, of saffranine in 500 parts warm glycerine; stir in carefully 500 parts alcohol, and an equal quantity of acetic acid; then dilute with 9,000 parts of water, in which is dissolved a little gum Arabic.—9. Dissolve 4 gr. of carmine in 1 oz. of aqua ammonia; add 6 gr. of gum Arabic.—10. (*Permanent.*) Vermilion, 4 parts; sulphate of iron, 1 part; drying oil to mix. Any other color will answer besides red. This ink will resist most of the usual reagents.

SCARLET.—1. Take garancine of best quality, 1 oz.; digest with liquor ammonia, 1 oz.; add 1 pt. of cold distilled water; triturate together in a mortar; filter, and dissolve in the solution ½ oz. of gum Arabic, or take pure carmine, 20 gr.; liquor ammonia, 3 fl. oz.; dissolve and add 18 gr. of powdered gum.—2. Use the aniline color called *eosine*.—3. (*Stephen's.*) Take some common soda, potash, or carbonate of ammonia; add to it, at intervals, twice its weight of crude argol in powder; when effervescence has ceased, pour off the solution, or filter it from insoluble matter; add to it, by measure, half the quantity of oxalate of alumina, prepared by adding to precipitated alumina in a damp state as much oxalic acid as will dissolve it; into this mixture when cold, put as much powdered cochineal as will give it a fine red color; after letting it stand for 48 hours, strain for use.

SILVER.—1. Triturate, in a mortar, equal parts of silver foil and sulphate of potassa, until they are reduced to a fine powder; wash the salt out, and mix the residue with a mucilage of equal parts of gum Arabic water.—2. Mix to a proper consistency finely ground mica with a solution of gum Arabic, in water.

SYMPATHETIC.—Fluids which, when used for writing, remain invisible until the paper is heated, or acted on by some other chemical agent. Sympathetic inks have been frequently employed as the instruments of secret correspondence, and have often escaped detection; but by using the proper reagent, the whole of them may be rendered visible.—(*Black.*) 1. A weak solution of galls; this is turned black by immersing the paper in a weak solution of protosulphate of iron.—2. A weak solution of sulphate of iron; turns black when moistened with infusion of galls.—3. Dissolve 1 fl. oz. of common oil of vitriol in 1 pt. of soft water; stir well and allow it to cool; write with a clean pen; when dry, it will be invisible; held to the fire, it turns black.—4. Writing done with a solution of nitrate of silver, will be invisible until exposed to the sun's rays or heat, when it will become permanently black.—(*Blue.*) 1. Make a simple solution of acetate of cobalt; use it as you would common ink, on a fine textured paper and with a clean quill pen; the writing will be invisible when cold, but on holding it before a fire it will assume a blue tint.—2. A weak solution of sulphate of iron; turns blue when moistened with a weak solution of prussiate of potassa.—3. A weak solution of protosulphate of iron; turns blue when moistened by a weak solution of prussiate of potash.—(*Brown.*) 1. Put into a vial ½ oz. of distilled water, 1 dr. of bromide of potassium, and 1 dr. of pure sulphate of copper; the solution is nearly colorless, but becomes brown when heated.—2. A diluted solution of nitrate of silver becomes dark brown when exposed to the sunlight.—3. A solution of acetate of lead, colorless; becomes brown when exposed to sulphuretted hydrogen gas.—(*Green.*) 1. Write with a solution of muriate of cobalt; the writing, while dry, will not be perceptible; but if held toward the fire will gradually become visible.—2. Digest 1 oz. of zaffre, or oxide of cobalt, at a gentle heat, with 4 oz. of nitro-hydrochloric acid, till no more is dissolved; add 1 oz. of common salt and 16 oz. of water. If this be written with, and the paper held to the fire, the writing becomes green, unless the cobalt should be quite pure, in which case it will be blue. The addition of a little nitrate of iron will impart the property of becoming green.—(*Gray.*) A weak solution of alum in lemon juice or tartaric acid; turns gray when the paper is immersed in water.—(*Purple.*) 1. Write with a weak solution of sulphate of copper, using a quill pen. The writing will remain invisible until it is held over the fumes of ammonia, when it will become purple. The color may then be expelled by holding it near the fire.—2. Write with a dilute solution of terchloride of gold; becomes purple when exposed to the sunlight.—(*Red.*) 1. Solutions of nitrate of silver and terchloride of gold become permanently dark when exposed to sunlight.—2. Boil oxide of cobalt in acetic acid; if a little nitre is added it becomes a pale rose color.—(*Yellow.*) 1. Pound and rub down some muriate of ammonia; pour upon it a small quantity of the solution of sulphate of copper; mix well, and filter the solution, which will then be a muriate of copper; when dry and cool, the characters written or drawn upon the paper will be invisible, but will turn yellow on exposure to heat.—2. Sulphate of copper and sal ammoniac, equal parts, dissolved in water; writes colorless, but turns yellow when heated.—3. Lemon juice; a very weak solution of either aquafortis, oil of vitriol, common salt, or saltpeter, will turn yellow or brown on exposure to the fire.—4. Dissolve crystals of chloride of cobalt in water; add a sufficient quantity of nitrate of copper; heat, and an ink of rich greenish yellow color will result. When the paper is laid aside, moisture is absorbed and the writing disappears, but if much heat is applied the traces will become permanent.—(*Landscape.*) 5. Draw a landscape with India ink, and paint the foliage of the vegetables with muriate of cobalt, some of the flowers with acetate of cobalt, and others with muriate of copper. While this picture is cold, it will appear to be merely an outline of a landscape, or winter scene; but when gently warmed, the trees and flowers will be displayed in their natural colors, which they will preserve only while they continue warm. This may be often repeated.

TRANSFER INKS (For Lithographing and Art Work).—For the manufacture of the following inks an iron pot and lid must be procured.—1. White wax, 8 oz.; white soap, 2 to 3 oz.; melt, and when well combined, add of lampblack, 1 oz.; mix well; heat it strongly; then add of shellac, 2 oz.; again heat it strongly, stir well together; cool a little, and pour it out as before. With this ink, lines may be drawn of the finest to the fullest class, without danger of its spreading, and the copy may be kept for years before being transferred.—2. White soap and white wax, of each 10 oz.; mutton suet, 3 oz.; shellac and mastic, of each, 5 oz.; lampblack, 3½ oz.; mix as above. Both the above are used for writing on lithographic paper. When the last

is employed, the transfer must be made within a week. The above inks are rubbed down with a little water in a small cup and saucer for use, in the same way as common water-color cakes or india ink. In winter, the operation should be performed near the fire, or the saucer should be placed over a basin containing a little tepid water. Either a steel pen or a camel-hair pencil should be employed with the ink.—3. (*Chalks.*) Virgin wax, 16 parts; tallow, 2; white soap, 12; lampblack, 3½; melt the wax and tallow, and mix with an iron spoon; then add the soap, which must be previously cut into strips; when melted, apply a light, and allow to burn until the whole is decreased to the same bulk as existed before the addition of the soap; carefully add the shellac, bit by bit, stirring the whole time to effect perfect amalgamation; next add the black, and mix the whole well while in a liquid state; then pour into a mold, or on a slab, and cut to the required size while warm. The same method of proceeding is alike applicable to the manufacture of transfer writing ink, proceeding with the wax only, there being no tallow.—4. (*Copper-plate Transfer Ink.*) Litho. writing ink, 4 parts; thin varnish, 1 part; wax, 1 part; tallow, ½ part; soap, 1 part; carefully melt the ingredients; when in a liquid state pour into molds, or cut to the required size.—5. (*Stone Re-transfer Ink.*) Litho. printing ink, 2 parts; writing ink, 2 parts; thin varnish, 2 parts; tallow, ½ part.—6. (*Stone Writing Ink.*) Virgin wax, 4 parts; tallow, 3 parts; soap, 13 parts; shellac, 6 parts; lampblack, 3 parts. To dissolve solid lithograph ink, warm the pot at the fire or gas, using rain or distilled water to rub it down with, as it is softer than other water. The pen will be found to work better at first if it is dipped in oil, and then wiped previous to writing.

VANISHING.—1. A piece of sal ammoniac is placed for 4 or 5 days in nitric acid, and then powder of touchstone, such as jewelers use for trying gold and silver, is mixed with the liquid in sufficient quantity. This gives a writing fluid which bleaches after 6 to 8 days.—2. A still better ink of this kind may be obtained as follows: Boil 4 oz. crushed gall-nuts in diluted nitric acid, and add 2 oz. of sulphate of iron and some chloride of ammonium. Writing done with this mixture will disappear in a few days.

VIOLET.—1. Boil 8 oz. of logwood in 3 pts. of water till reduced to 1½ pts.; strain, and add 1½ oz. of gum and 2½ oz. of alum.—2. Cudbear, 1 oz.; pearlash, 1½ oz.; hot water, 1 pt.; allow to stand for 12 hours; strain, and add about 2 oz. of gum; if required to keep, add 1 oz. spirits of wine.—3. Aniline violet, BBB; stir till dissolved in boiling water.

WHITE.—1. Mix pure freshly precipitated barium sulphate, or "flake white," with water containing enough gum Arabic to prevent the immediate settling of the substance. Starch or magnesium carbonate may be used in the same way. They must be reduced to impalpable powders.—2. Rub up fine French zinc white, or white lead, with gum-water to the proper consistency.

WHITE, For Black Bottles. — Grind flake white, or sulphate of baryta, with a little oil of turpentine, and any light colored varnish to a proper consistence.

WHITE, For Colored Paper.—1 part muriatic acid, and 20 parts starch-water. Very dilute oxalic acid may also be used. Write with a steel pen.

YELLOW.—1. Triturate gamboge with water, and add a little alum.—2. Boil 8 oz. of French berries with 1 oz. of alum in a qt. of water; strain, and add 1 oz. of gum.—3. 1 part fine orpiment: rub up well with 4 parts of thick gum-water.—A little alum, added to saffron, in soft hot water, makes a beautiful yellow ink.

INDELIBLE INKS.

ANILINE BLACK.—1. Dissolve bichloride of copper, 8½ gr., in distilled water, 30 gr.; add common salt, 10 gr.; and liquid ammonia, 9½ gr.; add a solution of 30 gr. of hydrochlorate of aniline in 20 gr. of distilled water to 20 gr. of solution of gum Arabic, containing 2 pt. of water. 1 pt. of gum Arabic, and 10 gr. of glycerine; mix 4 parts of the aniline solution, thus prepared, with 1 part of the copper solution. This ink can be used with a steel pen. It is green at first, but becomes black in a few days, or by the application of a hot iron. The finest devices can be written with it. It is better to mix the two solutions just before using.—2. Dissolve 4 parts of aniline black in 16 parts (by weight) of alcohol, with 60 drops of strong hydrochloric acid; dilute the dark blue solution with 90 parts (by weight) of water, in which 6 parts of gum Arabic have been previously dissolved. This ink may be used either with a pen or a stencil plate and brush; if it does not flow freely from the pen, it may be diluted with a little water. After exposure to the air this becomes black; or it may be changed to a black color immediately by passing a hot iron over the back of the fabric, or heating it over the flame of a spirit lamp. As a dry heat is apt to make the fibre saturated with the ink, brittle, it is preferable to hold the marked fabric over a vessel containing water in full ebullition. After steaming, the writing should be washed in hot soapsuds, which gives the ink a fine blue shade. This ink is not acted upon by acids or alkalies, and if the fibres are well saturated with the ink, there is no danger of its being removed by washing.—3. Dissolve ½ oz. nitrate of silver in about 2 oz. of distilled water; add carbonate of soda so long as a precipitate falls; wash this precipitate, and add tartaric acid till effervescence ceases; wash the insoluble tartrate of silver, and dissolve in 1 oz. of strong solution of ammonia. Use this with a quill pen, and hot iron as generally directed.—4. Dissolve with the assistance of heat, 20 parts of brown shellac, in a solution of 30 parts of borax in 300 to 400 parts of water, and filter the solution while hot; then add to the filtrate a solution of 10 parts of aniline black, soluble in water, 3-10 part of tannin, 1-10 part of picric acid, 15 parts spirit sal ammoniac and ½ oz. water.

BLACK.—1. Dissolve nitrate of silver, ½ oz., in water, ¾ oz.; add as much of the strongest liquor of ammonia as will dissolve the precipitate formed on its first addition; add of mucilage, 1½ dr., and a little sap green, syrup of buckthorn, or finely powdered indigo, to color. Writing executed with this ink turns black on being pressed over by a hot flat-iron, or held near the fire.—2. Dissolve nitrate of silver, 100 gr., in distilled water, 1 oz.; gum Arabic, 2 dr.; sap green, 1 sc. The linen is first to be dampened with the following: Sub-carbonate of soda, 1 oz.; water, 8 oz.; dried and rubbed smooth; then written on by a clean quill or bone pen.—3. Rub together 1 oz. of nitrate of silver and 1 oz. of bitartrate of potash; add 4 oz. of liquor of ammonia; when dissolved, mix in 6 dr. of white sugar, 10 dr. of powdered gum Arabic, ½ oz. of archil, and water to make up 6 oz., by measure. Press the part written on with a hot iron.—4. Dissolve separately nitrate of silver, 1 oz.; crystal carbonate of soda, 1½ oz.; mix, and collect the precipitate on a filter; wash well; then introduce the moist precipitate into a mortar; add 8 sc. of tartaric acid; triturate till effervescence ceases; add a sufficient quantity of strong liquor of ammonia to dissolve the tartrate of silver; to which add 4 fl. dr. of archil; 4 dr. of powdered white sugar, and 12 dr. of powdered gum Arabic; and make up to 6 fl. oz., if required, with distilled water. Press the part written on with a hot iron.—5. Dissolve 2 dr. of lunar caustic, and ½ oz. of gum Arabic in a gill of rain water; dip whatever is to be marked in strong pearlash water; when perfectly dry, iron it very smooth; the pearlash water turns it a dark color, but washing will efface it. After marking the linen, put it near a fire, or in the sun to dry.—6. Dissolve 1 part of hypophosphite of soda and 2 parts of gum Arabic in 16 parts of distilled water. The linen or cotton to be marked must be thoroughly moistened with the liquid, and then left to dry; when well dried, the following liquid, composed of 1 part of nitrate of silver and 6 parts of gum, dissolved in 6 parts of distilled water, is used as marking ink with a quill pen.—7. Varnish (such as is used for ordinary printing ink), 1 lb.; black sulphuret of mercury, 1 lb.; nitrate of silver, 1 oz.; sulphate of iron, 1 oz.; lampblack, 2 tablespoonfuls; grind all well together; thin with spirits of turpentine as desired.—8. Sulphate of manganese, 2 parts; lampblack, 1 part; sugar, 4 parts; all in fine powder; rub to a paste with a little water. This is to be used with types or stencil plates; the part, when dry, being well rinsed in water.—9. Heat to redness equal weights of black oxide of manganese and caustic potash, and mix it with an equal weight of pipe-clay, and sufficient water to give it a due consistence. This is to be applied with types or stencils. It becomes brown and does not wash out.—10. Add caustic alkali to a saturated solution of cuprous chloride until no further precipitate forms; allow the precipitate to settle; draw off the supernatant liquid with a siphon, and dissolve the hydrated copper oxide in the smallest quantity of ammonia. It may be mixed with about 6 per cent. of gum dextrine for use.—11. Combine lampblack ground in a lye of caustic soda, with a mixture of gentin and caustic soda.—12. Borax, 1 oz.; shellac, 2 oz.; water, 18 fl. oz.; boil in a covered vessel until dissolved; strain; add of thick mucilage 1 oz.; triturate it with levigated indigo and lampblack, of each sufficient quantity to give a good color; settle for 2 hours; then decant it from the dregs, and bottle for use.—13. Lampblack, previously heated to dull redness in a covered vessel, ½ oz.; triturate with good black ink (gradually added), 1 pt.—14. Dissolve 20 parts of potassa in boiling water; add 10 parts of fine cut leather chips, and 5 parts of flowers of sulphur; heat the whole in an iron kettle until it is evaporated to dryness; continue the heat until the mass becomes soft, care being taken that it does not ignite; remove the pot from the fire; allow it to cool; add water; strain the solution, and preserve it in bottles. This ink flows easily from the pen.—15. A strong solution of chloride of platinum, with a little potassa, sugar and gum to thicken.—16. Phosphate of magnesia, 1 oz.; muriatic acid, 2 oz.; anthracene, 4 dr.; bichromate of potassa, 2 dr.; water, 2 dr.; sufficient gum Arabic; dissolve the phosphate of magnesia in the muriatic acid; to the solution add the anthracene and the bichromate, dissolved in the water; and, lastly, enough gum Arabic to thicken the liquor.—17. The fluid contained between the kernel and shell of the cashew nut, when used on linen and cotton, turns gradually black, and is very durable.

BLUE.—1. Dissolve 5 parts of oxide of molybdenum in the smallest necessary quantity of muriatic acid; also dissolve 2 parts of extract of licorice, and 6 of gum Arabic, in 200 parts of water; mix the solutions, and write with them on the linen to be marked; after writing, moisten with a solution of chloride of tin in water. This is not only indelible in ordinary washing, but in acids and alkalies.—2. Dissolve 22 parts of carbonate of soda in 25 parts of distilled water; 17 parts of crystal nitrate of silver in 24 parts of ammonia; liquefy 20 parts of gum in 60 parts of water and mix with the soda solution; afterwards with the nitrate of silver, and, lastly, add 33 parts of sulphate of copper. This writes a rich blue.—3. Mix powdered ultramarine with sufficient turpentine to make it thin enough to flow from the pen.

CRIMSON.—1. Dissolve 1 oz. of nitrate of silver, and 1½ oz. of carbonate of soda in crystals, separately in distilled water; mix the solutions; collect and wash the precipitate on a filter; put the washed precipitate, still moist, into a Wedgewood mortar; add to it tartaric acid, 2 dr. and 40 gr., rubbing together till effervescence ceases; dissolve carmine, 6 gr., in liquor ammoniæ, 6 oz.; add to it the tartrate of silver; mix in white sugar, 6 dr.; powdered gum Arabic, 10 dr.; add as much distilled water as will make 6 oz.—2. Powdered cochineal, 2 oz.; cream of tartar, 2 oz.; carbonate of potassa, 1 oz.; alum, 1 oz.; gum Arabic, 1 oz.; boiling water, sufficient; boil the cochineal and cream of tartar with 8 oz. of the water; strain; add the carbon-

ate of potassa; then the alum and gum Arabic; if the color of the liquid partakes too much of the scarlet shade, add enough carbonate of potassa to turn it to the hue desired.

NORMANDY'S. — Frankfort lampblack, 24 lbs.; ground with mucilage, made by adding 24 lbs. of gum to 60 gals. of water, and the mixture filtered through a very coarse flannel; then add 4 lbs. of oxalic acid, with as much decoction of cochineal and sulphate of indigo as will yield the shade of color desired.

PINK.—Write with a solution of chloride of gold on linen previously starched and pressed; expose the part written on to the sunlight, and the letters will become of a bright, rose-pink color.

PURPLE. — 1. Moisten the material to be marked with a solution of chloride of tin; then write with a solution of chloride of gold.—2. Terchloride of gold, 1½ dr.; water, 7 fl. dr.; and a sufficient quantity of sap green, to color. This is to be written with on a ground prepared with a weak solution of protochloride of tin, and dried.

RED.—Moisten the place where the letters have to be written with a solution of 1 dr. of carbonate of soda, and 1 dr. of gum Arabic in ½ oz. of water; smooth the spot with a warm iron; write with a quill pen, using the following solution: bichloride of platinum, 1 dr.; water, 2 oz.; when the writing is dry, write over the letters only with the following solution: Protochloride of tin, 1 dr.; water, 2 oz.—2. Mix and reduce to a fine powder ½ oz. of vermilion; 1 dr. of the salt of steel; and linseed oil to render it of the consistency of good ink.—3. (*Welger's.*) Mix enough finely pulverized cinnabar to form a moderately thick liquid, with egg albumen previously diluted with an equal bulk of water, beaten to a froth, and filtered through fine linen. Write with a quill pen; after the letters have become dry, press the cloth on the other side with a hot iron. This ink should be kept in well closed bottles.

MARKING INKS.

ANILINE BLACK.—Dissolve 4 parts of soluble nigrosine in 15 parts of hot water.

BLACK.—1. Mix ½ oz. of bichromate of potassa and 4 oz. of extract of logwood in a stone jar or demijohn, with 2 gals. of hot water; shake well and let it stand, shaking occasionally.—2. Mix lampblack thoroughly with sufficient turpentine to make it thin enough to flow from the brush.—3. Triturate together 1 pt. pine soot and 2 pts. Prussian blue with a little glycerine; add 3 pts. gum Arabic and sufficient glycerine to form a thick paste.

BLUE.—Shellac, 4 parts; borax, 1 part; dissolve in a small quantity of boiling water and dilute with hot water to the consistency of very thin syrup; to this add soluble Prussian blue or blue carmine.

STENCIL.—1. Take of shellac, 2 parts; borax, 1 part; soft water, 10 parts; gum Arabic, 1 part; lampblack and indigo, sufficient quantity; boil the shellac and borax in the water until they are dissolved; add the gum Arabic, and withdraw the mixture from the fire; when cold add lampblack to bring it to a suitable color and consistence, and lastly a very small quantity of finely-powdered indigo. Keep in glass or earthenware vessels.—2. Boil 1 lb. of logwood chips in 1 gal. of water at boiling point 10 minutes; stir in ½ oz. of bichromate of potash; boil this 10 minutes longer; add, when cold, ½ lb. of common gum, previously dissolved, and stir well in. This will mark bags with either the stencil plate or block.

WATERPROOF.—Pitch, 11 lbs.; lampblack, 1 lb.; turpentine, sufficient; mix with heat. This is suitable for tombstones.

TICKETING INK, For Grocers.—Dissolve 1 oz. of gum Arabic in 6 oz. water, and strain; this is the mucilage; for *black* color, powder and grind drop black with the mucilage to extreme fineness; for *blue*, use ultramarine in the same manner; for *green*, emerald green; for *white*, flake white; for *red*, vermilion, lake or carmine; for *yellow*, chrome yellow; when ground too thick thin with a little water; apply to the cards with a small brush. The cards may be sized with a thin glue, and afterwards varnished, if it is desired to preserve them.

BALES, Ink for Marking.—Shellac, 2 oz.; borax, 2 oz.; water, 25 oz.; gum Arabic, 2 oz.; Venetian red, sufficient to color.

BLUE.—Silver nitrate, 4 grm.; ammonia, 12 grm.; sodium carbonate, 4 grm.; powdered gum Arabic, 6 grm.; cupric sulphate, 20 grm.; distilled water, 16 grm.; dissolve the silver salt in the ammonia, and the soda, gum and copper salt in the distilled water, and mix the two solutions.

LEATHER AND WOOD, Ink for Marking.—The following is an ink that does not corrode steel pens: Triturate 3·65 gr. of aniline black with 22 gr. of alcohol and 4 drops of hydrochloric acid; a porcelain mortar is employed, and the paste thus produced is mixed with 1·82 gr. of gum Arabic, previously dissolved in 85 gr. of hot water. If this ink be added to an alcoholic solution of shellac (21 gr. of shellac to 85 of alcohol), a black product results, suitable for coloring leather and wood.

STAMPING INK, For Rubber Type,—(*Black.*) Rub lampblack into a smooth paste with a sufficient quantity of glycerine, A solution of nigrosine in alcohol and glycerine, may also be used. Fats and oils being injurious to india-rubber, should be avoided.—(*Colored.*) 1. Can be made of glycerine, mixed with ordinary paints, such as Prussian blue, carmine, chrome green, chrome yellow, etc.—2. Dissolve fine aniline red, violet, or any other aniline color, in boiling water (as little as possible); then stir up a sufficient quantity of this with pure concentrated glycerine.

WHITE, For Lantern Slides.—1. Use ordinary Chinese white for marking lantern slides, or the following solution can be employed for writing on the film: Potassium iodide, 10 parts; water, 30 parts; iodine, 1 part; gum Arabic, 1 part. Use an ordinary pen, writing on the dark portions of the film. The solution converts the silver into silver iodide, thus pro-

ducing white letters on a black or dark ground. —2. Grind zinc white (oxide of zinc) with water till smooth, adding a little clean gum Arabic.

Copying Processes.

ADLER'S PROCESS.—This is a multiplying process based upon the use of the glue plate, consisting of gelatine, glycerine and water, used in the hektograph and other similar processes. (See the receipt for *Gelatine Copying-Pad.*) For writing or drawing use a concentrated solution of alum, to which, in order to render the writing or drawing visible upon the paper, add a few drops of some aniline color. Before laying the writing or drawing upon the gelatine surface pass a damp sponge over the latter, and allow the moisture to sink in for a few minutes so as to have a greater effect upon the alum; then lay the written side downward upon the gelatine, and, after the lapse of a few minutes, on removing it the writing will be found reversed and eaten into the gelatine film as if it were engraved; by means of an India-rubber roller a little common printing ink is spread over the plate and absorbed by the lines sunk by the alum, and again rejected on the application of moisture upon the paper laid down upon it, and smoothed over it by the flat hand. When removed this paper will have upon it the first impression of the writing or drawing; for each succeeding impression the plate must be inked by the India-rubber roller.

ALISOFF'S PROCESS.—Instead of a tray filled with a compound, sheets of prepared paper may be used. Coat sized or unsized paper on one side with the following composition: 80 lbs. animal glue or gelatine; 20 lbs. glycerine; 20 lbs. soap; 200 lbs. water. If the paper thus prepared be found to be too sticky for use (which will depend on the surrounding temperature and the quality of the materials employed), wash the prepared paper with a solution of alum, the strength of which can only be determined by experiments in each case. The paper may be of different thicknesses, and if not transparent may be made so by any of the ordinary and well-known means. The aniline ink is prepared by dissolving about 1 lb. of aniline of commerce in about 1½ lbs. of alcohol, and adding thereto, when dissolved, as much water as is necessary to render it sufficiently fluid. It may then be bottled for use. To produce the matrix take a sheet of prepared paper, and lay it on a sheet of damp flannel or cloth placed upon a zinc plate or an oil paper; sponge it with clean water, or, in hot weather, with water containing a little alum, and place the dry original upon the prepared paper; over that place another piece of damp flannel, zinc or oil paper, and put the whole pile into an ordinary copying press. A good matrix can be obtained by mere pressure of the hands without a press. The text must be written, drawn or printed with aniline ink, taking care that the pen be quite clean and always full of ink. The ink, when dry, ought to shine like a metallic surface. In taking copies from the matrix after having detached the original therefrom by pulling off, the sheets of paper on which copies are desired to be made are placed face downward in the same place, gently rubbed on evenly, then likewise pulled off and laid aside to dry. They will at first be curled up, but can be very easily and quickly straightened out under a weight when dry; but if copies or matrices are to be taken from 2, 4, 6 or 8 pages at once, place a sheet of damped prepared paper on each page with damp flannels and zinc sheets between the leaves of prepared paper, and proceed in the way above described. The prepared paper may be bound into copying books which can be used like ordinary copying books made of tissue paper, and copies on ordinary paper may be taken from the matrices thus preserved, even after a considerable time. After a few copies have been taken the written text can be read from the reverse side of the matrix. Should it be found desirable to obtain manifold copies of printed matter, this may be accomplished by employing, in combination with prepared paper, a special printing ink. (See *Polygraphic Printing Ink.*)

GELATINE COPYING PAD.—This wonderful invention is beautiful in its simplicity, but will not give satisfaction unless thoroughly understood and neatly managed. A little patience and experience will make it a valuable labor saver at trifling cost. Take any shallow tin or other plate of rectangular shape; or, better, have the tinman make a pan about 9 by 12 in. (or any size wanted), and ½ in. deep, with a loose

Copying Pad.

cover. Take a two-quart (or larger) tin cup or kettle, which must sit in a water-bath, like a glue-kettle, to avoid spoiling the contents with too much heat; put in it ½ lb. of powdered or granulated gelatine (glue will not do so well), and thoroughly mix with 1 pt. of water; let it stand ½ hour; then place it in the water-bath, and over a gentle heat, till entirely dissolved; do not add more water if it can be avoided; add 1½ lbs. of glycerine (crude glycerine will do, if obtainable); mix well and raise heat to boiling point; add a few grains of salicylic (or carbolic) acid to prevent molding; prepare one or two pieces of stiff paper, cut squarely to 2x3 in.; pour out into the pan; skim off all scum and bubbles, with the pieces of paper, till the whole surface is like a sheet of glass; put on the cover

till entirely cooled, which will take several hours. To make copies of any writing, first write an original with the special ink, for which we elsewhere give the receipt. (*See Copying-pad Ink.*) When dry, lay the sheet (writing down) on the face of the tablet, evenly and with care; rub it down gently all over with the balls of the fingers; let it remain 15 minutes; pull it off; copies can now be taken by rubbing on other sheets only for a minute in the same way, to the number of from 20 to sometimes nearly 100. When through, the ink must be washed out of the tablet at once, with an abundance of water and a soft sponge, and all surplus water wiped off; after being allowed to dry, another writing can be copied on the same surface. In case of extreme cold weather, it may be necessary to add more glycerine; if hot weather more gelatine, to suit, or as experience shows. In case of the tablet's smooth surface being cut or broken up, all can be re-heated in a water-bath, and a new surface made.

STENCIL PROCESS.—By the following process, 1,000 or more copies of writings or drawings may be obtained with the gelatine tablet. Coat fine linen or bank-note paper over, on one side, by means of a camel-hair varnish brush, with a clear solution of 1 oz. of pine resin in 4 oz. of absolute alcohol; when this coat has dried, put on another. The ink used on this prepared paper is made as follows: Water, 1 oz.; caustic potash, 1 oz.; Vandyke brown, to color, a sufficient quantity. Write or draw with an ordinary pen, on the coated side of the paper; then float the paper on the surface of clear water, written side up, with care to avoid wetting the upper side; in about 10 minutes take the paper out by one corner and place, writing downward on a blotter; wash the back of the paper over with a camel-hair brush filled with water; then turn the paper on the blotter and wash in a similar manner until the ink disappears; dry the sheet between blotters, when it is ready for use. The tablet composition is prepared by dissolving by the aid of heat over a salt water-bath, 1 oz. of fine gelatine, previously softened by soaking it in a little cold water over night, in 6 oz. of best glycerine, and pouring the solution out in a shallow tin pan; this pan may be ½ in. deep, 10 in. wide, and 14 in. long; when the composition is poured in, it should stand level, and should remain in this position for 12 hours; the surface of the tablet should be sponged over with cold water and allowed to dry before using. Place the stencil paper, written side down, smoothly upon the tablet, and with a small paste brush paint over the back of the paper with an ink prepared from aniline violet (best), 1 oz.; glycerine (pure), 1 oz.; triturate together in a hot mortar; and allow the ink to stand for 12 hours or more before using it. Place over the inked sheet another blank sheet of the prepared paper; rub the hand firmly over it, and put a weight of 2 or 3 lbs on it; a book or smooth board, with a quantity of printing paper beneath it, does very well; in about ½ hour remove this weight, and carefully separate the stencil paper from the tablet, leaving a strip of ½ in. of it adhering at the side and turning the sheet over the edge of the pan. If the manipulations have been properly conducted, a reversed copy, in the aniline ink, will be found on the tablet; and from this a large number of positive copies may be obtained, by spreading a blank sheet of paper on the tablet and passing the hand gently over the paper. When the print becomes faint, the stencil may be folded over and pressed against the tablet as before, the adhesion of the edge of this stencil securing, with a little care, proper registration, and the rubbing re-enforcing the transfer; a few minutes is all that is required for this re-enforcing. The stencil should be turned back on a card-board, keeping the blank sheet under it. This stencil paper is semi-translucent, so that in copying drawings, wood engravings, etc., it may be used as a tracing paper. In floating the stencil on the water, care should be taken that no air-bubbles are left under the paper.

SUGAR PAPER.—Mix white sugar, 1½ dr., with 1 oz. of ink; use this with an ordinary pen; place over the writing a moistened sheet of unsized paper; lay both leaves between two layers of carpet; put the whole under a piece of board large enough to cover; then stand on the board for a few seconds; an excellent impression will be found on the copying paper.

HEKTOGRAPH SHEETS.—Soak 4 parts of best white glue in a mixture of 5 parts of water and 3 parts of solution of ammonia, until the glue is soft; warm the mixture until the glue is dissolved, and add 3 parts of granulated sugar and 8 parts of glycerine, stirring well and letting come to the boiling point; while hot paint it upon white blotting paper with a broad copying brush, until the paper is thoroughly soaked and a thin coating remains on the surface. Allow it to dry for 2 or 3 days. An aniline ink should be used, and before transferring to the blotting paper, wet the latter with a sponge, and allow it to stand 1 or 2 minutes; then proceed in the ordinary way. If the sheets are laid aside for 2 days, the old writing sinks in, and does not require to be washed off. These sheets will give satisfaction.

EXPLOSIVES AND FIREWORKS.

EXPLOSIVES.

CARTRIDGES.—These are paper or metallic cases, which contain the exact charge of a musket, rifle or fowling-piece. Both the bullet and powder are placed in them. In modern practice, a fulminate is placed in the end, to be struck by the trigger, to explode the cartridge, If they are for a heavy gun, the charge of powder should be made up in a bag of serge.

Blank cartridges contain powder, but no bullet. Cartridges for sporting purposes contain small shot. The outer paper covering should contain a wire net-work and a charge of shot intermixed with bone-dust; at the end place wadding; make them waterproof by any compound of grease and gum used for that purpose.

DYNAMITE.—Mix infusorial silica with about 75 per cent. of nitro-glycerine, which it readily absorbs; it is exploded by percussion priming.

FULMINATE OF MERCURY.—1. Mercury, 1 part; nitric acid, 12 parts; dissolve; add at intervals to this solution, alcohol, 16.3 parts; apply heat, till the effervescence and cloud of gas disappears; add gradually, on the action becoming violent, 16.3 parts more of alcohol.—2. Mercury, 100 parts; nitric acid, 1,000 parts; dissolve by a gentle heat; when the solution has acquired the temperature of 130° Fahr., slowly pour it through a glass funnel tube into alcohol, 880 parts; as soon as the effervescence is over and white fumes cease to be evolved, filter through double paper; wash with cold water, and dry by steam or hot water; then pack in 100 gr. paper parcels, and store in a tight box or corked bottle.

FULMINATE OF SILVER.—1. Digest oxide of silver (recently precipitated and dried by pressure between bibulous paper) in concentrated liquor of ammonia, for 12 or 15 hours; pour off the liquid, and cautiously dry the black powder in the air, in divided portions; the decanted ammoniacal liquor, when gently heated, yields, on cooling, small crystals, which possess a still more formidable power of detonation than the black powder, and will scarcely bear touching even while under the liquid.—2. Metallic silver, 40 to 50 gr.; nitric acid, $\frac{3}{4}$ fl. oz.; dissolve by the aid of a gentle heat; add, while the solution is still hot, alcohol, 2 fl. oz.; again apply heat until reaction commences; the fulminate slowly separates from the hot liquid under the form of small, brilliant, white crystalline plates, which, after being slightly washed with a little cold distilled water, are to be distributed upon separate pieces of filtering paper, in portions not exceeding 1 to 2 gr. each, and left to dry in the air; when dry, the papers are to be folded up, and carefully preserved in a box or bottle.

FULMINATING POWDER. — 1. Mix together, in a warm mortar, 3 parts of pulverized nitre, 2 of dry carbonate of potash, and 1 of sulphur; a small quantity, heated on an iron shovel or ladle, till it fuses, suddenly explodes with great violence.—2. Sulphur, 1 part; chlorate of potassa, 3 parts; when triturated with strong pressure, in a marble or Wedgewood-ware mortar, it produces a series of loud reports; it also fulminates by percussion.

GREEK FIRE.—A solution of phosphorus in bisulphide of carbon; not strictly an explosive, but an agent in ancient warlike naval operations; burns on water.

GUN COTTON.—Mix $4\frac{1}{2}$ oz. of pure dry nitrate of potash with 30 fl. dr. of sulphuric acid; after cooling thoroughly, stir into this mixture, carefully, 30 dr. of best carded cotton; as soon as saturation is complete, throw the cotton into a tubful of clear rain water, and change the water repeatedly until litmus ceases to show the presence of acid; then squeeze it in a cloth, and after being well pulled out, dry it cautiously at a temperature not exceeding 140° Fahr.; it is now explosive, and too much caution cannot be observed in handling it.

GUNPOWDER, Blasting.—Saltpeter, 62 parts; sulphur, 20; charcoal, 15.

GUNPOWDER, Sporting.—79.6 parts of saltpeter; 9.6 of sulphur; and 13.5 of charcoal.

GUNPOWDER, War.—1. 75 parts of nitre, recrystallized; 15 of best quality of charcoal; 10 of distilled sulphur.—2. Well dried yellow prussiate of potash, 1 part; white sugar, 1 part; chlorate of potash, 2 parts; let the ingredients be separately reduced to a fine powder, and the powders mixed by the hand, or by means of a leathern barrel turning on its axis.

NITRO-GLYCERINE.—This is prepared by the action of strong nitric and sulphuric acids on glycerine at a low temperature. Sulphuric acid, $4\frac{3}{4}$ lbs.; nitric acid, $2\frac{1}{2}$ lbs.; glycerine, 1 lb. Nitro-glycerine collects at the bottom of the vessel, and is freed from the acids by carefully washing in a copious supply of water; the explosion is caused by the rapid transformation from the liquid to the gaseous state.

NITROLIN.—From 5 to 20 parts of sugar or syrup are mixed with from 25 to 30 parts of nitric acid in a wooden or gutta-percha vessel; of this compound, 25 to 30 parts are mixed with 13 to 35 parts of nitrate of potassa and from 13 to 15 parts of cellulose.

PERCUSSION CAPS.—These are small copper receptacles containing fulminating powder and a little fulminate of mercury; they are then covered with paper. They are placed in the lock of the gun to explode the powder. They are made waterproof by various compounds of grease and gum.

TORPEDOES, For War.—These are used to blow up ships; they are of two kinds—the self-acting, and those fired by electricity. The self-acting consists of a hollow iron cone, water-tight, with a ring at the point, by which it is anchored; the part nearest the base is left empty, while the portion near the point is filled with gunpowder, from 100 to 300 lbs.; at the top of the powder is an iron case, filled with lime, and in it a thin glass tube, containing sulphuric acid; the upper part of the tube is enclosed by the ringed end of an iron rod, which passes through the base of the cone, some distance above it; the rod moves on a joint at the point it intersects the base; at its upper extremity are placed horizontal bars, called feelers. The ship touches the feeler, the rod moves, the ring breaks the glass tube, and the sulphuric acid explodes the powder. Those fired by electricity are similar in form, fired by a battery on shore or on a ship. Fish torpedoes are intricate in construction and usually patented.

FIREWORKS.

REMARKS.—The three prime materials of the art of pyroteehny, are nitre, sulphur and char-

coal, along with filings of iron, steel, copper, zinc and resin, camphor, lycopodium, etc. Gunpowder is used either in grain, half-crushed or finely ground, for different purposes. The longer the iron filings, the brighter red and white sparks they give; those being preferred which are made with a coarse file and quite free from rust. Steel filings and cast-iron borings contain carbon, and afford a very brilliant fire, with wavy radiations. Copper filings give a greenish tint to flame; those of zinc, a fine blue color; the sulphuret of antimony gives a less greenish blue than zinc, but with much smoke; amber affords a yellow fire, as well as colophony and common salt, but the last must be very dry. Lamp-black produces a very red color with gunpowder, and a pink with nitre in excess; it serves for making golden showers. The yellow sand, or glistening mica, communicates to fireworks golden radiations. Verdigris imparts a pale green; sulphate of copper and sal ammoniac, a palm-tree green. Camphor yields a very white flame and aromatic fumes, which mask the bad smell of other substances. Benzoin and storax are used also on account of their agreeable odor. Lycopodium burns with a rose color and a magnificent flame. Iron tools must never be used in making fireworks of any kind, as they are liable to throw out sparks when striking against a hard stony substance, besides which the sulphur used would injure the iron. Brass tools may be used, but copper tools are preferable.

BALLOONS.—Use, in making these, fine, thin, close-textured tissue paper. Having determined that the balloon shall consist of a specific number of gores, or sections, make a pattern for cutting them by, of pasteboard, or some tolerably hard substance. Suppose the circumference of the balloon intended to be made is to be 12 ft., and the number of gores 12, an elegant shape will be got by making the pattern of a semi-lanceolate shape, being 3 in. wide at one end, 12½ in. wide at the broadest point, and coming to a point at the other end; the broadest part should be about ⅓ of the length from the point, if the balloon is intended to have a pear-like shape with open neck. Put them together with gum-water, or clean, thin paste; after pasting or gumming about ½ in. of one of the gores, lay the edge of another about midway across the part pasted; then double over about ¼ in. of it, dabbing it lightly from end to end with a clean cloth, to insure its holding securely; two of the gores being thus united, unite two others in like manner, and so on, until, if there were 12 gores in all, the number is reduced to 6, and then to 2; hanging the sections up at every pasting, so that they may get thoroughly dry while proceeding; the 2 halves are last of all to be connected in the same way; a circle of wire about 12 in. in diameter should be worked into the bottom of it, to keep the fabric of the balloon at a sufficient distance from the flame of the spirit; fix another wire across this circle to hold a piece of sponge, which should be immersed in spirits of wine; a smouldering piece of brown paper held underneath the aperture will, in a few minutes, put the balloon in an ascending condition; when inflated, ignite the piece of sponge and let it rise. When it is intended to inflate the balloon with hydrogen or coal gas, the latter apparatus is not needed; but a light car, or any other ornament proportioned to the ascending power of the balloon, may be appended to it, which will have the effect of maintaining it in the right position, and also of keeping it longer in sight than would otherwise be the case.

BATTERY.—Wooden boxes about 4 in. wide and 8 in. long, of the depth of an 8 ball Roman candle, made to stand on a small base, to be filled with Roman candles; a few small pieces of quick match laid on the top, covered over with paper, leaving an end of match protruding; when the match is lighted, all the Roman candles go off, forming a magnificent fountain of stars.

BENGOLAS (Bengal Lights). — Small paper cases, about 4 in. long and 1 in. in diameter, filled with colored fires, and joined with touch-paper; they are burned for the purpose of illuminating.

BLUE LIGHTS.—Same as bengolas, but are smaller, being about the size of a lead-pencil.

BOMB SHELLS.—These are paper cases, containing stars or other pyrotechnics, made with a fuse to burn 1 or 2 seconds; to be projected high into the air from a gun or mortar made for the purpose, made of either steel or hooped board; a small cartridge of rifle powder is attached to the fuse in the inside of the shell; this bursts the shell open, ignites the stars, which, flying and spreading over a large space, produce a beautiful effect.

COLORED FIRES.—The ingredients for these compounds must be dry, not too finely powdered, and mixed very uniformly; the ingredients should always be reduced to powder separately, and mixed very lightly with the other powders; the whole must then be passed through a sieve once or twice. Great caution is required when dealing with chlorate of potash. The following compositions form the different colors:—(*Blue.*) 1. Sulphur, 4 oz.; mealed powder, 4 oz.; antimony, 2 oz.; lampblack, 16 oz. — 2. Sulphur, sulphate of potassa, and ammonio-sulphate of copper, of each, 15 parts; nitre, 27 parts; chlorate of potassa, 28.—3. From metallic antimony, 1 part; sulphur, 2 parts; nitre, 5 parts.—4. Realgar, 2 parts; charcoal, 3 parts; chlorate of potassa, 5 parts; sulphur, 13 parts; nitrate of baryta, 77 parts. — (*Crimson.*) Charcoal, 4½ parts; sulphuret of antimony, 5½ parts; chlorate of potassa, 17½ parts; sulphur, 18 parts; nitrate of strontia, 55 parts.—(*Green.*) 1. Nitrate of baryta, 80 parts; chlorate of potash, 32 parts; sulphur, 24 parts; calomel, 16 parts; fine charcoal, 3 parts; shellac, 2 parts.—2. Chlorate of baryta, 2 oz.; nitrate of baryta, 3 oz.; sulphur, 1 oz. — 3. Metallic arsenic, 2 parts; charcoal, 3 parts; chlorate of potassa, 5 parts; sulphur, 13 parts; nitrate of baryta, 77 parts.—4. Lampblack, 1 part; chlorate of potassa, 4 parts; sulphur, 6 parts; dry nitrate of baryta, 18 parts.—(*Lilac.*) 1. Black oxide of copper, 6 parts; dry chalk, 20 parts; sulphur, 25 parts; chlorate of potassa, 49 parts.—2. From

black oxide of copper, 3 parts; dried chalk, 22 parts; sulphur, 25 parts; chlorate of potassa, 50 parts.—(*Orange.*) Sulphur, 14 parts; chalk, 34 parts; chlorate of potassa, 52 parts.—(*Pink.*) 1. Charcoal, 1 part; chalk and sulphur, of each, 20 parts; chlorate of potassa, 27 parts; nitre, 32 parts.—2. Chlorate of potash, 12 oz.; saltpeter, 5 oz.; milk sugar, 4 oz.; lycopodium, 1 oz.; oxalate of strontia, 1 oz. — (*Purple.*) 1. Chlorate of potash, 5 parts; nitrate of strontian, 16 parts; realgar, 1 part; sulphur, 2 parts; lampblack, 1 part.—2. Chlorate of potash, 2 oz.; sulphur, 1 dr.; oxide of copper, 1 oz.—3. Sulphuret of antimony, $2\frac{3}{8}$ parts; black oxide copper, 10 parts; sulphur and nitrate of potassa, of each, $22\frac{3}{4}$ parts; chlorate of potassa, 42 parts.—(*Red.*) 1. Nitrate of strontia, $37\frac{1}{2}$ parts; flowers of sulphur, 10 parts; charcoal, $1\frac{1}{4}$ parts; powdered chlorate of potash, 5 parts; black sulphur of antimony, $3\frac{1}{8}$ parts.—2. Sulphur, sulphuret of antimony and nitre, of each, 1 part; dried nitrate of strontia, 5 parts.—3. Chlorate of potash, 32 parts; nitrate of strontia, 48 parts; calomel, 20 parts; shellac, 12 parts; Chertier's copper, 4 parts; fine charcoal, 1 part.—(*Violet.*) 1. Charcoal, 8 parts; sulphur, 10 parts; metallic copper, 15 parts; chlorate of potassa, 30 parts.—2. Alum and carbonate of potassa, of each, 12 parts; sulphur, 16 parts; chlorate of potassa, 60 parts.—3. Sulphur, 14 parts; alum and carbonate of potassa, 16 parts; chlorate of potassa, 54 parts.—(*White.*) 1. From nitre, 60 parts; sulphur, 20 parts; black antimony, 10 parts; meal powder, 6 parts; powdered camphor, 4 parts.—2. Nitre, 16 oz.; mealed powder, 4 oz.; sulphur, 8 oz.—(*Yellow.*) 1. Nitre, 2 oz.; sulphur, 4 oz.; nitrate of soda, 20 oz.; lampblack, 1 oz.—2. From sulphur, 16 parts; dried carbonate of soda, 23 parts; chlorate of potassa, 61 parts.

COLORED FLAMES.—(*Green.*) Mix chloride of copper or boracic acid with alcohol.—(*Red.*) Mix alcohol with nitrate of strontium, nitrate of iron or nitrate of lime.—(*Yellow.*) Mix alcohol with nitrate of soda.

FLAME or ELECTRIC PAPER. — 1. Soak Swedish filtering paper for 10 minutes in a mixture of 4 parts of oil of vitriol with 5 parts of strong nitric acid, both by measure; when the strips are removed from the acid they must be thoroughly washed, first with cold, then with hot rain or distilled water, till the washings cease to be acid; then make different solutions, not too strong, of such of the chlorates of the metals as give the desired flame reactions; make them slightly warm, and saturate the papers separately with them; dry the papers before the fire previous to lighting them; they show to best advantage when a slip is loosely crumpled up into a pellet, lighted quickly at one corner, and thrown into the air against a dark background. By briskly rubbing these papers on a woolen surface, they become highly magnetic, and interesting experiments may be made with them.—2. Dry 1,000 grains of pure nitre at a moderate heat; place it in a dry retort; pour on it 10 dr. by measure of strong sulphuric acid; distil until 6 dr. of nitric acid have passed over into the receiver; dry some thin unsized paper, such as filter paper, and weigh out 60 gr. of it; mix 5 measured dr. of the nitric acid with an equal volume of strong sulphuric acid in a small glass vessel; allow the mixture to cool; immerse the paper; press it down with a glass rod; cover the vessel with a glass plate; set it aside for 15 or 20 minutes; lift the paper out with a glass rod; throw it into a bucket of water; wash it thoroughly in a stream of water till it no longer tastes acid or reddens blue litmus paper; dry it by exposure to the air, or at a very gentle heat.

FLOWER POTS.—Are the same as showers, but with wooden handles, to be held in the hand.

FLYERS, SAXONS, or REVOLVING CRACKERS.—These crackers are charged at each end with clay to a depth of two lines; fill with a composition without gunpowder; the clay prevents the fire streaming out at the ends, and it escapes through two holes placed opposite each other; the two holes are united at the same time by connecting them by means of a quick-match, and a rotary motion is thus communicated to the cylinder.

FLYERS, WITH BRILLIANT FIRE.—1. 8 parts of meal powder; 1 of sulphur; and 2 of iron filings.—2. 36 of meal powder; 1 of sulphur; and 8 of steel filings.—3. 18 of meal powder; 1 of sulphur; 2 of litharge; and 3 of steel filings.

FLYERS, WITH CHINESE FIRE.—1. 9 parts of meal powder; 6 of saltpetre; 1 of sulphur; $1\frac{1}{2}$ of charcoal; and 5 of fine iron.—2. 6 of meal powder; 8 of saltpetre; 2 of sulphur; $1\frac{1}{2}$ of charcoal; and 5 of sand.

GRASSHOPPERS.—The case is made of cartridge paper, the dimensions required being 15 in. by $3\frac{1}{2}$ in.; 1st fold down one edge, about $\frac{3}{4}$ of an in. broad, then turn down the double edge about $\frac{1}{4}$ of an in. and bend back the single edge over the double fold, so as to form within a channel, which is to be filled with mealed powder, not ground very fine; the powder is then to be covered by the folds on each side; the whole is to be pressed by a flat ruler; the part containing the powder is to be folded into the remainder of the paper, every fold being pressed down; then double backwards and forwards in folds about $2\frac{1}{2}$ in., which are pressed quite close, and a piece of twine is passed twice round the middle across the folds, and the joinings secured by causing the twine to take a turn round the middle at each fold successively; one of the ends of the folds may be doubled short under, which will produce an extra report; the other must project a little beyond the rest for the purpose of being primed. For the composition use:—1. 5 parts of meal powder and one of fine charcoal.—2. 8 of meal powder; 2 of fine charcoal; and one of saltpeter.—3. 16 of meal powder; 17 of fine charcoal; 1 of sulphur; and 7 of saltpeter.—4. 6 of meal powder; 6 of coarse charcoal; 2 of sulphur; and 16 of saltpeter.

GERBES.—Make the cases and drive in the composition, a hadleful at a time; after putting in each hadleful, give the drift 12 blows with the mallet; fill the cases until there remains a space of 2 in. only unoccupied at the end; into this end put a gun charge and a half of gunpowder;

with a brad-awl separate one or two of the inner folds of the paper of the case; turn these down on top of the powder; for filling in the ends of the cases melt in an earthern pipkin a mixture of 2 parts of common resin and 1 of wax; pour this into the ends of the cases upon the paper that has been turned down; it will harden in a few minutes, and will be found to ensure a good report from the powder. To prime these cases (if the point of the nipple is not too long), all that is needed is to press into the mouth of the case some meal-powder paste; but if a cavity has been left in the composition, this must be filled up before priming, or the case will inevitably burst; it is an excellent plan to take for the first ladleful, not any of the compositions for Chinese fire, but a ladleful of some slower fire containing no iron borings; these gerbes or jets are exhibited, when finished, by being attached to strong frames of wood or metal, arranged in such a manner as the exhibitor may wish, to produce any desired effect; the mouths of the cases are connected by means of a quick-match. The following are the compositions used: (*Brilliant.*) 1. 16 oz. of meal powder; 6 oz. of saltpeter; 3 oz. of sulphur; 3 oz. of fine charcoal; 10 oz. of bright steel filings. It is important to see that the interior of the cases are quite smooth and free from wrinkles.—2. Meal powder, 16 parts; nitre, 8 parts; sulphur, 4 parts; charcoal, 4 parts.—(*Chinese.*) 1. Meal powder, 16 parts; nitre, 16 parts; sulphur, 4 parts; charcoal, 4 parts; iron borings, 14 parts.—2. Saltpeter, 1 lb.; sulphur, 3 oz.; charcoal, 4 oz.; iron sand, 7 oz.; moisten the iron sand with spirits of wine; mix this with the coal and saltpeter.—(*White Chinese.*) 1. Meal powder, 16 parts; nitre, 6 parts; sulphur, 3 parts; iron borings, 10 parts.—2. Saltpeter, 1 part; bruised powder, 12 parts; charcoal, 7 parts; iron sand, 11 parts.

GOLDEN RAIN.—Procure a piece of brass rod, the diameter of which is 3-16 of an inch, or rather less; the length from 6 to 8 in.; cut thin brown paper into short strips, about 2 in. wide, and long enough, when wrapped round the former, to make a case whose external diameter should be ¼ in., or rather more; the former should have a small cup-shaped hollow cut in one of its ends, into which the paper may be turned, to form a closed end to the cases; paste the strips of paper all over; rub some paste on the former; then roll the paper round the former, and draw it out so as to leave its cupped end ¼ of an in. inside one of the ends of the case; pinch in the paper that projects beyond the former, and drive it down with a tap upon the pasting slab, so that the twisted end is pressed into the cup of the former; dip this into warm size or glue; if a little red-lead is mixed with this size, it will solidify much more rapidly; dipping the ends of the cases into size should not be done until they are dry from the paste; for filling the cases a tin funnel is used that will exactly fit into the mouth of golden-rain cases; when the case is charged, the funnel must be removed, and the space that was occupied by its nozzle filled with gunpowder or meal powder, moistened with gum water; take care that this paste is pressed well into the mouth of the cases, and fills them. The compositions used are:—1. Nitre, 16 oz.; sulphur, 11 oz.; mealed powder, 4 oz.; lampblack, 3 oz.; flowers of zinc, 1 oz.; gum Arabic, 1 oz. All the materials used must be in the state of fine powders and perfectly dry.—2. 16 parts of saltpeter; 8 of sulphur; 2 of fine charcoal; 2 of pen soot; and 4 of meal powder.—3. 4 of saltpeter; 2 of sulphur; 4 of fine charcoal; and 16 of meal powder.

JAPANESE MATCHES (Scintellettes).—Lampblack, 5 parts; sulphur 11 parts; gunpowder from 26 to 30 parts, this last proportion varying with the quality of the powder; grind very fine; make the material into a paste with alcohol; form it into dice about ¼ in. square, with a knife or spatula; let them dry rather gradually on a warm mantelpiece, not too near a fire; when dry, fix one of the little squares into a small cleft made at the end of a lavender stalk, or, what is better, the solid straw-like material of which housemaids' carpet brooms are made; light the material at a candle; hold the stem downward; after the first blazing off, a ball of molten lava will form, from which the curious coruscations will soon appear.

LANCES.—These are used to make up devices, such as names, mottoes, wreaths, and so on. They consist of small cases, generally made round a piece of glass or brass rod or tube 2-11 of an in. in diameter; tubes are always best for these; they are about 2 or 2½ in. long, with one end pinched or turned in; two rounds of thin demy or double crown white paper, pasted, will give sufficient thickness and substance for the case; procure a board of sufficient size for the design, or make a wooden framework of the shape that is required; sketch the design upon one side of the board, or, if larger than a board will allow, make a plain rough framework describing the letters; when this is done, decide upon the distance at which to place the lances one from another; this distance is generally about 2 in.; upon the outlines of the sketch make little pencil circles wherever it is intended to place a lance; as far as possible, arrange that the lances shall be equidistant one from another; with a center-bit, or what is better, a pin-bit, bore a hole about ¼ in. deep where the circles are pencilled; these holes must be of such a size that the closed ends of the lances will fit easily into them; get either some glue or some of the mixture of size and red-lead, and when it is liquid, dip into it the closed end of each of the lances; enough of the mixture will adhere to the lances to allow of their being secured firmly in the holes that have been bored; in a very short time all will be hard and dry, and you will then have a series of lances projecting at right angles with your board or framework, each having its mouth primed, and all being the same length. They should be connected with each other by means of a quick-match, so that they will burn simultaneously. The compositions are as follows: (*Blue.*) Chlorate of potash, 12 parts; Chertier's copper, 6 parts; sulphur, 4 parts; calomel, 1 part.—(*Emerald Green.*) Chlorate of baryta, 18 parts; calomel, 7 parts;

very fine shellac, 8 parts.—(*Green.*) Chlorate of potassa, 60 parts; nitrate of baryta, 41 parts; calomel, 49 parts; powdered sugar, 30 parts; shellac, 1 part.—(*Lilac.*) Chlorate of potash, 12 parts; prepared chalk, 4 parts; sulphur, 5 parts; calomel, 3 parts; sulphide of copper, 10 parts.—(*Red.*) Chlorate of potash, 13 parts; nitrate of strontia, 10 parts; calomel, 8 parts; shellac, 3 parts; dextrine, 1 part; Chertier's copper, 1 part.—(*Rose Colored.*) Chlorate of potash, 24 parts; sulphur, 2 parts; stearine, 3 parts; oxalate of strontia, 4 parts.—(*Violet.*) Chlorate of potash, 26 parts; calomel, 24 parts; carbonate of strontia, 4 parts; Chertier's copper, 3 parts; sugar, 14 parts.—(*Yellow.*) 1. Chlorate of potash, 72 parts; oxalate of soda, 60 parts; stearine, 6 parts; sulphur, 6 parts.—2. Chlorate of potash, 40 parts; oxalate of soda, 16 parts; shellac, 8 parts; stearine, 3 parts.—(*White.*) 1. Nitre, 16 parts; sulphur, 8 parts; meal powder, 6 parts.—2. Nitre, 16 parts; sulphur, 4 parts; meal powder, 6 parts.

MARROONS.—These are small cubical boxes filled with an explosive composition which explodes suddenly, making a loud report. The boxes are made of pasteboard, the corners being made tight by pasting paper over them, but leaving the top open until they are filled; they are filled with coarse gunpowder, when the top is closed with strong paper well cemented, and the whole box is wrapped round two or three times with a lind cord dipped in strong glue; a hole is made in one of the corners, into which a quick-match is introduced, and the marroon is ready for action.

MINES.—Take large paper cases made strongly; place in the center a Roman candle with a hole made in the bottom, so the fire will come out; in the bottom of the large case place a small cartridge of rifle powder arranged so that the Roman candle will set fire to it; fill up the large case to about ⅓ of its height with stars; pack a little tow on top as a wad; the Roman candle, when lighted, will, as it burns, carry fire to the cartridge, which exploding, ignites all the stars, which, rising in the air, spread in every direction.

PAPER CAPS.—Small drops of fulminating powder, placed between two small pieces of paper, pasted together, so arranged that the fulminate will explode by concussion; used in toy pistols.

PHARAOH'S SERPENTS (Eggs).—1. These consist of the powder of sulphocyanide of mercury made up in a conical mass of about ½ in. in height; ignited at the apex an ash is protruded, long and serpentine in shape. The fumes evolved are very poisonous.—2. Bichromate of potassium, 2 parts; nitrate of potassa, 1 part; white sugar, 3 parts; pulverize each of the ingredients separately, and then mix them thoroughly; make small paper cones of the desired size; press the mixture into them; they will then be ready for use but must be kept from light and moisture, and are non-poisonous.—3. Fuse in a crucible equal parts by weight of yellow prussiate of potash and flower of sulphur; frequently it is advisable, if the heat cannot be well regulated, to include a little carbonate of potash; wash the mass with water and filter; the filtrate will be sulphocyanide of potassium, which, upon being added to a solution of mercury dissolved in nitric acid, gives a copious precipitate of sulphocyanide of mercury; collect this; wash well with water and dry; roll into a small pyramid, cover with tin-foil, and when dry it is ready to be lit.

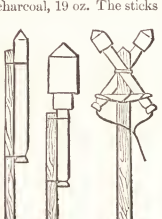
PIN or SCROLL WHEELS. — A long wire about 3-16 in. in diameter is the former; on this wire are formed the pipes, which being filled with composition, are afterwards wound around a small circle of wood so as to form a helix or spiral line; the cases are generally made of double-crown paper (yellow wove), and cut into strips so as to give the greatest length, and of width sufficient to roll about four times round the wire, and pasted at the edge so as to bite firmly at the end of the last turn; when a number of pipes are made and perfectly dry, they are filled with composition; these cases are not driven for filling, but are filled by means of a tin funnel with a tube ¾ in. long, made to pass easily into the mouth of the case, which is gradually filled by lifting a wire up and down in this tube, the diameter of the charging wire being half that of the tube; the dry composition being placed in the funnel, the moment an action of the wire takes place the composition begins to fall into the case, which the charging wire compresses by continuous motion until you have filled the pipe to within ¾ in. of the top; the pipe is then removed, and the mouth neatly twisted, which will be the point for lighting. When a number of pipes are ready, place them on a damp floor, or in any damp situation, until they become very pliant, but by no means wet; then commence winding them round a circle of wood whose substance must be equal to the thickness of the diameter of the pipe; either close together or openly in the form of a scroll; when wound, secure the end with sealing wax, to prevent its springing open; after winding the required quantity, let them dry; cut some strips of crimson or purple paper 3-16 in. wide, and in length twice the diameter of the wheel; then paste all over thoroughly; take a strip and paste it across the wheel diametrically; rub it down, then turn the wheel over and place the ends down to correspond with the opposite side; when dry, the wheel will be ready for firing; they may be fired on a large pin or held in the hand, but it is preferable to drive the pin into the end of a stick, which will prevent any accident, should a section of the wheel burst; The following are the compositions used: (*Brilliant.*) Nitre, 1 part; sulphur, 1 part; mealed powder, 16 parts; and steel filings, 7 parts.—(*Chinese.*) Nitre, 1 part; sulphur, 1 part; mealed powder, 7 parts; and cast iron filings, 7 parts.—(*Common.*) Nitre, 6 parts; sulphur, 1 part; mealed powder, 16 parts; charcoal, 6 parts.—(*White.*) Nitre, 6 parts; sulphur, 7 parts; and mealed powder, 16 parts.

PORTFIRE.—Make the cases of brass, and not less than ¼ in. in diameter, and the wire for filling them not less than ⅛ in.; prepare them in precisely the same manner as that described for *Golden Rains*, and also prime in the same

way. The following are the compositions usually employed for portfires: 1. Nitre, 6 parts; sulphur, 2 parts; meal powder, 1 part.—2. Saltpeter, 2 lbs.; sulphur, 3 lbs.; and antimony, 1 lb.

QUICK-MATCH.—Make a thick paste of gunpowder and hot water, with a small quantity of gum in it; take about 4 strands of cotton, such as is sold in balls and used for making the wicks of lamps; steep this in the solution of nitre used for making touch-paper, and wring it as dry as possible; rub well into the gunpowder paste, till it is thoroughly impregnated with it; dry on a frame, each strand kept separate; inclose in paper tubes for use, as it will not burn with the necessary rapidity if not covered. When thoroughly dry, it should be stiff and hard, and the less it is bent or doubled, the better. To use this match for connecting the mouths of different fireworks, make some long paper tubes round a wire former which has a diameter of not less than 3-16 of an inch; thread these pipes on the match, and cut a piece away at their side wherever they are inserted into the mouth of a case, in order that the match may be laid bare and convey its fire to the priming of the cases.

ROCKETS.—Make the cases of any kind of thick stiff paper, either cartridge paper (or what is equally good and much cheaper, common bag-paper); roll up the cases with a smooth, round ruler, exactly the size of the cavity of the rocket, and 10 or 12 times as long; lay a sheet of the paper upon a slab of slate, marble or glass, and paste 4 or 5 in. along the end of it, leaving the rest of the sheet of paper without paste; roll it smoothly over the ruler, dry end first, until the whole is rolled up, when of course the paste will stick and a thin ease be formed; keep rolling it along the slab with the hands, in the same way as a rolling-pin is used, for 2 or 3 minutes, until the various folds of the paper set close and tight to each other; put on another sheet in the same way, and so on, till the case is thick enough; that is, until the sides are a trifle more than ¼ the thickness of the ruler; the length of the rocket case, and consequently the width that the sheets of brown paper are to be cut before pasting, varies with the size of the rockets; in small rockets the length of the case may be 6 times the diameter; in larger rockets 4 or 5 times is sufficient; now choke the case; then fasten a thin cord at one end to a staple in the wall, and by the other tied round the waist of the operator; as he may lean back, of course the cord would be tightened and the sides of the case brought together until they nearly touch. When the case is sufficiently compressed, tie it with 2 or 3 turns of strong string. Put the cases in the mold (as elsewhere described) with the piercer in it, and put enough composition in to fill about 1 in. of the case; take the rammer, ram it down with 3 or 4 strong blows with a mallet; put in the same quantity of composition again and ram that down in the same manner, and so on till the case is filled to the top of the piercer and 1 diameter above it; separate some of the central folds of the paper, which it has been observed is not parted, and turn them down upon the composition, ramming them down hard upon it; or, what will do as well, put in a piece of paper as wadding; when this is rammed down, and firm, bore with a brass brad-awl 3 or 4 holes through it; these holes serve to make the requisite communication between the rocket and the head. The rocket being charged, the head or pot must be fixed; this is a paper case made upon a wooden former, turned cylindrical, about 4 in. in length, and a shade larger in diameter than the exterior of the rocket case; take some thick brown paper and cut it in strips large enough to go twice round the former; paste and roll as for the case; pinch one end, and a cylinder of paper will be thus made which should fit nicely over the clay end of the rocket; now fix upon the pinched end a conical cap made upon a former of like shape; trim the end which was choked, which is still open, and which has a hole passing up it, which the piercer occupied; fill up the hole with loose gunpowder made into a stiff paste with very weak gum water, and paste a piece of touch-paper over it. For the composition use, nitre, 26 oz.; sulphur, 5½ oz.; and charcoal, 19 oz. The sticks are fastened on to the case by means of wires or strings and are of the following sizes: 2-lb. rockets require sticks 9 ft. 4 in. long, 1 in. square at top, and rather more than ½ in. square at bottom; 1 lb. rocket sticks are 8 ft. 2 in. long, ¾ in. square at top and ⅝ in. at bottom; 8-oz. rocket sticks are 6 ft. 2 in. long, ¾ in. square at top, and ⅝ in. at bottom; 4-oz. rocket sticks are 5 ft. 3 in. long, ⅝ in. by ½ in. at top, and ¼ in. square at bottom; 2-oz. rocket sticks are 5 ft. 1 in. long, 3-10 in. by ½ in. at top, 4-10 in. at bottom; 1-oz. rocket sticks 3 ft. 6 in. long, and so on for other various sizes; the weight and the length of the stick must be such, as that when tied on, the rocket shall balance on the finger, at a point about 1 inch from the part choked.



Rockets.

ROCKETS. Mold for.—This consists of a solid foot of wood; upon the centre of this stands a short cylinder about ½ in. high, and exactly of the size of the mold, to be placed over it, as afterwards described; this short cylinder has a shoulder above, and terminates in a round top; out of the middle of the top is a tapering thick brass wire, projecting some inches upwards; the whole is so arranged, that when one of the newly made cases is put upon the wire and forced down, the wire fills up the choke-hole, the round top fits into the small parts of the case below the choke, the shoulder of the cylinder bears the extreme end of the case, and the short cylinder agrees in size with the outsides of the ense; there fits over this a strong wooden or metal tube; so that it is seen that there is no cavity

anywhere, except the inside of the rocket case, and even in this a thick wire runs up nearly to the top of that part of the case where the composition is rammed, or nearly ⅔ of the whole case from the choke upwards; all rockets must be placed in the mold to be filled, as well as to smooth and consolidate the part choked.

ROMAN CANDLES have a composition to burn in the intervals between the stars, which will throw a jet of fire uniformly good throughout. To have stars of tolerably rapid combustion (otherwise they will not be ignited before they are blown into the air), and to have the charges of powder for blowing the stars regulated to a great nicety, the former for the cases must be ⅛ in. in diameter and 18 in. long. The cases require rather a large amount of straw board for their manufacture, but otherwise they are made similar to rocket cases. The following are the compositions used between the stars: 1. Nitre, 18 parts; sulphur, 6 parts; fine charcoal, 7 parts; meal powder, 4 parts. — 2. Nitre, 16 parts; meal powder, 8 parts; fine charcoal, 6 parts; sulphur, 6 parts. — 3. Nitre, 16 parts; meal powder, 11 parts; sulphur, 6 parts; antimony, 4 parts. The next thing is to fill the case; before charging, tamp a little clay in the bottom of the case, to prevent blowing out; ram down as much composition as will fill the case ⅓ of its height; over this put a small piece of paper covering about ⅔ of the diameter; then a little rifle powder, and upon that a star, observing that the star is rather smaller than the diameter of the case; over this first ball more of the composition must be put, and rammed lightly down to prevent breaking the ball, till the case is ½ full; then a little powder, and another ball as before, till the case is filled with balls and composition; take care to place composition above the highest ball; when the case is thus filled, cap it with touch-paper by pasting it round the orifice, and add a little priming of powder.

SHOWERS.—1. Mealed powder, 1 lb.; sulphur, 2 oz.; iron filings, 5 oz.—2. Mealed powder, 1 lb.; charcoal, 2 oz. Mold small paper cases on a rod 2-10 in. in diameter and 2½ in. in length; do not choke them, as it will be sufficient to twist the end of the case; and having put the rod into it, beat it to make it assume its form; when the cases are filled (which is done by immersing them in the composition), fold down the other end, and then apply a match; fix on a frame with leaders, to be fired simultaneously.

SILVER RAIN.—1. Saltpeter, 4 oz.; sulphur, mealed powder and antimony, of each, 2 oz.; sal prunella, ½ oz.—2. Salpeter, 8 oz.; sulphur, 2 oz.; charcoal, 4 oz.—3. Saltpeter, 1 lb.; antimony, 6 oz.; sulphur, 4 oz.—4. Saltpeter, 4 oz.; sulphur, 1 oz.; powder, 2 oz.; steel dust, ¾ oz. Used in similar cases, and treated in the same way as *Golden Rain.*

SPARKS (Trail Stars).—Fine gunpowder, 1 part; powdered saltpeter, 3 parts; powdered camphor, 4 parts; place in a mortar; pour some weak gum water, in which a little gum tragacanth has been dissolved, over it; work the whole up to a thin paste; some lint, prepared by boiling it in vinegar or saltpeter, and afterwards dried and unravelled, is placed in the composition so as to absorb the whole; then pour into balls about the size of a pea; dry and sprinkle with fine gunpowder.

SQUIBS.—Roll cartridge paper in slips of 6 or 8 in. in breadth round a former; the case having been choked at one end, fill by inserting a funnel into the case; fill the funnel with composition; gently move a rod or rammer up and down the funnel-pipe, the rod being introduced before the composition; a piece of touch-paper is fastened to the end; ram in hard a thimbleful of coarse gunpowder before filling the case. The following compositions are used: 1. Mealed powder, 1 lb., 8 oz.; charcoal, 4 oz.; sulphur, 1 oz.; saltpeter, 3 oz.—2. Saltpeter, 16 parts; sulphur, 8 parts; fine gunpowder, 4 parts; antimony, 1 part; after having rammed this down into the case tolerably tight, fill the remainder of the space with grained or corned powder.

STARS.—These are made as follows: Moisten the compositions very slightly; the mold in which stars are shaped is a brass tube, of a size proportioned to the dimensions required. The drift with which the composition is pressed into the tube, is made of boxwood or metal and fits easily into the tubular mold; at one of its ends there is a wire point; place the end having the point in the mold as far as it will go; it will leave a space at the end of the mold unoccupied by the drift; press this empty end of the tube into the slightly moistened composition until it is filled by it, so that the drift being driven down upon the composition will compress it into a firm cylindrical mass, into the centre of which the wire point projects; when the star is thus formed in the mold, the drift must be withdrawn, reversed, its long plain end inserted, and the star pushed out and placed separately upon a tray to dry. The following compositions are used: (*Blue.*) 1. Chlorate of potash, 8 parts; sulphide of copper, 6 parts; Chertier's copper, 5 parts; sulphur, 4 parts.—2. Chlorate of potash, 16 parts; Chertier's copper, 12 parts; calomel, 8 parts; stearine, 2 parts; sulphur, 2 parts; shellac, 1 part.—3. Nitre, 12 parts; sulphuret of antimony, 2 parts; sulphur, 4 parts; lampblack, 2 parts.—(*Brilliant.*) 1. Mealed powder, ¾ oz.; saltpeter, 3½ oz.; sulphur, 1½ oz.; spirits of wine, 1½ oz.—2. Nitre, 16 parts; sulphur, 8 parts; sulphuret of antimony, 4 parts; meal powder, 8 parts.—(*Crimson.*) 1. Chlorate of potash, 24 parts; nitrate of strontia, 32 parts; calomel, 12 parts; sulphur, 6 parts; shellac, in fine powder, 6 parts; sulphide of copper, 2 parts; fine charcoal, 2 parts.—2. Chlorate of potash, 12 parts; nitrate of strontia, 20 parts; sulphur, 11 parts; charcoal, 2 parts; antimony, 2 parts; mastic, 1 part.—(*Green.*) 1. Chlorate of potash, 20 parts; nitrate of baryta, 40 parts; calomel, 10 parts; sulphur, 8 parts; shellac, 3 parts; fine charcoal, 1 part; fused sulphide of copper, 1 part.—2. Nitrate of baryta, 42 parts; realgar, 2 parts;

Star Mold.

sulphur, 8 parts; lampblack, 1 part.—3. Chlorate of potash, 28 parts; nitrate of baryta, 12 parts; sulphur, 15 parts; mastic, 1 part. —(*Lilac.*) Potash, 50 parts; sulphur, 25 parts; chalk, 22 parts; black oxide of copper, 3 parts.—(*Rose.*) Chlorate of potash, 20 parts; carbonate of strontia, 8 parts; calomel, 10 parts; shellac, 2 parts; sulphur, 3 parts; fine charcoal, 1 part.—(*Violet.*) Chlorate of potash, 9 parts; nitrate of strontia, 4 parts; sulphur, 6 parts; carbonate of copper, 1 part; calomel, 1 part; mastic, 1 part. —(*White.*) Mealed powder, 4 oz.; saltpeter, 12 oz.; sulphur, 6½ oz.; oil of spike, 2 oz.; camphor, 5 oz.—(*Yellow.*) 1. Chlorate of potash, 20 parts; bicarbonate of soda, 10 parts; sulphur, 5 parts; mastic, 1 part.—2. Nitrate of soda, 74½ parts; sulphur, 19½ parts; charcoal, 6 parts.

SUN CASES.—These are gerbes, without an explosion, and filled with brilliant fires.

TORPEDOES (Toy).—Are made by inclosing a small quantity of fulminate of silver with a little common gravel, washed free from dirt, in a piece of paper twisted together; the gravel is to make weight; the torpedo explodes by concussion on being dropped upon the floor.

TOUCH or PRIMING PAPER. — Dissolve 2 oz. of the best saltpeter in 1 qt. of warm water, and take care that the water is very clean; after the mixture has stood for ½ hour, pour off 1½ pts. into a white basin; cut your sheets of dark blue double-crown paper in half; place the paper on a slab sufficiently large to give you room to use a small piece of sponge, with which you use the liquor to wet the paper; cover each half sheet with the liquor as quickly as possible, on one side only, and immediately this is done place it on a line, the wet side outwards, and when nearly dry, if you have a great number of sheets, place them together as evenly as possible under a press for one hour; then lay them out to dry, after which they will be quite smooth and ready for use. In pasting this paper on the work, take care that the paste does not touch that part which is to burn; to use this paper correctly, cut it in strips sufficiently long to go twice round the mouth of the case, or even more if requisite; when you paste on the strips, leave a little above the mouth of the case not pasted; in small cases a little meal powder is put into the mouth; then the paper is twisted to a point; in larger cases damp priming is used, and when dry, the capping process is proceeded with.

TOURBILLIONS.—A stout case filled with a strong sparkling composition, and closed very tightly at both ends; in this case are bored four holes, at which the fire is to find vent; two of these holes are made underneath the case; from these the fire issues in a downward direction and gives the piece the power of ascending perpendicularly; the outer two holes are made in opposite sides of the case near each end; the fire issuing from these causes the cases to revolve in a horizontal direction while it is ascending. Make the cases as for rockets, about 8 in. in length and ¾ in. in their bore; their external diameter will be found to be about 1¼ in.; make a mold of a hollow cylinder of wood; divide it longitudinally in half; keep the halves together by means of iron rings; put into the mold the tourbillion; fasten it in tightly with the rings; put in as much clay as will, when rammed in tight, fill ⅜ of an in. of the case; now drive in the composition, a ladleful at a time, until ½ in. of the upper end of the case is empty; into this vacant space drive the same quantity of clay that was put into the lower end, and be sure that it is rammed in very firmly; find the exact central point at which the case balances, at which point the stick should be placed; the two extreme holes, which are on opposite sides of the case, are made at the ends of the composition; the fire issuing from these gives the tourbillion a horizontal revolution round its center of balance; the two inner holes, which are on the under side of the case, should be the same distance from one another that they are from the extreme holes; the fire issuing from these gives the tourbillion its ascending power; now connect all these holes with quick-match, in order that the composition may take fire at all the four points simultaneously; begin at one of the under holes; press into the end a piece of uncased quick-match; take care that the match reaches the composition; then carry the match on to the nearest side hole, and press it into it; carry on the quick-match over the upper side of the tourbillion to the side hole at the other end of the case; press it in there; carry it on to the remaining under hole and press it into it; cut some strips of thin paper, about 1 in. wide; paste them well over, covering the quick-match with them, holes and all; adjust the stick, which shall have the effect of keeping its under side downwards, and so of compelling it to move upwards perpendicularly; this stick is usually made of rattan, 8 in. long, about ½ in. thick, and of a curved shape; attach the stick by a flat-headed nail, driven into the tourbillion at its balance point; the stick must, of course, lie at right angles with the case; to fire the tourbillion, place it stick downwards on a level board, and see that it spins easily and freely on the head of the nail; then with a portfire burn through the quick-match in the middle on the upper side; the tourbillion will make a few revolutions on the board before it begins to rise. Take care to keep the head from over it. The following compositions are used:—1. Nitre, 8 parts; meal powder, 16 parts; sulphur, 4 parts; charcoal, 4 parts.—2. Meal powder, 16 parts; nitre 8 parts; sulphur, 3 to 4 parts; fine charcoal 3 parts; steel filings, 6 parts.

TRIANGLES AND VERTICAL WHEELS are made by using three or more driving cases arranged on a frame to be pivoted in the center so that as the cases are discharged they will cause the frame to revolve, thereby forming a wheel or circle of fire. The driving cases are made similar to a rocket case, but without the pot or head; the cases are to be connected together with quick-match, so that the fire will communicate from one to another.

PERFUMERY.

ACETIC AND AMMONIATED PERFUMES.

REMARKS.—Perfume is a substance that emits or casts off volatile particles, which, diffused through the atmosphere, agreeably affect the olfactory organ. The principal source of perfume is the vegetable kingdom. A few perfumes, as musk, ambergris and civet, are derived from the animal kingdom; but none of the latter compare with the former in delicacy and variety of scents. The animal scents excel those of the vegetable kingdom in strength.

Musk will not hold its perfume indefinitely. It loses its odor in a short time when exposed to outward air. It is too rank by itself, but combined with the aroma of flowers, and used as the basis of a "bouquet," there is produced a lingering scent belonging only to the costliest and choicest inventions. Of the four animal perfumes, musk holds the most distinguished position, though civet is fast displacing it. It is by far the most delicate, yet has the greatest pungency. Ambergris, a product of the whale, and castor, a secretion of the castor beaver, and nearly obsolete in the perfume trade, have but little odor until infused in spirit, when it is developed in a remarkable degree. Ambergris is found but rarely, and only in the bowels of sperm whales, a result of disease. Like musk, ambergris extract is used for mixing, and sweetened with fleeting scents its odor can still be detected on fabrics which have passed through the wash. The secretion of the castor beaver is more like that of the civet cat. The qualities that recommend it are those of economy. The little animals secreting the pods are found on the lands of the Hudson's Bay Company and in Siberia. Large quantities of civet are sent to this country from Abyssinia, where the civet cat is a household pet. The substance secreted in an external pouch is in its natural state a most disgusting odor, but when infinitesimally combined its perfume is agreeable. So it is with the concentrated attars or "ottos," such as patchouly, thyme and neroli. The extract of civet is obtained by mixing it in a mortar with orris root powder, or any like rough substance that will separate the civet, and then adding rectified spirits. After a month of maceration, the preparation is ready to combine with delicate "ottos."

Musk "pods," so called by the trade, which contain the "grain musk," are obtained from an organ of the musk deer, which inhabits the great chain of the Himalayas, the northern belt of India, Siberia and China. The difficulty and danger in capturing these graceful little creatures account for the enormous price of musk. Oftentimes the wily natives adulterate the contents of the pods by extracting the grains and putting back a mixture of animal matter and musk. The three kinds of musk vary in price, according to quality. The Russian, from its comparative poverty in fragrance, does not sell for more than $1.25 an ounce; the Assam, next in value, has a strong rank odor, and brings but about $4.50 in the pod, while the Chinese musk, the most prized, sells in the pod for over $5. Two ounces of grain musk, added to one gallon of rectified spirit, will, after a month's maceration, give the commercial extract of musk, which is used for mixing with other perfumes, thereby modifying it with the various attars. The scent of musk is wonderfully diffusive and subtle, the articles in its vicinity soon becoming impregnated and long retaining its odor. Of the famous nosegays that have musk for their basis, are the Empress Eugenie's, "the Fleur D'Italie," which has also the costly ambergris as an ingredient, "Wood Violet" and "West End." Of the best dry perfumes, nearly all have grains of musk mixed in their compounds, while among expensive scented soups, such as Paris "Windsor," which owes its great reputation among the elite to its delightful odor, is simply the duly modified fragrance of musk. The finest floral perfumes can have no enduring scent without the aid of the grosser animal odors.

AROMATIC VINEGARS.—These are solutions of aromatics in acetic acid, and are highly esteemed as reviving perfumes, both for the toilet and sick room. They are generally dropped on a small piece of sponge placed in a stoppered bottle or vinaigrette. They are corrosive, and should be kept from the skin and clothes.—1. Dried rosemary and origanum, of each, 1 oz.; lavender flowers, ½ oz.; bruised cloves ½ dr.; acetic acid, 1½ pt.; macerate for 7 days; express and filter. A fragrant and refreshing perfume.—2. Prepare as the last, but use distilled vinegar instead of the strong acid. Inferior.—3. Camphor, 2 oz.; oil of lavender, 10 gr.; oil of cinnamon, 20 gr.; oil of cloves, 30 gr.; concentrated acetic acid, 1 pt. Very fragrant and refreshing.—4. Oil of cloves, 1 dr.; oils of lavender and citron, of each, 2 sc.; oils of bergamot and thyme, of each, 1 sc.; oil of cinnamon, 10 drops; strongest acetic acid, 1 oz., mix. Limpid, yellow-brown; highly fragrant and refreshing.—5. Glacial acetic acid, 1 lb.; oil of cloves, 1½ dr.; oil of rosemary, 1 dr.; oils of bergamot, cinnamon pimento and lavender, of each, ½ dr.; neroli, 20 drops; camphor, 2½ oz.; rectified spirit, 2 fl. oz.; mix. Very fine.—6. Glacial acetic acid, 8 oz.; true oil of rosemary, 20 gr.; bergamot, 15 gr., lavender, 9 gr.; cloves, 24 gr.; neroli, 4 gr.; cinnamon, 20 gr.; dissolve the oils in 2 dr. rectified spirit.—7. Strongest acetic acid, 1 lb.; camphor, 1 oz.; dissolve, and add 1 oz. each of oil of lavender, oil of cloves and oil of lemon.—8. Oil of rosemary, oil of juniper, oil of lemon, of each, 1 part; oil of thyme, 2 parts; oil of cloves, 5 parts; tincture of cinnamon, 100 parts;

aromatic tincture, 50 parts; diluted acetic acid, 200 parts; distilled water, 1,000 parts; mix; keep for 3 days in a cool place, then filter.—9. 1 oz. of dried tops of rosemary; 1 oz. of dried leaves of sage; 1 oz. of dried flowers of lavender; 1 dr. of cloves; 1 dr. of camphor; 1½ pts. of distilled vinegar; macerate for 14 days with heat, then filter.—10. Camphor, 1 oz.; rectified spirit, 1 fl. dr.; pulverize and dissolve in strong acetic acid, 10 fl. oz. This preparation is also useful as an embrocation in rheumatism and neuralgia; as an extemporaneous vesicant and counter-irritant, and as a fumigation in fevers.

Lavender Vinegar.—Fresh lavender flowers, 1 lb.; vinegar, 12 lbs.; macerate. It is sometimes distilled, drawing off 8 lbs.

Rose Vinegar.—1. Red roses, picked and dried, ½ lb.; best vinegar, 8 lbs.; macerate for a fortnight, with occasional stirring, and strain; then filter.—2. Dried rose leaves, 4 oz.; otto of roses, 90 drops; rectified spirit, 10 oz.; diluted acetic acid, 40 oz.; macerate in a closed vessel for 14 days.

Thieves' Vinegar. — Dried tops of large and small (pontic) wormwood, rosemary, sage, mint, rue, lavender flowers, of each 2 oz.; calamus root, cinnamon, cloves, nutmeg, garlic, of each ½ oz.; camphor, ½ oz.; concentrated acetic acid, 2 oz.; strong vinegar, 8 lbs.; macerate the herbs, etc., in the vinegar for a fortnight; strain, press and add the camphor dissolved in the acetic acid.

Vinaigre de Bully.—Essence of bergamot, 40 drops; essence of lemon, 30 drops; oil of rosemary, 20 drops; oil of balm, 6 drops; oil of cloves, oil of lavender, oil of neroli, of each 4 drops; dissolve in rectified spirits, 9 oz; then mix with tincture of benzoin; tincture of styrax, tincture of Tolu, of each 1 dr.; distilled water, 14 oz.; diluted acetic acid, 5 oz.; mix well, let stand, and filter.

Vinaigre de Cologne.—To each pt. of eau de cologne add an ounce of strong acetic acid.

Vinaigre de Flore.—Equal parts of rose vinegar, vinaigre virginal, and orange flower vinegar.

Vinaigre de Jouvence. — Spirit of cucumber, 4 oz.; spirit of storax, 2 lbs.; strong vinegar, 8 lbs.

SMELLING SALTS may be prepared by simply adding a sufficient quantity of ammonia to the liquid perfumes. When the articles are to be distilled, a cheaper plan is to add about 5 dr. of sal ammoniac and 8 dr. of carbonate of potassa to each pint of the article just before distillation.—1. Chloride of ammonium, 5 dr.; carbonate of potash, 8 dr.; eau de cologne, 12 oz.; essential oil of cedrat and of bergamot, of each 15 drops, dissolved in 1 oz. of rectified spirit; orange flower water, 8 oz.; mix and carefully distil 15 or 16 oz.—2. English oil of lavender, 1 oz.; spirit of ammonia, 2 lbs.; dissolve.—3. Sesquicarbonate of ammonia, 40 oz., broken into small pieces not larger than a filbert, put into an air-tight ½ gal. jar; pour over it 20 oz. strong solution of ammonia (sp. gr. .880), previously perfumed according to taste, and immediately fix on the lid of the jar, taking care that it is properly secured; keep in a cool place, opening and stirring with a stiff spatula every other day for a week; allow it now to remain for 2 or 3 weeks, at the end of which time it will have become hard.—4. Oil of cinnamon, 6 drops; otto of roses, 12 drops; oil of cloves, 1 fl. dr.; essence of bergamot, 2 fl. dr.; oil of lavender, 4 fl. dr.; essence of musk, 5 fl. dr.; liquor of ammonia, 1 pt.; mix in a cold place, and shake the bottle until the whole is combined.—5. Essence of violets and oil of cinnamon, of each 12 drops; neroli, essence of jasmine and otto of roses, of each ½ dr.; oil of lavender, 1 dr.; essence royale and essence of bergamot, of each 2½ dr.; liqtor of ammonia, 1 pt.; as the last.—6. Oils of lemon and bergamot, of each 5 fl. dr.; oil of lavender, 1½ fl. dr.; otto of roses, 1 fl. dr.; oils of cassia, neroli, cloves and cedrat, of each ½ fl. dr.; oil of sandal wood, 15 drops; liquor of ammonia, 1 pt. — 7. Essence of bergamot, 6 fl. dr.; oil of lavender, 4 fl. dr.; oil of cloves, 3 fl. dr.; oil of cassia, 1½ fl. dr.; oil of verbena (lemon grass), 1 fl. dr.; otto of roses, 30 drops; liquor of ammonia, 18 fl. oz.—8. Oil of bergamot, 3 oz.; essence of lemons, 2 oz.; oil of lavender, 6 dr.; essence of jasmine, 4 dr.; oil of sassafras, 3 dr.; oil of neroli, 2 dr.; otto of roses, 1½ dr.; oil of origanum and essence of ambergris, of each 1 dr.; musk, 20 gr.; macerate for a week, and decant the clear portion. Add to the strongest liquor of ammonia in proportion of 1½ oz. to the pint.—9. English oil of lavender and essence of bergamot, of each 1 dr.; oil of orange peel or of cedrat, 8 drops; oil of cinnamon, 4 drops; oil neroli, 2 drops; alcohol and strongest water of ammonia, of each 2 oz. (or 4 oz. of strong ammoniated alcohol).—10. Ammoniated alcohol, 12 fl. oz.; English oil of lavender, essence of bergamot and essence of lemon, of each 1 dr.; cloves, ½ dr.; camphor, ½ oz.; macerate for 1 week, and filter.

Eau de Lavange.—To lavender water, 1 pt., add of liquor of ammonia ½ fl. oz.

Eau de Luce.—Mastic, 2 dr.; rectified spirits, 9 dr.; dissolve, and add to the clear tincture 30 drops of oil of lavender; 10 drops of bergamot, and 1 pint of strong water of ammonia. Agreeable.

DISTILLED WATERS AND OILS.

REMARKS.—Perfumes can be distilled by using a glass retort, with a napkin wetted with cold water covering the tube, attached to a receiver placed upon a table, having a lamp burning under the retort at a moderate distance, taking care that the liquid never runs, but passes drop by drop; when inclined to run, remove the lamp a greater distance. Very convenient stills for making perfumes may be purchased at mathematical instrument makers; these perform the operation in a better way than the above contrivance. For perfumery, the still

should have a high and narrow neck, to prevent the liquor from spirting over, and should be furnished with a steam jacket or a bath to prevent injury from excessive heat. Dry, hard or fibrous substances should be bruised or macerated in water before distillation. Salted or pickled flowers, herbs, etc., are superior to fresh ones; then the waters keep better and reach the full development of their odor in a shorter time. Ebullition should begin as quickly as possible and be continuous, and the heat regulated. Waters distilled from plants are apt to have a smoky odor at first, even when the greatest care has been observed. Exposure for a short time to the air will remove this, after which they should be kept in closely stoppered bottles entirely filled. The simple distilled waters (without spirit) used in perfumery, are chiefly those of rose, elder and orange flower, cinnamon, etc. The points requisite to be attended to are, that the flowers be fresh, gathered after the sun has risen and the dew has exhaled, and that sufficient water be used to prevent the flowers being burned, but no more.

Waters prepared without distillation are seldom so effective for perfumery purposes as those distilled from the flowers.

ANGEL WATER.—1. Orange flower and rose water, of each 1 pt.; myrtle water, ½ pt.; essence of ambergris, ½ fl. oz.; essence of musk, ¼ fl. oz.; shake well together for some hours, then filter the mixture through paper.—2 Myrtle flowers, 3½ lbs.; water, 2 gals.; distil 1 gallon. A pleasant perfume.—3. From benzoin, 4 oz.; storax, 2 oz.; cloves, ½ oz.; calamus and cinnamon, of each ½ oz.; coriander seeds, 1 dr. (all bruised); water, 3 qts.; distil 2 qts.

AROMATIC WATER.—1. Coriander seed, ground, 5 oz.; star anise and cinnamon, of each 5 oz., cloves, nutmeg, and fresh orange peel, of each 2½ oz.; mix in a still with 12 pts. of water and distil eight pints.—2. Oil of star anise, cinnamon and coriander, of each 10 drops; oil of cloves, nutmegs and orange, of each 5 drops; carbonate of magnesia, 120 gr.; water, 2 pts.; triturate the oils with the magnesia; add the whole quantity of water and filter, adding enough water through the filter to make the filtrate measure 2 pints.

CINNAMON WATER.—A gallon should be distilled from 20 oz. of fine cinnamon (bruised) and 2 gallons of water.

EAU DE NAPHRE.—Orange flowers, 7 lbs.; fresh yellow peel of the bigarade or Seville orange, ½ lb.; water, 2 gals.; macerate 24 hours, and distil 1 gal. In many cases ordinary orange flower water is sold for eau de naphre.

ODORS OF FLOWERS, To Extract.—Procure a quantity of the petals of any flower of an agreeable odor; card thin layers of cotton wool, which dip into the finest Florence oil; sprinkle a small quantity of fine salt on the flowers, and place layers of flowers and cotton, alternately, until an earthen or wide-mouthed glass vessel is quite full; tie the top close with a bladder, and lay in a south aspect exposed to the sun, and in 15 days a fragrant oil may be squeezed away from the whole mass; little inferior, if roses are used, to the dear and highly valued otto or odor of roses.

ORANGE FLOWER WATER.—Orange flowers, 12 lbs.; water, 36 lbs.; distil 24 lbs. for double orange flower water; this, with an equal quantity of distilled water forms the single. The flowers should not be put into the still until the water nearly boils.

OTTO OF ROSES.—Roses (and all flowers containing perfumed oils) may be made to yield their aromatic properties by steeping the petals or flower leaves in a saucer or flat dish, and setting it in the sun. The petals should be entirely covered with soft or rain-water; a sufficient quantity should be allowed for evaporation, and the vessel left undisturbed a few days, when a film will be found on the water. This is the essential oil of the flower, and every particle is impregnated with its odor. It should be taken up carefully and put into tiny vials, which should be kept open until all watery particles are evaporated. A very small quantity of this oil will last a long time.

ROSE WATER.—The quantities usually directed are, roses, 15 lbs.; water, 40 lbs.; distil 15 lbs. for single, and the same water with 15 lbs. of fresh roses, for double rose water.

STRAWBERRY WATER.—Bruised strawberries, 4 lbs.; water, 1 gal.; macerate for 12 hours, and distil 6 pints.

DRY PERFUMES.

REMARKS.—Dry perfumes are simply sweet smelling gums, resins and herbs, powdered or ground up together. They form incense, used for burning in churches, and sachet powders, for laying in ladies' boxes and drawers, where handkerchiefs and gloves are kept, and which thus become fragrant.

FRANGIPANNI POWDER.—Powdered violet roots, 3 lbs.; powdered sandal wood, ½ lb.; orange oil, rose oil, oil of sandal wood, of each 1 dr.; pulverized musk, 1 oz.; pulverized civet, 2 dr.

INCENSE.—1. Olibanum 2 or 3 parts; gum benzoin, 1 part.—2. Olibanum, 7 parts; gum benzoin, 2 parts; cascarilla, 1 part; on a hot plate, or burned, it exhales an agreeable perfume.—3. Benzoin and storax, of each 4 oz.; labdanum and myrrh, of each 6 oz.; cascarilla, 3 oz.; oil of cinnamon, 8 minims; oils of bergamot and lavender, of each 20 minims; oil of cloves, 10 minims; mix, and pass through a coarse sieve.—4. Styrax, 2½ oz.; benzoin, 12 oz.; musk, 15 gr.; burnt sugar, ½ oz.; frankincense, 2½ oz.; gum tragacanth, 1½ oz.; rose water, sufficient to form a mass; to be divided into small tablets.—5. Powdered cascarilla, 2 oz.; myrrh, styrax, benzoin and Bergundy pitch, each 1 oz.; mix.

PASTILS. For Burning.—1. Benzoin, 4 oz.; cascarilla, ½ oz.; nitre and gum Arabic, of each

3 dr.; myrrh, 1 dr.; oils of nutmeg and cloves, of each 25 drops.; charcoal, 7 oz.; all in fine powder; beat to a smooth, ductile mass with cold water; form into small cones with a tripod base and dry in the air.—2. Yellow sanders, 3 oz.; styrax, 4 oz.; benzoin, 3 oz.; olibanum, 6 oz.; cascarilla, 6 oz.; ambergris, 1 dr.; Peruvian balsam, 2 dr.; myrrh, 1½ oz.; nitre, 1½ oz; oil of cinnamon, 20 drops; oil of cloves, ½ dr.; otto, 30 to 60 drops; oil of lavender, 1½ drs.; balsam of Tolu, 1½ oz.; camphor, ½ oz.; strong acetic acid, 2 oz.; charcoal, 3 lbs.; mix; beat into a paste with mucilage of tragacanth, and form into conical pastils. Poorer qualities may be made by using more charcoal.—3. Benzoin, 2 oz.; balsam of Tolu, ½ oz.; labdanum, 1 dr.; yellow sanders, ½ oz.; light charcoal, 6 oz.; nitre, ¼ oz.; mucilage of tragacanth, a sufficient quantity; reduce the substances to powder; form into a paste with the mucilage, and divide into small cones with a tripod base.—4. Powdered cascarilla, 8 oz.; benzoin, 4 oz.; yellow sanders, 2 oz.; styrax calamita, 2 oz.; olibanum, 2 oz.; charcoal, 3 lbs.; nitre, 1½ oz.; mucilage of tragacanth, q. s.—5. Benzoin and cascarilla, of each 1 oz.; myrrh, 8 scruples; oil of nutmeg and oil of cloves, of each 4 sc.; nitre, ½ oz.; charcoal, 6 oz.; mucilage of tragacanth, q. s.

POMADE SCENTS. To Perfume Pomades and Hair Oils.—1. (*Cowslip.*) Essence of bergamot, 8 oz.; essence of lemon, 4 oz.; oil of cloves, 2 oz.; essence de petit grain, 1 oz.—2. (*Jonquil.*) Essence of bergamot and lemon, of each 8 oz.; oils of orange peel and cloves, of each 2 oz.; oil of sassafras, 1 oz.; liquid storax, ½ oz.; digest with warmth and agitation for a few hours, and decant the clear portion in a week.—3. (*Millefleur.*) From essence of ambergris (finest), 4 oz.; essence of lemon, 3 oz.; oil of cloves and English oil of lavender, of each 2 oz.; essence de petit grain, essence of bergamot and balsam of Peru (genuine), of each 1 oz.; then as the last.

PORTUGAL.—Dried orange peel, 1 oz.; dried bergamot peel, ½ oz.; cloves, 4 oz.; storax, 1 dr.; ambergris, 8 gr.; benzoin, 1 dr.; musk seed, 1 sc.; musk, 4 gr.

POT POURRI.—A mixture of odorous flowers, gums, resins, roots, etc., preserved in a mass to use as wanted as a base for varied compounds.—1. Gather the petals of the most fragrant kinds of roses (other flowers may be mixed in small proportion); spread them out to dry in the sun, or in a warm room; sprinkle a little salt on them, and put them into a jar, in which they are to be kept covered up till wanted for use; take of these rose leaves, 4 oz.; dried lavender flowers, 8 oz.; vanilla, cloves, storax and benzoin (all bruised), of each 1 dr.; ambergris, 20 gr.; otto of roses, 20 drops; mix.—2. Calamus root and yellow sanders, of each 1 oz.; vanilla, 1 dr.; musk and ambergris, of each 8 gr.; cascarilla, 1 oz.; orris root, 3 oz.; cinnamon and lavender flowers, of each 1 oz.; styrax, benzoin and cloves, of each 2 dr.; coriander seed, 1 oz.; nutmegs, 2 dr.; otto of roses, 20 drops; oil of neroli, 10 drops; coarsely bruise the dry ingredients; mix.—3. Take the petals of the pale and red roses, pinks, violets, moss rose, orange flower, lily of the valley, acacia flowers, clove-gilliflower, mignonette, heliotrope and jonquils; with a very small quantity of the flowers of myrtle, balm, rosemary and thyme; spread out for some days, and as they become dry put into a jar with alternate layers of dry salt, mixed with orris powder, till the vessel is full; close for a month; then stir the whole up, and moisten it with rose water.—4. Orris root, 16 oz.; dried acacia flowers, 8 oz.; dried bergamot peel, 2 oz.; musk seed, ½ oz.; cloves, ½ oz.; pound them together.—5. Dry rose leaves quickly on a wicker tray in a warm place; to a pint of the petals add powdered orris, 2 oz.; pimento, ½ oz.; cascarilla, ½ oz.; musk, 2 gr.; otto of roses, 2 drops; bruised cloves, ½ oz.

POUDRE DE CHYPRE.—Oak moss is macerated in clean water for a day or two, and strongly pressed in a cloth; it is then moistened with rose water mixed with ½ of orange flower for 2 days; pressed and pulverized. It serves as a basis for other perfumes, the power of which it is said to increase.

POUDRE A LA MARESCHALE.—Oak moss, in powder, 2 lbs.; plain starch powder, 1 lb.; cloves, 1 oz.; calamus, cyperus and rotten oak-wood powder, of each 2 oz.; mix.

POUDRE A LA MOUSSELINE.—Orris root, 16 oz.; coriander seed, 8 oz.; musk seed, 2 oz.; cinnamon, cloves and sandal wood, each 1 oz.; star aniseed, ½ oz.; mace, ginger and violet ebony, of each 2 oz.; beat them to a powder, and pass through a sieve.

POUDRE A L' ŒILLET.—Red roses, 48 oz.; orris, 48 oz.; cloves, 6 oz.; bergamot peel, 20 oz.; musk seed, 24 oz.; cinnamon, 6 oz.; long cyperus, 6 oz.; pale roses, 26 oz.; dried acacia flowers, orange flowers and clove stalks, of each 8 oz.

ROSE POWDER.—Pulverized rose leaves, 1 lb.; pulverized sandal wood, ½ lb.; rose oil, 2 dr.

SACHET POWDERS.—1. From orris root, 2 oz.; cassia, 1½ oz.; cloves, 1 oz.; yellow sandal wood, ¼ oz.; oils of lavender and bergamot, of each 1 dr.; otto of roses, 20 drops; musk and ambergris, of each, rubbed with a little sugar, 6 gr.; reduce the dry ingredients to coarse powder, mix them, and add the oils.—2. From corianders, orris root, rose leaves and calamus aromaticus, of each 4 oz.; lavender flowers, 8 oz.; rhodium wood, 1 dr.; musk, 20 gr.—3. From corianders, orris, calamus aromaticus and red roses (dried), of each 1 oz.; lavender flowers, 2 oz.; mace and cloves, of each 1 dr.; essential oil of almonds, 10 drops.—4. As last, but substituting musk, 5 grs., for the oil of almonds.—5. From patchouly, 8 oz.; lavender flowers (lightly dried), 3 oz.; orris root, 2 oz.; cloves, 1 oz.; essence of bergamot, 1 dr.; essences of ambergris and musk, of each ½ dr.—6. ½ lb. of lavender flowers; ½ oz. each of dried thyme and dried mint; ½ oz. each of cloves and caraway seeds; 1 oz. of common salt; rub the lavender flowers from the stalk; reduce the thyme and mint to powder; and bruise the cloves and caraway seeds in a mortar; then mix the whole with the salt, which must be well dried before it is used;

when the ingredients have been thoroughly mixed, the compound may be put into silk or paper bags for use.

SACHET, CASSIA.—Flowers of acacia farnesiana and powdered orris root, equal parts; mix.

SACHET, HELIOTROPE.—Take of powdered orris root, 2,000 parts; rosa centifolia, 1,000 parts; tonka bean, 500 parts; cut vanilla bean, 250 parts; powdered musk, 10 parts; essential oil of bitter almonds, 1 part; pound the musk and vanilla bean together, and add the rest; pass through a not close sieve. An excellent imitation of heliotrope.

SACHET, LAVENDER.—Take of powdered lavender, 75 parts; powdered benzoin, 20 parts; oil of lavender, 1 part; mix.

SACHET A LA MARESCHALE.—Take of sandal wood and orris root, each 280 parts; rosa centifolia, cloves and cassia bark (Laurus cassia), each 140 parts; musk, 1 part; powder coarsely.

SACHET, MILLEFLEURS.—Take lavender flowers, ground orris root, rose leaves and benzoin, of each 1 lb.; tonka beans, vanilla, sandal wood and ground cloves, of each ¼ lb.; cinnamon and allspice, of each 2 oz.; mustard, civet, each 2 dr.

SACHET FOR PERFUMING LINEN.—Orris root, rosa centifolia, of each 125 parts; nutmegs, 8 parts; grana moschata, 15 parts; powder coarsely, and mix.

SPIRITUOUS WATERS.

REMARKS.—The two terms, essences and extracts, are applied somewhat indiscriminately in perfumery to the strong spirituous solutions of the essential oils and to the odorous principles of flowers. Like cologne water, the finest quality of the imported extracts are prepared by distillation from the flowers, but those in common use are solutions of their fragrant matters, previously separated by maceration in strong deodorized alcohol.

ALMOND ESSENCE.—Essential oil of almonds, 1 fl. oz.; deodorized strong alcohol, 19 fl. oz.; mix and agitate, or shake them together until united.

AMBERGRIS ESSENCE.—1. Ambergris (cut very small), 5 dr.; rectified spirit, 1 pt.; place them in a strong bottle or tin can; secure the mouth very firmly and expose it to the heat of the sun, or in an equally warm situation for 1 or 2 months, frequently shaking it during the time; lastly decant and filter through paper.—2. Ambergris, 4 oz.; musk, 2 oz.; tincture of musk seed, 7 pts.; digest with a gentle heat.

AMBERGRIS TINCTURE.—Ambergris, 30 gr.; orris powder, 1 dr.; alcohol, 8 oz.; beat the ambergris with the orris root to a powder; then add the alcohol and macerate for 30 days with occasional agitation, and filter.

AROMATIC WATER.—Sage leaves, 4 parts; rosemary leaves, peppermint, lavender flowers, of each 2 parts; fennel seed and cassia bark, of each 1 part; alcohol, 26 parts; common water, 130 parts; let the cut and bruised ingredients macerate for 24 hours; distil 72 parts.

ARQUEBUSADE WATER.—1. Sage, angelica, wormwood, savory, sweet fennel, hyssop, balm, sweet basil, rue, thyme, marjoram, rosemary, angelica seed, origanum, red calamine, creeping thyme, lavender flowers, of each 10 oz.; sweet flag root, 5 oz.; rectified spirit, 2 gals.; water sufficient; distil 3 gals.—2. Balm, rosemary, thyme, calamus root, angelica seeds, lavender flowers, of each 4 oz.; rectified spirit, 3 pts.; water, q. s.; macerate for a day, and distil 4 pts.

BALM OF A THOUSAND FLOWERS.—1. White castile soap, 2 oz.; honey, 4 oz.; water, 12 oz.; alcohol, 4 oz.; melt the castile soap and honey in the alcohol and water with a gentle heat, and flavor with wintergreen, sassafras and rose.—2. Deodorized alcohol, 1 pt.; nice white bar soap, 4 oz.; shave the soap, and when put in stand in a warm place till dissolved; then add oil of citronella, 1 dr., and oils of neroli and rosemary, of each ½ dr.

BALSAM OF PERU SPIRIT.—Balsam, 3 parts; spirit, 15 parts; carbonate of potash, 1 part; macerate for three days, and distil by water bath.

BENZOIN TINCTURE.—Benzoin, 2 oz.; alcohol, 1 pt.; mix.

BERGAMOT ESSENCE.—Spirits of wine, ½ pt.; bergamot peel, 4 oz.

BOUQUET D' AMOUR.—From esprits de rose, jasmin, violette, and cassie (flowers of *acacia farnesiana*) of each 2 parts; essences of musk and ambergris, each 1 part; mix, and filter.

BOUQUET ESSENCE.—Rose spirit, 2 oz.; ambergris tincture, 2 dr.; orris tincture, 1 oz.; bergamot otto, 1 dr.; lemon otto, 15 min.; mix.

BRIDAL BOUQUET.—Vanilla tincture, 2 dr.; musk, benzoin and orris tinctures, of each 1 dr.; cassie essence, 4 oz.; tuberose essence and jasmine essence, of each 2 oz.; bergamot otto, 16 min.; orange flower otto, 6 min.

CEDRAT ESSENCE.—Essence of bergamot, 1 oz.; essence of neroli, 2 dr.

CIVET TINCTURE.—Civet, 30 gr.; orris root powder, 1 dr.; alcohol, 8 oz.; triturate the civet with the orris root until thoroughly mixed; then add the alcohol, and macerate for 30 days, with occasional agitation, and filter.

CLOVE ESSENCE.—Spirits of wine, ½ pint; bruised cloves, 1 oz.; other essences in the same manner.

COLOGNE ESSENCE.—1. Take 8 times the quantity of ingredients ordered for cologne water, and use the strongest rectified spirit.—2. Oils of lemon and cedrat, of each 2 dr.; oil of rosemary, 1 dr.; oil of bergamot, 1 oz.; spirit of neroli, 2 fl. oz.; purest rectified spirit, 5 fl. oz. Use as a condensed perfume.

COLOGNE WATER.—For the production of good eau de cologne it is absolutely essential that the spirit be of the purest description, both tasteless and scentless, and that the oils be genuine and recently distilled. A very excellent

eau de cologne may be produced by simple solution of the oils or essences in the spirit, provided they be new, pale colored and pure.—1. Essences of bergamot and lemon, of each 1 fl. dr.; oil of orange, ½ dr.; oil of neroli, 20 drops; oil of rosemary, 10 drops; essence of ambergris and musk, of each 1 drop; rectified spirit, ½ pt.; mix.—2. Oil of bergamot, 8 oz.; oil of lemon, 3 oz.; oil of orange, 2 oz.; oil of rosemary flower, 1 oz.; oil of neroli bigarade, 2 oz.; oil of neroli (petit grain), 2 oz.; oil of cloves, 4 dr.; extract of orange flower, 10 oz.; tincture of orris root, 4 oz.; tincture of benzoin, 4 oz.; alcohol, deodorized, 6 gals.; orange flower water, sufficient; dissolve the essential oils in 5½ gals. of the alcohol; add the extract and the tinctures; and lastly orange flower water by small portions, until the mixture acquires a slight milky tint that no longer disappears on shaking; then add the remainder of the alcohol; set the mixture aside for 2 or 3 weeks, then filter through paper.—3. Pure alcohol, 6 gals.; oil of neroli, 4 oz.; oil of rosemary, 2 oz.; oil of orange and citron, of each 5 oz.; oil of bergamot, 2 oz.; mix with agitation, then allow it to stand for a few days perfectly quiet before bottling.—4. The following affords a good article, but not equal to the preceding: pure alcohol, 6 gals.; oil of neroli, 2½ oz.; oil of rosemary, 2 oz.; oil of orange peel, lemon and bergamot, of each 4 oz.; treat in the same way.—5. Take of rectified spirit, 5 gals.; calamus aromaticus, sage and thyme, of each ½ dr.; balm-mint and spearmint, of each 1 oz.; angelica root, 10 gr.; camphor, 15 gr.; petals of roses and violets, of each 3 dr.; lavender flowers, 1½ dr.; orange flowers, 1 dr.; wormwood, nutmeg, cloves, cassia lignea, and mace, of each 20 gr.; oranges and lemons sliced, of each 2 in number; bruise or slice the solids; macerate, with agitation, for 48 hours; then distil off ⅔, and add to the product essences of lemon, cedrat, balm-mint and lavender, of each 1 fl. dr.; pure neroli and essence of the seeds of anthos, of each 20 drops; essences of jasmine and bergamot, of each 1 fl. oz.; mix well, and filter if necessary.—6. Alcohol, 1 pint; oil of bergamot, oil of orange peel, true oil of rosemary, cardamom seeds, of each 1 dr.; orange flower water 1 pt.; mix and distil 1 pt. by water-bath.—7. Oil of lavender, oil of bergamot, oil of lemon, oil of neroli, of each 1 oz.; oil of cinnamon, ½ oz.; spirit of rosemary, 15 oz.; highly rectified spirit, 8 pts.; let them stand 14 days, then distil in a water-bath.—8. (*Golden Farina Cologne.*) Tincture of Canada snake-root, 4 oz.; tincture of orris root, 12 oz.; oils of bergamot, lavender and lemon, of each 6 dr.; essence of musk, 1 dr.; oil of neroli, cinnamon, cloves, of each 1 dr.; orange flower water, 8 oz.; cologne spirits, sufficient to complete, 6 pts.—9. (*Verbena Cologne.*) Otto of lemon grass, 3 dr.; otto of lemon peel (fresh), 2 oz.; otto of orange peel (fresh), 4 dr.; pure spirit, 4 pts.; mix, and after standing a month, filter.

EAU D' AMBRE ROYALE.—Rectified spirit, 2 lbs.; tincture of musk seed, 1 lb.; essence of ambergris, 1 oz.; tincture of musk, 1 oz.; reduced with a proper proportion of orange flower water.

EAU D' ANGE.—Flowering tops of myrtle (bruised), 1½ lbs.; rectified spirit, 7 pts.; water, 3 pts.; digest a week; add of common salt, 2 lbs., and distil 1 gal.

EAU BOTOT.—Tincture of cedar wood, 1 pt.; tincture of myrrh and rhatany, each 4 oz.; oil of peppermint and rose, of each 10 drops; mix.

EAU DE BOUQUET.—1. 2 oz. each of storax, lemon peel and nutmeg; 6 oz. each of coriander and calamus aromaticus; 1½ oz. cloves; 4 oz. iris of Florence; ½ oz. essence of bergamot; 1 dr. essence of lemon; 1 dr. of rosemary; 15 drops otto of roses; ½ dr. of ambergris; ½ dr. of vanilla; 3½ gals. of spirits of wine; 1 qt. of orange flower water; bruise all the solids except the iris, amber and vanilla, and infuse in the spirits of wine for several days, then distil, and add the amber, iris and vanilla; infuse for several days; filter the mixture, and add the orange flower water; when used as a cosmetic dilute with water.—2. Spirits of rosemary and essence of violets, of each 1 fl. oz.; essences of bergamot and jasmine, of each 1 fl. dr.; oils of verbena and lavender, of each ½ fl. dr.; orange flower water, 1 fl. oz.; eau de rose, ½ pt.; rectified spirit, 1 qt.; mix.

EAU DE BOUQUET DE FLORE.—Spirits of rosemary and roses and essence of violets, of each ½ fl. oz.; oil of cedra and essence of ambergris, of each 1 fl. dr.; orange flower water, 5 fl. oz.; rectified spirit, 1 pt.

EAU D' ELEGANCE.—Spirit of jessamine, 2 lbs.; spirit of styrax, 1 lb.; spirit of hyacinth, 1 lb.; spirit of star aniseed, 4 oz.; tincture of balsam of Tolu, 4 oz.; tincture of vanilla, 2 oz.

EAU DE FRAMBOISES.—Strawberries (bruised), 16 lbs.; rectified spirit, 1 gal.; digest, and distil to dryness in a salt-water or steam bath.

EAU DE HELIOTROPE.—Essence of ambergris, ½ fl. dr.; vanilla, ½ oz.; orange flower water, ½ pt.; rectified spirit, 1 qt.; digest a week, and filter.

EAU DE HONGRIE.—A fragrant stimulant and cosmetic; sweetened with sugar, it is also used as a liquor. It is prepared as follows:—1. Rosemary tops in blossom, 4 lbs.; fresh sage, ½ lb.; bruised ginger, 2 oz.; rectified spirit, 1½ gals.; water, ½ gal.; macerate for 10 days; add of common salt, 3 lbs., and then distil 11 pts.—2. Oil of rosemary, ½ fl. dr.; oil of lavender, ½ dr.; orange flower water, ½ pt.; rectified spirit, 1½ pts.; mix.

EAU D' ISPAHAN.—Essential oil of bitter orange peel, 4 oz.; oil of rosemary, 3 dr.; oil of mint, 1 dr.; oil of cloves, 7 sc.; neroli, 7 sc.; spirits of wine, 14 pts. It is used for the same purposes as eau de cologne.

EAU DE MARESCHALE.—Spirit of wine, 1½ pts.; spirit of jessamine, 1 oz.; essence of bergamot, ¼ oz.; essence of violets, 1 oz.

EAU DE MELISSE.—Fresh flowering balm, 24 oz.; yellow rind of lemon, cut fine, 4 oz.; cinnamon, cloves and nutmeg (bruised), of each 2 oz.; coriander seed (bruised), 1 oz.; dried angelica root, 1 oz.; rectified spirit, 1 gal.; macerate for 4 days, and distil in a water bath.

EAU DE MILLEFLEURS.—1. Rectified spirit, 2 pts.; balsam of Peru, ¼ oz.; essence of bergamot, ½ oz.; oil of cloves, ¼ oz.; essence of neroli, ½ dr.; essence of musk, 1 dr.; orange flower water, 2

oz.—2. Balsam of Peru and essence of cloves, of each 1 oz.; essences of bergamot and musk, of each 2 oz.; essences of neroli and thyme, of each ½ oz.; eau de fleurs d'oranges, 1 qt.; rectified spirits, 9 pts.; mix well; very fine.

EAU DE PORTUGAL.—To rectified spirit, 1 gal., add the following essential oils: of orange peel, 6 oz.; of lemon peel, 1 oz.; of lemon grass, ½ oz.; of bergamot, 1 oz.; and of otto of roses, ¼ oz.

EAU SANS PAREILLE.—Essence of bergamot, 5 dr.; essence of lemon, 8 dr.; essence of citron, 4 dr.; Hungary water, 1 pt.; rectified spirit, 6 qts.; mix, and distil.

EAU SPIRITUEUSE DE HELIOTROPE.—Vanilla, 3 dr.; double orange flower water, 6 oz.; rectified spirit, 1 qt.; macerate for 3 days, and distil in a water bath. It may be colored with cochineal. But the essence de heliotrope of some perfumers appears, by the color, not to have been distilled.

EAU DE VIOLETTES.—Macerate 5 oz. of fine orris root in 1 qt. of rectified spirits, for some days, and filter.

ESPRIT DE BOUQUET.—English oil of lavender, oil of cloves and of bergamot, of each 2 dr.; otto of roses and oil of cinnamon, of each 20 drops; essence of musk, 1 dr.; rectified spirit, 1 pt.; mix.

ESPRIT DE JASMIN ODORANTE.—Spirit of jasmine and rectified spirit, of each 1 pt.; essence of ambergris, 1 fl. dr.

ESPRIT DE LA REINE.—Oil of bergamot, 1 fl. oz.; essence of ambergris, 2 fl. dr.; otto of roses, 1 fl. dr.; rectified spirit, 1 qt.

ESPRIT DE RONDELETIA.—Mitcham oil of lavender, 3 oz.; oil of cloves, 1½ oz.; oil of bergamot, 1 oz.; essences of musk and ambergris, of each 2 fl. dr.; rectified spirit, 3 pts.

ESPRIT DE ROSE.—1. Macerate the fresh and picked flowers of the most fragrant varieties of the rose, with ½ their weight of rectified spirit, and distil in a water-bath to dryness.—2. Dissolve from 20 to 30 drops of otto in 1 pt. of rectified spirit. A stronger solution, 6 or 8 drops of otto to 1 oz. of alcohol, forms essence of roses, or *esprit de rose triple.*

ESPRIT DE SUAVE.—The essences of cloves and bergamot, of each 1 fl. dr.; neroli, ½ fl. dr.; essence of musk, 1 fl. oz.; spirit of tube rose and rectified spirit, of each 1 pt.; spirits of jasmine and cassia, of each 1 qt.; dissolve; then add of eau de rose, 1 pt., and mix well.

ESPRIT DE VIOLETTES.—Florentine orris root (reduced to coarse powder), ¼ lb.; rectified spirit, 1 pt.; by simple maceration for a fortnight. A stronger and finer article is prepared from orris root, 5 lbs.; rectified spirit, 1 gal.; by percolation.

FLORAL BOUQUET.—Musk tincture, 2 oz.; orris, tonka and vanilla tinctures, of each 6 dr.; ambergris tincture, 1 oz.; rose spirit, 4 oz.; mix.

FLORIDA WATER.—Dissolve ½ oz. each of the oils of lemon, lavender and bergamot; ½ dr. each of the oils of cinnamon and cloves, in 1 qt. of the best deodorized alcohol; add 2 qts. of filtered water, and bottle for toilet use.

FRANGIPANNI BOUQUET.—Essence of vetiver, 3 oz.; oil of neroli, 15 min.; oil of sandal wood, ½ dr.; otto of roses, 40 min.; essence of musk, 3 dr.; esprit de violette, 3 oz.; essence of ambergris, 6 dr.; rectified spirit to make up 20 oz.

FRANGIPANNI EXTRACT.—Tuberose essence, 1 oz.; vetiver spirit, ½ oz.; sandal, rose and orange flower ottos, of each 15 min.; alcohol, ½ oz.; musk tincture, 2 oz.; orris tincture and orange flower essence, of each 1 oz.; mix.

GERANIUM WATER.—Oil of rose geranium and tincture of orris root, of each 1 oz.; tincture of musk, two dr.; alcohol, 2 pts.; rose water, 4 oz.

GUIBOURT'S ROYAL ESSENCE. For the Handkerchief.—Ambergris, 25 parts; musk, 12 parts; civet, 5 parts; oil of rose, 2 parts; oil of cinnamon, 3 parts; oil of wood of Rhodes, 2 parts; oil of orange flowers, 2 parts; carbonate of potash, 6 parts; alcohol, at 90°, 860 parts; macerate 15 days, and filter.

HELIOTROPE ESSENCE, Artificial.—1. Vanilla (cut in pieces), 12 parts; alcohol, at 85°, 1,000 parts; water of orange flower, 125 parts; macerate for 8 days, then filter.—2. Spirituous extract of vanilla, ½ pt.; French rose pomatum, ¼ pt.; orange flower pomatum, 2 oz.; ambergris, 1 oz.; add 5 drops of the essential oil of almonds.

HELIOTROPE EXTRACT.—Orange flower essence and rose spirit, of each 1 oz.; vetiver spirit, 2 oz.; vanilla tincture, 1 oz.; orris tincture, 2 oz.; tonka tincture and orange flower spirit, of each 1 oz.; ambergris tincture, 4 dr.; sandal wood otto, 10 min.; clove otto, 4 min.; mix.

HONEY WATER.—1. 2½ oz. coriander seeds (ground small in a starch mill); a few slips of sweet marjoram, in flower, dried and stripped from the twigs; 1 dr. of calamus aromaticus; 1 dr. of yellow sanders; and 1 dr. of orange and lemon peel; let the three last named articles be separately beaten to a fine powder; mix these ingredients, and put them into a still that will hold 3 pts., and add to them 1 pt. of rain-water and 1 pt. of proof spirit; lute well all the joints of the apparatus, and leave the ingredients in this state, without fire, for 48 hours; begin to distil by a very gentle heat, or the flowers and leaves will rise in the still-head, stop up the worm and spoil the process; increase the fire after the first ½ hour, and keep it at a regular heat till the termination of the process.—2. Rectified spirits, 8 pts.; oils of cloves, lavender and bergamot, of each ½ oz.; musk, 15 gr.; yellow sanders shavings, 4 oz.; digest for 8 days, and add 2 pts. each of orange flower and rose waters.—3. Oil of sandal, 20 drops; tincture of musk and essence of bergamot, of each 2½ oz.; oils of cloves and lavender, of each 5 dr.; rose water and orange flower waters, of each 2 pts.; spirit of wine, 1 gal.; mix, and filter.—4. White honey and coriander seed, of each 8 oz.; fresh lemon peel, 1 oz.; cloves, ¾ oz.; nutmeg, benzoin and styrax calamita, of each 1 oz.; rose and orange flower waters, of each 4 oz.; rectified spirit, 3 pts.; digest for a few days, and filter. Some receipts add 3 dr. of vanilla, and direct only ½ oz. of nutmeg, storax and benzoin.—5. 1 oz. of essence of bergamot; 3 dr. of oil of lavender; ½ dr. each of oil of cloves and aromatic vine-

gar; 6 gr. of musk or ambergris; 1½ pts. of spirits of wine; mix, and distil. Very superior perfume is produced.

HONEYSUCKLE ESSENCE. — Spirituous extract of rose pomatum, 1 pt.; of violet, 1 pt.; of tuberose, 1 pt.; extracts of vanilla and Tolu, of each 1 pt.; oil of neroli, 10 drops; essential oil of almonds, 5 drops.

HOVENIA ESSENCE.—Rectified spirit, 1 qt.; rose water, ½ pt.; essential oil of lemons, ½ oz.; otto of roses, 1 dr.; oil of cloves, ½ dr.; oil of neroli, 10 drops.

JASMINE EXTRACT.—Jasmine essence, 4 oz.; vanilla tincture, ½ oz.; ambergris tincture, 2 dr.; mix.

JASMINE WATER.—12 oz. white jasmine flowers; essence of bergamot, 8 drops; spirits of wine, 1 gal.; water, 2 qts; digest for 2 days in a close vessel; then draw off by distillation 1 gal. and sweeten with loaf sugar.

JOCKEY CLUB BOUQUET. — Extract of orris root, 2 pts.; esprit de rose triple, 1 pt.; esprit de pomade de rose, 1 pt.; extracts of pomade of cassia and tuberose, ½ pt. each; extract of ambergris, ½ pt.; oil of bergamot, ½ oz.

JOCKEY CLUB EXTRACT.—Tuberose essence, rose spirit, rose essence, of each 2 oz.; ambergris tincture, 1½ oz.; civet and musk tinctures, of each 2 dr.; bergamot otto, 3 min.; clove otto, 10 min.; mix.

JONQUIL ESSENCE.—Spirituous extract of jasmine pomade, 1 pt.; of tuberose, 1 pt.; of orange flower, ½ pt.; add extract of vanilla, 2 oz.

KISS ME QUICK.—Spirit, 1 gal.; essence of thyme, ½ oz.; essence of orange flowers, 2 oz.; essence of neroli, ½ oz.; otto of roses, 30 drops; essence of jasmine, 1 oz.; essence of balm-mint, ½ oz.; petals of roses, 4 oz.; oil of lemon, 20 drops; calorus aromaticus, ½ oz.; essence of neroli, ½ oz.; mix and strain.

LAVENDER ESSENCE.—Essential oil of lavender, 3½ oz.; rectified spirit, 2 qts.; rose water, ½ pt.; tincture of orris, ½ pt.

LAVENDER WATER.—1. Spirit of wine, ½ pt.; essential oil of lavender, 1 dr.—2. Lavender flowers (free from stalks), 2 lbs.; rectified spirit, 8 pts.; water, 16 pts.; distil 8 pts.—3. 2 dr. oil of lavender; 30 gr. of bergamot; 1 gr. essence of musk; 1 pt. rectified spirits of wine; 1 gill of clear spring water; mix, and let it stand 10 days before filtering.—4. Oil of lavender, 4 oz.; spirit, 3 qts.; rose water, 1 pt.; mix, and filter. —5. An excellent lavender water, obtained by simple mixture, is produced from the following formula: oils of lavender and bergamot, of each 3 dr.; otto of rose and oil of cloves, of each 6 drops; oil of rosemary and essence of musk, of each ½ dr.; benzoic acid, ½ dr.; honey, 1 oz.; alcohol, 1 pt.; esprit de roses, 2 oz.; mix well, and keep till old.—6. The flowering tops of lavender, 7 lbs.; rectified spirit, 2 gals.; macerate for a week; add of water, ½ gal (holding in solution) common salt, 3 lbs.; and distil 2 gals.—7. From Mitcham oil of lavender, 8 oz.; essence of musk, 4 oz.; essence of ambergris and oil of bergamot, of each 1½ oz.; rectified spirit, 2 gals.; mix well; very fine.—8. Oil of lavender, 20 oz.; oil of bergamot, 5 oz.; essence of ambergris, ½ oz.; rectified spirit, 5 gals.; mix. The product of the last formula is better for distillation; but in that case the essences of ambergris and musk should be added to the distilled spirit.

LEMON ESSENCE.—Spirits of wine, ½ pt.; fresh lemon peel, 4 oz.; let it stand for a month; strain and bottle.

LILY OF THE VALLEY ESSENCE.—Mix the following extracts: of tuberose, ½ pt.; of jasmine, 2 oz.; of orange flower, 2 oz.; of vanilla, 3 oz.; of cassia, ¼ pt.; of rose water, ¼ pt.; add 3 drops of hydrocyanic acid; keep together for a month, then bottle.

LISBON WATER.—To rectified spirit, 1 gal., add the essential oils of orange peel and lemon peel, of each 3 oz.; and of otto of roses, ¼ oz.

MAGNOLIA ESSENCE. — Spirituous extract of orange flower pomatum, 1 pt.; of rose pomatum, 2 pts.; of tuberose pomatum, ½ pt.; of violet pomatum, ½ pt.; essential oil of citron, 2 dr.; and essential oil of almonds, 10 drops.

MIGNONETTE ESSENCE.—Digest 1 lb. of pomade de réséda in rectified spirit, 1 pt., for 14 days; filter off, and add 1 oz. of extrait d' ambre.

MISTURA ODORATA.—Rectified spirit, 48 oz.; tincture of benzoin, 4 oz.; tincture of vanilla, ½ oz.; tincture of musk, ½ oz.; balsam of Peru, ½ oz.; oils of cloves, mace and cinnamon, of each ½ oz.; oil of bergamot, 1 oz.; oil of cedrat, 2 oz.

MOSS ROSE ESSENCE. — Otto of rose, 1½ dr.; essence of ambergris, 2½ oz.; essence of musk, 1 oz.; alcohol, 15 oz.; concentrated rose water, 10 oz.; mix, and shake frequently for 1 week.

MOSS ROSE EXTRACT.—Rose spirit, 3 oz.; orange flower essence, 1 oz.; ambergris tincture, ½ oz.; musk tincture, 2 dr.; mix.

MUSK ESSENCE.—1. 1 pt. proof spirit; add 2 dr. of musk; let it stand a fortnight, with frequent agitation.—2. Finest pure grain musk, ½ oz.; civet and ambergris, of each 1 dr.; strong deodorized alcohol, 1 pt.; spirits of hartshorn, ½ dr.; bottle and cork closely, and proceed as directed for essence of ambergris.

MUSK EXTRACT.—Musk and civet tinctures, of each 2 oz.; rose otto, 10 min.; alcohol, 1 oz.; mix.

MUSK TINCTURE.—Tonquin grain musk, 1 dr.; hot water, 4 dr.; alcohol, 1 pt.; digest the musk in the hot water for 3 or 4 hours; then add the alcohol, and macerate for 30 days, with occasional agitation, and filter.

MYRTLE ESSENCE.—1. Take the following extracts: of vanilla, ½ pt.; of roses, 1 pt.; of orange flower, ½ pt.; of tuberose, ½ pt.; of jasmine, 2 oz.; mix, and allow to stand for a fortnight.—2. Myrtle tops (in blosson), 2½ lbs.; proof spirit, 9 pts.; digest 3 days, then distil 1 gal. A pleasant perfume.

NEROLI ESSENCE.—1. Neroli, 3 dr.; rectified spirit of wine, 1 pt.; mix. A delicious perfume.—2. Oil of orange, 2 dr.; orris root (bruised), ½ oz.; ambergris, 10 gr.; neroli, 25 drops; spirits of wine, 1 pt.; digest 14 days, and filter. Very fragrant, but less refined than the last.—3. Spirits of wine, ½ pt.; orange peel (cut small), 3 oz.; orris root (in powder), 1 dr.; musk, 2 gr.; let it stand in a warm place for 3 days, and filter.

NEW MOWN HAY EXTRACT.—Moss rose extract, 1 oz.; benzoin tincture, 1 oz.; tonka tincture, 4 oz.; musk tincture, 1 oz.; rose geranium otto, 40 min.; bergamot otto, 40 min.; alcohol, 1 oz.; mix.

ODOR DELECTABILIS.—1. 4 oz. of distilled rose water; 4 dr. of orange flower water; 1 dr. each of oils of cloves and lavender; 2 dr. of oil of bergamot; 2 gr. each of ambergris and musk; and 1 pt. of spirits of wine; dissolve the musk and ambergris in the spirit; then mix the whole; it will be better for being passed over a still.—2. Oils of lavender, bergamot, rose geranium and cloves, of each 1 fl. dr.; eaux de rose and fleurs d' orange, of each ¼ pt.; rectified spirit, 1½ pts.

ORANGE FLOWER SPIRIT.—1. Orange flower otto, 40 min.; alcohol, 8 oz.; mix.—2. Fresh flowers, 1 lb.; rectified spirit, 4 lbs., or pts.; water, 2 lbs.; distil 4 lbs. or pints.

ORANGE FLOWER WATER.—Oil of neroli, 8 drops; rectified spirits, 2 dr.; magnesia, ½ dr.; rub together in a mortar, gradually adding a pt. of distilled water; filter the liquid through white blotting paper.

ORANGE PEEL SPIRIT.—Fresh peel, 1 lb.; rectified spirit, 6 lbs.; macerate for 2 days, and distil in a water-bath to dryness; or 1 oz. of the essential oil to 2 pts. of spirit.

ORRIS TINCTURE.—Orris root powder, 2 oz.; alcohol, 4 oz.; macerate the orris root for 7 days and filter; then percolate the orris root with alcohol sufficient to make the measure up to 4 fl. oz.

PARFUM DES ROIS.—Spirit of wine, 2 gals.; styrax, 6 oz.; benzoin, 16 oz.; aloes-wood, 8 oz.; spirit of rose and spirit of orange flowers, of each, 2 pts.; essence (tincture) of ambergris, 8 oz.; tincture of musk, 8 oz.; tincture of vanilla, 16 oz.

PATCHOULY ESSENCE.—1. Indian patchouly (leaves or foliaceous tops), 2½ lbs.; rectified spirit, 9 pts.; digest for a week; add of water, 1 gal.; oil of lavender, 3 dr.; common salt, 2 lbs.; agitate well together; distil over (rapidly) 1 gal., and add essence of musk, 3 fl. dr. This is a very fashionable perfume.—2. Patchouly, 3 oz.; rectified spirit, 1 pt.; digest 1 week, press, and filter. A commoner kind is made with proof spirit.

PATCHOULY EXTRACT.—Patchouly otto, 2 dr.; rose otto, 20 min.; alcohol, 15 oz.; mix.

PEACH BLOSSOM EXTRACT.—Take essence of lemons, 1 oz.; pure balsam of Peru, 2 dr.; essence (oil) of bitter almonds, 1 dr.; rectified spirit, 3 pts.; spirit of orange flowers, 1 pt.; spirit of jasmine, ½ pt.; mix. This is a pleasant and powerful perfume.

PRINCESS BOUQUET.—Bergamot and clove ottos, of each ½ dr.; lavender otto, 1 dr.; musk, vanilla and ambergris tinctures, of each 2 dr.; rose spirit, 1 oz. and 2 dr.; alcohol, 8 oz.; mix.

RONDOLETIA ESSENCE.—Essence of bergamot, essence of lemon, oil of cloves, of each 1 dr.; otto of roses, 6 drops; rectified spirit, 1 pt.

RONDOLETIA EXTRACT.—Lavender otto, 1 dr.; clove otto, 15 min.; bergamot otto, 30 min.; musk, vanilla and ambergris tinctures, of each 2 dr.; rose spirit, 1½ oz.; alcohol, 8 oz.; mix.

ROSE ESSENCE.—1. Otto of roses, 2 dr.; alcohol, 1 pt.; agitate frequently until they unite.—2. Otto of roses, 1 oz.; rectified spirit, 1 gal.; mix in a close vessel, and assist the solution by placing it in a bath of hot water; as soon as the spirit gets warm, take it from the water and shake it till quite cold; the next day filter.—3. Rose otto, 50 min.; rose geranium otto, 40 min.; alcohol, 8 oz.; mix.

ROSE WATER.—1. Procure a glass bottle with a wide mouth and ground glass stopper; fill ⅔ full with deodorized alcohol; add rose leaves until no more can be forced into the bottle; let it stand several months, keeping it airtight; strain when the virtue has left the leaves; white roses are best.—2. Take otto of roses, 25 drops; rub it in with 1 oz. white sugar and 4 dr. of carbonate of magnesia; then add gradually ½ gal. of water, and 4 oz. of proof spirits.

ROYAL ESSENCE.—Ambergris, 1 dr.; civet, 15 gr.; musk, 30 gr.; carbonate of potash, 20 grs.; triturate together, and add oil of cinnamon, 10 drops; oils of rhodium and neroli, 6 drops; otto of roses, 6 drops; rectified spirit, ¼ pt.; digest and filter.

SANDAL WOOD EXTRACT.—Sandal wood otto, 3 dr.; rose otto, 20 min.; alcohol, 8 oz.; mix.

SPRING FLOWERS EXTRACT.—Rose essence, tuberose essence and rose spirit, of each 2 oz.; musk tincture, ½ oz.; ambergris tincture, 1½ oz.; clove otto, 10 min.; bergamot otto, ½ dr.; mix.

STRAWBERRY OR RASPBERRY SPIRIT.—Fresh fruit, 3 lbs.; rectified spirit, 1 lb.; macerate 24 hours, and distil 2 lbs.

SWEET BRIAR ESSENCE.—Spirituous extract of French rose pomatum, 1pt.; of cassia and orange flowers, of each ¼ pt.; esprit de rose, ¼ pt.; with oils of neroli and lemon grass, of each ½ dr.

SWEET PEA ESSENCE.—Essences of tuberose, orange flower and rose pomatum, of each ½ pt.; essence of vanilla, 1 oz.

TUBEROSE EXTRACT.—Tuberose essence, 4 oz.; orris and ambergris tinctures, of each ½ oz.; mix.

UPPER TEN.—Spirits of wine, 4 qts.; essence of cedrat, 2 dr.; essence of violets, ½ oz.; essence of neroli, ½ oz.; otto of roses, 20 drops; orange flower essence, 1 oz.; oil of rosemary, 30 drops; oils of bergamot and neroli, of each ½ oz.

VANILLA TINCTURE.—Vanilla beans, 6 troy dr.; alcohol, 1 pt.; beat the vanilla to coarse powder; macerate with gentle heat for 4 hours, and filter; while macerating, keep a wet towel over the mouth of the bottle, using a water-bath.

VERBENA ESSENCE.—Rectified spirit of wine, ½ pt.; otto of verbena, ½ dr.; otto of bergamot, 1 dr.; and tincture of tolu, ½ oz.; mix them together, and it is ready for use; it does not stain the handkerchief, and is very economical.

VERBENA EXTRACT.—Verbena otto (true), 1 dr.; lemon otto, 1 dr.; alcohol, 8 oz.; mix.

VERBENA WATER.—1. Rectified spirits, 1 pt.; grass-oil (verbena-oil), 3 dr.; oil of lemon peel, 2 oz.; oil of orange peel, ½ oz.; mix, and let stand for a few hours; filter, if necessary, and fill in bottles.—2. A very superior article, sold un-

der the name of *Extrait de Verbene*, is made according to the following receipt: Rectified spirit, 1 pt.; oil of orange peel, 1 oz.; oil of lemon peel, 2 oz.; oil of lemon, 1 dr.; grass-oil (verbena oil), 2½ dr.; essence of orange flowers, 7 oz.; essence of tuberose, 7 oz.; essence of rose, ½ pt.

BUCKINGHAM PALACE BOUQUET.—Extract fleur d'orange, extract cassie, extract jasmine, extract rose, from pomade of each, 1 pt.; extract of orris, extract of ambergris, of each, ½ pt.; otto of neroli, ½ dr.; otto of lavender, ½ dr.; otto of rose, 1 dr.

COLOGNE, Cheap.—Oil of bergamot, 1 fl. dr.; oil orange, 1 fl. dr.; oil rosemary, 1 fl. dr.; orange flower water, 1 pt.; alcohol, 1 pt.; cardamom seeds, 1 dr.; mix, digest, and distill over 1 pt.

CREOLE WATER.—Orris root, 6¾ oz., cut in small pieces, put in 1½ pt. French brandy; allow it to stand for 2 weeks, stir frequently; filter; then add 3 pt. French brandy, 3 dr. oil of orange blossoms, ¾ fl. oz. oil geranium. Distill, and add a little cumarin essence.

EAU DE PARIS.—Eighty-five per cent alcohol, 2,000 parts; Portugal oil, 15½ parts; oil of lemon, 15½ parts; oil of bergamot, 15½ parts; neroli, 3½ parts; oil of rosemary, 2 parts.

EAU DE COLOGNE.—It consists of alcohol perfumed with essential oils. Lebeaud and Fontenelle give the following recipe: Dried rosemary, thyme, sweet marjorum, wormwood, balm, and hyssop, 1 oz. each; cloves, cinnamon, angelica root, juniper berries, anise, cummin, fennel, and caraway-seeds, fresh orange peel, and oil of bergamot, 1 oz. each; cardamoms, lavender flowers, and bruised nutmegs, each, 2 oz., the whole to be digested in 10 qts. of alcohol several days, and then distilled to dryness by water-bath. Purity of the ingredients, and freedom, especially of the alcohol, from fusel oil, are essential to the perfection of the perfume.

EAU DE LUCE.—A strong solution of ammonia, scented and rendered milky by the addition of a little mastic and oil of amber. It is considered an effective remedy in India against the bite of poisonous snakes.

EAU DES ALPES.—Alcohol, 400 parts; oil of bergamot, 9½ parts; oil cedrat, 9½ parts; oil of orange blossoms, 9½ parts; Portugal oil, ¾ part; oil of lemon, ¾ part; oil of wormwood, 2 parts; oil of cloves, 1 part.

EAU SPIRITUEUSE D'ANIS.—Angelica seed, 6 oz.; anise, 6 oz.; brandy, 8 lb.; bruise the seeds, and after some days' infusion with the brandy, distill.

EAU ROMAINE.—1. Jasmine water, 3 qt.; vanilla water, 1 qt.; acacia water, 1 qt.; tuberose water, 1 pt.; essence of amber, 2 oz.; tincture of benzoin, 8 oz.—2. Essence of ambergris, 1 fl. dr.; tincture of benzoin, 4 fl. dr.; spirit of tuberose, 1½ fl. oz.; tincture of vanilla, 2 fl. oz.; esprit de fleurs d'acacia, 2½ fl. oz.; esprit de jasmin, 7½ fl. oz.; essence de petit grain, 8 or 10 drops; mix. The last essence is often omitted, and the tincture of benzoin reduced in quantity.—3. Essence of ambergris, 1 fl. oz.; tincture of benzoin, 4 fl. oz.; spirit of tuberose, ½ pt.; spirit of acacia flowers, 1 pt.; tincture of vanilla 1 pt.; spirit of jasmin, 3 pt.

MARIE STUART.—Extract musk, 4 oz.; extract civet, 4 oz; extract benzoin, 4 oz.; extract orange flower, 16 oz.; extract oil of rose, Kissanlik, 60 min.; oil bergamot, 60 min.; extract tonka, 4 oz.; alcohol, 1 gal.; water, 1 pt.

NIGHT BLOOMING CEREUS.—1. Spirit of rose, 4 oz.; essence of jasmine, 4 oz.; tincture of tonka, 2 oz.; tincture of civet, 2 oz.; tincture of benzoin, 4 oz.; cost $1.65 per pint.—2. Extract vanilla, 8 oz.; extract civet, 2 oz.; extract benzoin, 2 oz.; oil bergamot, 2 oz.; alcohol, 2 gal.; water, 3 pt.

PARADISE WATER.—Distill 90 per cent alcohol Tr., 2⅜ gal.; cardamoms, ½ oz.; anise seed, 1⅜ oz.; rosewood, 1 oz.; calamus, 1⅜ oz.; orris root, 1 oz.; angelica root 1⅜ oz.; fresh lemon peel, 1½ lb.; to this add 13½ lb. sugar sirup and 1½ gal. water; color green; add a little silver leaf rubbed fine.

PASSY WATER.—Sulphate of iron, 2 gr.; chloride of sodium, 3 gr.; carbonate of soda, 4 gr.; chloride of magnesium, 2 gr.; aerated water, 1 pt.

PEACH WATER.— Eighty-degree alcohol, 3 pt.; tincture of tolu, 3 oz.; oil of almonds (essential), 1½ dr.; extract of jasmine, 6 oz.; extract orange flower, 6 oz.; pleasant toilet water.

SWEET PINK.—Oil ylang ylang, 1 dr.; oil bergamot, 2 dr.; extract benzoin, 2 dr.; civet, 2 dr.; extract rose from pomade, 8 oz.; alcohol, 1½ qt.

VETIVER ESSENCE.—2 lb. of the root of vetiver (cut small); moisten with a little water; macerate for 24 hours; then beat in a marble mortar; macerate it in sufficient spirit to cover, for 8 or 10 days, and strain with pressure; filter through paper, and in a fortnight repeat the filtration.

VIOLET ESSENCE.—Digest 1½ oz. of coarsely powdered best Florentine orris root in 36 oz. of strong deodorized alcohol for 2 weeks; then express and filter; or prepare by percolation.

VIOLET EXTRACT.—Violet essence, 4 oz.; cassia essence, 1 oz.; rose essence, 3 dr.; orris tincture, 1 oz.; ambergris and civet tinctures, of each, 2 dr.; almond spirit, 20 min.; mix.

WEST END.—Rose spirit, 3 oz.; benzoin and musk tinctures, of each, 1 oz.; verbena extract and civet tincture, of each, ½ oz.; sandal wood otto, 10 min.; mix.

WHITE LILAC ESSENCE.—Spirituous extract of tuberose pomade, 2 pt.; of orange flower pomade, ½ pt.; add essential oil of almonds, 3 drops, and extract of civet, ½ oz.

WHITE ROSE EXTRACT.—Rose spirit, 4 oz.; violet and jasmine essence, of each, 2 oz.; patchouly extract, ½ oz.; mix.

YLANG YLANG EXTRACT.—1. Extract of jasmine, 8 oz.; extract of rose, 16 oz.; tincture of orris root, 8 oz.; tincture of civet, 4 oz.; oil of ylang ylang, 4 dr.; alcohol, 2 pts.—2. Tincture of tonka beans, 3 oz.; tincture of musk and extracts of tuberose and cassia, of each, 4 oz.; tincture of orris root, 8 oz.; oil of orange (fresh), 2 dr.; neroli, ½ dr.; alcohol, sufficient to make 4 pts.

Thimbleful.....	"	¾	fl. Drachm
Pinch (of leaves and flowers)	"	1	dr. (Troy)
Handful (leaves and flowers)	about	10	dr.(Troy)

8 wineglassfuls (each 2 fluid ounces) in a pint
24 dessertspoonfuls (each 2 fluid drachms) in 6 fluid ounces.
16 dessertspoonfuls (each 2 fluid drachms) in 4 fluid ounces.
32 teaspoonfuls (each 1 fluid drachm) in 4 fluid ounces.
16 teaspoonfuls (each 1 fluid drachm) in 2 fluid ounces.
8 teaspoonfuls (each 1 fluid drachm) in 1 fluid ounce.

WEIGHTS AND MEASURES, For Domestic Purposes.—Wheat flour, one pound is a quart.

Indian meal, one pound two ounces is one quart.

Butter, when soft, one pound is one quart.

White sugar, when powdered, one pound one ounce is one quart.

Best brown sugar, one pound two ounces is one quart.

Liquids.—Eight large tablespoonfuls are one gill.

Twenty-five drops are equal to one teaspoonful.

A common tumbler is equal to a half pint.

Four large tablespoonfuls are half gill.

A common wineglass is equal to a half gill.

SPECIFIC GRAVITIES OF LIQUIDS.—

Gases and Vapors.—Atmospheric air =1.000. Hydrogen, .0692; nitrogen, .972; oxygen (Graham, 1.1056; carbonic oxide, .972; carbonic acid (carbonic anhydride), 1.524; light carburetted hydrogen, .5595; olefiant gas, .981; chlorine, 2.470 (2.421 Graham); vapor of eth-

er, 2.582; vapor of water, .622; vapor of sulphur at 900°, 6.617 (Graham); vapor of phosphorus, 4.284; vapor of iodine, 8.716.

TABLES OF MEASURES.—Most liquid substances are dispensed by measure instead of by weight.

Apothecaries' or Wine Measure is the official or standard system in use by the pharmacists of the United States. Its denominations are gallon, pint, fluid ounce, fluid drachm and minim, and the signs used to express them and their relative value are:

Cong.		O.		F. Oz.		F. Dr.		Minims.
1	=	8	=	128	=	1,024	=	61,440
		1	=	16	=	128	=	7,680
				1	=	8	=	780
						1	=	60
								1

Imperial Standard Measure is the system in use by British pharmacists. Its denominations and their relative value are:

Gal.		Qts.		Pts.		F. Oz.		F. Dr.		Minims.
1	=	4	=	8	=	160	=	1,280	=	76,800
		1	=	2	=	40	=	320	=	19,200
				1	=	20	=	160	=	9,600
						1	=	8	=	480
								1	=	60

The relative value of United States Apothecaries' and British Imperial Measure is as follows:

U. S. Apothecaries' Measure.		Imperial Measure. Pt.	F. oz.	F. dr.	Drops.
1 Gal. = .83311 Imp. Gal., or		6	13	2	22.85
1 Pint = .83311	" Pt., "		16	5	17.86
1 F.oz.=1.04139	" F. oz., "		1	0	19.76
1 F. dr.=1.04139	" F. dr., "			1	2.48
1 Min. =1.04139	" Minim,"				1.04

TABLES OF WEIGHTS.—Apothecaries' Weight is used by apothecaries in compounding medicines, and is the official standard of the *United States' Pharmacopeia.* In buying and selling medicines not ordered by prescriptions, avoirdupois weight is used. The denominations of apothecaries' weight and their relative values are:

Pound.		Ounces.		Drachms.		Scruples.		Grains.
1	=	12	=	96	=	288	=	5,760
		1	=	8	=	24	=	480
				1	=	3	=	60
						1	=	20

Avoirdupois Weight is used for weighing all goods except those for which troy and apothecaries' weights are employed, and for compounding receipts for domestic purposes and for the arts. Its denominations and their relative values are:

Ton.	Cwt.	Qrs.	Lbs.	Ozs.	Drs.
1	= 20	= 80	= 2,240	= 35,840	= 573,440
	1	= 4	= 112	= 1,792	= 28,672
		1	= 28	= 448	= 7,168
			1	= 16	= 256
				1	= 16

The common standard weight by which the relative values of these systems are compared, is the *grain*, which for this purpose may be regarded as the unit of weight. The pound troy and that of apothecaries' weight have each 5,760 grs; the pound avoirdupois has 7,000 grs. The relative proportions and values are as follows:

TROY.		AVOIRDUPOIS. Oz.	Dr.
1 pound	=	13	2.65
1 ounce	=	1	1.55
1 dwt.	=		0.877

		APOTHECARIES'. Lb.	Oz.	Dr.	Sc.	Gr.
1 pound	=	1	0	0	0	0
1 ounce	=		1	0	0	0
1 dwt.	=			1	0	4
1 grain	=					1

APOTHECARIES'.		AVOIRDUPOIS. Oz.	Dr.
1 pound	=	13	2.65
1 ounce	=	1	1.55
1 drachm	=	6	2.19
1 scruple	=	0	0.73

		TROY. Lb.	Oz.	Dwt.	Gr.
1 pound	=	1	0	0	0
1 ounce	=		1	0	0
1 drachm	=			2	12
1 scruple	=				20

AVOIRDUPOIS.		TROY. Lb.	Oz.	Dwt.	Gr.
1 ton	=	2,922	2	13	8
1 cwt.	=	146	1	6	16
1 quarter	=	34	0	6	16
1 pound	=	1	2	11	16
1 ounce	=		1	8	5$\frac{1}{2}$
1 drachm	=			1	3$\frac{11}{32}$

		APOTHECARIES'. Lb.	Oz.	Dr.	Sc.	Gr.
1 pound	=	1.	2	4	2	0
1 ounce	=		7	0	0	17$\frac{1}{2}$
1 drachm	=			1	0	7$\frac{1}{2}$

Troy Weight is used by jewelers and at the mints, in the exchange of the precious metals. Its denominations and their relative value are as follows:

Pound.		Ounces.		Pennyweights.		Grains.
1	=	12	=	240	=	5,760
		1	=	20	=	480
				1	=	24

TABLES OF BOTH WEIGHTS AND MEASURES.

Metric System.—This system of weights and measures is very simple. It does not consist of a number of foreign terms, as many suppose. The terms *meter, liter, gram, are,* etc., and the prefixes, *milli, centi, deci, deka, hekto, kilo* and *myria,* are no part of the metric system at all, and could be dropped if other names and numerals were found preferable. The essential characteristics of the metric system are:—1. That it rests upon a basis of a constant of nature (the measure of a ten-millionth part of the quadrant of the earth).—2. That it is harmonious throughout, so that the units for the measurement of surface, volume and weight, all bear the simplest relation possible to the unit of length, which is the basis for all.—3. That it is decimal and corresponds with our arithmetic. The prefixes used in the metric system are simply numerals: milli means 1-1000th; centi means 1-100th; deci means 1-10th;

deka means 10; hekto means 100; kilo means 1,000, and myria means 10,000. The only prefixes used to any great extent in medicine and pharmacy are kilo, centi and milli.

1 meter is equal to 39.370432 English inches.

1 liter is equal to 1.056717 wine quarts, or about 34 United States fluid oz.

1 cubic centimeter is equal to 16.231 United States' minims.

1 gram is equal to 15.43234874 troy grs.

Physicians and pharmacists use only weights and fluid measures. The following contains all that is necessary of the metric weights and fluid measures: 1 kilogram = 1,000 grams; 1liter = 1,000 fluigrams. As 1 United States fluidrachm weighs very nearly 1 drachm (really only 57.047 troy grains), it is customary to use the terms drachm and fluid drachm, ounce and fluid ounce, almost indiscriminately, thus saying "an ounce of water," when a *fluid* ounce of water is meant, etc. In the metric system, 1 liter of water and 1 kilogram of water is actually the same quantity; and 1 gram of water is just 1 cubic centimeter of water: therefore it is very convenient to drop the term cubic centimeter, and to give to it the name fluigram instead, so as to show the intimate relationship between the gram and fluigram. For all practical purposes in medicine and pharmacy, it is perfectly proper to ignore the interminable fractions given above in comparing the metric units with those of the old system. The difference is so insignificant that it would be absurd to suppose that any therapeutic objection exists against ignoring it. The metric units compare with the old units as follows: 1 gram = 15 troy grs.; 1 troy gr. = 1-15 gram; 1 fluigram = 15 minims; 1 minim = 1-15 fluigrams. Or—1 dr. = 4 grams; 1 gram = ¼ drachm; 1 fluidrachm = 4 fluigrams; 1 fluigram = ¼ fluidrachms. If now the centigram be called a cent, and the milligram a mill, and if we call the 10th part of 1 fluigram a fluidime, we will then have an Americanized metric system of weights and measures such as will be very easy indeed to learn. Weights: 1 kilogram = 1,000 grams; 1 gram = 100 cents, or about 1,000 mills. Measures: 1 liter = 1,000 fluigrams; 1 fluigram = 10 fluidimes, or 100 fluicents, or 1,000 fluimills. As 1 fluidime is equal to only 1½ United States' minim, a smaller unit for fluid measures would be useless. 1 cent is equal to about ⅛ troy gr.; 1 mill = 1-64 troy gr. In writing metric quantities it is most convenient to spell and abbreviate as follows: Meter; liter; cubic centimeter, C.C.; gram, Gm.; fluigram, fGm.; fluidime, fD.

RULES FOR CONVERSION.

1. To convert troy grs. into cents (centigrams), multiply by 6.

2. cents (centigrams), into troy grs. divide by 6.

3. Troy grs. into mills (milligrams), multiply by 60.

4. Mills (milligrams), into troy grs., divide by 60.

5. Troy grs. into grams, or min. into fluigrams, divide by 15.

6. Grams into grs., or fluigrams into min., multiply by 15.

7. Drachms into grams, or fluidrachms into fluigrams, multiply by 4.

8. Grams into drachms, or fluigrams into fluidrachms, divide by 4.

1 troy gr. = 6 cents; 1 dr. = 4 grams; 1 troy oz. = 30 grams; 1 min. = 1-15 fluigram; 1 fluidrachm = 4 fluigrams; 1 drop = about ½ fluidime. The average drop is about 0.05 fGm.; a teaspoonful is about 5 fGm; a dessertspoonful is about 10 fGm.; a tablespoonful is about 20 fGm.; a winglassful is about 75 fGm.

TEMPERATURES.—In English pharmacy it is customary to measure the degree of heat by Fahrenheit's thermometer. When a boiling heat is directed, 212° is meant. A gentle heat is that

which is denoted by any degree between 90° and 100° Fahr. Whenever specific gravity is mentioned, the substance spoken of is supposed to be of the temperature of 62° Fahr. In chemical works in this country, generally, the specific gravities of bodies are taken at, or referred to, the temperature of 60° Fahr. The following data may be useful to the pharmacist:

Degrees of Fahr.

644 Mercury boils (Daniell); 662 (Graham).
640 Sulphuric acid boils (Magrignac); 620 (Graham).
630 Whale oil boils (Graham).
600 Linseed oil boils.
518 Bismuth melts (Gmelin).
380 Arsenious acid volatilizes.
356 Metallic arsenic sublimes.
315 Oil of turpentine boils (Kaure).
302 Etherification ends.
257 Saturated sol. of sal ammonic boils (Taylor).
256 Saturated sol. of acetate of soda boils.
239 Sulphur melts (Miller); 226 (Fownes).
238 Saturated sol. of nitre boils.
221 Saturated sol. of salt boils (Paris Codex).
220 Saturated sol. of alum, carb. soda and sulph. zinc, boil.
218 Saturated sol. of chlorate and prussiate potash, boil.
216 Saturated sol. of sulph. iron, sulph.copper, nitrate of lead, boil.
214 Saturated sol. of acetate lead, sulph. and bitartrate potash, boil.
213 or 213.5 Saturated sol. of water begins to boil in glass.
212 Water boils in metal, barometer at 30".
207 Sodium melts (Regnault).
145 White of egg begins to coagulate.
185 Nitric acid 1.52 begins to boil.
180 (about) Starch forms a gelatinous compound with water.
176 Rectified spirit boils, benzol distils.
173 Alcohol (sp. gr. .796 to .800) boils.
151 Beeswax melts (Kane); 142 (Lepage).
150 Pyroxylic spirit boils (Scanlan).
141.8 Chloroform and ammonia of .945, boil.
44.5 Potassium melts (Bunsen).
132 Acetone (pyroacetic spirit) boils (Kane).
122 Mutton suet and styracin melt.
116 Bisulphuret of carbon boils (Graham).
115 Pure tallow melts (Lepage); 92 (Thomson).
112 Spermacetti and stearin of lard melt.
111 Phosphorus melts (Miller).
98 Temperature of the blood.
95 Ether (.720) boils.
95 Carbolic acid crystals become an oily liquid.
88 Acetous fermentation ceases, water boils *in vacuo*.
77 Vinous ferm. ends, acetous ferm. begins.
64.4 Oil of anise liquefies.
59 Gay Lussac's *Alcoomètre* graduated at.
55 Syrups to be kept at.
30 (about) Olive oil becomes partially solid.
32 Water freezes.
5 Cold produced by snow 2 parts, and salt 1 part.
—37.9 Mercury freezes.

DRUGGISTS' RECIPES.

BUG DESTROYER.—Tincture of tobacco, 200 parts; boric acid, 6 parts; carbolic acid, 6 parts; salicylic acid, 12 parts; oil of Indian balm, 1 part.

CAMPHORATED CHALK, For the Teeth.—Precipitated chalk, 1 lb.; powdered orris root, ½ lb.; powdered camphor, ¼ lb.; reduce the camphor to powder by rubbing it in a mortar with a little spirit; then sift the whole well together.

COMPLEXION POWDERS. — 1. (*Pozzoni's White.*) It imparts a brilliant transparency to the skin, removes all pimples, freckles and discolorations, makes the skin delicately soft; perfectly harmless, containing no arsenic or other deadly material. Found upon examination to be: French chalk, 55·95 per cent; calcium carbonate, 31·25 per cent; bismuth oxy-chloride, 12·8 per cent.—2. (*Wright's.*) A harmless face powder, claimed by its manufacturer to be entirely free from lead or other poisonous minerals, and no more hurtful in use than common starch. Upon examination, it proved to be: French chalk, 25·48 per cent; corn starch, 33·73 per cent; bismuth oxide, 0·8 per cent; calcium sulphate, 40·19 per cent. The foregoing are analyses merely, and are not to be taken as formulæ, from which the various preparations may be compounded. Perfumes have to be added, and it is not necessary to adhere rigidly to the quantities given.—3. (*Violet.*) Best starch, 25 lb.; terra alba, 25 lb.; talc (without mica), 25 lb.; French chalk, 25 lb.; pulverized orris, 10 lb.—4. (*Rose Face Powder.*) Rice starch, 7 lb.; rose pink, ½ dr.; otto of rose, 2 dr.; otto of santal, 2 dr.

FLY PAPER.—1. Oil the paper, and coat with turpentine varnish.—2. (*Cobalt.*) Quassia chips, 150 parts; chloride of cobalt, 10 parts; tartar emetic, 2 parts; tincture of long pepper (1 to 4 of proof spirit), 80 parts; water, 400 parts.—3. Powdered black pepper is mixed with sirup to a thick paste, which is spread by means of a broad brush upon coarse blotting paper; common brown sirup will answer; but sirup made from sugar is preferable, as it dries quicker. For use, a piece of this paper is laid upon a plate and dampened with water. The paper may also be made directly at the mill by adding sugar to the pulp and afterward ¼ to ⅓ of powdered black pepper and rapidly working it into a porous absorbent paper.—4. To 1 lb. resin add 2 fl. dr. linseed oil; while the mixture is warm, spread it on foolscap paper.—5. Make a solution of 2 parts arseniate of potassium, or arseniate of sodium; 4 parts white sugar; 40 parts water; saturate stout unsized paper in this solution; then dry. To use the paper, moisten it with water, and place in saucers.

Great care should be taken with this paper, as it is poisonous.—6. (*Free from Poison.*) Half lb. quassin wood; 1 qt. water; pour the water over the wood, and allow it to stand over night; strain and boil the liquid down to 1 pt.; boil the wood again with 1 pt. water until ½ pt. remains; mix the two infusions; add ½ lb. sugar; when the sugar has dissolved, pass the paper through the liquid; drain and dry.

FUMIGATING PASTILS.—1. (*Indian or Yellow.*) Santal wood, in powder, 1 lb.; gum benzoin, 1½ lb.; gum tolu, ¼ lb.; otto of santal, otto of cassia, otto of cloves, of each; 3 dr.; nitrate of potass., 1½ oz.; mucilage of tragacanth, q. s. to make the whole into a stiff paste. The benzoin, santal wood and tolu are to be powdered, and mixed by sifting them, adding the ottos; the niter being dissolved in the mucilage, is then added; after well beating in a mortar, the pastils are formed in shape with a pastil mold, and gradually dried.—2. Gum benzoin, powdered, 4 oz.; cascarilla, powdered, 1 oz.; niter, powdered, ½ oz.; gum tragacanth, powdered, 3 dr.; charcoal, powdered, ½ lb.; oil of nutmeg, ½ fl. dr.; oil of cloves, ½ fl. dr.; beat them to a stiff, ductile mass, with cold water, q. s.; mold it and dry the pastils by exposure to the air. The product may be varied by omitting one, or both, the essential oils; or by the addition of a little styrax (liquid or in tears), or balsam of Peru. Some persons add 1 to 2 dr. of myrrh.—3. (*For Mosquitoes.*) Charcoal, 1 lb.; saltpeter, 2 oz.; carbolic acid, 1½ oz.; Persian insect powder, 8 oz.; tragacanth mucilage, q. s.

FUMIGATING RODS.—Gum benzoin, 6 parts; balsam of tolu and powdered sandal wood, each, 4 parts; powdered tragacanth and labdanum, each, 1 part; powdered niter and gum Arabic, each, 2 parts; cinnamon, 12 parts; light charcoal (linden), 48 parts; form into smooth ductile mass by aid of heat; mold and cool.

INSECT POWDER, Constituents of.—An investigation has recently been made of Dalmatian insect powder, the object being to ascertain why some powders of commerce differ from the proprietary powders. A portion of the powder was first submitted to the ordinary process for the distillation of essential oil, and a distillate was obtained which was opaque, owing to the presence of a very small quantity of essential oil, possessing the characteristic odor of the flowers. Some bugs and ants were put along with a portion of this odorous substance under a bell glass, but after eight hours they were as lively as ever, entirely unaffected by the volatile essence. It has been shown that the essential oil of pyrethrum carneum is without influence on insect life, and the same is also true of the pyrethrum of the Caucasus. The resinous matter of the powder being extracted by means of ether, obtains 5·6 per cent of dry product, 3·8 of it being fatty matter and 1·8 resin. An alcoholic solution of the entire residue was placed on paper, the alcohol allowed to evaporate, and some insects placed on the paper. Immediately the insects showed symptoms of much agitation, and within five minutes they died. A solution of the resin alone had exactly the same effect. Alcoholic and aqueous extracts of the powder were also made, but these proved to be innocuous to insects, and it is concluded it is the ether-soluble resin which is the insect-killing constituent, and that the finer the powder is the more active it is. The following is the result of the complete analysis of the powder: Essential oil, a trace; fatty bodies, soluble in ether, 3·8 per cent; resin, soluble in ether, 1·8 per cent; brown resin, soluble in alcohol, 4·8 per cent; vegetable albumen, 1·75 per cent; gummy matter, 14·75 per cent; inulin and starch, 8·5 per cent; mineral salts, 7·88 per cent; woody matter, 56·72 per cent. The ash—7·885 per cent—consisted of potassium chloride, 1·94; calcium carbonate, 4·15; calcium phosphate, 0·17; silica and iron, 1·625. A mere trace of iron was only found. In a recent investigation it was ascertained that the active principle of pyrethrum flowers is an acid (pyrethrotoxic acid) soluble in alcohol, amylic alcohol, ether and chloroform, which may be isolated by means of ether after having been converted into an alkaline salt and decomposed by tartaric acid in aqueous solution. Apparently this is the resin above mentioned.

MOTH POWDER.—Lupulin (flour of hops), 1 dr.; Scotch snuff, 2 oz.; gum camphor, 1 oz.; black pepper, 1 oz.; cedar sawdust, 4 oz; mix thoroughly and strew, or put in papers, among the furs or woolens to be protected.

SHOW BOTTLES.—The large ornamental carboys and jars, filled with colored liquids, displayed in the shop windows of druggists, are striking objects when the solutions are bright and of a deep pure tint, especially at night, when they are seen by transmitted light. In making these, distilled water should be used, and rather more made of the color than will fill the carboys, to avoid the necessity of adding water to fill up after filtration, as this sometimes renders them turbid. The carboys should be perfectly clean and dry, or rinsed out with a portion of the filtered liquid.

Amber.—1. Deep chrome yellow, 3 oz.; pearlash, 9 oz.; water, 2 gal.; boil gently for ½ hour; take it off to cool, and add 6 oz. hydrochloric acid, and water to the desired color.—2. Dragon's blood in coarse powder, 1 part; oil of vitriol, 4 parts; digest, and when the solution is complete, dilute the mixture with distilled or soft water, q. s.

Blue.—1. Dissolve 1 oz. of vitriol in 1 qt. of water; add the same quantity of alum, and afterwards a little oil of vitriol.—2. Dissolve sulphate of indigo in water.—3. Dissolve Prussian blue in water.—4. Dissolve blue stone in water, and add spirits of hartshorn.—5. Sulphate of copper, 4 to 8 oz.; water, 1 gal.; oil of vitriol, 1 oz.—6. (*Royal Blue.*) Sulphate of copper, 8 oz.; water, 1 gal.; dissolve, and add water of ammonia till the full color is developed; then water to make up 2 gals.—7. (*Finest Royal Blue.*) Nitrate of copper, 3 oz.; water, sufficient to dissolve it; add water of ammonia as long as the color becomes deeper, then water to make up 2 gals.—8. (*Paler Blue.*) Crystallized acetate of copper, ½ oz.; hydrochloric

acid, 1½ oz.; water of ammonia, q. s.; water, to make up 2 gals.—9. (*Light Blue.*) Crystallized acetate of copper, 1 sc.; water of ammonia, 2 oz.; water, 2 gals.

Crimson.—Iodine and iodide of potassium, of each, 2 dr.; triturate with 1 dr. of water, then add 3 gals. water and 4 oz. muriatic acid.

Green.—1. Dissolve common verdigris in 3 oz. oil of vitriol, and add 2 qts. of water.—2. Add distilled vinegar and blue vitriol to a strong decoction of turmeric acid.—3. (*Emerald Green.*) Nickel, 3 oz.; muriatic acid, 4 oz.; nitrous acid, 2 oz.; digest for 24 hours; add 2 gals. water, and filter.

Lilac.—Smalts, 4 oz.; nitric acid, 4 oz.; let it stand 24 hours; add 2 gals. of water, 1 oz. of alum, and 4 oz. of water of ammonia.

Magenta.—Acetate of rosaniline, dissolved in water, q. s.

Olive.—Dissolve sulphate of iron and oil of vitriol, equal weights, in water, and add of nitrate of copper enough to strike the color.

Orange.—1. A solution of bichromate of potash in water, either with or without the addition of some hydrochloric or sulphuric acid.—2. Dissolve gamboge or annatto in liquor of potassa; dilute with water and add a little spirit.

Purple.—1. A solution of sulphate of copper, 1 oz., in water, 1 qt., or q. s., with the addition of sesquicarbonate of ammonia, 1½ oz.—2. To the last add a sufficient quantity of the first pink to turn the color.—3. To an infusion of logwood, add carbonate of ammonia or of potassa, q. s.—4. Sugar of lead, 3 oz.; powdered cochineal, 1 dr.; water, q. s. — 5. Add sulphate of indigo, nearly neutralized with chalk, to an infusion of cochineal, till it turns purple.—6. Verdigris, 2 dr.; spirits of hartshorn, 4 oz.; water, 1½ pts.—7. Sugar of lead, 1 oz.; cochineal, 1 sc.; water, to fill up.

Red.—1. Dried rose petals, 8 oz.; boiling water, 1 gal.; digest for 12 hours; strain; digest the roses with more water and strain; mix the infusions; add 1 pt. of diluted sulphuric acid, and filter.—2. Cochineal, ½ oz.; boiling water, 1 gal.; digest, and strain; add ½ oz. of sulphuric acid, and water to make up 2 gals.—3. Dissolve carmine in liquor of ammonia and dilute with water.—4. Digest powdered cochineal in a weak solution of ammonia or of sal ammoniac, and afterwards dilute with water.—5. Add oil of vitriol, 4 oz., to water, 1 gal., and digest dried red rose leaves, 8 oz., in the mixture 24 hours.—6. Dissolve madder lake in a solution of sesquicarbonate of ammonia, and dilute the solution with water.

Violet.—To a solution of nitrate of cobalt in a solution of sesquicarbonate of ammonia, add solution of ammonio-sulphate of copper, q. s., to strike the color.

Yellow.—1. A solution of scsquioxide or rust of iron, ½ lb., in hydrochloric acid, 1 qt., diluted with water.—2. To a strong decoction of French berries add a little alum.—3. Chromate or bichromate of potash with water, q. s.—4. Bichromate of potash, 2 dr.; pure water, 4 oz.; dissolve, and add 4 oz. sulphuric acid and 2 gals. water.—5. Bichromate of potash, nitrate of potash and water.

STORM-GLASS.—A thin glass tube, about 12 inches long and ¾ inch in diameter, about ⅔ filled with the following liquid, and covered with a brass ear, having an almost capillary hole through it, or else tied over with bladder. Take of camphor, 2 dr.; nitre, 1½ dr.; sal ammoniac, 1 dr.; proof spirit, 2½ fl. oz.; dissolve and place in the tube. When the liquid is clear in all but the lower portion of the tube, it denotes clear weather; when the cloudy appearance arises in the middle, a change in the weather is indicated; when the whole contents of tube become clouded with the mixture, rainy or stormy weather is betokened. Thus a simple barometer may be made for home or office use. This invention will be more reliable in action if the glass is kept in the outer air, under shelter.

Tests for Purity.

REMARKS.—No attempt is here made to give a full list, but only to briefly touch on some of the commonest difficulties met with in procuring pure articles. And the instances given relate chiefly to adulterations—not to impurities remaining from the processes of manufacture. The prominence given to oils results from their frequent high cost, which tempts adulteration.

ALCOHOL.—Alcohol burns with a flame of a bluish color, when strong; but yellowish, when weak. It is often adulterated with fusel oil; this may be detected by adding a little of the solution of nitrate of silver to the alcohol, and then exposing it to a bright light; if the oil be present, it will be converted into a black powder by the action of the oxide of silver. Official alcohol will not withstand this test, as the best contains a little oil. Four fl. oz. treated with 25 min. of a solution of 1 part of nitrate of silver in 40 of distilled water, exposed to a bright light for 24 hours, and then freed from the black powder which forms, by being passed through a filter, purified by weak nitric acid, undergo no farther change when exposed to the light with more of the test. If the oil is not all removed by the amount of test prescribed, it is deemed to be present in too large an amount to constitute a good rectified spirit.

ALMONDS, Oil of.—Equal weights of pure concentrated sulphuric acid, red fuming nitric acid and water are mixed, and the mixture allowed to cool. The test is applied by mixing 5 parts of the oil with one part of the acid liquid, when true almond oil will give a yellowish white liniment; oil of peach kernels assumes red color of peach blossoms, turning to dark orange; benne oil turns pale yellowish-red, then dirty orange-red; poppy oil and walnut oils yield a somewhat whiter liniment than almond oil. This test permits the detection of 5 per cent. of peach kernel and benne oil. Mixed with pure nitric acid (sp. gr. 1.40), pure

almond oil yields a pale yellowish liniment.

ALOES yields its active matter to cold water, and when good is almost wholly dissolved by boiling water; but the inert portion is deposited as soon as the solution cools; it is also soluble in alcohol, rectified or diluted. It is inflammable, swelling up and decrepitating when it burns, and giving out a thick smoke which has the odor of the drug.

ANISEED, Oil of.—When pure, oil of aniseed congeals into a solid crystalline mass on being cooled to 50° Fahr., and does not melt again until heated to about 63°. Treated with iodine it quickly congeals into a solid hard mass, with a perceptible increase of temperature, and the development of orange-colored and gray fumes. Sulphuric acid, with heat, turns it of a rich purple-red color, and the compound soon afterwards becomes inspissated and hard. In alcohol, .806, it is soluble in all proportions; but rectified spirit, .838, dissolves only 42 per cent. of this oil.

BALSAM OF PERU is frequently adulterated with either resin, gum, benzoin, storax, copaiba, or castor oil. The specific gravity of a pure article varies from 1.138 to 1.147, and as all the adulterants mentioned are lighter than the pure balsam, the specific gravity becomes an important indication of its purity.

BEESWAX.—The following are tests for beeswax: For water—knead the wax with well-dried copper sulphate, which will give a blue color. For mineral and starchy matters—solve in turpentine; these remain unsolved. Sulphur—by igniting, when sulphurous acid gas is given off. Resin gives to wax a terebinthinate odor, and makes it adhere to the teeth, if chewed. Paraffin makes the wax brittle, and lowers its melting point. Lard is indicated by fatty odor and touch.

BERGAMOT ESSENCE OIL.—Similar in adulteration and test to *Coriander*, which see.

BITTER ALMONDS, Oil of.—When it is pure, mixed with oil of vitriol, it strikes a clear, crimson-red color without visible decomposition; mixed with an alcoholic solution of potassa, crystals are eliminated; iodine dissolves only partially and slowly in it, without further visible results; chromate of potassa does not affect it; nitric acid causes no immediate reaction, and in the course of 3 or 4 days crystals of benzoic acid begin to appear; but if only 8 or 10 per cent. of alcohol or rectified spirit is present, a violent effervescence speedily commences, and nitrous fumes are evolved. By using nitric acid (sp. gr. 1.5) the smallest quantity of alcohol may be detected.

CAJEPUT, Oil of.—Oil of rosemary or turpentine, impregnated with camphor and colored with resin of milfoil, is sometimes employed to adulterate this. The best test is iodine, which, after a moderately energetic reaction, with little increase of temperature, and but a slight development of orange vapors, occasions immediate inspissation into a loose coagulum, which soon becomes a dry, greenish-brown, brittle mass.

CARAWAY SEED OIL is adulterated with essential oil derived from caraway chaff, and this chaff oil is first mixed with rectified spirit of turpentine; this can be detected by its insolubility in 95 per cent. alcohol.

CARBONATE OF LEAD. — This is usually adulterated with earthy or metallic sulphates. These are detected by their insolubility in diluted nitric acid. Chalk may be detected as follows: Dissolve the suspected substance in nitric acid, and precipitate the lead by hydrosulphuric acid; boil and filter the solution, in which will be contained nitrate of lime, recognizable by a test with oxalic acid.

CASTOR OIL, when pure, mixes in all proportions with alcohol and ether, and also dissolves, to a certain extent, in rectified spirit, but the portion of the oil separates on standing. Camphor and benzoic acid increase its solubility in spirit. By long exposure to the air, it becomes rancid, thick, and is ultimately transformed into a transparent yellow mass; light hastens these changes. Exposed to cold, a solid white crystalline fat separates from the liquid portion, and when cooled to 0° it congeals into a yellow transparent mass, which does not again liquefy until the temperature rises to about 18° Fahr.

CHLOROFORM.—Chloroform is liable to contain alcohol and ether, both of which lower its specific gravity. Drop into distilled water a small quantity of the chloroform. If pure, it remains transparent at the bottom of the glass; but if it contain even a small proportion of alcohol, the globules acquire a milky appearance. It is easily set on fire, and burns with a smoky flame, chlorine being among the products of its combustion. It is heavier than water, and has an acrid, penetrating odor like that of the other oil. Pure chloroform, when mixed with an equal volume of the acid, does not color it; but when contaminated with these oils gives the acid a color, varying from yellow to reddish-brown, according to the amount of impurity present. In applying this test, several fl. oz. of chloroform should be used; as a slight change of color cannot easily be seen in a test-tube.

CINNAMON OIL.—Oil of cassia and highly rectified spirit are the substances usually employed for this purpose. The increased sp. gr. resulting from the first, and the diminished sp. gr. from the second, afford ready means of detecting frauds. The presence of oil of cassia may also be detected by an experienced person by the odor, which differs a little from that of pure oil of cinnamon. Oil of cassia is less limpid than oil of cinnamon, and it stands a greater degree of cold without becoming turbid or congealing. Nitric acid converts it nearly into a uniform crystalline mass. During this reaction the odor of bitter almonds is perceptible. Both oil of cassia and oil of cinnamon are thus converted into a brown balsam; with oil of cassia, however, a brisk decomposition occurs sooner, and at a slighter heat; it also forms a crystalline compound with ammonia. These reactions, unfortunately, are not characteristic.

CITRIC ACID.—Citric acid is frequently met with adulterated with tartaric acid; the fraud is easily detected by dissolving the acid in a little cold water, and adding to the solution a small quantity of acetate of potash. If tartaric

acid be present, a white crystalline precipitate of cream of tartar will be produced on agitation. When pure, it is devoid of color, and entirely, or almost entirely, decomposed by heat. It is soluble in water and in spirit, and what is thrown down from its watery solution by acetate of lead, is dissolved by nitric acid. No salt of potassium precipitates anything with citric acid except the tartrate. When a few drops of a solution of citric acid are added to lime water, a clear liquid results, which, when heated, deposits a white powder, soluble in acids without effervescence. By the action of nitric acid, citric acid is converted into oxalic acid.

CLOVES, Oil of.—Pure oil of cloves forms a butyraceous coagulum when shaken with pure liquor of ammonia, which crystallizes after fusion by a gentle heat; treated with an alcoholic solution of potassa, it entirely congeals into a crystalline mass, with total loss of its characteristic odor.

COD-LIVER OIL.—The most reliable tests are the sensible properties of odor and taste. If there be none of the peculiar shoe-leather smell and taste, or if a strong lamp-oil odor is perceptible, the oil may be suspected. Little of importance can be inferred from the color.

COPAIBA.—The fixed oils are the most frequent addition, especially castor oil, which, in consequence of its solubility in alcohol, cannot, like the others, be detected by the agency of that fluid. The simplest test is to boil 1 dr. of the copaiba in 1 pt. of water, till the liquid is wholly evaporated. If the copaiba contain a fixed oil, the residue will be more or less soft, according to the quantity present; otherwise it will be hard. Turpentine, which is said to be sometimes added to copaiba, may be detected by its smell, especially if the copaiba be heated.

CORIANDER ESSENCE OIL is adulterated with colorless rectified oil of orange, on account of the lower cost of the latter, and may be detected by its insolubility in 95 per cent. alcohol. The pure oil dissolves in all proportions; the mixed one makes a turbid mixture.

CREOSOTE.—This is frequently adulterated with oil of tar, camphor and a substance like almond oil. These impurities are readily detected by mixing separate portions of the suspected liquid with acetic acid and caustic potash: pure creosote is completely soluble in these fluids; not so the adulterated.

CROTON OIL.—This is often adulterated with other fixed oils. When agitated with an equal volume of alcohol and gently heated, it forms a clear solution, from which about $\frac{3}{4}$ of the oil separates on cooling.

CUBEBS, Oil of.—When pure, iodine has little action on this oil, and immediately gives it a violet color, without any very marked reaction; nitric acid turns it opaque, and the mixture changes to a pale red when heated; sulphuric acid turns it to a crimson red. When adulterated with oil of turpentine, both its viscidity, solubility in rectified spirit, and its density, are lessened; when mixed with castor oil it leaves a greasy stain on paper.

GINSENG.—This is sometimes mixed with a root so closely resembling ginseng as to defy detection, unless every root is broken and carefully examined. Sometimes leaden plugs are inserted in the root to add to the weight.

GLYCERINE.—1. When treated slowly with sulphuric acid, it should not turn brown; with nitric acid and nitrate of silver, it should not become cloudy; and when rubbed between the fingers it should not emit a fatty smell.—2. To 5 drops of glycerine add 100 to 120 drops of water, 0.4 to 0.6 grain of ammonium molybdate, 1 drop pure nitric acid, and boil for $1\frac{1}{2}$ minutes. If sugar or dextrine is present it will turn deep blue.

GUAIACUM is adulterated with the resin of the pine, which may be detected by the terebinthinate odor exhaled when it is thrown upon burning coals, and by its partial solubility in hot oil of turpentine. This dissolves resin, but leaves pure guaine untouched. Amber is said to be another adulteration. If paper moistened with the tincture be exposed to the fumes of nitric acid, it speedily becomes blue.

GUM ARABIC.—Powdered gum Arabic is adulterated with flour or farina, or with Senegal or other inferior gums. The first may be detected by agitating a little of the powder with cold water; the pure gum dissolves rapidly, whilst the starch or flour falls to the bottom of the vessel. Or, a little of the powder may be mixed with boiling water, and when cold, tested with tincture of iodine; if it contains starch or flour, the paste will assume a blue color. If it contains cherry-tree gum or tragacanth, it will be only partly soluble in cold water, and the paste will be partly colored, and interspersed with gelatinous clots.

GUM TRAGACANTH.—Powdered tragacanth is adulterated with flour of starch, and with the commoner varieties of gum Arabic. This is detected by making a mucilage of the suspected gum, and adding to it a few drops of alcoholic tincture of guaiacum, stirring it all the while. If it contains gum Arabic, the mixture assumes a fine blue color; 5 per cent. of gum Arabic can be thus detected. When the quantity is very small, 1 to 4 hours may elapse before the color is developed.

JALAP is adulterated with mechoacan and other substances. It should be rejected when light, of a whitish color internally, of a dull fracture, spongy or friable.

JUNIPER, Oil of.—This is adulterated with oil of turpentine, but may be detected by the sp. gr. which is less than that of the unadulterated oil. The sp. gr. of the pure oil is .879 to .911.

LAVENDER, Oil of.—Sulphuric acid turns it reddish-brown, and the reaction is accompanied by strong inspissation. It fulminates quickly and violently with iodine, and the thick, syrupy residue possesses a pungent, acid, balsamic odor. The presence of alcohol weakens the action of this test, unless it is added in an equal volume, when only a lively effervescence and a disengagement of orange-colored vapors are produced by the iodine, without fulmination. Santaline is nearly insoluble in pure oil of lavender, and exerts no marked action on it, but is freely soluble in oil of lavender adulterated with alcohol or rectified spirit.

LEMON OIL.—This is commonly adulterated

with oil of turpentine, and occasionally with nut or poppy oil. These leave a permanent stain on paper when present. When pure, it is soluble in all proportions in absolute alcohol, but rectified spirit only dissolves 16 per cent. of it. It also boils at 148° Fahr., whereas oil of turpentine boils at 312°, and mixtures of the two at intermediate temperatures, depending on the proportions.

LINSEED OIL.—An excess of crude nitric acid mixed with a suspected oil and agitated, will indicate the presence of fish oil by the dark brown discoloration of the oil which follows. Pure linseed oil under the same treatment would be changed to a sea-green and finally greenish yellow, while the acid itself becomes yellow. Rosin oil to any extent is also indicated by adding to 1 part of the suspected oil in a small vial 3 parts of pure linseed oil. If the samples contain a rosin oil the pure linseed oil floats on the top and the line of contact is plainly visible.

MYRRH.—To test myrrh triturate a small quantity of the powder of the suspected article with an equal amount of chloride of ammonium, adding water gradually; if the whole is readily dissolved, the myrrh is genuine; otherwise it is adulterated with some inferior substance.

NEROLI, Oil of.—This is frequently adulterated with oil of bergamot and orange leaves. The pure oil of neroli is neutral to test-paper, of a density of 889, exhibits a bright violet florescence when mixed with alcohol, and assumes an intense permanent crimson hue on being shaken with a concentrated solution of bisulphite of sodium.

NITRATE OF SILVER.—Fused nitrate of silver is likely to contain free silver from having been exposed to too high a heat, the nitrates of lead and copper from the impurity of the silver dissolved in the acid, and nitrate of potassa from fraudulent admixture. Free silver will be left undissolved, as a black powder, after the action of distilled water. A very slight residue of this kind is hardly avoidable; but if there be much free silver, it will be shown by the surface of a fresh fracture of one of the sticks presenting an unusually dark gray color. In order to detect nitre, a solution of the suspected salt should be precipitated by muriatic acid in excess, and sulphuretted hydrogen, to remove the silver, and other metals if they happen to be present. The filtered solution, if the salt be pure, will entirely evaporate by heat; if it contain nitre, this will be left, easily recognizable by its properties as a nitrate.

NITRE increases the combustion of many substances in a remarkable degree. When thrown on burning coals, it deflagrates with bright scintillations. Nitre may be readily recognized by its effect in increasing the combustion of live coals, when thrown upon them; and by evolving white or reddish vapors on the addition of sulphuric acid. Its most usual impurity is common salt, which is seldom entirely absent, and which injures it for the manufacture of gunpowder. The presence of this salt or chloride of potassium will cause a precipitate with nitrate of silver. If a sulphate be present, a precipitate will be formed with chloride of barium. 100 gr. of the pure and dry salt, treated with 60 gr. of sulphuric acid, and the whole ignited until it ceases to lose weight, yield 86 gr. of sulphate of potassa. If the residue weighs less, part of it is probably sulphate of soda, and the nitre tested may be assumed to have contained nitrate of soda.

NITRIC ETHER.—Inferior articles are those diluted with water and spirits of wine. Aldehyd and acid of nitrogen are accidental impurities often present, and may be detected by the flavor, and by taking the sp. gr.; its density is .834. Acid of nitrogen may be detected by litmus, and by the effervescence produced on the addition of alkaline carbonates.

OLIVE OIL.—1. When pure olive oil is shaken in a vial, only half filled, the bead (or bubbles) rapidly disappear; but if the sample has been mixed with poppy or other oil, the bubbles continue longer before they burst. —2. Olive oil congeals at 36° Fahr., and is completely solidified when a small bottle containing it is surrounded by ice or a freezing mixture; but when mixed with poppy oil it remains partly liquid, even when the latter forms only $\frac{1}{4}$ of the mass; if more than $\frac{1}{4}$ of poppy oil is present, it does not solidify at all, unless cooled much below the freezing point of water.—3. About 1 teaspoonful of oil is put into a test-tube, and a thermometer suspended in the oil, which is now to be heated to 472° Fahr. For a comparison, a second test-tube of pure oil may be treated in the same manner. Pure olive oil, when heated, grows rather lighter in color, but most other oils, like cotton seed, peanut oil, etc., grow darker. The latter, also, evolve a penetrating and disagreeable odor, but olive oil has a pleasant smell, not unlike strawberries.

OXALIC ACID. — The crystals of oxalic acid of commerce are sometimes contaminated with nitric acid. In this state they have usually a faint odor, and stain the cork of the bottle yellow. From the general resemblance which the crystallized oxalic acid bears to Epsom salt, many fatal mistakes have occurred in consequence of its being sold for that saline purgative. Nothing, however, can be easier than to distinguish them; for, upon tasting a minute portion of the acid (which may be done with perfect safety), it will be found strongly sour, whereas the salt in question is bitter.

PEPPERMINT, Oil of. — Much of this oil is adulterated with oil of pennyroyal, and gives as a reliable test a solution of 2 parts of chloral in 1 part of sulphuric acid, to which is added 5 per cent. of alcohol. This test, mixed with suspected oil in equal proportion, gives a fine cherry color to pure oil, and a dark olive green if mixed with pennyroyal.

POTASSIUM, Iodide of.—Often largely adulterated with carbonate of potash. The impure salt may be distinguished by its wanting any regular crystalline form; by adding a few particles of it to lime water, a milky fluid is obtained, whereas the liquid remains transparent

if the iodide be pure; by its destroying the color of tincture of iodine, whereas, the pure salt does not affect it; and, lastly, by alcohol, which dissolves iodide of potassium, but not carbonate of potash.

QUINIA, Sulphate of. — Sulphate of quinia has often been adulterated. Sulphate of lime and other alkaline or earthy salts, gum, sugar, mannite, starch, stearin or margarin, caffeine, salicin, and sulphate of cinchonia, are among the substances which have been fraudulently added. By attending to the degree of solubility of the sulphate in different menstrua, and to its chemical relations with other substances already described, there can be little difficulty in detecting these adulterations. The presence of any mineral substance not readily volatilizable, may be at once ascertained by exposing the salt to a red heat, which will completely dissipate the sulphate of quinia, leaving the mineral behind. A volatile ammoniacal salt may be detected by the smell of ammonia emitted upon the addition of potassa. Gum and starch are left behind by alcohol, and fatty matters by water acidulated with sulphuric acid. Sugar and mannite cause a solution of the salt in acidulated water to have a sweet taste, after the precipitation of the quinia by an alkaline carbonate. Salicin imparts the property of becoming red upon the contact of sulphuric acid when the proportion of salicin exceeds 1-10. Caffeine alters the solubility of the medicine in different menstrua.

ROSEMARY, Oil of.—This is sometimes adulterated with oil of turpentine, which may be detected by mixing the suspected liquid with an equal volume of pure alcohol; the oil of rosemary is dissolved and that of turpentine left.

ROSES, Oil of.—This is adulterated with sandal-wood oil, other volatile oils, fixed oils, spermaceti, etc. The volatile additions may be detected by not being concrete; the fixed, by the greasy stain they leave upon paper when heated.

SAFFRON.—Water is often added to increase its weight; oil is also added for the same purpose, or to improve its appearance; sometimes the flowers of other plants are mixed with it, particularly safflower, officinal marigold, and arnica; they may be known by their shape, which is rendered obvious by throwing a portion of the suspected mass into hot water, which causes them to expand. Other adulterations are fibres of dried beef, the stamens of the crocus distinguishable by their yellow color. The flowers of a Brazilian plant have lately been used to adulterate saffron; they may be detected by shaking gently but repeatedly a large pinch of the suspected saffron over a piece of paper. The flowers of fuminella, being smaller and heavier, separate and fall, and may be seen to consist of very small fragments, with a color like that of saffron, but with a rusty tint which the latter does not possess. Sulphuric acid instantly changes the color of pure saffron to indigo blue.

SULPHURIC ETHER.—An easy method for detecting and measuring any alcohol which may be present in ether, is to agitate it, in a minim measure, with half its volume of a concentrated solution of chloride of calcium. This will remove the alcohol, and the reduction of the volume of the ether, when it rises to the surface, will indicate the amount of the former. Heavy oil of wine may be discovered by the ether becoming milky upon being mixed with water.

WINTERGREEN, Oil of.—This is adulterated with alcohol and chloroform, and also with oil of sassafras. The first two may be detected by fractional distillation. Chloroform will make itself evident on warming a sample of suspected oil. Strong nitric acid will detect oil of sassafras, turning the sample red and throwing down a dark resinous mass. In pure oil this test leaves the oil unchanged for some time, and finally deposits white crystals of methyl-nitro-salicylic acid. A second method is to distil from the sample the chloroform—generally added with the sassafras to give the correct specific gravity; add to the residue $\frac{1}{4}$ its weight of potassium hydrate solved in 4 parts of hot water, when the odor of the sassafras will be apparent.

A VERY SERIOUS CASE.

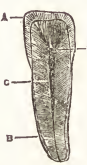
HEALTH AND DISEASE.

ANATOMY.

REMARKS.—This description of human anatomy is chiefly adapted from Professor Huxley's popular treatise on physiology. By him the body is separated into *head*, *trunk* and *limbs*; in the head, the brain-case or *skull* is distinguishable from the *face*; the trunk is divided into the chest or *thorax*, and the belly or *abdomen*; of the limbs there are two pairs—the upper, or *arms*, and the lower, or *legs*; the legs and arms again are subdivided by their joints into parts which obviously exhibit a rough correspondence; *thigh* and *upper arm*, *leg* and *fore arm*, *ankle* and *wrist*, *fingers* and *toes*; the two last, as they are similar, receive the same name of *digits*; while the several joints of the fingers and toes have the common denomination of *phalanges*.

ABDOMEN.—The *abdomen* is the belly, or that part of the body between the diaphragm and the inner surface of the pelvis. It contains, in addition to its segment of the alimentary canal and of the sympathetic system, the two *kidneys*, one placed against each side of the vertebral column, the *liver*, the *pancreas* or sweetbread, and the *spleen*.

ALIMENTATION, Organs of.—The *alimentary canal* traverses the abdomen and thorax from one end to the other, piercing the diaphragm. It is the great source of gain to the blood and the only channel by which any appreciable amount of solid matter leaves the body in an undissolved condition. It contains all the organs of mastication and digestion. The organs of alimentation are the mouth, pharynx, gullet, stomach, and intestines, with their appendages. They first receive and then grind the food. They then act upon it with chemical agents, of which they possess a store which is renewed as fast as it is wasted; and in this way separate it into a fluid containing nutritious matters in solution or suspension, and innutritious dregs or *fæces*. In the mouth are 32 *teeth*, each of which consists of a *crown* and one or more *fangs*, which are imbedded in sockets called *jaws*. A tooth is made up of 4 separate tissues, the enamel, cementum, dentine and pulp. The *enamel* is a very hard tissue which encases the crown of the tooth; it is thickest on the cutting edges and masticating surfaces, gradually becoming thinner towards the neck, at which point it is met, or slightly overlapped by the cementum. The *cementum* is a layer of hard tissue covering the roots of the teeth. It is intermediate in hardness between dentine and bone, resembling the latter more than either of the other hard tissues found in the tooth. The *dentine* constitutes the bulk of the tooth, giving each tooth its size and shape. If the enamel and cementine were removed, the dentine would still preserve the general form of the tooth. It is usually highly sensitive both to variations of temperature and to contact with foreign substances. It owes nearly all its sensitiveness to the pulp of the tooth. The *pulp*, incorrectly called the nerve, occupies a cavity in the centre of the tooth; it is a mass composed of nerves and blood-vessels, held together by a cobweb connective tissue, and supplies nourishment to the tooth. It is acutely sensitive, not only to contact with foreign substances, but to variations of temperature. When the pulp dies the tooth loses its brilliancy, the dentine loses its sensibility, and it gradually changes in color. The nerves and blood vessels which supply the pulp with nutritive material enter through a small canal in the root of the tooth; and with the exception of this small aperture, the pulp is surrounded by solid dentine. The 8 teeth on opposite sides of the same jaws are constructed upon exactly similar patterns; but the 8 which bite against each other, though similar, differ in the details of their patterns; the 2 in each 8 nearest the middle line, in front of the jaw, have wide but sharp



Structure of a Tooth.

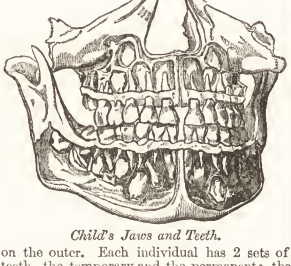
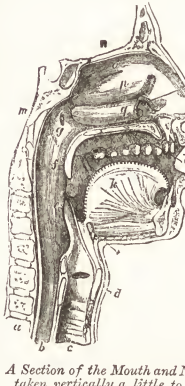
and chisel-like edges, hence called *incisors*, or cutting teeth. The tooth which comes next is a tooth with a more conical and pointed crown, called the *canine* or eye-tooth. The next 2 teeth have broader crowns, with two cusps, or points, on each crown, one on the inside and one on the outside, termed *bicuspid* teeth, and sometimes false grinders. All these teeth have usually one fang each, except the bicuspid, the fangs of which may be more or less completely divided into 2. The remaining teeth have 2 or 3 fangs each, and their crowns are much broader. As they crush and grind the matters which pass between them, they are called *molars*, or true grinders. In the upper jaw their crowns present 4 points at the 4 corners, and a diagonal ridge connecting 2 of them. In the lower jaw, the complete pattern is five-pointed, there being 2 cusps on the inner side and 3



Child's Jaws and Teeth.

on the outer. Each individual has 2 sets of teeth, the temporary and the permanent; the former being contained in the jaws at birth, and taking their proper positions within the first 3 years of childhood, the latter being at the same time developed in the jaws and appearing from 6 to 21 years. The temporary teeth are 20 and the permanent 32 in number. In the illustration the whole of the temporary teeth are seen in their proper positions, and in addition, the crowns of 4 of the permanent teeth have appeared through the gum at the back of the temporary set. The remaining permanent teeth are those embedded in the jaws and at present imperfectly developed. The teeth of the 2 jaws correspond in number and form, and the temporary teeth are as follows: In the centre of each jaw are 4 cutting or incisor teeth; on each side of these is a pointed canine or eye-tooth; and beyond these again 2 grinding or molar teeth. When solid food is taken into the mouth, it is cut and ground by the teeth, the fragments which ooze out upon the outer side of their crowns being pushed beneath them again by the muscular contractions of the cheeks and lips. The cavity of the mouth is a chamber with a fixed roof, formed by the *hard palate*, and with a movable floor, constituted by the lower jaw, and the tongue which fills up the space between the two branches of the jaw. Besides the teeth, this cavity includes the cheeks at the sides, and the lips in front. When the mouth is shut, the back of the tongue comes into close contact with the palate; and, where the hard palate ends, the communication between the mouth and the back of the throat is still further impeded by a sort of fleshy curtain, the *soft palate* or *velum*, the middle of which is produced into a prolongation, the *uvula*, while its sides, skirting the sides of the passage, or *fauces*, form



A Section of the Mouth and Nose taken vertically a little to the left of the Middle Line.

a, the vertebral column; *b*, the gullet; *c*, the windpipe; *d*, the thyroid cartilage of the larynx; *e*, the epiglottis; *f*, the uvula; *g*, the opening of the left Eustachian tube; *h*, the opening of the left lachrymal duct; *i*, the hyoid bone; *k*, the tongue; *l*, the hard palate; *m*, *n*, the base of the skull; *o*, *p*, *q*, the superior, middle, and inferior turbinal bones. The letters *g*, *f*, *i*, are placed in the pharynx.

double muscular pillars, termed the *pillars* of the fauces; between these, the *tonsils* are situated, one on each side. The velum with its uvula comes into contact below with the upper part of the back of the tongue, and with a sort of gristly, lid-like process connected with its base, the *epiglottis*. Behind the partition thus formed lies the cavity of the *pharynx*, a funnel-shaped bag with muscular walls, the upper margins of the slanting, wide end of which are attached to the base of the skull, while the lateral margins are continuous with the sides, and the lower with the floor of the mouth. The narrow end of the bag passes into the gullet or œsophagus, a muscular tube, which affords a passage into the stomach. There are 6 distinct openings into the front part of the pharynx; 4 in pairs, and two single ones in the middle line. The two pairs are, in front, the hinder openings of the nasal cavities; at the sides, close to these, the apertures of the *Eustachian* tubes. The two single apertures are, the hinder opening of the mouth between the soft palate and the epiglottis, and, behind the epiglottis, the upper aperture of the respiratory passage, or the *glottis*. The mucus membrane which lines the mouth and the pharynx is beset with minute

glands, the *buccal* glands; but the great glands from which the cavity of the mouth receives its chief secretion are the 3 pairs which are called *parotid*, *submaxillary*, *sublingual*, and which secrete the principal part of the saliva. Each parotid gland is placed just in front of the ear, and its duct passes forwards along the cheek until it opens in the interior of the mouth, opposite the 2nd upper grinding tooth. The submaxillary and sublingual glands lie between the lower jaw and the floor of the mouth, the submaxillary being situated further back than the sublingual. Their ducts open in the floor of the mouth below the tip of the tongue. The secretion of these salivary glands, mixed with that of the small glands of the mouth, constitutes the saliva, a fluid which, though thin and watery, contains a small quantity of animal matter, called *Ptyalin*. The *stomach* consists of a tube with muscular walls composed of smooth muscular fibres, and lined by an epithelium; it differs from the gullet in several circumstances. Its cavity is larger, and its left end is produced into an enlargement which, being on the heart side of the body, is called the *cardiac* dilatation. The opening of the gullet into the stomach, termed the cardiac aperture, is nearly in the middle of the whole length of the organ, which presents a long, convex, greater curvature, along its front or under edge, and a short concave, lesser curvature, on its back or upper contour. Towards its right extremity the stomach narrows, and, where it passes into the intestine, the muscular fibres are so disposed as to form a sort of sphincter around the aperture of communication. This is called the *Pylorus*. The *intestines* form one long tube, with mucous and muscular coats. Both the intestines and the stomach are enveloped in peritoneum. The intestines are divided into two portions, the small intestines and the large intestines; the latter having a much greater diameter than the former. The small intestines again are subdivided into the *duodenum*, the *jejunum*, and the *ileum*, but there is no natural line of demarcation between these. The duodenum (see *Circulation, Organs of,*) is distinguishable as that part of the small intestine which immediately succeeds the stomach, and is bent upon itself and fastened by the peritoneum against the back wall of

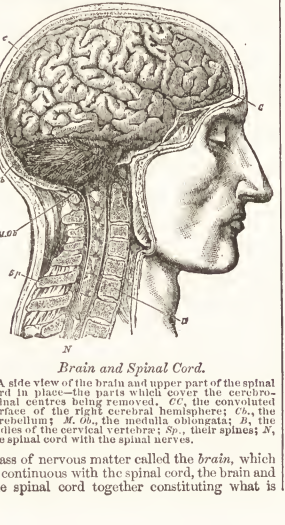
the abdomen. The ileum is no wider than the jejunum or duodenum, so that the transition from the small intestine to the large is quite sudden. The opening of the small intestine into the large is provided with prominent lips which project into the cavity of the latter, and oppose the passage of matters from it into the small intestine, while they readily allow of a passage the other way. This is the *ileo-cæcal* valve. The large intestine forms a blind dilatation beyond the ileo-cæcal valve, which is called the *cæcum*; and from this an elongated, blind process is given off, which, from its shape, is called the *vermiform appendix* of the cæcum. The cæcum lies in the lower part of the right side of the abdominal cavity. The *colon*, or first part of the large intestine, passes upwards from it as the ascending colon; then making a sudden turn at a right angle, it passes across to the left side of the body, being called the transverse colon in this part of its course; it next suddenly bends backwards along the left side of the abdomen; it then becomes the descend-

ing colon. This reaches the middle line and becomes the *rectum*, which is that part of the large intestine which opens externally. The mucous membrane of the whole intestine is provided with numerous small and simple glands which pour into it a secretion, the intestinal juice, the precise functions of which are unknown, though it appears in some creatures at least to possess the power of converting starch into sugar, and proteids into peptone. At the commencement of the duodenum are certain racemose glands, called the glands of Brunner, whose function is wholly unknown. Structures peculiar to the small intestine are the *valvulæ conniventes*, transverse folds of the mucous membrane, which increase the surface; and the *villi*, which are minute thread-like processes of the mucous membrane on the valvulæ conniventes and elsewhere, set side by side, like the pile of velvet. Each villus is coated by epithelium, and contains in its interior the radicle or commencement of a lacteal vessel, between which and the epithelium lies a capillary network with its afferent artery and efferent vein.

CEREBRO SPINAL SYSTEM. — Where the body is succeeded by the head, the uppermost of the vertebræ is followed by a continuous mass of bone, which extends through the whole length of the head, and separates a dorsal chamber from a ventral one. In the dorsal chamber which opens into the spinal canal is found a



Brain and Spinal Cord.

A side view of the brain and upper part of the spinal cord in place—the parts which cover the cerebro-spinal centres being removed. *CC*, the convoluted surface of the right cerebral hemisphere; *Cb.*, the cerebellum; *M. Ob.*, the medulla oblongata; *B*, the bodies of the cervical vertebræ; *Sp.*, their spines; *N*, the spinal cord with the spinal nerves.

mass of nervous matter called the *brain*, which is continuous with the spinal cord, the brain and the spinal cord together constituting what is termed the cerebro-spinal axis. It is a complex organ, consisting of several parts, the hindermost of which, termed the *medulla oblongata*, passes insensibly into, and in its lower part has the same structure as, the spinal cord. Above, it widens out, and the central canal, spreading with it, becomes a broad cavity. This cavity is termed the *fourth ventricle*. Overhanging the fourth ventricle is a great laminated mass, the *cerebellum*. On each side, this organ sends down several layers of transverse fibres, which sweep across the brain and meet in the middle line of its base, forming a kind of bridge in front of the medulla oblongata. The longitudinal nerve-fibres of the medulla oblongata pass forwards, among and between these layers of transverse fibres, and become visible, in front of the bridge, as two broad diverging bundles, called *crura cerebri*. Above the crura cerebri lies a mass of nervous matter raised up into 4 hemispherical elevations, called *corpora quadrigemini*. Between these and the crura cerebri is a narrow passage, which leads from the fourth ventricle into what is termed the third ventricle of the brain. The third ventricle is a narrow cavity lodged between two great masses of nervous matter, called *optic thalami*, into which the crura cerebri pass. The roof of the third ventricle is merely membranous; and a peculiar body of unknown function, the *pineal* body, is connected with it. The floor of the third ventricle is produced into a sort of funnel, which ends in another anomalous organ, the *pituitary* body. The third ventricle is closed in front by a thin layer of nervous matter; but beyond this, on each side, there is an aperture in the boundary wall of the third ventricle which leads into a large cavity. The latter occupies the centre of the cerebral hemisphere, and is called the lateral ventricle. Each hemisphere is enlarged backwards, downwards and forwards into as many lobes; and the lateral ventricle presents corresponding prolongations, or *cornua*. The floor of the lateral ventricle is formed by a mass of nervous matter, called the *corpus striatum*, into which the fibres that have traversed the optic thalamus enter. If a body be cut in half, $\frac{1}{2}$ of the body would exhibit, in the trunk, the cut faces of 33 bones, joined together by a very strong and tough substance into a long column, which lies much nearer the *dorsal* (or back) than the *ventral* (or front) aspect of the body; the bones, thus cut through, are called the *vertebræ*. The vertebræ are connected by thick plates of elastic fibro cartilage, which give to the whole column considerable play and springiness, and yet prevent any great amount of motion between the several vertebræ. This lies on the dorsal side of the vertebræ, which separates it from the spacious chamber of the chest and abdomen, which lies upon their ventral side. The spinal canal contains a long white cord, the *spinal cord*, which is an important part of the nervous system. It is a column of grayish-white soft substance, extending from the top of the spinal canal, where it is continuous with the brain, to about the second lumbar vertebra, where it tapers off into a fila-

ment; a deep fissure, the *anterior fissure*, divides it in the middle line in front, nearly down to its centre; and a similar cleft, the *posterior fissure*, extends nearly to its centre in the middle line behind; the pia matter extends into each of these fissures, and supports the vessels which supply the cord with blood; each half of the cord is divided longitudinally into three equal parts, the anterior, lateral and posterior columns, by the lines of attachment of two parallel series of delicate bundles of nervous filaments, the roots of the spinal nerves; the roots of the nerves arising along the line nearest the posterior surface, are called posterior roots; those along the anterior surface, the anterior. A certain number of anterior and posterior roots, on the same level on each side of the cord, converge and form anterior and posterior bundles; and then the two bundles, anterior and posterior, unite into the trunk of a spinal nerve; before this union, the posterior bundle presents an enlargement, the ganglion. Besides the alimentary canal, a long double series of distinct masses of nervous substance, called *ganglia*, are connected together by nervous cords, and, constituting the so-called sympathetic system, traverses the abdomen and thorax. It consists chiefly of a double chain of ganglia, lying at the sides and in front of the spinal column, and connected with one another, and with the spinal nerves by commissural cords. From these ganglia nerves are given off which for the most part follow the distribution of the vessels, but which, in the thorax and abdomen, form great networks, or *plexuses*, upon the heart and about the stomach. The sympathetic nerves influence the muscles of the vessels generally, and those of the heart, of the intestines, and of some other viscera; and it is probable that their ganglia are centres of reflex action to afferent nerves from these organs.

CIRCULATION, Organs of.—A system of minute tubes with very thin walls, termed *capillaries*, is distributed through the whole organism, except the epidermis and its products, the epithelium, the cartilages, and the substance of the teeth. On all sides these tubes pass into others, which are called arteries and veins; while these, becoming larger and larger, at length open into the heart, an organ which is placed in the thorax. During life, these tubes

and the chambers of the heart, with which they are connected, are full of liquid, which is for the most part, blood. The walls of the heart are muscular, and contract rhythmically, or at regular intervals. By means of these contractions the blood which its cavities contain is driven in jets out of these cavities into the arteries and thence into the capillaries, whence it returns by the veins back into the heart. This is the circulation of the blood. Almost all parts of the body are vascular; that is to say, they are traversed by minute and very close-set canals, which open into one another so as to constitute a small-meshed network, and confer upon these parts a spongy texture. The canals, or rather tubes, are provided with distinct but very delicate walls, composed of a structureless membrane in which at intervals small oval bodies termed *nuclei* are imbedded. These tubes are the capillaries. They vary in diameter from 1-2000th to 1-1500th of an inch, and are sometimes disposed in loops, sometimes in long, sometimes in wide, sometimes in narrow meshes; the interspaces between the capillaries are sometimes hardly wider than the diameter of a capillary, sometimes many times as wide. Capillaries are so exceedingly thin that their fluid contents readily exude through the delicate membrane of which they are composed, and irrigate the tissues in which they lie. Of the capillary tubes thus described, one kind contains, during life, *blood*, while the others are filled with a pale, watery or milky fluid, termed *lymph*, or *chyle*. The capillaries which contain blood, are continued on different sides into somewhat larger tubes, with thicker walls, which are the smallest *arteries and veins*. The walls of these vessels are thicker than those of the capillaries; the walls of the arteries and veins are thus rendered far less permeable to fluids, and that thorough irrigation of the tissues, which is effected by the capillaries, cannot be performed by them. The most important difference between these vessels and the capillaries, however, is that their walls are more complex, being composed of several coats, one, at least, of which is muscular. The number, arrangement, and even nature of these coats differ according to the size of the vessels, and are not the same in the veins as in the arteries, though the smallest veins and arteries tend to resemble each other. They are similar in structure, but the larger arteries and veins differ widely; the larger arteries have walls so thick and stout that they do not sink together when empty; and this thickness and stoutness arises from the circumstance that not only is the muscular coat

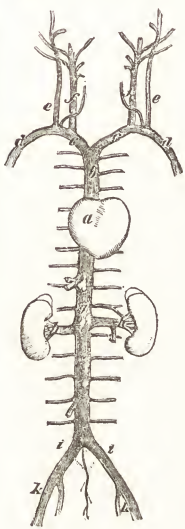
very thick, but that, in addition, and more especially, several layers of a highly elastic, strong fibrous substance become mixed up with the muscular layers. The larger veins, on the other hand, contain but little of either elastic or muscular tissue. Hence, their walls are thin, and they collapse when empty. Another great difference is the presence of what are termed *valves* in a great many of the veins, especially in those which lie in muscular parts of the body. They are absent in the largest trunks, and in the smallest branches, and in all the divisions of the portal, pulmonary, and cerebral veins. These valves are pouch-like folds of the inner wall of the vein. The bottom of the pouch is turned towards those capillaries from which the vein springs. The free edge of the pouch is directed the other way, or towards the heart. The veins of the stomach, intestines and pancreas combine into the *vena portæ*, which, having reached the liver, enters it and breaks up into capillaries, which ramify through the liver, and become connected with those into which the artery of the liver, called the *hepatic artery*, branches. From this capillary mesh-work veins arise, and unite, at length, into a single trunk, the *hepatic vein*, which emerges from the liver and opens into the inferior *vena cava*. The portal vein is the only great vein in the body which branches out and becomes continuous with the capillaries of an organ like an artery. The *heart* is an organ, the size of which is roughly estimated as equal to that of the closed fist of the person to whom it belongs, and which has a broad end turned upwards and backwards, and rather to the right side, called its *base*; and a pointed end, which is called its *apex*, turned downwards and forwards, and to the left side, so as to lie opposite the interval between the fifth and sixth ribs. It is lodged between the lungs, nearer the front than the back wall of the chest, and is inclosed in a sort of double bag, the *pericardium*. One-half of the double-bag is closely adherent to the heart itself, forming a thin coat upon its outer surface. At the base of the heart, this half of the bag passes on to the great vessels which spring from



Great Veins.

or open into that organ; and becomes continuous with the other half, which loosely envelops the heart and the adherent half of the bag. Between the two layers of the pericardium, there is a completely closed narrow cavity, lined by an epithelium, and secreting into its interior a small quantity of clear fluid. The outer layer of the pericardium is firmly connected below with the upper surface of the diaphragm. Inside, the heart contains two cavities, separated

by a fixed partition, extending from the base to the apex of the heart; these are subdivided transversely by a movable partition. The cavity above the transverse partition, on each side, is called the *auricle*; the cavity below, the

hanging with its point downwards into the ventricular cavity. On the right side there are, therefore, three of these broad, pointed membranes, whence the whole apparatus is called the *tricuspid valve*. On the left side there are but two, which bear the name of the *mitral valve*. The *thorax* is a completely shut, conical box, with the small end turned upwards, the back of the box being formed by the spinal column, the sides by the ribs, the front by the breast bone, the bottom by the diaphragm, and the top by the root of the neck. The two lungs occupy almost all the cavity, which is not taken up by the heart.

CONNECTIVE TISSUE.—The same tissue that makes up the dermis, is the great connecting medium by which the different parts of the body are held together. It passes from the dermis between all the other organs, ensheathing the muscles, coating the bones and cartilages, and eventually reaching and entering into the mucous membranes. And so completely and thoroughly does the connective tissue permeate almost all parts of the body, that if every other tissue could be dissected away, a complete model of all the organs would be left composed of this tissue. Connective tissue varies very much in character; sometimes being very soft and tender, at others, as in the tendons and ligaments, which are almost wholly composed of it, attaining great strength and density.

DIAPHRAGM.—The ventral chamber, or front aspect of the body, is divided into the two subordinate cavities of the thorax and abdomen by a remarkable, partly fleshy and partly membranous, partition, the *diaphragm*, which is concave towards the abdomen, and convex towards the thorax. From its middle, which is tendinous, muscular fibres extend downwards and outwards to the ribs, and two which are called the *pillars of the diaphragm*, to the spinal column. When these muscular fibres contract, they tend to make the diaphragm flatter, and to increase the capacity of the thorax at the expense of that of the abdomen, by pulling down the bottom of the thoracic box.

EXCRETORY ORGANS.—The fluid containing the dissolved or suspended nutritive matters which are the result of the process of digestion, traverses a very thin layer of soft and permeable tissue, which separates the cavity of the alimentary canal from the cavities of the innumerable capillary vessels which lie in the walls of that canal, and enters the blood, with which those capillaries are filled. Whirled away by the torrent of the circulation, the blood, charged with nutritive matter, enters the heart, and is thence propelled into the organs of the body. To these

organs it supplies the nutriment with which it is charged; from them it takes their waste products, and, finally, returns by the veins, loaded with useless and injurious excretions, which sooner or later take the form of water, carbonic acid, and urea. These excretory matters are separated from the blood by the *excretory organs*, the *skin*, the *lungs*, and the *kidneys*. They are constructed upon the same principle. Each consists of a very thin sheet of tissue, like so much delicate blotting-paper, the one face of which is free, or lines a cavity in communication with the exterior of the body, while the other is in contact with the blood which has to be purified. The excreted matters are strained from the blood through this delicate layer of filtering-tissue, and on to its free surface, whence they make their escape. Each of the organs is especially concerned in the elimination of one of the chief waste products (water, carbonic acid, and urea), though it may at the same time be a means of escape for the others. The lungs are especially busied in getting rid of carbonic acid, but at the same time they give off a good deal of water. They also import oxygen, which, introduced by the blood, by which it is absorbed, into all corners of the organism, seizes upon those organic molecules which are disposable, lays hold of their elements, and combines with them into the new and simpler forms, carbonic acid, water, and urea. The duty of the kidneys is to excrete urea (together with other saline matters), but at the same time they pass away a large quantity of water and a trifling amount of carbonic acid; while the skin gives off much water, some amount of carbonic acid, and a certain quantity of saline matter, among which urea is, at all events, sometimes present. The two lungs occupy all the cavity of the thorax not occupied by the heart. Each is inclosed in its serous membrane, the *pleura*, a double bag very similar to the pericardium which surrounds the heart; the inner bag closely covers the lung and the outer forms a lining to the cavity of the chest. So long as the walls of the thorax are entire, the cavity of each pleura is practically obliterated, that layer of the pleura which covers the lung being in close contact with that which lines the wall of the chest; but if a small opening be made into the pleura, the lung shrinks to a small size, and thus develops a great cavity between the two layers of the pleura. (See illustration in *Circulation, Organs of.*) The human skin consists of two portions: a superficial layer, which is constantly being shed in the form of powder or scales, composed of minute particles of horny matter, and is called the *epidermis;* and the deeper part, the *dermis*, which is dense and fibrous. The epidermis, if wounded, neither gives rise to pain nor bleeds. The dermis, under like circumstances, is very tender, and bleeds freely. The skin can be readily enough removed from all parts of the exterior, but at the margins of the apertures of the body it seems to stop, and to be replaced by a layer which is much redder, more sensitive, bleeds more readily, and which keeps itself continually moist by giving out a more or less tenacious fluid, called *mucus*. Hence, at these apertures, the skin is said to stop, and to be replaced by *mucous membrane*, which lines all those interior cavities, such as the alimentary canal, into which the apertures open. But, in truth, the skin does not really come to an end at these points, but is directly continued into the mucous membrane, which last is simply an integument of greater delicacy, but consisting fundamentally of the same two layers, a deep, fibrous layer, containing blood-vessels and nerves, and a superficial, insensible, and bloodless one, now called the *epithelium*. The dermis, and the deep, sanguine layer, which answers to it in the mucous membranes, are chiefly made up of a filamentous substance, which yields abundant *gelatine* on being boiled, and is the matter which tans when hide is being made into leather. This is called *areolar, fibrous,* or better, *connective* tissue. The skin is one of the three sets of organs charged with the office of continually excreting carbonic acid, water and urea. There are two kidneys placed at the back of the abdominal cavity, one on each side of the lumbar region of the spine. From the middle of the concave side of each kidney, a long small tube, the *ureter*, proceeds to the bladder. The latter, situated in the pelvis, is an oval bag, the walls of which contain abundant unstriped muscular fibre, while

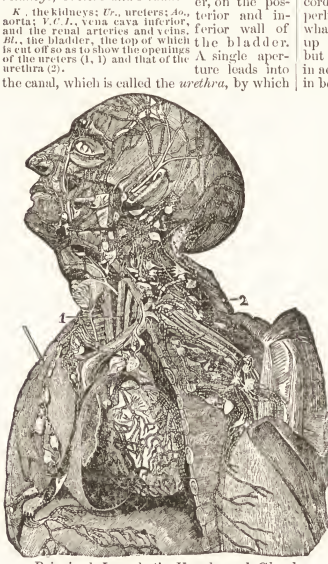
Kidneys, Ureters and Bladder.

K, the kidneys; *Ur.*, ureters; *Ao.*, aorta; *V.C.I.*, vena cava inferior, and the renal arteries and veins; *Bl.*, the bladder, the top of which is cut off so as to show the openings of the ureters (1, 1) and that of the urethra (2).

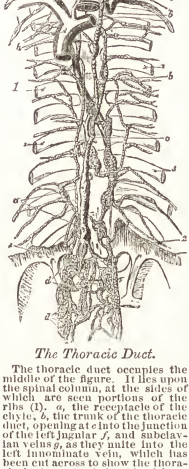
it is lined, internally, by mucous membrane, and coated externally by a layer of the peritoneum, or double bag of serous membrane, which has exactly the same relations to the cavity of the abdomen and the viscera contained in them, as the pleuræ have to the thoracic cavity and the lungs. The ureters open side by side, but at some little distance from one another, on the posterior and inferior wall of the bladder. A single aperture leads into the canal, which is called the *urethra*, by which the cavity of the bladder is placed in communication with the exterior of the body. The openings of the ureters enter the walls of the bladder obliquely, so that it is much more easy for the fluid to pass from the ureters into the bladder than for it to get the other way, from the bladder into the ureters. When a longitudinal section of a kidney is made, the upper end of the ureter seems to widen out into a basin-like cavity, which is called the *pelvis* of the kidney. Into this sundry conical elevations, called the *pyramids*, project; their summits present multitudes of minute openings, the final terminations of the *tubuli*, of which the thickness of the kidney is chiefly made up. If the tubuli be traced from their openings towards the outer surface, they are found at first to lie parallel with one another in bundles, which radiate towards the surface, and subdivide as they go; but at length they spread about irregularly and become interlaced.

LYMPHATICS AND GLANDS. — Besides the capillary network and the trunks connected with it, which constitute the blood-vascular system, all parts of the body which possess blood capillaries, except the brain and spinal cord, the eyeballs, the gristles, tendons, and perhaps the bones, also contain another set of what are termed *lymphatic* capillaries, mixed up with those of the blood-vascular system, but not directly communicating with them, and in addition, differing from the blood capillaries in being connected with larger vessels of only one kind. That is to say, they open only into trunks which carry fluid away from them, there being no large vessels which bring anything to them. In the skin, muscles and internal organs, they begin as a network of fine, hair-like tubes. These collect together, forming two trunks, which empty their contents into the large vein situated under the left collar-bone. The lymphatic trunks differ from the veins, in that they do not rapidly unite into larger and larger trunks, which present a continually increasing calibre, and allow of a flow without interruption to the heart. On the contrary, remaining nearly of the same size, they, at intervals, enter and ramify in rounded bodies called *lymphatic glands*, whence new lymphatic trunks arise. In these glands the lymphatic capillaries and passages are closely interlaced with blood capillaries. Sooner or later, however, the great majority of the smaller lymphatic trunks pour their contents into a tube, which is about as large as a crow-quill, lies in front of the backbone, and is called the *thoracic duct*. This opens at the root of the neck into the cojoined trunks of the great veins which bring back the blood from the left side of the head and the left arm. The remaining lymphatics are connected by a common canal with the corresponding vein on the right side. The liver is a dark, red colored viscus, lying on the right side of the body, immediately below the dia-



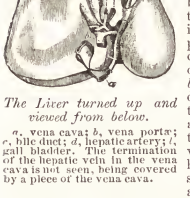
Principal Lymphatic Vessels and Glands.
1 and 2, thoracic duct, forming an arch.

phragm, while its lower surface touches the intestines and the right kidney. The liver is invested by a coat of peritoneum, which keeps it in place. It is flattened from above downwards, and convex and smooth above, where it fits into the concavity of the lower surface of the diaphragm. Flat and irregular below, it is thick behind, but ends in a thin edge in front. Viewed from below, the *inferior vena cava* is seen to traverse a notch in the hinder edge of the liver as it passes from the abdomen to the thorax. The trunk of the *vena portæ* divides into the chief branches which enter into, and ramify through, the substance of the organ. The *hepatic artery*, coming almost directly from the aorta, similarly divides, then enters the liver, and ramifies through it; the single trunk of the duct, called the *hepatic duct*, conveys away the bile brought to it by its right and left branches from the liver. Opening into the hepatic duct is the duct of a large oval sac, the *gall-bladder*. The duct is smaller than the artery, and the artery than the portal vein. The *spleen* lies upon the left side of the stomach in the abdominal cavity. It is an elongated flattened red body, abundantly supplied with blood by an artery called the *splenic artery*, which proceeds almost directly from the aorta. The blood which has traversed the spleen is collected by the *splenic vein*, and is carried by it to the *vena portæ*, and so to the liver. A section of the spleen shows a dark red spongy mass dotted over with minute whitish spots. Each of these last is the section of one of the spheroidal bodies called *corpuscles of the spleen*, which are scattered through its substance, and consist of a solid aggregation of minute bodies, traversed by a capillary network, which is fed by a small twig of the splenic artery. The dark red part of the spleen, in which these corpuscles are imbedded, is composed of fibrous and elastic tissue supporting a very spongy vascular network. The blood of the splenic vein is found to contain proportionally fewer red corpuscles, but more colorless corpuscles and more fibrin, than that in the splenic artery. All the veins of every part of the body, except the lungs, the heart itself and certain viscera of the abdomen, join together into larger veins, which, sooner or later, open into one of two great trunks termed the *superior* and the *inferior vena cava*, which debouch into the upper, or broad end of the right half of the heart. All the arteries of every part of the body, except the lungs, are more or less remote branches of one great trunk, the *aorta*, which springs from the lower division of the left half of the heart.



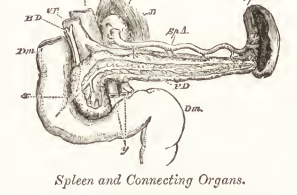
The Thoracic Duct.

The thoracic duct occupies the middle of the figure. It lies upon the spinal column, at the sides of which are seen portions of the ribs (1). *a*, the receptacle of the chyle; *b*, the trunk of the thoracic duct, opening at e into the junction of the left jugular *f*, and subclavian veins *g*, as they unite into the left innominate vein, which has been cut across to show the thoracic duct running behind it; *d*, lymphatic glands placed in the lumbar regions; *h*, the superior vena cava formed by the junction of the right and left innominate veins.



The Liver turned up and viewed from below.

a, vena cava; *b*, vena portæ; *c*, bile duct; *d*, hepatic artery; *l*, gall bladder. The termination of the hepatic vein in the vena cava is not seen, being covered by a piece of the vena cava.

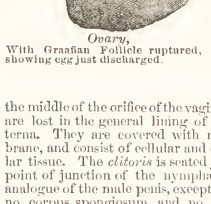


Spleen and Connecting Organs.

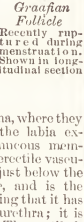
The spleen, *Spl.*, with the splenic artery, *Sp.A.* Below this is seen the splenic vein running to help form the vena portæ *V.P.* &c., the aorta; *D.*, a pillar of the diaphragm; *P.D.*, the pancreatic duct exposed by dissection in the substance of the pancreas; *Dm.*, the duodenum; *B.D.*, the biliary duct uniting with the pancreatic duct into the common duct, *x*, *y*, the intestinal vessels.

GENITALS, Female. — These are generally divided into the *external* and *internal*. The external consist of the *mons veneris*, *labia externa*, *perineum*, *clitoris*, *nymphæ*, *vestibule*, *meatus urinarius*, *hymen* in virgins, and *caruncule myrtiformes* in matrons. The internal are the *vagina*, *uterus*, and *uterine appendages*, which latter are the *broad ligaments*, *round ligaments*, *two ovaries*, and *two Fallopian tubes*. The *mons veneris* is placed at the lower part of the abdomen, and upper part of *symphysis pubis*; it consists of dense fibro-cellular and adipose tissue, and is covered, in the adult, with hair, among the roots of which are num-

erous sebaceous follicles. The *labia externa* are two folds of skin and mucous membrane, which commence in front of the symphysis pubis, and extend downwards and backwards to the perineum, where they again meet. The superior junction is called the *anterior commissure* of the vulva; the posterior is called the *posterior commissure*. Their texture is principally *cellular* and *vascular*, and their use is to protect the organs situated between them. The *perineum* extends from the lower union of the labia externa backwards towards the anus. It is capable of great distension. The *nymphæ*, *labia interna*, or *minora*, arise from nearly the same point, at the anterior commissure, and run downwards and backwards about an inch, to

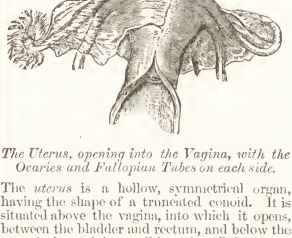


Ovary, With Graafian Follicle ruptured, showing egg just discharged.



Graafian Follicle Recently ruptured during menstruation. Shown in longitudinal section

the middle of the orifice of the vagina, where they are lost in the general lining of the labia externa. They are covered with mucous membrane, and consist of cellular and erectile vascular tissue. The *clitoris* is seated just below the point of junction of the nymphæ, and is the analogue of the male penis, excepting that it has no corpus spongiosum, and no urethra; it is erectile, and extremely sensitive. The *vestibule* is a triangular space, bounded superiorly by the clitoris, and laterally by the nymphæ, it is covered by smooth mucous membrane, and at its lower portion we find the orifice of the urethra. The *urethra* is about an inch and a half long, dilatable, and extends from before backwards and upwards, running under and behind the symphysis pubis. The *hymen* is a fold of mucous membrane, generally of a crescentic shape, with its concavity upwards, which is found just within the orifice of the vagina; it is generally ruptured at the first sexual intercourse, and its remains constitute the *carunculæ myrtiformes*. The space between the hymen and the fourchette is called the *fossa navicularis*. The *vagina* is a musculo-membranous canal, extending from its origin in the vulva obliquely through the cavity of the pelvis to the uterus, in its progress describing a curve, which is greater even than that of the sacrum and coccyx, having the neck of the bladder, the urethra, and the symphysis pubis anteriorly, and the rectum posteriorly. It is about 5 inches long, and 3 in circumference, being shorter and more capacious in those who have borne children.



The Uterus, opening into the Vagina, with the Ovaries and Fallopian Tubes on each side.

The *uterus* is a hollow, symmetrical organ, having the shape of a truncated conoid. It is situated above the vagina, into which it opens, between the bladder and rectum, and below the convolutions of the small intestine. It is flattened from before backward, and is nearly an inch in thickness. It is two inches broad at its highest part, and becomes narrower towards the vagina, terminating in a contracted portion, called the *cervix*, or neck. The *cavity* of the uterus is triangular, its base being directed upwards; in size it is about equal to a split almond, and the internal walls are nearly always in contact. Its inferior angle communicates with the vagina through the canal of the cervix, which is barrel-shaped, and from $\frac{1}{2}$ to $\frac{3}{4}$ of an inch long. The contraction at the upper extremity of the canal is called the *internal os uteri*, while that at the lower extremity is called *os uteri* or *os tincæ*. In the mucous membrane of the cervix are found the *glandulæ Nabothi*. The *broad ligaments* of the uterus are two duplicatures of peritoneum, one on either side, extending from the sides of the uterus to the ilia; they act as *stays* to the uterus, and contain the *Fallopian tubes*, which run along their upper margin, and the *ovaries*, which are inclosed in a posterior fold. The *Fallopian tubes* are two cylindrical canals, about 4 inches long, which arise from the superior angles of the uterus. They open *obliquely* into the uterus. In their unimpregnated state they are about the size of a bristle. At their terminal extremity they expand into a trumpet-shaped enlargement, called *fimbria*, or *morsus diaboli*, which applies itself to the ovary. They are looked upon as the excretory ducts of the ovaries. The *ovaries* are two in number, and are the analogues of the male testis. They are situated on the posterior face of the broad ligaments, and are attached to the uterus by a ligament of their own, called the *ligamentum ovarii*. They are oval in shape.

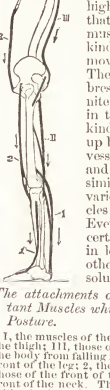
GENITALS, Male.—The male genitals are the *penis*, *prostate gland*, *seminal vesicles*, and

testicles. The *penis* is a hollow, spongy organ, through which runs the passage from the bladder called the *urethra*, by which the urine escapes, and which serves also for the exit of the *semen* (impregnating fluid). Its body consists of two distinct parts, very different in size, of which the upper and larger (in two halves) is called the *corpora cavernosa*, and the under the *corpus spongiosum*. Both parts extend from the pubes at the body to the glans situated at the end of the penis. The corpora cavernosa and corpus spongiosum are, as their names indicate, cavernous, spongy or hollow tissues. This formation has the special design of allowing great enlargement and rigidity for erection, by the blood attracted to and firmly distending the organ when congested by sexual excitement. The parts relax, contract and resume their normal size and proportions after this congestion subsides. The whole organ is surrounded with skin (excepting the end), the inner fold of which is attached to the end of the corpus cavernosum, while the outer fold is extended beyond, so that it may partly or wholly cover the glans, or, not being attached to it, can be drawn back. This loose skin is called the *foreskin* or *prepuce*, and is the part cut off in the Jewish rite of circumcision. It is a protection to the glans, but in some persons the foreskin extends so far over the glans as to make circumcision a necessity; but in most persons the glans is partly exposed. In structure the *glans penis* is an enlargement of the peculiar erectile tissue surrounding the end of the urethra; the skin covering it is very thin and sensitive, and quickly susceptible to excitement; in form it is cone-like, and on the under side the froeskin is attached nearly at the end by a cord, called the *frænum* or *bridle*. The *urethra* is the urinary canal or tube from the bladder, and perforates the corpus spongiosum. The *prostate gland* is a dense, hard structure, about the size of a horse-chestnut, which surrounds the neck of the bladder and the commencement of the urethra. It is placed between the rectum, which is behind, and the triangular ligament in front. The secretion of this gland, together with the secretion of Cowper's glands—two little glands about the size of a pea, situated in front of it—are suppose to lubricate the urethra, and also to mix with the secretion of the testicles to form the semen. The *seminal vesicles* consist of two convoluted tubes placed at the posterior and inferior portion of the bladder. They are oblong in shape, and converge downwards and forwards. Each appears to be about 2 inches in length, but, when unravelled, it is a tube 5 inches in length with numerous pouches. The *duct* of the vessel is joined by the *vas deferens* on either side in the prostate gland; the junction forms the *ductus ejaculatorius* which, passing through the prostate, opens into the urethra. They serve as receptacles for the semen, after it has been secreted by the testicles. The *testicles* (*1* next figure) are the glands for the secretion of semen. They are 2 in number, oval in shape, and flattened laterally. They hang obliquely by the spermatic cord, being attached above the middle of the posterior edge; the right being higher than the left.

1, the testicle; 2, *tunica albuginea*, the coat which covers and shapes it; 3, one of those *tubules*, which form the testicle; 4, a *tubulus seminiferus*, where it has become straight, forming the *vas rectum*; 5, the *rete testis*; or *corpus highmorianum*; 6, the *vasa efferentia*; 7, the united *coni vasculosi*, forming the commencement of the *epididymis*, or *globus major*; 8, the *epididymis*; 9, the lower part of the *epididymis*, or *globus minor*; 10, the *vas deferens*, which forms a part of the spermatic cord; 11, the *vasculum aberrans*, a small, blind, convoluted duct, connected with the *epididymis*, and pursuing a course generally parallel with the *vas deferens*.

Testicle.

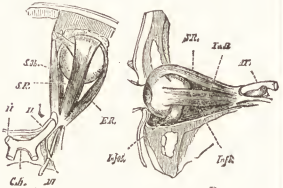
MUSCLES.—The great *intermittent sources of gain of waste products* to the blood are the muscles, every contraction of which is accompanied by a pouring of certain products into the blood. That much of this waste is carbonic acid is certain from the facts that the blood which leaves a contracting muscle is always highly venous, far more so than that which leaves a quiescent muscle. Muscles are one of the kinds of organs that produce the movements of the human body. They are accumulations of fibres, each fibre having a definite structure which is different in the *striated* and *unstriated* kinds. These fibres are bound up by fibrous tissue with blood-vessels, etc., into small bundles; and these bundles are again similarly bound up together in various ways so as to form muscles of various shapes and sizes. Every fibre has the power, under certain conditions, of shortening in length, while it increases its other dimensions, so that the absolute volume of the fibre remains unchanged. This power is called *muscular contractility*; and whenever, in virtue of this power, a muscular fibre *contracts*, it tends to bring its two ends, with whatever may be fastened to them, together. The



The attachments of some of the most important Muscles which keep the Body in the erect Posture.

I, the muscles of the calf; II, those of the back of the thigh; III, those of the spine. These tend to keep the body from falling forward. 1, the muscles of the front of the leg; 2, those of the front of the thigh; 3, those of the front of the abdomen; 4, 5, those of the front of the neck. These tend to keep the body from falling backwards. The arrows indicate the direction of action of the muscles, the foot being fixed.

muscles are imbedded in and ensheathed by the connective tissue. The different muscles of the human body are: 1. Those of the ear; namely, stapedius, which passes from the floor of the tympanum to the orbicular bone and tensor tympani, from the front wall of the drum to the malleus. — 2. Those of the eyeball; namely, four straight muscles, or *recti*, and two oblique muscles, the *obliqui*. The straight muscles are



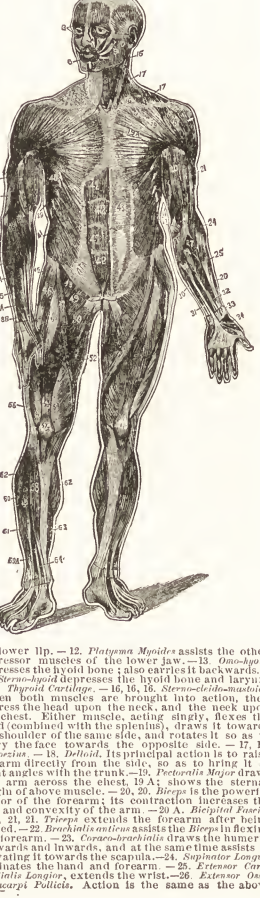
Muscles of the Eye.

A, the muscles of the right eyeball viewed from above, and B of the left eyeball viewed from the outer side. *S.R.*, the superior rectus; *Inf.R.*, the inferior rectus; *E.R.*, *In.R.*, the external rectus; *S. Ob.*, the superior oblique; *Inf.Ob.*, the inferior oblique; *Ch.*, the chiasma of the optic nerves (*II.*); *III.*, the third nerve which supplies all the muscles except the superior oblique and the external rectus.

attached to the back of the orbit, round the edges of the hole through which the optic nerve passes, and run straight forward to their insertions into the sclerotic—one, the *superior rectus*, in the middle line above; one, the *inferior*, opposite it below; and one half-way on each side, the *external* and *internal recti*. The eyeball is completely imbedded in fat behind and laterally; and these muscles turn it as on a cushion; the superior rectus inclining the axis of the eye upwards, the inferior downwards, the external outwards, the internal inwards. — 3. Those of the heart.—4. Those of the mouth.—5. Those of the vessels.—6. Those of the voice. These are found passing from one arytenoid cartilage to the other, at their posterior surfaces and are called the *posterior arytenoid*. There are also two sets connecting each arytenoid with the cricoid, called the posterior and lateral crico-arytenoid.—7. Those of motion and locomotion; these are found in the arms and limbs.

Muscles—Front View.

1. *Occipito-frontalis*. The frontal portion of this raises the eyebrows and skin over the root of the nose; at the same time throwing the integument of the forehead into transverse wrinkles, as seen in the emotions of delight and surprise. — 1 a. *Tendinous Aponeurosis* of above muscle, covering the vertex of the skull. — 2. *Temporal* raises the lower jaw against the upper jaw with great force.—3. *Orbicularis Palpebrarum* closes the eye; when acting, strongly, the integuments of the forehead, temple and cheek are drawn inwards towards the inner angle of the eye. — 4. *Levator Labii Superioris Alæque Nasi*. Its most important action is on the nose, which it dilates to a considerable extent, at the same time lifting the upper lip. It is the principal agent in the expression of contempt.—5. *Levator Labii Superioris*. It elevates the upper lip, at the same time carrying it a little outwards, as in laughing. — 6. *Orbicularis Oris*. It contracts the lips. — 7. *Zygomaticus Major*.—8. *Zygomaticus Minor*. Both these muscles have the same action as the *Levator Labii Superioris*.—9. *Masseter superficial portion*.—10. Is a deep portion of the same muscle. Action is similar to that of the *temporal* muscle. — 11. *Depressors of the lower lip*; viz., Depressor Labii Inferioris, Depressor Anguli Oris. They depress

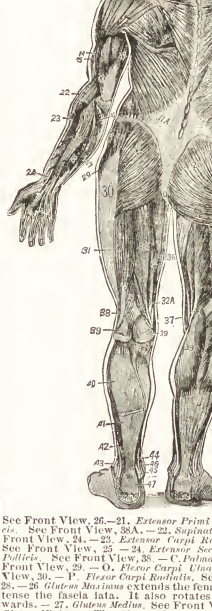


the lower lip. — 12. *Platysma Myoides* assists the other depressor muscles of the lower jaw.—13. *Omo-hyoid* depresses the hyoid bone; also carries it backwards.—14. *Sterno-hyoid* depresses the hyoid bone and larynx. —15. *Thyroid Cartilage*. — 16, 16, 16. *Sterno-cleido-mastoid*. When both muscles are brought into action, they depress the head upon the neck, and the neck upon the chest. Either muscle, acting singly, flexes the head (combined with the splenius), draws it towards the shoulder of the same side, and rotates it so as to carry the face towards the opposite side. — 17, 17. *Trapezius*. — 18. *Deltoid*. Its principal action is to raise the arm directly from the side, so as to bring it at right angles with the trunk.—19. *Pectoralis Major* draws the arm across the chest. 19 A; shows the sternal origin of above muscle. — 20, 20. *Biceps* is the powerful flexor of the forearm; its contraction increases the size and convexity of the arm. —20 A. *Bicipital Fascia*. —21, 21, 21. *Triceps* extends the forearm after being flexed.—22. *Brachialis anticus* assists the *Biceps* in flexing the forearm. —23. *Coraco-brachialis* draws the humerus forwards and inwards, and at the same time assists in elevating it towards the scapula.—24. *Supinator Longus*, supinates the hand and forearm. — 25. *Extensor Carpi Radialis Longior*, extends the wrist.—26. *Extensor Ossis Metacarpi Pollicis*. Action is the same as the above

muscle.—27. *Pronator Radii Teres*, pronates the hand and forearm.—28. *Flexor Carpi Radialis*, assists in the flexion of the wrist.—29. *Palmaris Longus*, a tensor of the palmar fascia; when this action has been fully effected, it flexes the hand upon the forearm.—29 A. *Palmar Fascia*.—30. *Flexor Carpi Ulnaris*, flexor of the wrist.—31. *Flexor Sublimis Digitorum*, flexes the fingers.—32. *Flexor Longus Pollicis* flexes the last phalanx of the thumb.—33. *Annular Ligament* extends across the wrist, binding the muscular tendons down and keeping them in position.—34. *Abductor Pollicis*, abducts the thumb from the palm.—35. *Extensor Carpi Radialis Longior*, extensor of the wrist.—35 A. *Extensor Carpi Radialis Brevior*. Action same as the above.—36. *Extensor Communis Digitorum*, extends the fingers.—37. *Extensor Carpi Ulnaris*, assists in extending the wrist.—38 A. *Extensor Primi Internodii Pollicis*.—38. *Extensor Secundi Internodii Pollicis*. Both muscles extend the thumb.—39. *Latissimus Dorsi*, (See II, Back View.)—40. *Serratus Magnus*. It is the most important external inspiratory muscle. When the shoulders are fixed, it elevates the ribs, and so dilates the cavity of the chest. This muscle, especially its middle and lower segments, draws the base and inferior angle of the scapula forwards, and so raises the point of the shoulder by causing a rotation of the bone on the side of the chest, assisting the *trapezius* muscle in supporting weights upon the shoulder.—41, 41, 41. *Obliquus Externus*.—41 A. *Abdominal Fascia*.—42, 42, 42. *Rectus Abdominis*.—43. *External Sheath of the Rectus*.—44. *Pyramidalis*.—45. *Gluteus Medius*. See Back View, 27.—46. *Tensor Vaginæ Femoris*, a tensor of the fascia lata, and also assists in the rotation of the thigh inwards.—47. *Sartorius*, flexes the leg upon the thigh, and, continuing to act, flexes the thigh upon the pelvis, at the same time drawing the limb inwards so as to cross one leg over the other.—48. *Psoas Magnus* flexes the thigh upon the pelvis, at the same time rotates the thigh outwards; also serves to maintain the erect position by supporting the spine and pelvis upon the femur, and assists in raising the trunk when the body is in the recumbent position.—49. *Pectineus*. Actions same as two following muscles.—50. *Adductor Longus*.—51. *Adductor Magnus*. The pectineus and adductors adduct the thigh powerfully; they are especially used in horse exercise, the flanks of the horse being grasped between the knees by the action of these muscles. In consequence of the obliquity of their insertion, they rotate the thigh outwards, assisting the external rotators, and when the limb has been adducted, they draw it inwards, carrying the thigh across that of the opposite side. They also assist in flexing the thigh upon the pelvis.—52. *Gracilis* assists the sartorius in flexing the leg and drawing it inwards; also an adductor of the thigh.—53. *Rectus Femoris*.—54. *Vastus Internus*.—54 A. *Vastus Externus*. The rectus and vasti have the same action, which is to extend the leg upon the thigh. Taking its fixed point from the leg, as in standing, these muscles will act upon the femur, supporting it perpendicularly upon the head of the tibia, and thus maintaining the entire weight of the body.—56. *Fascia Lata*.—57. *Patella*. See Fig. 21, No. 30.—58. *Tibialis Anticus* flexes the ankle; also raises the inner border of the foot.—59. *Extensor Longus Digitorum* extends the phalanges of the toes.—59 A. *Peroneus Tertius* assists in the flexion of the ankle.—60. *Peroneus Longus* extends the foot upon the leg; it also turns the sole of the foot outwards.—61. *Peroneus Brevis* assists in the extension of the foot.—62. *Gastrocnemius*. Front View. See Back View, 39.—63. *Soleus*. See Back View, 40.—64. *Extensor Proprius Pollicis* extends the great toe.

Muscles—Back View.

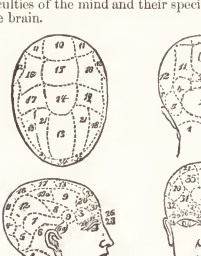
1. *Occipito-frontalis*. See Front View, 1.—2. *Temporal*. See Front View, 2.—3. *Masseter*. See Front View, 9.—4 *Sterno-cleido Mastoid*. See Front View, 16, 16.—5. *Splenius Capitis and Colli*. The splenii muscles of the two sides, acting together, draw the head directly backwards; while, acting separately, they assist (6 and 4) in drawing it to one or the other side, and slightly rotate it.—6. *Trapezius* draws the head backwards or from side to side. It also assists in supporting the head in the erect position.—7 *Ligamentum Nuchæ*. In man it is merely the rudiment of an important elastic ligament, which, in some of the lower animals, serves to sustain the weight of the head.—8. *Deltoid*. See Front View, 24.—9. *Supraspinatus*. *Infraspinatus*. The *supraspinatus* assists the deltoid in raising the arm from the side, and fixes the head of the humerus in its socket. *Infraspinatus* assists in rotating the head of the humerus outwards. When the arm is raised, they assist in retaining it in that position and carrying it backwards.—11. *Rhomboideus Major* assists in drawing the scapula backwards and upwards.—10. *Teres Major* assists the *Latissimus Dorsi* in drawing the humerus downwards and backwards when previously raised, and rotating it inwards when the arm is fixed.—11. *Latissimus Dorsi*. When it acts upon the humerus, draws it backwards and downwards, at the same time rotates it inwards. It also assists in forcible inspiration; and, when the arms are fixed, the two muscles may assist the abdominal and great pectoral muscles in drawing the whole trunk forwards, as in climbing, or walking on crutches. See Front View, 39.—11 A. *Lumbar Aponeurosis*.—12. *Obliquus Externus*. See Front View, 41, 41, 41.—E. *Bicipital Fascia*. See Front View, 20 A.—13. *Triceps*. See Front View, 21, 21, 21.—14. *Brachialis Anticus*. See Front View, 22.—15. *External Head of the Biceps*. See Front view, 20.—16. *Anconeus* assists the triceps in extending the forearm.—17. *Extensor Carpi Ulnaris*. See Front View, 37.—18. *Extensor Minimi Digiti* extends the little finger.—19. *Extensor Communis Digitorum*. See Front View, 36.—20. *Extensor Ossis Metacarpi Pollicis*.



See Front View, 26.—21. *Extensor Primi Internodii Pollicis*. See Front View, 38A.—22. *Supinator Longus*. See Front View, 24.—23. *Extensor Carpi Radialis Longior*. See Front View, 25.—24. *Extensor Secundi Internodii Pollicis*. See Front View, 38.—C. *Palmaris Longus*. See Front View, 29.—O. *Flexor Carpi Ulnaris*. See Front View, 30.—P. *Flexor Carpi Radialis*. See Front View, 28.—26 *Gluteus Maximus* extends the femur, and makes tense the fascia lata. It also rotates the thigh outwards.—27. *Gluteus Medius*. See Front View, 45.—28. *Gluteus Minimus*. The *Gluteus Maximus* and *Minimus* rotate the thigh inwards, etc. Taking their fixed point from the femur, the glutei muscles act upon the pelvis, supporting it and the whole trunk upon the head of the femur, which is especially obvious in standing on one leg.—29. *Tensor Vaginæ Femoris*. See Front

View, 46. — 30. *Fascia Lata.* See Front View, 56. — 31. *Biceps.* Actions, see below. — 32. *Semitendinosis.* Actions, see below. — 32 A. *Semitendinosis* its short head. — 33. *Adductor Magnus.* See Front View, 51. — 34. *Semimembranosus.* The biceps forms the outer hamstring; the inner one being formed by the semitendinosis, semimembranosus, gracilis, and sartorius. The hamstring muscles flex the leg upon the thigh. When the knee is semiflexed, the biceps, in consequence of its oblique direction downwards and outwards, rotates the leg slightly outwards; and the semimembranosus, in consequence of its oblique direction, rotates the leg inwards, assisting the Popliteus. Taking their fixed point from below, these muscles serve to support the pelvis upon the head of the femur, and to draw the trunk directly backwards, as in feats of strength, when the body is thrown backwards in the form of an arch. — 35. The short head of the *biceps.* — 36. *Gracilis.* See Front View, 52. — 37. *Sartorius.* See Front View, 47. — 38. *Plantaris.* 39. *Gastrocnemius.* Actions, see below. — 40. *Soleus.* The muscles of the calf possess considerable power, and are constantly called into use in standing, walking, dancing, leaping; hence the large size they usually present. In walking, these muscles draw powerfully upon the os calcis, raising the heel, and with it the entire body from the ground; the body being thus supported on the raised foot, the opposite limb can be carried forward. In standing, the soleus, taking its fixed point from below, steadies the leg upon the foot, and prevents the body from falling forward. The gastrocnemius, acting from below, serves to flex the femur upon the tibia. — 41. *Tendo-Achillis*, the thickest and strongest tendon in the body. — 42. *Peroneus Longus.* See Front View, 60. — 43. *Peroneus Brevis.* See Front View, 61. — 44. *Flexor Longus Digitorum.* Action, see below. — 45. *Flexor Longus Pollicis.* The above two muscles are direct flexors of the toes or phalanges, and, continuing their action, extend the foot upon the leg. — 46. *Tibialis Posticus* extends the ankle; it also assists in turning the sole of the foot inwards. — 47. *Os Calcis* serves to transmit the weight of the body to the ground, and forms a strong lever for the muscles of the calf, to which they are attached. — A. *Cornco-brachialis.* See Front View, 23. — D. *Coccyx.*

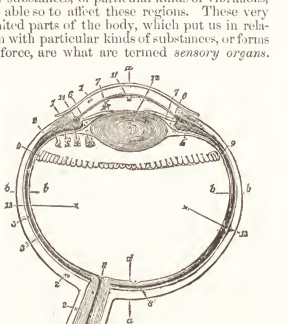
PHRENOLOGY.—Phrenology is the science of special functions of the parts of the brain, or of the supposed connection between the various faculties of the mind and their special organs in the brain.



Phrenological Divisions.

1, amativeness; 2, philoprogenitiveness; 3, concentrativeness; 3a, inhabitiveness; 4, adhesiveness; 5, combativeness; 6, destructiveness; 6a, alimentiveness; 7, secretiveness; 8, acquisitiveness; 16, conscientiousness; 17, hope; 18, wonder; 19, ideality; 19a, (not determined); 20, wit; 21, imitation; 22, individuality; 23, form; 24, size; 25, weight; 26, coloring; 27, locality; 28, number; 29, order; 30, eventuality; 31, time; 32, tune; 33, language; 34, comparison; 35, causality.

SENSORY ORGANS. — Only very few and comparatively small portions of the bodily frame-work are competent to be affected in such a manner as to cause the sensations of taste or smell, of sight or of hearing: and only a few substances, or particular kinds of vibrations, are able so to affect these regions. These very limited parts of the body, which put us in relation with particular kinds of substances, or forms of force, are what are termed *sensory organs.*

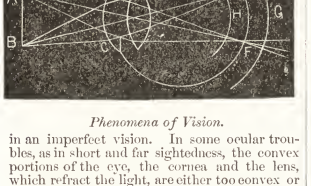


Horizontal Section of the Eyeball.

1, cornea; 1', conjunctiva; 2, sclerotic; 2', sheath of optic nerve; 3, choroid; 3'', rods and cones of the retina; 4, ciliary muscle; 4', circular portion of ciliary muscle; 5, ciliary process; 6, posterior chamber between 7, the iris and the suspensory ligament; 7', anterior chamber; 8, artery of retina in the center of the optic nerve; 8', centre of blind spot; 8'', macula lutea; 9, ora serrata (this is of course not seen in a section such as this, but is introduced to show its position); 10, space behind the suspensory ligament (canal of Petit); 12, crystalline lens; 13, vitreous humor; 14, marks the position of the ciliary ligament; *a*, optic axis (in the actual eye of which this is an exact copy, the yellow spot happened, curiously enough, not to be in the optic axis); *b*, line of equator of the eyeball.

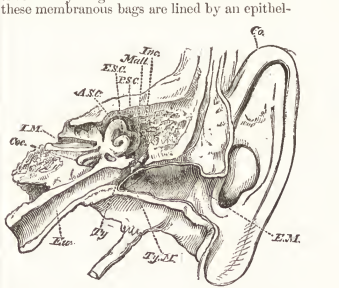
There are two such organs for sight, two for hearing, two for smell, and one, or more strictly speaking, two, for taste. The *eyeball* is composed of a tough, firm, spheroidal case, consisting of fibrous or connective tissue, called the sclerotic; in front of this is a transparent membrane called the cornea; in reality this is a part of the sclerotic. The corneo-sclerotic case of the eye is kept in shape by what are termed the *humors*, watery or semi-fluid substances, one of which, the *aqueous* humor, which is hardly more than water holding a few organic and saline substances in solution, distends the corneal chamber of the eye, while the other, the *vitreous*, which is rather a delicate jelly than a regular fluid, keeps the sclerotic chamber full. The two humors are separated by a very beautiful, transparent, doubly-convex *crystalline* lens, denser, and capable of refracting light more strongly than any of the humors. The crystalline lens is composed of fibres having a somewhat complex arrangement, and is highly elastic. In close contact with the sclerotic externally, and lined, internally, by a layer of small polygonal bodies called pigment cells, is a vascular coat called the choroid coat; the pigment cells give color to the eye. The iris is a curtain with a round hole in the middle, provided with circu-

lar and radiating unstriped muscular fibres; the edges are connected with the capsule of the eye at the junction of the cornea and sclerotic by the ciliary ligament. The phenomena of vision is explained as follows: Rays of light reflected from the points A and B are slightly refracted inwards upon entering the anterior chamber at C C, which contains the aqueous humor. Upon entering the crystalline lens D, they are still further bent, until at length these lines, meeting together at one point, form the focus E F. The highest point becomes lowest, and *vice versa*; or, in other words, the object is inverted. In the normal eye the point of meeting, or focus, of the lines is just on the retina, or inner lining of the eye. Should the posterior wall be too close to the crystalline lens, the lines would not meet; therefore the vision would be confused, as on the line H. Should the retina be at the line G, the rays having come to a focus at E F, will again diverge, and will thus result



Phenomena of Vision.

in an imperfect vision. In some ocular troubles, as in short and far sightedness, the convex portions of the eye, the cornea and the lens, which refract the light, are either too convex or not sufficiently so, and thus the image is imperfectly reproduced on the retina. When an excess of light falls on the retina, and obliquely to the point of vision, the superfluous rays are absorbed by the pigments of the choroid coat. Otherwise an excess of light again falling on the retina would again be reflected, blurring the distinctness of the vision. The *nose* is the organ of smell. It is a delicate mucous membrane which lines a part of the nasal cavities. Each nostril leads into a spacious nasal chamber, separated in the middle by the *septum*. Below, each nasal chamber is separated from the cavity of the mouth by the bony palate. The partition is continued down at the end of this palate to the root of the tongue by a fleshy curtain. The uppermost and front part of the roof of the nasal cavity between the eyes, is formed by a delicate, horizontal plate of bone, perforated like a sieve by a great many small holes, called the *cribriform* plate. This plate (with the membranous structures which line its two surfaces) separates the cavity of the nose from that which contains the brain. The olfactory lobes which are directly connected with, and form indeed a part of, the brain, enlarge at their ends, and their broad extremities rest upon the upper side of the cribriform plate; sending immense numbers of delicate filaments, the olfactory nerves, through it to the olfactory mucous membrane. On each wall of the septum this mucous membrane forms a flat expansion, but on the side walls of each nasal cavity it follows the elevations and depressions of the inner surfaces of what are called the upper and middle turbinal, or spongy bones. The interior of each of these is occupied by air cavities separated from each other by very delicate partitions only, and communicating with the nasal cavities. There is a third light, scroll-like bone, distinct from these two, and attached to the maxillary bone, which is called the *inferior* turbinal, as it lies lower than the other two, and imperfectly separates the air passages from the proper olfactory chamber. It is covered by the ordinary ciliated mucous membrane of the nasal passage, and receives no filaments from the olfactory nerve. The *ear*, or organ of the sense of hearing, is much more complex than either of the sensory organs yet described. The essential parts, on either side of the head, consist, substantially, of two peculiarly formed membranous bags, called, respectively, the *membranous labyrinth* and the *scala media of the cochlea*. Both these bags are lodged in cavities which they do not completely fill, situated in the midst of a dense and solid mass of bone called *petrosal*, which forms a part of the temporal bone, and enters into the base of the skull. Each bag is filled with a fluid, and is also supported in a fluid which fills the cavity in which it is lodged. In the interior of each bag, certain small, mobile, hard bodies are contained; the ultimate filaments of the auditory nerves are so distributed upon the walls of the bags that their terminations must be knocked by the vibrations of the small, hard bodies, should anything set them in motion. Both these membranous bags are lined by an epithel-



Transverse Section showing the Parts of Ear.

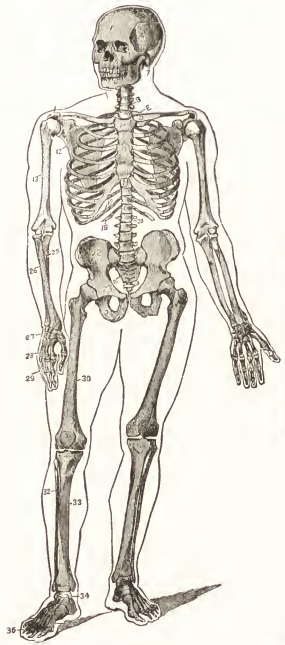
Co., concha or external ear; *E.M.*, external auditory meatus; *Ty.M.*, tympanic membrane; *Inc. Mall.*, incus and malleus; *A.S.C.*, *P.S.C.*, *E.S.C.*, anterior, posterior, and external semicircular canals; *Coc.*, cochlea; *Eu.*, Eustachian tube; *I.M.*, internal auditory meatus, through which the auditory nerve passes to the organ of hearing.

ium. The auditory nerve, after passing through the dense bone of the skull, is distributed to

certain regions of each bag, where its ultimate filaments come into peculiar connection with the epithelial lining. The membranous labyrinth is surrounded by a bony labyrinth, and the scala media is only a part of an intricate structure called the *cochlea*. The bony labyrinth and cochlea with all the parts inside each constitute together what is called the internal ear. The membranous labyrinth has the figure of an oval vestibular sac, consisting of two parts, the one called utriculus, the other *sacculus hemisphericus*. The hoop-like, semicircular canals open into the *utriculus*. They are three in number, and, two being vertical, are called the anterior and posterior vertical semicircular canals; while the third, lying outside and horizontally, is termed the external horizontal semicircular canal. One end of each of these canals is dilated into what is called an *ampulla*. The fluid which fills the cavities of the semicircular canals and utriculus is termed *endolymph*. That which separates these delicate structures from the bony chambers in which they are contained is the *perilymph*. Each of these fluids is so thin as to be little more than water. In the scala media the primitive bag is drawn out into a long tube which is coiled $2\frac{1}{2}$ times on itself into a conical spiral and lies in a much wider chamber of corresponding form, excavated in the petrous bone in such a way as to leave a central column of bony matter called the *modiolus*. The scala media has a triangular transverse section, being bounded above and below by the membranous walls which converge internally and diverge externally. At their convergence, the walls are fastened to the edge of a thin plate of bone, the *lamina spiralis*, which winds round the modiolus. At their divergence they are fixed to the wall of the bony chamber. The two passages thus formed are called scala tympani and scala vestibuli. They are filled with perilymph. In the dry skull there are two wide openings, termed *fenestræ*, or windows, on the side nearest the outside of the skull. Of these fenestræ, one, termed *ovalis* (the oval window), is situated in the wall of the vestibular cavity; the other, *rotunda* (the round window), behind and below this, is the open end of the *scala tympani* at the base of the spire of the cochlea. In the fresh state, each of these windows or fenestræ is closed by a fibrous membrane, continuous with the periosteum of the bone. The *fenestra rotunda* is closed only by membrane; but fastened to the centre of the membrane of the *fenestra ovalis*, so as to leave only a narrow margin, is an oval plate of bone, part of one of the little bones to be described shortly. The outer wall of the internal ear is far away from the exterior of the skull. Between it and the visible opening of the ear, are placed, 1st, the tympanum, and 2d, the long external passage or meatus. The tympanic membrane separates these two, being tightly stretched in an oblique across the passage. 3 small bones, the auditory ossicles, lie in the cavity of the tympanum: 1. *Stapes*, the foot-plate, is fastened to the fenestra ovalis; its hoop projects into the tympanic cavity. 2. *Malleus*, a long process fastened to the inner side of the tympanic membrane. The body of the malleus and a small process is fastened to the wall of the tympanum by ligaments. The rounded surface of the head of the malleus fits into a corresponding pit in the end of a third bone, the *incus* or anvil, which has two processes: 1, horizontal, resting upon the walls of the tympanum; the other, vertical, descends almost parallel with the long process of the malleus, and unites with the *os orbiculare*, which articulates with the stapes. The organ of the sense of taste is the mucous membrane which covers the tongue, especially its back part, and the hinder part of the palate. Like that of the skin, the deep or vascular layer of the mucous membrane of the tongue is raised up into papillæ, but these are large, separate, and have separate coats of epithelium. Towards the tip of the tongue they are for the most part elongated and pointed, and are called *filiform*; over the rest of the surface of the tongue these are mixed with other larger papillæ, with broad ends and narrow bases, called *fungiform*; but towards its root there are a number of large papillæ, arranged in the figure of a V with its point backwards, each of which is like a fungiform papilla surrounded by a wall. These are the circumvallate papillæ. The larger of these papillæ have subordinate small ones upon their surfaces. They are very vascular, and they receive nervous filaments from two sources, the one the nerve called *glossopharyngeal*, the other the *gustatory*, which is a branch of the 5th nerve. The latter chiefly supplies the front of the tongue, the former its back and the adjacent part of the palate.

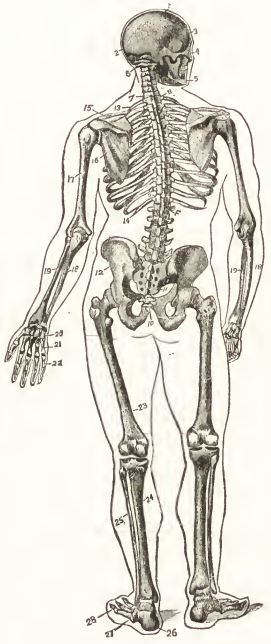
SKELETON.—The different cartilages, composed of a dense, firm substance, known as gristle, make up the skeleton of man. All the bones are fastened together by ligaments, or by cartilages; and where they play freely over one another, a coat of cartilage furnishes the surfaces which come into contact. The cartilages which thus form part of a joint are called *articular* cartilages, and their free surfaces, by which they rub against each other, are lined by a delicate *synovial* membrane, which secretes a lubricating fluid, the *synovia*. The harder tissues are the *bones*, which are masses either of cartilage, or of connective tissue, hardened by being impregnated with *phosphate* and *carbonate of lime*. They are animal tissues which have become, in a manner, naturally petrified; and when the salts of lime are extracted, as they may be, by the action of acids, a model of the bone in soft and flexible animal matter remains. More than 200 separate bones are ordinarily reckoned in the human body, though the actual number of distinct bones, varies at different periods of life, many bones which are separate in youth becoming united together in old age. From their shapes, bones are called long, short, flat, and irregular. Long bones are hollow, and filled with a fatty matter; the others solid. Place a section of bone under the microscope and there will be noticed little canals running in a longitudinal direction. These are named *Haversian* canals, and around these canals the bone is placed in layers in the

form of rings. Branching in all directions from these canals are smaller little tubes called *canaliculi*. These canaliculi end in little pouches named *lacunæ*. All these small canals and pouches are filled with a fluid which nourishes the bone.



Skeleton—Front View.

1, frontal; 2, nasal; 3, malar; 4, temporal; 5, superior maxillary, or upper jaw; 6, inferior maxillary, or lower jaw; 7, mastoid process; 8, last cervical vertebra; 9, first dorsal vertebra; 10, acromion process of the scapula, 12; 11, coracoid process of the scapula; 12, scapula; 13, humerus; 14, manubrium, or first piece of sternum; 15, sternum, or breast-bone; 16, ensiform, or third piece; 17, cartilage of sixth rib; 18, eleventh rib; 19, 12th rib; 20, first lumbar vertebra; 21, sacrum; 22, 23, 24, pelvis; 22, ilium; 23, pubes; 24, ischium; 25, ulna; 26, radius; 27, tarsal; 28, metatarsal; 29, phalanges; 37, internal cuneiform.



Skeleton—Back View.

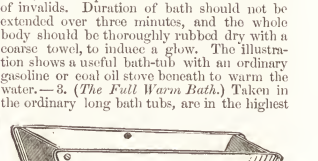
1, parietal; 2, occipital; 3, frontal; 4, malar; 5, inferior maxillary or lower jawbone; 6, atlas or first cervical vertebra; 7, vertebra prominens, or seventh cervical vertebra; 8, first dorsal vertebra; 9, twelfth dorsal, first lumbar vertebra. Of the vertebræ there are originally 33, but the twenty-fifth, twenty-sixth, twenty-seventh, twenty-eighth, and twenty-ninth early unite into one great bone, called the sacrum; the four remaining vertebræ often run into one bony mass called the coccyx; 10, coccyx; 11, sacrum; 12, twenty-four ribs bound the chest laterally, twelve on each side, and most of them are connected by cartilages with the breast-bone. In the girdle which supports the shoulder, two bones are always distinguishable as the scapula and the clavicle. The pelvis, to which the legs are attached, consists of two separate bones called the os innominatum; 13, first rib; 14, twelfth and last rib; 15, clavicle or collar-bone; 16, scapula or shoulder-bone; 17, humerus; 18, ulna; 19, radius; 20, carpal bones; these are the scaphoides, trapezium, semilunare, trapezoides, cuneiforme, magnum, pisiforme, and uneiforme; 21, metacarpal, 5; 22, phalanges, 14; 23, femur; 24, tibia; 25, fibula; 26, tarsus; these are the calcaneum, astragalus, naviculare, cuneiform, and the cuboid; 27, metatarsus, 5; 28, phalanges, 14.

HYGIENE.

REMARKS.—The following are good general rules for the preservation of health: 1. Health requires, in order that we may breathe the same air once only, proper ventilation.—2. Our dwellings and places of business should freely admit solar rays.—3. Decomposing animal and vegetable substances, the gases of which enter the lungs and corrupt and poison the blood, should be kept away from our abodes and every precaution observed to secure a pure atmosphere.—4. An equal bodily temperature should be maintained by physical exercise, by proper clothing or by fire. Physical exercise warms, invigorates and purifies the blood, clothing preserves the warmth the body generates, fire imparts warmth externally; therefore, to obtain and preserve warmth, exercise stands first, then clothing and fire.—5. Fire consumes the oxygen of the air and produces noxious gases; the air is less pure in the presence of candles, gas or coal fire than otherwise, and the deterioration should be repaired by increased ventilation.—6. As the skin imbibes moisture or throws it off, according to the state of the atmosphere and the temperature of the body, it must be repeatedly washed and kept perfectly clean.—7. As late hours and anxious pursuits exhaust the nervous system and produce disease and premature death, 8 hours should be given to rest.—8. The best health is enjoyed upon plain, simple solids and fluids, of which a sufficient but temperate quantity should be taken, and strong drinks, tobacco, snuff, opium, and all mere indulgences should be avoided.—9. Clothing in quantity and quality should be adapted to the alternations of the weather of night and day, and of the seasons, more especially by the young and old. —*Finally*, moderation in eating and drinking; the amount of time and energy spent in labor, business or study; regularity in physical exercise, enough only to keep up a good circulation of the blood; recreation and rest; cleanliness, equanimity of temper and equality of temperature, are the great essentials to that which surpasses all wealth—*health of mind and body*.

AVERAGE WEIGHTS AND MEASURES of the Human Body.—There are a few good points to be remembered, namely: That the average weight of an adult man is 140 lbs., 6 oz.; that the average weight of a skeleton is about 14 lbs.; that the number of bones is 240; that the average weight of the brain of a man is 3½ lbs.; of a woman, 2 lbs. and 11 oz.; that the brain of a man exceeds twice that of any other animal; that the average height of an Englishman is 5 ft., 9 in.; that the average number of teeth is 32; that a man breathes about 20 times in a minute, or 1,200 times in an hour; that a man breathes about 18 pts. of air in a minute, or upwards of 7 hogsheads in a day; that the average of the pulse in infancy is 120 per minute; in manhood, 80; at 60 years, 60; the pulse of females is more frequent than that of males; that the weight of the circulating blood is about 28 lbs.; that the heart beats 75 times in a minute, sends nearly 10 lbs. of blood through the veins and arteries each beat, and makes 4 beats while we breathe once; that 540 lbs., or over 1 hhd. of blood, passes through the heart in an hour; that 12,960 lbs., or 24 hhds., 4 gals., or 10,782½ pts., pass through the heart in 24 hours.

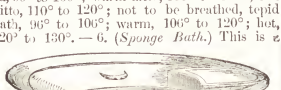
BATHING.—Nothing is of more transcendent importance to the maintenance of health than cleanliness, and this can only be obtained by the free use of water, in washing, sponging or bathing. The modes of bathing are various, and, when rightly used, are most powerful for good.—1. (*The Cold Bath.*) Taken in sea or river, temperature from 35° to 65° Fahr., this has a most powerful, exhilarating and tonic effect on the frame, and imparts a vigorous glow and stimulus to the system, when the body is not debilitated. It should not be continued longer than two or three minutes.—2. (*The Temperate Bath.*) Ranging from 65° to 80° Fahr., is much preferable to the last for the use of invalids. Duration of bath should not be extended over three minutes, and the whole body should be thoroughly rubbed dry with a coarse towel, to induce a glow. The illustration shows a useful bath-tub with an ordinary gasoline or coal oil stove beneath to warm the water.—3. (*The Full Warm Bath.*) Taken in the ordinary long bath tubs, are in the highest



Portable Bath, with Stove.

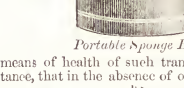
degree promotive of health and comfort. The temperature should range from 90° to 98°; better under that than over it. The benefits will be increased by the use of carbonate of soda, 4 oz. to 30 gals. water. This rids the system of much effete matter, promotes the cure of disease, and thoroughly cleanses the emunctories. After bathing, rub thoroughly dry.—4. (*The Hot Bath.*) Ranging from 98° to 112°, thoroughly stimulates the nervous system, but immersion cannot be prolonged over 2 or 3 minutes without permanent injury. Water scalds at 150°, but heated air at 260° is not painful. It is not safe to tamper with such high temperatures. The sensation in hot vapor resembles that of contact with boiling water.—5. (*Poor Man's Vapor Bath.*) Heat two or three bricks and place them under the patient's chair; sprinkle some water over the bricks, and cover the patient to keep in the steam; or, a large lump of quicklime placed in a pan or old iron pot and sprinkled with water or wrapped up in a wet coarse towel. Neither of these methods,

however, are at all comparable to the efficiency of a properly administered vapor bath, either pure or medicated, in which the temperature of the steam, etc., can be regulated as follows: Temperature of tepid vapor bath, to be breathed, 90° to 100°; warm ditto, 100° to 110°; hot ditto, 110° to 120°; not to be breathed, tepid bath, 96° to 106°; warm, 106° to 120°; hot, 120° to 130°. — 6. (*Sponge Bath.*) This is a

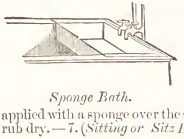


Portable Sponge Bath.

means of health of such transcendent importance, that in the absence of other bathing facilities, it should never be neglected for a single day. Only a small quantity of tepid water is used. The water should be applied with a sponge over the whole body. Then rub dry. — 7. (*Sitting or Sitz Bath.*) It should be arranged to admit of complete immersion of the lower part of the back and abdominal regions, the thighs, etc., with ample room for laving the water and kneading the parts. The cold tonic bath given in this way is excellent for diseases of the kidneys, bladder, urino-genital organs, piles, constipation, etc.—8. (*Head Bath.*) Taken by placing the patient on his back, on a mattress, with his head in a shallow basin, made with a depression in the rim to accommodate the neck, and about 3 inches of water, warm or cold, as may be desired. A most excellent cooling application for affections of the head, brain, etc.— 9. (*Douche Bath.*) Consists of a jet of water used as a stimulant in lethargic states of the system; also a remedy for swellings, sprains, stiff joints, rheumatic affections, etc. Applied directly to the parts. A jet from a hose may be used as a substitute for the douche bath in certain cases. —10. (*Wet Sheet Pack.*) A most powerful remedial agent for invalids. Immerse a cotton or linen sheet in a pail of cold water, remove the bedclothes from the mattress, and on the mattress spread a coverlet; then two or three blankets; next, wring out the wet sheet in the bucket of water and spread it over the blankets. The patient should now warm his feet, divest himself of clothing, and place himself at full length on the cold, wet sheet, with his hands placed over his breast. The sheet, blanket and coverlet should be tucked in closely all around his body by an attendant, the head elevated on pillows and covered with a wet cloth. The first sensation is that of a chill, which gives place almost immediately to a comfortable glow, gradually increasing to a sweat. Remain in the pack from 25 minutes to an hour or more. Some have been known to fall asleep in it. To receive the fullest benefit, it should be followed at once by a plunge bath, or thorough ablution in cold water, and friction by means of a coarse towel.—11. (*Spirit Vapor Bath.*) The patient divested of all clothing excepting a night shirt, seats himself on a wooden-bottomed chair, and covers well before and behind with blankets or coverlets reaching from the shoulders to the floor. Place a saucer containing a few spoonfuls of alcohol, whisky, or any spirit that will burn, on the floor under the chair and ignite. The vapor ascends, and, confined by the blankets, it will soon induce a copious perspiration from every pore of the body subject to its action. The operation is highly beneficial to the system, and may last until a free perspiration is induced. Be careful about the burning spirit.—12. (*Galvanic, Electric and Magnetic Baths.*) The first is taken by placing the patient in a wooden bath tub, filled with water impregnated with any desired drug. The negative pole of the battery is suspended in the water, and a wire connected with the positive pole, with a sponge attached, communicates with the body. The electric current from the positive pole enters the body and escapes through the pores. An electro-positive bath is given while the patient sits on a chair, insulated by placing glass under the feet. While the glass plate of the electric machine is being revolved, the patient holds the prime conductor, and his body becomes charged with positive electricity.—13. (*Acid Bath.*) Highly beneficial in liver and other complaints, and may be compounded with water acidified with vinegar, or with water, 30 gals., muriatic acid, 14 oz. Use the latter in a wooden tub or non-metallic vessel.—14. (*Shower Bath.*) This, with cold water, never fails to produce a shock which weak and nervous patients find it very hard to withstand; but to persons of strong constitution the shock is usually succeeded by a most agreeable reaction. This bath may be rendered agreeable, even to the feeble, by the use of tepid or warm water, applied in the form of a delicate spray, passed through minute perforations in a tin vessel placed overhead, and fitted with a proper apparatus for regulating the descent.— 15. (*Foot Bath.*) This is calculated to produce the most decided benefit in correcting cold feet, also to relieve heat in the head. Use warm or hot water, with the addition of mustard or cayenne pepper. In cases of swollen limbs, ulcers, rheumatic pains, etc., great relief will be obtained by extending the treatment to the legs, knees, limbs, etc., thoroughly washing and laving the parts.—16. (*Mud Bath.*) One of the most powerful remedial agents. On the principle that charcoal purifies foul water, absorbing its impurities, so mud acts on the body, opening the pores, withdrawing effete matter, cooling the skin, and curing disease.—



Sponge Bath.



Sitz Bath.

17. (*Sulphur Bath.*) Produced by allowing sulphuric acid gas to surround the patient's body, being confined there by surrounding him with a blanket or other suitable arrangement for keeping it from his face. A convenient manner of extemporizing a bath of this kind is to place sulphur on a red-hot brick surrounded by a small amount of water, over which the patient is seated, enveloped with a blanket, as recommended for a vapor bath.—18. (*Mercurial Bath.*) May be extemporized in a like manner by placing ten or twenty grains of calomel on the brick.—19. (*Ammoniacal Bath.*) It may be prepared by adding a half to an ounce of the spirits of hartshorn to the gallon of water, according to the strength required. Great caution should always be exercised in using the stronger medicated baths.—20. (*Turkish or Hot Air Bath.*) In ordinary forms of baths the accumulations on the skin are washed off. In this they are literally washed out. The bather, wrapped only in a soft sheet, reclines on a lounge in the sweating-room, where the intense perspiration induced by a dry heat, varying from 120° to 140° Fahr., is continued for a sufficient time to flush every channel of the skin, and expel from the body every particle of obstructed perspiration. The bather is subjected to a process of elaborate shampooing, a kind of kneading of the muscles of the entire body by the hands of the assistant, by which means every particle of impurity is effectually worked out of the body, which is then scraped and washed. The bather is then wrapped in a dry sheet, and conducted to an agreeable divan, where he remains for a sufficient time to recover from fatigue. In obesity, chronic rheumatism, malaria, gout, various skin diseases, and numerous chronic affections, it is a remedy of great value. Persons of deliciate physique are, however, sometimes unfavorably affected by the heroic treatment.

BEDS AND BED-CLOTHES.—A bed, whatever it be made of, should be so flexible that all parts of the body may rest upon it equally. It ought to adapt itself to the outline of the body in whatever position the body may be placed. The very hard mattress which yields nothing, and which makes the body rest on two or three points of corporeal surface, should be excluded from use. On the other hand, the bed that is so soft that the body is enveloped in it, though it may be very luxurious, is too oppressive, hot and enfeebling; it keeps up a regular fever, which cannot fail to exhaust both physical and mental energies. The best bed is one of two kinds: A fairly soft feather bed laid upon a soft horse-hair mattress; or a thin mattress laid upon one of the elastic steel-spring beds. Heavy bed-clothes are a mistake; weight in no true sense means warmth. The light down quilts or coverlets are the best to use. One of these quilts takes well the place of two blankets, and they cause much less fatigue from weight than layer upon layer of blanket covering. It should be the rule to learn so to adapt the clothing that the body is never cold and never hot while under the clothes.

BRAIN. Health of.—Do not overtax the brain. No man should do more work of muscle or of brain in a day than he can perfectly recover from the fatigue of in a good night's rest. Up to that point, exercise is good; beyond, are waste of life, exhaustion and decay. In apoplexy, a blood-vessel of the brain gives way; and the blood accumulates near its base, and pressing on the cranial nerves, on which the action of the vital organs depend, cuts off the flow of nervous force to the latter. A slighter effusion may cause only paralysis, from which the patient may recover, the wound healing and the blood being taken gradually up and carried off by the absorbents. Sometimes the serous portion of the blood escapes through the pores of the vessels sufficiently to occasion a similar result. Free-livers are especially liable to apoplexy. They keep the vessels too full and the current too strong. Distaste for work, except in one constitutionally lazy, is a sign of cerebral fatigue. Brain workers should take just enough exercise to keep up a good circulation. For food they require what can be digested easily.

CHEWING or MASTICATION.—By this act food not only becomes comminuted, but mixed with the saliva, and reduced to a form fit for swallowing. It has been justly regarded by the highest authorities as the first process of digestion, and one without which the powers of the stomach are overtasked, and often performed with difficulty. Hence the prevalence of dyspepsia and bowel complaints among persons with bad teeth, or those who bolt their food without chewing.

CLEANLINESS.—The proper healthfulness of cities and dwellings depends upon personal cleanliness, household cleanliness, and municipal cleanliness. All the legislation conceivable will be of no service in preserving the health of a city unless the first of these is observed, and it is there that the work should commence. Free baths, with whatever of compulsion is necessary to make that class of citizens use them who need them most and which class is most averse to their use, are of the first importance. Bodily cleanliness is the first step toward household neatness, for no clean family will live in a filthy house. For methods see *Bathing*. The cleansing of dwellings does not depend alone upon the use of water. Dry dirt is preferable to moist and moldy cleanliness. Scrubbing is good sanitation only when followed by thorough drying and ventilation. Dry dirt, even on a kitchen floor, is far more tolerable, hygienically, than slops and rotten beams under the floor. Moist and mildewed papers, held to sodden walls by putrid paste, will originate diseases which could have no existence in a dry atmosphere. These evils are often intensified by the addition of sewer gases escaping from defective joints. Tear off sodden paper, carry off from the roofs the rain which permeates the walls, and put down kitchen floors that are impermeable to water. To properly cleanse streets and alleys is to remove the filth, by scraping and sweeping it up and carting it away; by leaving the streets as dry as may be except from the most superficial sprinkling; by removing all the slops and garbage from the al-

leys, and using disinfectants at all offensive localities. A model street is one composed of a smooth, not slippery, hard material, impermeable to moisture, having its dust and accumulations swept or washed away at night.

CLOTHING. — The object of our clothing should be threefold: Warmth in winter, coolness in summer, and health and comfort at all times. Our clothes have no power to manufacture or impart heat. Heat is generated within our bodies, and what is termed warm clothing is that made from materials that are bad conductors of it, and which consequently retain the natural heat of our bodies; and cool clothing is made from materials that are good conductors of heat, and hence convey it away from the body or allow it to escape. Linen is a good conductor of heat, and is hence largely worn in summer and in tropical or warm climates. Cotton is not so good a conductor of heat, and hence is warmer than linen. Silk and wool are bad conductors of heat, and are hence much warmer and consequently better suited for winter clothing and for colder climates. Furs and feathers are very bad conductors of heat, and much used for wraps of various kinds. All kinds of clothing near the skin absorb more or less of insensible perspiration, and should be frequently changed. Clothing worn through the day should be laid off and a night-dress used for sleeping in. India-rubber, when worn continuously, is injurious and unhealthy, on account of interrupting and retaining the insensible perspiration. All wearing apparel of this kind should be laid off upon entering the house. All persons should wear thick or thin flannel next the skin, winter and summer; it absorbs the perspiration, and does not chill the body by coming in contact with it, as cotton and linen garments do. The feet should at all times be kept warm and dry, and the shoes and boots should be made of substantial material, and with thick soles. Clothing should be made to fit the form. We should not attempt to torture the body into some unnatural form to suit the foolish caprice of fashion. The dress of children should favor to the fullest extent the natural and unrestrained development of the body. Many poor infants are cruelly tortured, deformed, or permanently injured for life, by tight and misshaped dresses. The practice of dressing infants in long clothes, is objectionable, when continued too long or beyond severe weather, for, besides being injurious to health, it cramps the action of the limbs, and by so doing prevents their proper development.

COLDS.—Sudden warming when cold is dangerous, as well as the reverse. There is ordinarily little, if any, danger to be apprehended from wet clothes, so long as exercise is kept up, for the "glow" about compensates for the extra cooling by evaporation. Nor is a complete drenching more likely to be injurious than wetting of one part. But never sit still wet, and in changing, rub the body dry. When overheated or drenched with perspiration, put on a warm garment before resting still. Except in localities where malignant miasmata prevail, and that only in warm weather, persons who are out of doors the most take and feel cold least.

COMPLEXION. — Arsenic is a very common ingredient of compounds used for improving the complexion. Not one of them that has been analyzed is fit to rub on the human skin. All complexion fluids are poisonous, and are taken into the system by absorption through the skin. Brisk rubbing, opening the pores of the skin and inducing healthy action, will produce far better effects than any cosmetics.

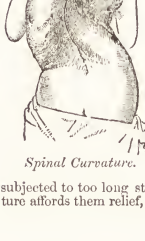
CONTAGION, To Prevent. — Among diseases liable to be spread by the distribution of organic poisons, may be mentioned scarlet fever, typhus fever, typhoid fever, yellow fever, measles, small-pox, diphtheria, infectious ophthalmia, hydrophobia, erysipelas, cholera and glanders. The walls of hospitals should be glass-lined, the better to prevent contamination, and means should be used to destroy the contagious matter by chemical agents. Solar light and great heat, are other powerful disinfectants. (See *Disinfectants.*) Thoroughly disinfect all fecal discharges, and, if in the country, they should be taken at least 200 feet from any well. Under no circumstances should they be disposed of in an open out-house. In the city, in case the drainage is good, it is safe to use the sewer. Contagion is largely propagated by means of clothing. This should be placed in a box or a closet maintained at a temperature of 220°, dry, for perhaps an hour. Carbolic acid will not permanently destroy the effect of vaccine virus. People are far more liable to contract diseases on an empty than on a full stomach.

DIGESTION.—All of the strength of body and mind, of power to move, to work, to think, comes from proper food well digested. A few hours of effort use up certain elements in the muscles, nerves and brain, which can only be replaced by digested food. Tonics and stimulants may temporarily help the dormant or weak digestive organs, enabling them to digest food, but they do not add to the stock of strength. The food in the stomach is moistened and largely liquified by a fluid supplied from the blood, coming through myriads of little openings on the inner coating of the stomach. If there is much food to be worked up, there must be a great flow of blood to supply this digesting fluid, the gastric juice. The blood is then drawn away from other parts of the body. After a heavy meal one feels dull, sluggish, because there is less general circulation of the blood. If violent or strong exertion of body or mind is made soon after eating, it draws the blood from the stomach, and digestion of the food is retarded. If there is more food than the stomach can readily supply gastric juice for, some of it will be imperfectly worked over, and will go into the system in that condition. It will disturb the brain and other organs. It will affect and intensify any local trouble or disease. If one has weak or diseased lungs, this imperfectly digested food will irritate and intensify the trouble. To be well digested by the gastric juice, the food must first be mixed with a good supply of saliva, by thorough chewing. Eat slowly, and keep every portion of food to be swallowed some time in the mouth, to get a full supply of saliva.

DIPHTHERIA, To Guard against. — Procure from a drug store 1 lb. of sulphate of zinc. Put into an ordinary water pail 8 tablespoonfuls with ½ of common salt, and to this add 1 gal. of boiling water. This disinfecting solution is to be kept in the room, and into it should be placed and kept for one hour every article of soiled clothing, bedding, handkerchiefs, etc. When they are removed from this, they should be put into boiling water before being washed. The dishes and spoons used by the patient should be put into boiling water before they are permitted to leave the room. The remarks under *Contagion* are also appropriate here.

DISINFECTANTS.—The following are some of the principal disinfectants: 1. For privies, use sulphate of iron dissolved in water in the proportion of 1½ lbs. to the gallon; or the same amount of chloride of lime, thoroughly mixed in water.—2. For clothing and bed linen, use sulphate of zinc and common salt; or boil in a solution of permanganate of potassa, 1 oz. to 3 gals. of water; if the articles cannot be boiled, expose them, in a dry room, to a dry heat from 200° to 250° Fahr. Linen is stained by permangante of potassa, but the discoloration may be removed by sulphate of iron.—3. For occupied rooms, use a spray of Ledoyen's solution of nitrate of lead, or solid chloride of lime in shallow vessels, and ventilate the room well; or a tablespoonful of turpentine in a pail of water, is a powerful destroyer of germs and bad odors.—4. For water-closets, bed-pans, etc., use Labarraque's solution of chlorinated soda, 1 fl. oz. to 1 qt. of water.—5. For drinking water, add, after filtration, enough permanganate of potassa to render it just perceptibly pink in a strong light.—6. For dirt piles, cover with charcoal or dry earth, 2 or 3 inches deep.—7. For drains, ditches, and sewers, use sulphate of iron, coal tar, chloride of lime, etc.

DISTORTIONS.—Spinal curvature arises from a weakened state of the muscles, ligaments, and bones of the backbone. It is most frequently met with in those whose occupation compels them to stand the greater part of the day; as well as in persons who pass many hours at the desk or at needle work. Spinal curvature is also common in young fragile girls acting as nursemaids, and as such unduly subjected to carrying heavy infants on one side. Amongst the children of the poor, those of tender years are much too frequently put to this objectionable form of drudgery. Those subjected to too long standing, because the posture affords them relief, uneonseiously contract the habit of standing on the right leg, and at the same time of bending the left knee a little. One-sided postures cause distortion because the intervertebral substance is compressible to such an extent that an adult man of middle stature loses about an inch of his height after having been in the erect posture during the day, and does not regain it until after some hours of rest. Round shoulders are caused often by incessant desk labor and indolence both as to an erect posture and inflating the chest. By means of corsets, tight stays, and other implements of torture the ribs are pressed inwards to such an extent that all the conditions essential to health are imperilled, and eventually become overthrown. This mischievous and unnatural pressure exerted on the stomach pushes that organ out of its proper position, and in doing so forces the diaphragm also out of its place; a disturbance which so curtails the space in which the movements of the heart and lungs are performed, that if the pernicious custom be persevered in, these latter organs become seriously and ineurably diseased. The liver also shares in the damage inflicted, and frequently becomes incapable of discharging its office. Organic disease of the heart is by no means an uncommon contingency if tight lacing be persevered in; for that organ is not allowed room to beat, nor the blood to circulate. One effect of this is seen in frequent fainting fits. Again, tight lacing not unfrequently stops the growth and arrests the development of a young girl's breasts, thus seriously incapacitating her



Spinal Curvature.

from suckling her babe when she becomes a mother. Amongst the minor evils wrought by the baleful custom, indigestion, with its accompaniments of flatulence, heartburn, pain in the chest, etc., is the worst. Constipation, bad breath and a red nose are also its attendant ills. Another variety of distortion is that brought about by wearing tight boots and shoes, or those constructed upon false principles; for, a boot or shoe may be productive of considerable inconvenience to the wearer, as well as cause a certain amount of twisting out of place of the bones of the foot, without being too small.

Fig. 1. Natural Position of Bones of the Foot.

Amongst the consequences arising from the adoption of tightly fitting or badly constructed boots or shoes may be mentioned the following: Considerable bodily discomfort, and pain in walking; corns and bunions; growing in of the nails; chronic enlargement of the base of the great toe; caries or ulcerations of the bones of the feet; and flat feet. Fig. 1 represents the skeleton of the foot with the bones which form it in their natural position, and in which they are admirably adapted for executing the various movements required of them. Fig. 2 gives the inner and side view of the foot. It is an arch resting in front on the anterior heads of the five metatarsal bones, *a*, but chiefly on that of the great toe, and on the *calcaneum* or heel, *b*, behind. The astragalus, *c*, forms the keystone of the arch. This arch, which supports the superincumbent weight of the body, retains its curved form by means of strong ligaments or bands, which unite the bones which compose it into a compact, but withal flexible mass. The arch, owing to the pressure thrown upon it from above, becomes flattened when the foot is resting upon the ground; but when this pressure is removed and the foot hangs free, the curvature of the arch increases.

Fig. 2. Side View of a Good Foot.

Fig. 3. Unnatural Position of the Foot.

In front of the metatarsal bones are placed the toes, which are connected with the metatarsal bones by joints. The great toe has one joint; each of the smaller ones has two. Fig. 3 depicts the skeleton of a foot with the bones thrown out of their natural position. The great toe ought to have such a position that the line of its axis, when carried backwards, will emerge at the centre of the heel; this is its position in the healthy foot. The sole of an almost sound foot is given in Fig. 4, and the true position of the great toe is indicated by the dotted line. In a bad foot this line would not touch the great toe at all, but clear it entirely. The smaller toes, however, are by no means without their uses. In standing they rest on the ground and give lateral support to the foot; while in the act of walking they are bent in a peculiar manner, so that they are firmly pressed against the ground; and here, too, they support the foot laterally. The first joint is strongly bent upwards, while the second is hollow above. As boots and shoes are at present constructed, the foot is made to adapt itself to the sole, not the sole to the foot. This pernicious system must be abandoned. A sole is of the proper construction when a line (Fig. 5, *c*, *d*,) drawn at half the breadth of the great toe, distant from, and parallel to, the inner margin of that toe shall, when carried backwards, pass through the center of the heel. In the usual form of a sole this line passes out of the inner margin of the heel. (Fig. 6.) If it be thought desirable to have pointed shoes, the pointing must be effected from the outer side as in the annexed Fig. 7. In a pair of shoes made on these principles, placed side by side with the heels in contact, the inner margins of the front part of the foot are brought close together. (Fig. 8.) The heel-piece ought to be as low and broad as possible. High and small heels are quite unsuitable. Bow legs are caused chiefly by lack of nourishment of the bones. An improvement in the character of the food is necessary. (See *Food, Entire Wheat Flour as*; also WOMEN AND CHILDREN.) Bow legs may also be caused by encouraging children to stand on their feet too early.

DRAINAGE.—Every house should have a suitable drain for the removal of its liquid wastes. If the house can be brought into connection with a public sewer, it is all right; but in those cases where there is no public outlet, the question of the disposal of liquid wastes becomes extremely serious. For effective drainage, only sufficient inclination of the surface is required to secure a flow in the drains and 1 foot in 100

will be fall enough to accomplish this, especially where the flush-tank system is used. This is as follows: Let the tight drain deliver into a tightly cemented small cistern, say 4x4 ft., discharging through a bent overflow pipe of which the inlet is 12 in. below the point at which it leaves the wall of the cistern, near its top. (Fig. 1.) This will secure room for the deposit of solid matters at the bottom and for the floating of scum at the top. If necessary to clean out the solid accumulation at the bottom, it is always worth the

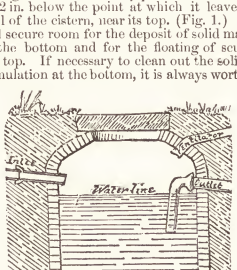

Fig. 1.—Flush Tank.

cost of removal as manure. The outlet should be not more than 12 in. below the surface of the ground, and should be continued through open-jointed land-drain tiles 2 in. in diameter, laid on a foundation of narrow boards or of inverted horse-shoe tiles, also open jointed, and nowhere more than about 12 in. below the surface. This drain may be continuous, or it may be the main for any number of longer or shorter branches. The whole system may act as a means for conveying the foul liquid to all parts of an area, and delivering it at a point within the reach of the roots of plants. When a single long line is not sufficient, lay the lateral drains about four feet apart. If the necessary other means are adopted to prevent the ingress of foul air into houses, then it is very well to use immediately under the outlets of wash-basins, sinks, etc., some form of water-seal trap, which shall be to a certain extent, a barrier against bad smells generated immediately within the waste pipe; but, as a main dependence, these traps are a delusion and a snare. The usual form given to them is shown in the figures 2, 3 and 4. Figure 4 represents the common bell trap so often used over the outlet pipe of the kitchen sink, etc. Its movable part is very easily taken off, and is very apt to be left off, and even when it is in place it offers very slight resistance to the pressure of foul air. The great objections to all water-seal traps are: 1. That the resistance they offer to the pressure of sewer gas is so slight that a trifling change in the temperature of a sewer or cesspool, the sudden filling of the sewer with water, or even the influence of a strong wind blowing against its outlet, will suffice to open them.—2. Water is a very imperfect disinfecting barrier. When water is once itself infected, what is to prevent its giving forth infection? Safety is to be sought, not through a shutting out of the foul gases formed in the sewer and drain, but in the prevention of this formation by the free admission and circulation of air.

DRINK.—Water enters more largely into the composition of our bodies than all other substances combined. Apart from its immediate invigorating influence, it favors the rapid transformation of tissues, and in this manner facilitates the elimination of deleterious substances from the system. A copious draught of water at retiring will sometimes entirely break up a recent cold. A tumbler of fresh water drunk regularly upon rising in the morning will often do more towards overcoming chronic constipation than medicine. In warm weather drink moderately of cold water. Chocolate, from its large proportion of albumen, is a nutritive beverage, but at the same time, from its quantity of fat, the most difficult to digest. Its aromatic substances, however, strengthen the digestion. A cup of chocolate is an excellent restorative, and invigorating even for weak persons, provided their digestive organs are not too delicate. Tea and coffee do not afford this advantage. Albumen in tea leaves, and legumin in coffee berries, are represented in very scanty proportions. Buttermilk nearer satisfies all the conditions of a cheap and wholesome summer drink than anything known at present. It is agreeable to all palates, thirst-subduing and wholesome. Lemonade is one of the best and safest drinks for any person, whether in health or not. It is suitable to all stomach diseases and excellent in sickness. Alcoholic liquors should be avoided. They are heating as well as stimulating; their use tends to excess and sure reaction. (See *Milk.*)

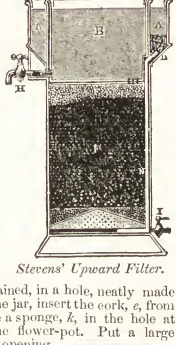
EAR.—Ear troubles begin early. The child is inclined to put small things into it, such as beans, coffee-kernels, pebbles, etc. These irritate and inflame the ear, and may become sources of most serious mischief. Older persons are hardly wiser who pick the ears with the head of a pin. Only the softest material and the gentlest pressure should be used in cleaning the ear. If the ticking of a watch can be heard at the distance of twenty-eight inches, the hearing is good. Each ear should be tested separately. Noises in the head, sometimes ringing, frequently are due to hardening of the wax in the ear. Sudden deafness is sometimes caused by a small mass of

wax, from ill-health or uncleanliness, becoming hard. A continued secretion of wax then blocks up the ear tube still more. A match-end, a pin-head, or a penholder, instead of removing, pushes down the wax and packs it against the tympanum; loss of hearing ensues because the membrane can no longer vibrate. The removal of wax is in some cases, especially those of longer standing, somewhat difficult; but with gentle treatment and patience may be finally accomplished, and the hearing fully restored. The best means for removing wax is by means of water, quite warm, with or without syringe. Never give a child a "box on the ears," for not only is deafness caused, but the inflammation of the internal cavity, which is so frequent a result, may be followed by disease of the bone, giving rise to abscess of the brain, and having a fatal termination.

EXERCISE.—Exercise invigorates the brain, expands the lungs, quickens the circulation, and braces the nerves. All exercise should, as far as possible, be in the open air. It facilitates the full and thorough oxygenation of the blood, the development of the muscles and the nervous system, and promotes sound digestion. Children especially should have the benefit of out-door exercises in all seasons, except in inclement weather; and, when confined within-doors, should have all the benefits of thorough ventilation. Many of the diseases of women are attributable to too close confinement to household drudgery and neglect of proper out-door exercise. Every person should take a daily walk in the open air. Horseback riding calls into activity and develops many of the muscles. Gardening is one of the most healthful exercises; the use of the various tools employed brings into play every muscle in the body; and with the ennobling pleasure to the mind it affords, it imparts a vigor and freshness to the entire system. Of all modes of exercise of children, that of jumping the rope is the most dangerous. It produces continuous concussions of the joints which impinge upon the bone often causing periostitis, and finally resulting in the death of the bone. Children should be encouraged in all their games to take exercise, but rope-jumping should be forbidden.

EYES.—Have sufficient light; never sit facing it; let it come from behind or from one side; have a moderate light, so that surrounding objects may not be too strongly illuminated; a black shade may sometimes be worn with advantage, so large that front and side light may not enter the eyes. With this protection the light may be safely in front; if reading, it is better that it be to one side. Never read in horse or steam cars; never read when lying down; do not read much during convalescence from illness. But while, on the one hand, the eyes should never be strained, or worked to the verge of fatigue, on the other, exercise is just as beneficial to them as to any other part of the body. The habit should be cultivated of studying small objects carefully, keenness of sight depending so much upon the mental attention one is in the habit of paying to visual impressions. Excesses of every kind tend to the injury of the eyesight, and so in a very great degree does the want of good and proper spectacles. In choosing glasses or spectacles the eyes should look through the centres of the lenses; the spectacles with which the print can be seen most distinctly, and, at the same time, with the greatest ease to the eyes, are the proper glasses to be used without regard to strength or number.

FILTRATION.—(See same in APPARATUS, MANIPULATIONS, ETC., in CHEMIST AND DRUGGIST.) Water often needs purification before it is fit to drink. The combined water cooler and filter here shown answers the purpose of rendering water drinkable. The water, before filtration, passes from chamber A, through sponge-box D, and is conveyed to the bottom of the filter, through influent pipe N, and upward through filtering material F, E, into clear water chamber B, from whence it is drawn as required, through faucet H. The filter contains a double bottom, creating a chamber for the deposit of sediment. By reversing the current of water, sediment is removed through faucet I. A good serviceable, cheap filter can be made as follows: Procure a wooden box, *a*, 3 ft. high and 1 ft. square, open on one side, with a shelf, *m*; on this shelf place a common stone jar, *c*, and let a flower-pot, *d*, rest in the mouth of the jar. If a jar or tank with a faucet fitted cannot be obtained, in a hole, neatly made in the bottom of the jar, insert the cork, *e*, from beneath, and place a sponge, *k*, in the hole at the bottom of the flower-pot. Put a large sponge, *f*, over the opening in the jar, and a piece of thin muslin, *g*, over this sponge; then put into the jar, first a layer of 3 or 4 qts. of clean white or river sand, *h*, then the same quantity of pulverized charcoal, *i*, and above that 1 qt. of small pebble stones, *j*. The pitcher, *b*, stands below the shelf, *m*. The filter should be kept constantly at work. During the greater part of the year it should be placed near the hydrant, or pump, so that the waste water may flow off. The flower-pot, *d*, whose sponge prevents coarse materials passing into the jar, should be cleaned once or



Stevens' Upward Filter.

Home-made Filter.

twice a week; but the jar requires attention not more than once or twice a year. Care must be taken to have the hole into which the cork, *e*, is fitted, close to the bottom of the jar, so that when the filter is not at work, no water will remain to become impure.

FOOD. Digestibility of.—

ARTICLE OF FOOD.	Condition.	Hours Required.
Rice	Boiled	1 00
Eggs, whipped	Raw	1 30

Food should pass into the stomach in a finely divided state. The rapidity with which the digestion is performed depends upon various circumstances. Strong emotion, as anger or grief, will retard it; moderate exercise hastens it, and thus the state both of body and mind influence it. A usual meal is generally digested in a healthy person in from 3 to 5 hours. A mixture of food is not especially objectionable, except as by variety it encourages the appetite, and often leads us to consume more than is needful. Animal food is digested more quickly than vegetable, and solid food more speedily than soups. Oily food is more quickly appropriated by the system than muscular fibre, when agreeing with the stomach. Uncooked oil is more digestible than cooked. Cream and butter are the purest of oils. Boiled meats are most digestible, roasted next, broiled and fried the least so. Bulk is necessary to digestion. The people of cold climates who live much on fats, mix crude matters, sometimes even sawdust, with them, and thus find them more readily digested. Milk is among the most nutritious and digestible of foods. With the same exercise, we need richer food in cold weather than in warm. Never eat between meals, unless extra exertion or exposure require it, and then select hearty and quickly digestible food. The stools from vegetable food are more copious than from meats, because vegetable is less nutritious than animal food, and more of it is therefore rejected. As a rule, ripe fruits or vegetables are more digestible than green, and green fruit stewed more digestible than when eaten in a raw state. Smoked meats are less digestible than fresh, and of smoked or salted meats, the inner portion is more easily digested than the outer part. Dried fruits, as prunes, raisins, apples, etc., are unfit to eat unless well cooked, and all unbroken seeds are indigestible. Alcoholic stimuli, or condiments of any kind, are not necessary in healthy conditions of the stomach.

FOOD, Entire Wheat Flour as.—The bread in common use is 40 per cent. deficient in sustaining qualities. Children fed on white bread are very liable to suffer from rickety bones, consumption and bad teeth, because their food does not nourish them properly. The systems of milling pursued fail to conserve the best food constituents of wheat. White flours are impoverished by being whitened through so much sifting and bolting; and coarse flours, known as Graham, are more or less injured, imperfectly prepared, and so mingled with waste matters as to do serious injury to delicate stomachs and intestines. The true food flour must contain all that the choicest wheat contains of food substance, and must be freed from the outer irritating particles. The grains or kernels of different varieties of wheat vary from each other slightly in form, but are in general irregularly oblong oval, having a deep groove extending from end to end on one side, and at the smaller end of the berry is a brush of vegetable hairs (Fig. 1). At the other end, on the opposite side of the berry, under an irregularly-

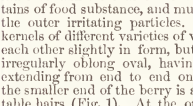

Fig. 1.

curved surface-layer of bran, technically called the *shield*, is the *embryo* or *germ* (Fig. 2). Pass a knife through the berry, midway between the two ends and perpendicularly to the axis, and there will be presented a section, which, under the microscope, will show an exterior envelope of several layers; an interior envelope, consisting of cells and their contents of gluten and phosphates, constituting the most nutritious portion of

Fig. 2.

the berry; and a mass of white, consisting of loose, cellular tissue supporting a vast body of starch granules, with clusters of cells of albuminoid matter extending to the heart of the berry (Fig. 3). Moisten the grains with water, and

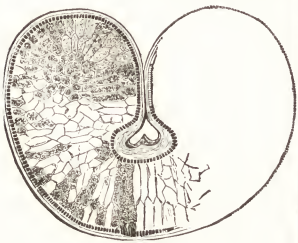

Fig. 3.

rub them between the folds of a rough cloth, and thus detach the outer covering, composed of two layers, constituting about 3.5 per cent. by weight of the plump unbranned berry (Fig. 4). To these layers are attached the vegetable hairs or beard and the shield covering the embryo.

Fig. 4.

The berry, thus hulled, treat with a solution of alum, and then with weak acetic acid; open it with a sharp knife along the curved surface on the side opposite the groove; digest with warm water and subject to gentle pressure; the starch and imbedded albuminoid bodies may thus be wholly separated, leaving a layer of cells containing gluten and phosphates, constituting a

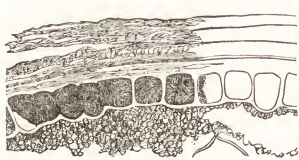

Fig. 5.

Transverse Section of a Scale of Millers' Bran, Magnified to 150 Diameters, part being left in outline only.

part of the inner bran coat. These inner bran coats then free from the gluten by maceration and gentle pressure. They consist of a honeycomb framework of cellular tissue from which the cells of gluten and phosphates have been removed, and the outside layers of envelope not separated with the rough cloth. Ordinarily, millers' bran includes all these coats, and also carries with them the layer of gluten sacs in addition, and traces of adhering white flour (Fig. 5). Fig. 6 gives in one illustration a complete and comprehensive idea of the structure of a grain of wheat, and the relative positions of the various parts comprising it.

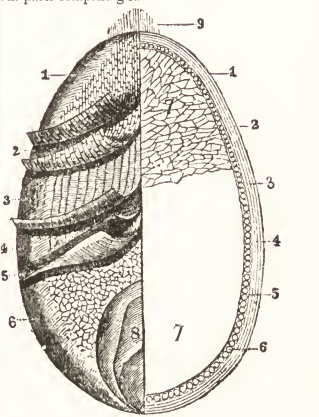

Fig. 6.

1. The *epicarp*, or outer coat of longitudinal cells.—2. The *mesocarp*, or inner coat of longitudinal cells.—3. The *endocarp*, or coat of transfer cells—the cigar coat.—4. *Episperm*, testa, outer seed coat, or color coat.—5. *Tegmen*, inner seed coat, or gluten comb coat, consisting of a layer of obliterated cells.—6. Layer of gluten sacs, or *perisperm*.—7. Interior mass of white, consisting of irregular cells containing starch and albuminoid bodies,—the *endosperm*.—8. *Embryo*, or *germ*.—9. Vegetable *hairs* or *beard*. 1, 2, 3 and 9 constitute the outer husk and fibrous beard. 4, 5, 6 and 8 constitute that portion of the wheat wherein resides nearly all the mineral elements existing in wheat. 7 represents the starch cells, and constitutes nearly seven-tenths of the entire berry.

It will be understood from the above why white flour is the only impoverished food on the diet list. To those who seek a flour possessing the requisites here shown, the "Entire Wheat Flour" of the Franklin Mills, of Appleton, Wis., is recommended.

FOOD, Nutritive Power of. — Physiologists have divided food into two classes: 1. Those containing elements for repairs of the tissue.—2. Those that produce heat. The first class are called nitrogenous, being made up of the elements carbon, nitrogen, hydrogen and oxygen; the second class contains only carbon, hydrogen and oxygen, and are called the non-

nitrogenous. Both of these are present in the animal and vegetable kingdoms. Besides these, phosphates and other salts are present, and assist principally in the maintenance of brain and nervous tissue. Water has no active properties, but only by its presence moistens the tissues, reduces solids to liquids, so that they may be easily carried from one part to another; it also regulates the temperature of the body. The following is a table of the most important articles of diet, in their natural state, showing their comparative usefulness as flesh-repairing or heat-giving (for their digestibility, see *Digestion*):

ARTICLES.	Materials for Muscles.	Heaters or Carbonates.	Fuel for the Nervous System.	Water.	Waste
Wheat	14.6	66.4	1.6	14.0	3.4
Barley	12.8	52.1	4.2	14.0	16.9
Oats	17.0	50.8	3.0	13.6	16.9
Northern corn	13.3	67.5	1.1	14.0	5.1
Southern corn	34.6	39.2	4.1	14.0	8.1
Buckwheat	8.6	53.0	1.8	14.2	22.4
Rye	6.5	75.2	0.5	13.5	4.3
Beans	24.0	40.0	3.5	14.8	17.7
Peas	23.4	41.0	2.5	14.1	19.0
Lentils	26.0	39.0	1.5	14.0	19.5
Rice	5.1	82.0	0.5	9.0	3.4
Potatoes	1.4	15.8	0.9	74.8	7.1
Sweet potatoes	1.5	21.8	2.9	67.5	6.3
Parsnips	2.1	14.5	1.0	79.4	3.0
Turnips	1.2	4.0	0.5	90.4	3.9
Carrots	1.1	12.2	1.0	82.5	3.2
Cabbage	1.2	6.2	0.8	91.3	0.5
Cauliflower	3.6	4.6	1.0	90.0	0.8
Cucumbers	0.1	1.7	0.5	97.1	0.6
Milk of cow	5.0	8.0	1.0	86.0	
Human milk	3.0	7.0	0.5	89.5	
Veal	17.7	14.3	2.3	65.7	
Beef	19.0	14.0	2.0	65.0	
Lamb	19.6	14.3	2.2	63.9	
Mutton	21.0	14.0	2.0	63.0	
Pork	17.5	16.0	2.2	64.3	
Chicken	21.6	1.9	2.8	73.7	
Codfish	16.5	1.0	2.5	80.0	
Trout	16.9	0.8	4.3	78.0	
Smelt	17.0	very little	3 or 6	75.0	
Salmon	20.0	some fat	6 or 7	74.0	
Eels	17.0	some fat	3 or 4	75.0	
Herring	18.0	some fat	4 or 5	75.0	
Halibut	18.0	some fat	3 or 5	74.0	
Oysters	12.6		0.2	87.2	
Clam	12.0	very little	2 or 3		
Lobster	14.0	very little	5 or 7	79.0	
Eggs, white of	13.0		2.8	84.2	
Eggs, yolk of	16.9	29.8	2.0	51.3	
Butter		100.0			
Artichoke	1.9	19.0	1.8	76.6	0.7
Asparagus	0.6	5.4	0.4	93.6	
Bacon	8.4	62.5	0.5	28.6	
Carp	18.0	0.8	2.9	78.3	
Cheese	30.8	28.0	4.7	36.5	
Cherries	0.6	21.0	1.0	76.3	1.1
Chocolate	8.8	88.0	1.8		1.4
Cream	3.5	4.5		92.0	
Currants	0.9	6.8	0.3	81.3	10.7
Dates, fresh		73.7		24.0	2.3
Figs	5.0	57.9	3.4	18.7	15.0
Ham	35.0	32.0	4.4	28.0	
Horseradish	0.1	4.8	1.0	78.2	16.0
Kidney	21.2	0.9	1.4	76.5	
Lard		100.0			
Liver	26.3	3.9	1.2	68.6	
Onions	0.5	5.2	0.2	93.8	
Pearl Barley	0.7	78.0	0.2	9.5	7.6
Pears	0.1	9.6		86.4	3.9
Pigeon	23.0	1.9	2.7	72.4	
Prunes	3.9	75.6	4.5	13.0	
Radishes	1.2	7.4	1.0	89.1	1.3
Suet		100.0			
Venison	20.4	8.0	2.8	68.8	
Vermicelli	47.5	38.0	1.7	12.8	
Whey		4.6	0.7	94.7	

It is easy to see, from the above table, that many of the articles of diet contain an excess of heat-producing elements, and *vice versa*. From these facts it will be plain that a mixed diet is the best.

HEADS. Jaded. — These are caused by overwork and want of exercise. Man has it in every rank of life; but it is chiefly found among persons of sedentary pursuits and among both sexes and almost all ages above fourteen. Generally the first symptom of the malady is discomfort during headwork in the back of the head and in the upper part of the spinal region. Meet this symptom with rest, and seek in sunlight and fresh air some fresh investment for the nervous system, and drop every habit that does not do you positive good. Alcohol and all sleep-producing drugs are dangerous in the highest degree; for they mask the malady, without curing.

HEATED BODY, To Cool. — During very hot weather, keep cool. Just before retiring take a cool bath, after which don the night dress without drying the body, and lie down. The result is much like that produced by sprinkling water on the floor in the evening. The water absorbs the heat, and as it evaporates throws the heat off with it, leaving the body dry and cool. If the bath is not convenient, sprinkle the bed with water. If both can be done, it is better. Avoid heating food. Do not increase the physical temperature, by alcoholic beverages. Sleep regularly; resist the temptation to sit up late because the evening is cool.

HEREDITY. — The great Froebel's motto was: "Let us live for our children." In health of body, as well as of morals and mind, every parent should recognize this as a solemn duty. Alcoholism bequeathes epilepsy and kindred disorders, and these in turn hand down a new apetite for drink. Mothers and fathers should reform, for the sake of their children, who will not reform after them. If the parents are intemperate, their posterity will die either in the insane asylum, of convulsions, of consumption, of intemperance, with St. Vitus' dance, or by suicide. Parents owe it to their children to bequeath to them healthy bodies and minds, and this can only be done by themselves from the first observing the laws of health.

HOMESTEAD, To Keep Healthy. — A healthy house makes healthy people. It should be dry, warm, airy, and free from smoky chimneys. To be dry it must be well drained and should be free from dense, overshading foliage. Do not scour the floors too often, for fear of dampness. It is not necessary to sleep in a cold room to get fresh air. The cold air of the external atmosphere should be made to enter the room in such a manner that it is thoroughly warmed. (See *Ventilation.*) Let plenty of light into the room. Throw open the blinds and draw aside the curtains. Pale cheeks, touched by sunlight, will acquire a deeper hue. Look well to the cellars. In too many cellars will be found rotten apples, cabbages, turnips, onions, etc. In some will be found old brine, with pieces of decayed meat, sending forth an odor, when the cover of the barrel is taken off, which is vile enough to wrench the stomach of a pig. In others there will be musty cider-barrels, possibly vinegar-casks, in which the vinegar has passed on to the putrefactive stage, disseminating the spores of decay and death. Decaying wood generates

one of the most subtle poisons, because the odor is not particularly offensive. Rotten timbers in the cellars and moldy wood or chips in the wood-house fill the air with spores, which, inhaled by one whose blood is low, may generate disease. Under the cider and vinegar barrels, and around potato bins, may often be found old timbers and boards that are full of dry rot, ready to propagate itself wherever the rotten particles may find a lodgment. In the well, also, rotten wood is a subtle poison, more dangerous than a decomposing toad, as the latter makes his presence known, while few tastes are so keen as to detect the presence of decaying wood. Probably the most prolific source of disease around the house is the cesspool into which pass the kitchen and chamber slops. In the cities and large villages these are carried off in the sewers, but seldom does a farm-house have any system of sewerage. The slops are too often thrown out of the kitchen door and left to generate vile odors on the surface of the ground. To keep the air of the cellar and around the house pure and sweet, resort to a free sprinkling, as occasion may demand, of dry, air-slacked lime. (See *Disinfectants.*)

LIGHT. — Daylight exercises considerable influence upon both animal and vegetable life, and also upon a good many inanimate substances. Upon those endowed with life, the effects are of the highest importance. The effect upon animal life may not be so apparent, but it should claim our attention. Its hygienic importance should be more studied than it generally is in the building of our houses. Apartments exposed to the full action of the sun may be less comfortable in hot weather than those from which the sun's rays are excluded, but they are more wholesome. It is the increased intensity of the sunlight in southern climes, independently of their greater warmth, that makes them so beneficial to many invalids. The little sunlight that finds its way into the narrow courts and alleys of great cities is partly the cause of the stunted growth and pale faces of children living there. When the outer skin is tanned, the sympathetic influence is felt also by the connecting mucous membranes lining every part of the body, and stomach and bowel derangements are less liable to occur. The inner as well as the outer skin is toughened. This shows the beneficial influence of light and fresh air in the summer complaints of children.

LONGEVITY.—The following table exhibits recent mortality statistics, showing the average duration of life among persons of various classes.

EMPLOYMENT.	YRS.	EMPLOYMENT.	YRS.
Men unemployed	68	Masons	48
Judges	65	Traders	46
Farmers	64	Tailors	44
Bank Officers	64	Jewellers	44
Coopers	58	Manufacturers	43
Public Officers	57	Bakers	43
Clergymen	56	Painters	43
Shipwrights	55	Shoemakers	43
Hatters	54	Mechanics	43
Lawyers	54	Editors	40
Rope Makers	54	Musicians	39
Blacksmiths	51	Printers	38
Merchants	51	Machinists	36
Calico Printers	51	Teachers	34
Physicians	51	Clerks	34
Butchers	50	Operatives	32
Carpenters	49		

By these figures it will be easily seen how tranquility or a quiet life affect longevity. All other things being equal, the phlegmatic man will live longer than the sanguine, nervous person, who burns out rapidly with borrowed worries. It is also known that women live longer than men. Marriage is favorable to longevity. Married men, from 25 to 30 years of age, die at the rate of 6; unmarried, at the rate of 10; and widowers at the rate of 22, per 1,000 per annum. Maids from 30 to 35 years of age, die at the rate of 11, and married women at the rate of 9, per 1,000, per annum.

MILK is an article of diet which all persons may use, under nearly all conditions. A person who is sick may take milk with the greatest possible advantage, because it contains, in the form of assimilation, all the elements essential for maintaining nutrition. It should be taken slowly in mouthfuls, never in draughts like other fluids. It should not be taken after other food, as it will be almost sure to burden the stomach. The minimum quantity required for the preservation of health, is 5 qts. per diem to a family of ten, and not less than 1 qt. daily to each child. If this, or anything approaching this, were the rule instead of the exception, the disease of rickets, in its manifold phases, would be completely banished from this country, and a much higher standard of health and robustness would unquestionably prevail.

MOUTH, Must be Kept Closed. — The peculiar arrangement of the narrowed and branched and delicately furnished nasal passages are specially suited to strain the air and to warm it before it enters the lungs. The foul air and sickening effluvia which one meets in a day's travel through the crowded city are breathed with greater impunity through the nose than through the mouth. Raw air, inhaled through the mouth, induces hoarseness, coughs, etc. No one who has been snoring through the night feels properly refreshed in the morning. Keep the mouth shut when reading silently, when writing, when listening, when in pain, when walking or riding, when angry, and when asleep.

PLANTS, Healthy Influence of.—House plants may properly be classed as therapeutic agents. They do not give off sufficient carbonic acid at night to become injurious. Every house mother can keep the air of winter rooms moist by having thrifty plants in them, and there is reason to believe that the lives of many persons who die from pulmonary complaints might be preserved by this agency at once so agreeable and so salutary. Certain selections of plants might be made as would exhale healing balsamic particles as odors.

SLEEP.—Rest is not less a luxury after exercise, than exercise is after rest. Both are essential for the continued enjoyment of health and happiness. The cure of sleeplessness requires a clean, good bed, sufficient exercise to produce weariness, pleasant occupation, good air, and not too warm a room, a clear conscience, and avoidance of stimulants, narcotics, and over-eating. We say *over*-eating; for it is a popular mistake that sleep after a full meal is unrefreshing. Every

animal seeks sleep immediately after eating, but man. An after-dinner nap is nature's own prescription. The best possible thing for a man to do when he feels too weak to carry anything through, is to go to bed and sleep as long as he can. Those who think most, who do most brain work, require most sleep. Time saved from necessary sleep is destructive to mind, body and estate. Extremes in sleep and early rising should both be avoided. To prolong the night into the day will bring on physical and mental stupor. It is a mistaken idea that children should lie and steam in bed every morning until disquieted nature forces them out. There is nothing that will so derange the nervous system of a person who is eliminative in nervous force as to lie all night in bed with a person who is absorbent in nervous force. The absorber will go to sleep and rest all night, while the eliminator will be tumbling and tossing, nervous and restless, and wake up in the morning fretful and peevish, fault-finding and discouraged. The feet should be warm and the head cool in order that sound sleep may be secured. A good sleep inducer is to sponge the whole length of the spine for 10 or 15 minutes before retiring.

VACCINATION.—If not well done, it had better be left undone. Good, fresh virus from a sound, healthy cow, only, should be used. The quills should be split; the skin where the virus is applied should be abraded or scratched with the sharp end of the piece of the quill until it barely oozes, not until it bleeds, and then after dampening the virus, or the other end of the quill, apply it. Following these directions does away entirely with the use of a lancet, and, a separate piece of quill being used for each individual, there is no danger of carrying diseased blood from one person to another.

VENTILATION.—Both from our lungs and from the seven millions of pores of the skin, carbonic acid and other impurities are being constantly thrown off; and it is to remove these and supply fresh air that ventilation is necessary. In the absence of other means for ventilation, the upper sash of a window should be kept constantly lowered say ½ to 1 inch in winter, and 4 to 6 inches in summer. In cold weather, in winter, we should rather increase the heat in the room than shut out the fresh air. There is no greater mistake than to suppose that air is pure simply because it is cold. The atmosphere can be tested for the presence of carbonic acid. It feebly reddens litmus paper, extinguishes the flame of a burning taper, and forms a white precipitate in aqueous solutions of lime and baryta, which is soluble in acetic acid. A lighted candle is generally used to test an atmosphere suspected to contain carbonic acid; but it is found that air that will support combustion will contain sufficient of this gas to cause insensibility. The following plan for ventilation is both simple and convenient: Prepare a piece of wood, 1 in. thick and 3 in. high and the exact length of the breadth of the window. Let the sash be now raised, the slip of wood placed on the sill, and the sash drawn closely upon it. If the slip has been well fitted, there will be no draft at that part; but the top of the lower sash will overlap the bottom of the upper one, and between the two bars perpendicular currents of air, not felt as draft, will enter and leave the room. Every closet in daily use in which the night clothes are hung by day and the day clothes by night, should have an airing as well as the bed. If the closet can be large enough to admit of a window—and it is in some cases—an ample provision for sunlight and a circulation of pure air is provided in the window, which should be left open for a short time each day. Another way to ventilate a room is thus: Make a hole through the room to the outer air, in a corner just above the skirting; through the hole put one arm of a tube 3 in. in diameter, and bent at right angles. The arm of the tube reaching to the outer air should be in length equal to the thickness of the wall, and the other arm should be two feet long, standing vertically in the corner of the room; if desired it can be covered with paper of the same pattern as that on the wall. A tube of the diameter given above is sufficient to ventilate a room of moderate size.

Easy Ventilator.

WATER.—Water is valuable to dilute the blood, to cleanse the blood of impurities within and without, and as the most efficient means of applying heat and cold in various forms of baths. Nothing relieves thirst like it. Nothing will regulate the temperature of a fever patient so effectually as water applied in the form of a cool pack. In relieving the coma of narcotic poisoning, apoplexy, sun-stroke, and lightning stroke, cold affusion is more potent than all other remedies combined. Water kept in the room awhile absorbs impurities, becomes unfit for use, and should often be renewed whether it has become warm or not. The water in a pump stock should all be pumped out in the morning before using. That which has stood over night is not fit for cooking. Impure water is quite as injurious to health as impure air. To purify water, see *Cisterns* and *Filters*. Hardness of water is caused by the suspension of lime-salts in it. These salts decompose the soap used in washing, causing it to become flaky and destroying its cleansing properties. An excessive quantity of lime-salts in water renders it decidedly objectionable for drinking as well as other purposes; but recent investigations would appear to show that in moderate quantities it is rather desirable than otherwise.

MEDICINE.

REMARKS ON DIAGNOSIS.—The expression of countenance, discharges from the body, pains, the pulse, breathing, and the tongue, are all indices of what is occurring in distant parts of the body, and afford valuable assistance to the physician in many obscure and complicated cases; features contracted, anxious expression, difficulty of breathing, and rapid dilatation of the nostrils, indicate acute inflammation of the lungs; features pointed, with expression of anxiety, brows knit, countenance pale, lips dry and bluish indicate pain and inflammation of the abdominal viscera; face flushed, wild expression of countenance, eyes red and sparkling, pupils contracted or dilated, great sensibility to light, squinting, twitching of the eyelids and muscles of the face, indicate inflammation of the brain; face flushed and swollen, lips blue, eyes prominent, anxious expression, sudden startings in sleep, indicate organic disease of the heart; cheeks pale and blanched, lips white and puffy, dark circle around the eyelids, languid expression, indicate chlorosis, or green sickness; pale, delicate complexion, puffiness of upper lip, with margins of a carnation tint, indicate scrofula; deep yellow complexion indicates jaundice, or derangement of the liver; squinting, or distorted eyes are ominous of dropsy of the brain; very light, or clay-colored stools evince a lack of bile; very dark evacuations denote an exuberance of bile; green discharges (of infants) denote acidity of the stomach; glairy, dark-green evacuations, like chopped spinach, are characteristic of dropsy of the brain; bloody, mucous stools, accompanied by straining, indicate intestinal inflammation; hard, dry stools indicate a relaxed and torpid state of the mucous membrane of the bowels; a healthy male adult excretes about 2½ pts. of urine in 24 hours; it is of a pale amber or straw color, remaining clear after standing, and precipitating no sediment, but having a peculiar ammoniacal smell; red scanty urine denotes inflammation; urine is clear, limpid, and abundant in nervous affections; urine depositing a sediment indicates biliary derangement; urine turning milky soon after being emitted (especially in children), denotes the presence of worms in the intestines; the pulse of a healthy, adult person beats from 70 to 75 times per minute; but some persons enjoy good health with a pulse at 50, and even lower; others are apparently as well whose pulse is at 90; the pulse varies at different periods of life; in infancy and childhood it ranges from 100 to 120 beats per minute, while in old age it is diminished, and rates at 60 or 70 per minute; a quick, full, bounding pulse indicates inflammation, or fever of an acute, inflammatory character; a sluggish, full pulse evinces a want of nervous energy; a slow pulse, if not habitual, may indicate debility, or tendency of the blood to the head; a changeable pulse indicates nervous derangement, and sometimes organic disease of the heart; a fine, scarcely perceptible pulse denotes great exhaustion and approaching death; sharp, darting pains, ceasing and returning at intervals, indicate neuralgia; tearing, throbbing, and aching pains, aggravated by contact, pressure, or movement, indicate inflammatory action; stitching, or pricking pains, indicate determination of blood to a part; sudden suspension of pain where there is acute inflammation, is ominous of mortification; sudden, rapid, jerking movements of the head and limbs indicate cerebral irritation, *mania à potu*, and some forms of insanity; pain in healthy structures often indicates disease in a remote part; for example, pain in the knee indicates disease of the hip joint, and pain in the right shoulder and arm is often the result of a diseased liver; short, hurried breathing, using principally the abdominal muscles, indicates inflammation of the lungs; using the muscles of the chest alone in breathing indicates abdominal inflammation; irregular breathing, with snoring respiration, indicates compression of the brain, or the effects of poisoning by opium; wheezing, short, panting, anxious respiration, with constriction of the top of the windpipe, indicates asthma; cough, with expectoration of thick, dirty-yellow or greenish sputa, which sinks in water, indicates disorganization of the lungs; cough, with expectoration of tough, white mucus, indicates chronic bronchitis; painful cough, with rust-colored or bloody expectoration, indicates inflammation of the lungs; a thick, dirty-white coating on the tongue indicates gastric derangement; a thick, yellow coating on the tongue, with bitter taste, indicates biliary derangement; a thick, white coating on the tongue, with red papillæ appearing through the fur, indicates scarlet fever; a clean, smooth, bright-red tongue indicates inflammation of the gastric or intestinal mucous membrane; a blackish, dry, furred, and tremulous tongue indicates abdominal or putrid typhus; a sharp, pointed, tremulous tongue indicates irritation and inflammation of the brain, often met with in habitual drunkards; a swollen tongue, coated white, indented or notched on the edges, indicates derangement of the nerves and lining membrane of the stomach; met with in gastric fevers.

ADMINISTRATION OF DOSES.—In measuring doses, it is convenient to have a graduated measuring glass, such as druggists use. Graduated medicine glasses are also sold. In the absence of either, the following guides are useful: 1 tumbler contains about 8 oz.; 1 teacup, 1 gill or 4 oz.; 1 wineglass, 2 oz.; 1 tablespoon, ½ oz.; 1 dessertspoon, 2 dr.; 1 teaspoon, 1 dr.; 1 teaspoon, 60 drops. Physicians' hand-books and some medical treatises give "dose-tables" showing the quantities that may be desirably and safely given of each drug prescribed. But as in this work the dose is nearly always stated with each prescription, besides being particularly stated throughout its department of MATERIA MEDICA and PHARMACEUTICAL CHEMISTRY, such a table would be superfluous here. In administering medicines, the dose must be adapted to

the age, sex, temperament, constitutional vigor

Medicine Spoon.

and peculiarities of the individual. In regard to age, a child 1 year old will generally bear 1-12 of the dose for an adult; afterwards the dose for children should be in proportion to that of the adult as the age of the child to his age increased by 12; thus, for a child 2 years old, it will be 1-7 of an adult dose; for 3 years old, 1-5; for 7 years old, 7-19, or a trifle more than ¼; i. e., the dose is very easily calculated by taking the age for the numerator, and the age plus 12 for the denominator. This rule applies to children under 12; at 12 a person is supposed to bear nearly as much medicine as an adult. A little common sense discretion must of course be used here; and indeed, on this whole subject; for the same rule will not apply to all medicines: calomel, for instance, is better borne by children than by adults, while the contrary is true of opium.

Medicine Glass.

Medicine Dropper.

ACNE.—This eruptive disease of the skin chiefly attacks the face and forehead, having its origin in the sebaceous follicles which secrete the oily matter that lubricates the surface of the skin. Youths at the age of puberty are very subject to it, and it sometimes continues later in life. The retained secretions inflame the skin, giving rise to small, red pimples, in some of which matter forms. The end of a pimple, when blackened by dust and smoke, resembles the head of a worm. When there are many such pimples, it is called spotted acne. *Treatment*: Take sulphur, cream of tartar, of each, 1 oz.; enough syrup or molasses to make a paste; take a dessert spoonful night and morning before eating, until the bowels are affected, and an odor of sulphur is perceived from the skin. A teaspoonful of Epsom salts every morning, or of Husband's magnesia, with like frequency, may have an equally favorable result. Bathe the face frequently with hot saleratus water, 1 dr. of saleratus to the pint of water, and often give it a thorough washing, using only refined soap, with hot water. Cultivate as much as possible the general health; and take three times a day a dessert spoonful of the following tonic: Corrosive sublimate, 1 gr.; iodide of potassium, 2 dr.; water, 3 fl. oz.; mix.

ADDISON'S DISEASE, or BRONZED SKIN DISEASE.—This is a peculiar form of anemia, which Dr. Thomas Addison, of London, in 1855, discovered to be almost always associated with disease of the supra-renal capsules, two flat, triangular bodies, which cover the upper part of the kidneys, and whose physiological use is not known. The skin becomes of a dark, smoky appearance, in some cases causing the patient to very closely resemble a mulatto. It is very fatal, and no successful treatment has been discovered.

ALCOHOLISM.—This term includes, 1. Intoxication; 2. Dipsomania, or the acute alcoholism of delirium tremens; and 3. The state of chronic inebriety. *Treatment*: In a case of intoxication empty the stomach with an emetic of 20 gr. of ipecac, or, if that is not at hand, with a large spoonful of mustard. Apply cold water to the head, but keep the feet and body warm; mustard plasters to the feet and pit of the stomach are useful. As soon as the patient can drink, give strong, hot coffee, without milk or sugar, in tablespoonful doses, every 5 minutes. Give iced milk for nourishment; and as a tonic, 3 times a day, tinct. nux vomica, 10 drops, mixed with 1 dr. each of comp. tinct. of gentian, and comp. tinct. of colombo. In delirium tremens, the first thing is to secure quiet and sleep; and no drug has been more efficient for this object than chloral hydrate, in ½ dr. doses; repeated, if necessary, 2 or 3 times. The bromide of potassium has also succeeded in some cases, 20 gr. every hour, until the nerves are quieted, and the patient rests. The strength must now be supported by nutritious diet of eggs, soups and milk, and by mild stimulants; as 10 drops tinct. of capsicum, or aromatic ammonia in ½ oz. of water every hour. These means, with good nursing, will generally succeed; where they fail, a very rare and moderate allowance of opium and brandy is sometimes permitted. In chronic inebriety most physicians now insist on entire cessation from the use of liquor at the beginning of the treatment; then give 1 fl. dr. tinct. of ginger, or tinct. capsicum, every 3 hours, combined with ½ dr. of bromide of ammonia, or 15 gr. of chloral hydrate as nervines. Sustain also, as much as possible, with generous diet. *Homeopathic*: If the patient lies in a state of stupor, eyes open, stertorous breathing, pupils contracted, give opium; if of a full habit with flushed face, red eyes, dilated pupils, give belladonna; if there is trembling of the limbs and spasmodic twitching of the muscles, give nux vomica. The best remedies for the inclination to drink and the evil effects of habitual drunkenness, are arsenic, nux vomica and sulphur. Administration: Of a solution of 3 drops or 12 globules in 10 teaspoonfuls of water, give 2 teaspoonfuls every 2 or 3 hours in urgent cases; but in milder forms of the disease, a dose 2 or 3 times a day will be sufficient.

ANEMIA, or POVERTY OF BLOOD.—In this disease the patient becomes pale and weak, and the blood watery and more than usually destitute of red globules. *Treatment*: Foster the patient's strength by diet and tonics, and make the blood richer in iron. Take tinct. of chloride of iron, 1 fl. oz.; sulphate of quinia, 20 gr.;

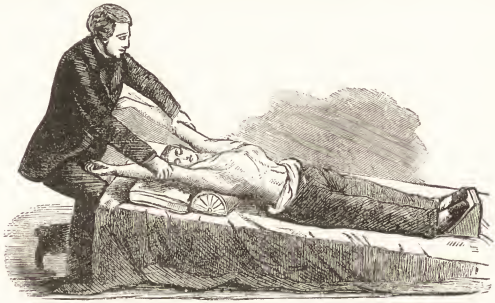
mix, and give 20 drops in sweetened water 3 times a day; sucked through a straw or tube to avoid injury to the teeth. Much also may be accomplished towards recovery by out-of-door gentle exercise and frequent bathing.

ANUS. Fissure of.—A common and very painful affection, especially of middle life, more frequently in females. Neglected constipation and piles are the most frequent causes. The symptoms are, at first, slight smarting or soreness when at stool, which later becomes severe, with intense pain, burning, aching and throbbing, lasting sometimes for hours. The stools are sometimes streaked with blood. *Treatment:* Bathe the part frequently with cold water, or weak lead water; wash thoroughly after every evacuation; anoint with equal parts of benzoated oxide of zinc ointment and belladonna ointment; if the pain is very severe use a suppository of opium and extract of belladonna, ½ gr. of each to 20 gr. of cocoa butter. In obstinate cases it may be necessary to touch the fissure occasionally with nitrate of silver. The bowels should be kept soluble by fruit, dried or mild laxatives, or the daily use of an injection of water or weak soap-suds.

APOPLEXY.—The premonitory symptoms are giddiness, pain and swimming in the head, loss of memory, faltering in speech, diminished sensibility of body or mind, drowsiness, noises in the ears, specks floating before the eyes, frightful dreams, laborious respiration, unrefreshing sleep, sighing without cause, cramp in the legs at night, etc.; then follows sudden suspension or loss of the powers of sense and motion, the heart continuing to beat and the lungs to act, but generally with difficulty; the patient usually lies in a stupor; in some cases there is paralysis of one side of the body, and convulsions of the other; the pulse is hard and full, sometimes feeble, the countenance flushed and bloated, the breathing stertorous, in other cases the skin is cold and the countenance pale. The presence of convulsions is indicative of great danger. The eyelids almost cover the eyes, which are fixed, whilst the pupils scarcely change their dimensions in light or darkness; the lips are usually purple or very dark; the lips and nostrils have generally a slight trembling movement by deep and laborious breathing. *Treatment:* On an attack the patient should be placed in an easy posture, in a well ventilated apartment, and in as erect position as possible; the neckcloth should be removed, and the clothes loosened, and the head and neck laid bare; secure a free exposure to fresh air in every possible way; bleed freely (from 15 to 20 fl. oz. or more) from the arm; if the face be pale, and the pulse feeble, cup at the back of the neck, or leech behind the ears, instead; cold water should be dashed on the head, and ice applied; the legs placed in pretty warm water, and blisters or mustard poultices applied between the shoulders; in the meantime 8 or 10 gr. of calomel may be administered, and its action subsequently promoted by the use of saline purgatives and stimulating clysters; when there is a difficulty of swallowing, a couple of drops of croton oil may be applied to the tongue, or it may be poured on sugar. When the premonitory symptoms are observed, aperient medicines and a light diet should be at once had recourse to; wine, beer, and spirits avoided as the most dangerous poisons. If the symptoms increase or continue, give an active purgative, a still lower diet, and bleed; to calm the circulation and strengthen the system, give one of the following sedatives: 1. Fowler's solution of arsenic, 2 fl. dr.; sulphate of quinia, ½ dr.; aromatic sulphuric acid, 10 drops; anise water, 4 fl. oz.; mix; a teaspoonful every 4 hours.—2. Tinct. of aconite root, 2 fl. dr.; bromide of sodium, 1½ oz.; enough peppermint water to make 4 fl. oz. of the whole; mix; a teaspoonful thrice a day.—3. Acetate of strychnia, 1 gr.; acetic acid, ½ fl. dr.; alcohol, 2 fl. dr.; water, 6 fl. dr.; mix; 10 drops 3 times a day. *Homeopathic:* Head hot, throbbing pulse, and red face, give aconite; eyes red, pupils dilated, tongue palsied and great difficulty in swallowing, give belladonna; sudden falling down with a shriek, loss of consciousness and of speech, foaming at the mouth and constriction of the throat, give hyoscyamus; giddiness, headache, and buzzing in the ears, give nux vomica; decided stupor and insensibility, with slow and laborred breathing, give opium. In administering these doses, dissolve 12 globules or 3 drops of the liquid medicine in ½ tumblerful of water, and give 2 teaspoonfuls every 20 or 30 minutes, in urgent cases. If the patient cannot swallow readily, place 6 or 8 globules on the tongue and allow them to dissolve; as soon as improvement begins, repeat the doses less frequently or discontinue the medicine.

ASPHYXIA.—In the treatment of persons asphyxiated, from whatever cause, the following general rules are to be followed. Treat the patient instantly on the spot in the open air, freely exposing the face, neck and chest to the breeze, except in severe weather, and removing all tight clothing from the neck and chest; clear the throat, by placing the patient gently on the face with one arm under the forehead; all fluids and the tongue itself then fall forward and leave the entrance into the windpipe free; if you place the patient on his back, first draw the tongue forward; keep it projecting beyond the lips by an elastic band over the tongue and under the chin, or a piece of string or tape may be tied around them; or by raising the lower jaw the teeth may be made to retain the tongue in that position; grasp the arms just above the elbows; draw them gently and steadily upward above the head, and keep them stretched upward for two seconds, thus opening the chest; turn down the patient's arms and press them gently and firmly for two seconds against the sides of the chest, thus closing it; repeat the movements alternately, deliberately and perseveringly, until a spontaneous effort to breathe is perceived; immediately on which proceed to rub the limbs upward with firm, grasping pressure and energy, etc.; the friction being continued under a blanket or over dry clothing, which has been substituted, if possible, for the wet; promote the warmth of the body by the application of hot flannels, bottles of hot water, heated bricks, etc., to the pit of the stomach, the

armpits, between the thighs, and to the soles of the feet; from time to time, if necessary to excite inspiration, let the surface of the body be slapped briskly with the hand, and cold water dashed briskly on the surface, previously rubbed dry and warm; if the patient has been carried to a house after respiration has been restored, be careful to let the air play freely about the room; on the restoration of life a teaspoonful of warm water should be given; then, if the power of swallowing has returned, small quantities of wine, warm brandy and water or coffee should be administered. Avoid the immediate removal of the patient, involving a dangerous loss of time; the use of the bellows or any forcing instrument, and of the warm bath; avoid rough usage, and do not allow the body to remain on the back unless the tongue is secured; under no circumstances hold the body up by the feet or roll it with a barrel; keep off crowds.



Inspiration.

Expiration.

ASTHMA.—A difficulty of breathing, coming by paroxysms, with a wheezing sound, cough and sense of suffocation, and generally terminating with a copious expectoration, usually rather thick and in pellets. The paroxysm may pass in a few minutes, or last for hours. It seems often to be hereditary, and may occur at any age. Men have it more than women. It is brought on by breathing certain vapors, odors, or irritating substances; by powerful emotions; by irritation of the stomach; by indigestible substances, loaded bowels, and irritable conditions of the genital organs; by atmospheric changes, and by certain diseases of the heart and lungs. *Treatment*: First, to relieve the spasm, give ½ to ¾ tea-spoonful each of wine of ipecac and tincture of lobelia, every 15 to 30 minutes, until nausea or expectoration is produced. 20 gr. of chloral with a like amount of bromide of potash or ammonia will often afford prompt re-

lief, as also the hypodermic injection of $\frac{1}{8}$ to $\frac{1}{6}$ gr. of morphia. Smoking tobacco or stramonium sometimes affords immediate ease. Many persons are relieved by breathing the fumes from burning paper that has been soaked in a saturated solution of nitrate of potash. One well-known remedy is to procure the musk-bag of a polecat and prepare an alcoholic tincture. The scent will avert a paroxysm of the disease and ultimately effect a permanent cure. A hot foot-bath, with mustard between the shoulders, may be used to advantage besides. Between the paroxysms avoid all exciting causes. Seek a residence which experience shows to be best adapted to the ease. A light nutritious diet, warm, dry clothing, and regular habits are important. *Homeopathic*: The choice of the remedy must be guided by the patient's constitution and the exciting cause. Ipecacuanha meets the suffocating feeling, and assists expectoration more generally than other drugs; a drop to be taken every hour till improvement sets in; nux vomica when the attack is due to indigestion, and there is furred tongue and constipation; a drop every 2 hours; arsenicum when there is prostration with cold sweats, weak pulse, and if the heart is affected, or the patient is advanced in years; a drop every 2 hours; aconite if the attack has been due to the influence of cold air, or if there is a dry skin and flushed face; antimonium tart. to assist the expectoration when the breathing is less difficult.

ATAXIA.—This affection, the full name of which is *Progressive Locomotor Ataxia*, is a peculiar form of palsy, characterized by diminution of the power of feeling, while the muscular power is retained. The patient can move, but not at will. *Treatment*: It is a very serious disorder, and no method of recovery has yet been discovered; yet the unpleasant symptoms have been greatly relieved by the following: 1. Fl. ext. ergot, 2 fl. oz.; bromide of sodium, 1½ oz.; camphor water, enough to make of the whole 4 fl. oz.; mix; a teaspoonful every 4 hours.—2. Ext. belladonna, 4 gr.; oil of turpentine, 2 fl. dr.; enough cocoa butter to make 12 capsules; mix; 3 capsules daily.—3. Nitrate of silver, 7 gr.; ext. nux vomica, 12 gr.; mix, and make 24 pills; one pill after each meal.

BALDNESS.—It is not uncommon for the hair to fall out during or after severe sickness; but very often between 30 and 40 years of age, without any assignable cause, it commences falling out, and if not arrested, more or less complete, and often permanent baldness results. *Treatment*: 1. As soon as the hair commences to come out, cut it short and bathe the entire scalp regularly in fresh or salt water, or water having in it a small quantity of spirits of ammonia; after rubbing vigorously with the fingers for a few moments, brush well with a moderately stiff brush. If the hair is dry and harsh, rub into it after each bathing a few drops of glycerine, or a mixture of 8 to 10 parts of glycerine with 1 part of tincture of cantharides and a little oil of rosemary, which will be stimulating to the scalp.—2. Muriate of piloearpia in subcutaneous injections, to be administered only by a physician. *Homeopathic*: Where the hair is thin and inclines to fall off, take 2 ounces of bay-rum and 5 drops of tincture of cantharides, mix well, and apply to the roots of the hair with a small sponge every 3 days. If this fails, take 2 drops of oil of bitter almonds and gradually mix with 2 tablespoonsful of melted beef's marrow; of this take a little on the fingers and incorporate into the roots of the hair every 3 days.

BILIOUSNESS.—This disease pertains to the stomach and liver; caused by overeating, which inflicts overwork on the stomach with excessive secretions from the liver; the stomach becomes overwhelmed and indigestion results. *Treatment*: Correct and regulate the diet; give an aloetic, mercurial, or saline aperient; or an emetic followed by a dose of castor oil, Epsom salts, or Seidlitz powder. Take a tumbler of pure cold water on retiring to rest, and another (or even 2) on arising in the morning. *Homeopathic*: Give nux vomica, when there is headach, vomiting of bile, and constipation; mercurius when diarrhea of a scalding character takes the place of the vomiting; aconite when there is feverishness in addition to the above-named symptoms, covered by nux vomica and mercurius; 1-drop doses in a dessertspoonful of water every 3 hours until the symptoms improve, then every four hours.

BOWELS, Bleeding from the.—*Treatment*: Should serious hemorrhage occur, rest and quiet, and cold water poured slowly over the lower portion of the belly, or clothes wet with cold water, or better, with ice water, applied over the belly and thighs, and to the lower end of bowels, will ordinarily arrest it. In some cases it may be necessary to use injections of cold water, or even to put small pieces of ice in the rectum.

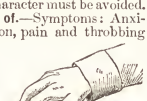
BOWELS, Falling of the.—A protrusion of a portion of bowel, more commonly in children. It sometimes results from violent purgative medicines, or from the straining at stool in diarrhea or dysentery. In children it sometimes results from allowing or encouraging the child to sit long on the chair. *Treatment*: When the bowel is down it should be washed, oiled and gently returned, then bathed freely with cold water. In children a pad and bandage may be necessary to retain it. The bowels should be carefully regulated, and a seat used so high that the feet cannot touch the floor; the hole should be so narrow as not to draw the buttocks apart. Then the bowel cannot be forced down, and a cure will result. In prolapsus, in the adult, a surgeon should be consulted. *Homeopathic*: Ignatia will cure most cases of a recent origin in children, a drop-dose in a spoonful of water 2 or 3 times daily; combined with the replacement of the bowel after evacuation. Calendulated water will relieve irritation of the bowel.

BOWELS, Inflammation of.—This is caused by blows or injuries, neglected constipation, or exposure to wet and cold, and when severe or extensive, is a very serious affection. There are sharp, darting or twisting pains in the bowels, greatly increased by pressure; the muscles of the belly seem drawn tight and the legs drawn up and bent, with fear of moving, lest the pains be increased; the bowels are constipated, with

nausea and vomiting of bile; the pulse quick, sharp and hard, and the urine high colored and scanty. Severe cases require prompt treatment or death may result. *Treatment*: The entire belly must be covered with hot poultices, or hot fomentations (hot hops or camomile infusions), and from ½ to 1 gr. doses of opium, or ½ to ½ gr. of morphia given every hour or two to control the pain. Cathartic medicines must be avoided, perfect quiet enjoined, and nothing but light liquid nourishment allowed. *Homeopathic*: Give aconite in the early stage, when presenting a high inflammatory fever, dry, hot skin, and full, frequent pulse, mouth and tongue dry, with intense thirst, abdomen swollen and tender to touch; (bell. bry.) cutting, burning and tearing pains in the umbilical region, aggravated by the least pressure, great fear and anxiety of mind, with nervous excitability; give arsenicum, usually in the last stage, when there is very rapid and weak pulse, sudden sinking of strength, cold clammy sweat, and great restlessness, intense thirst, drinking often, but little at a time, burning in the abdomen, with cutting and lancinations, worse after eating or drinking, vomiting, especially after eating or drinking, symptoms worse after midnight; give belladonna when there is great heat and tenderness of the abdomen, violent contractive or clutching pains in the bowels. In administration in severe cases, the remedy may be repeated every 1, 2 or 3 hours, according to circumstances; as soon as relief is obtained, give less frequently; 3 drops, or 12 globules in a tumbler ½ full of water, 2 teaspoonfuls at a dose.

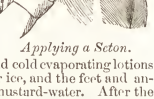
BRAIN, Concussion of.—Caused by blows or falls on the head; by jumping from a height, and sometimes even by slipping off a step. The symptoms are sudden unconsciousness; skin at first pale and cold; pulse small and rapid; later, skin dry and hot; breathing natural or sighing, and pupils contracted, or one may be contracted and the other dilated; when consciousness wholly or partly returns, it is sometimes with vomiting; the pulse becomes stronger; warmth of the body and color of the skin are restored, and, finally, dry, hot skin; intense headache; contracted pupils, and acute inflammation of the brain may result. *Treatment*: If the body is cold, wrap in hot blankets, apply heat to the extremities, and restore warmth and circulation by brisk rubbing; injections of warm brandy and ammonia may be used until reaction is established, when all stimulation must cease, and means be used to control any inflammatory action that may follow. *Homeopathic*: Arnica is the chief remedy to be relied upon, and should be given at the commencement; aconite in high fever, with hot, dry skin, violent thirst, shortness of breath, and great nervous excitability, delirium, especially at night; belladonna, when there is red, sparkling eyes, with furious looks, face red and bloated (also acon.), throbbing headache, great dread of noise or light, they aggravate all his symptoms, sleepy, but cannot sleep; opium, when there is snoring, breathing with eyes half closed, delirious talking, eyes wide open, face purplish and swollen, acuteness of hearing, stools round, hard, black balls. In administration, give 6 or 8 globules dry on the tongue, or dissolve double this quantity in 10 teaspoonfuls of water, and give 1 teaspoonful every 20 or 30 minutes, until relief is obtained; the dose may be repeated every ½ to 2 or 3 hours, until improvement sets in, when it should be given less frequently. The diet should be of the most simple kind; everything of a stimulating character must be avoided.

BRAIN, Inflammation of.—Symptoms: Anxiety, tightness, oppression, pain and throbbing in the head, loss of memory, intolerance of light and sound, a wild, staring expression in the eyes, frightful dreams, great watchfulness, a flushed face, an ungovernable delirium, the skin hot and dry, the tongue, at first red, becomes white and coated, and the pulse hard, sharp and quick, often great irritability of the stomach, and frequent vomiting, while the bowels are obstinately confined, and the urine very scanty and too high colored.

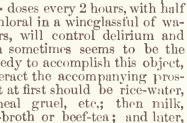


Applying Leeches.

Treatment: Leeches may be applied to the temple, and cut cups to the back of the neck and spine, followed with mustard plasters to the extremities and over the abdomen; in very strong patients, bleed from the arm; the bowels should be moved with a cathartic; the hair should be cut short, and cold evaporating lotions applied to the head, or ice, and the feet and ankles bathed with hot mustard-water. After the intensity of the disease has begun to subside, blister the scalp, and also, as a still more powerful counter-irritant and derivative, a seton of linen or silk, or (the more modern and cleanly one) of rubber, is sometimes inserted in the neck. The bromide of potash in 10 to 20 gr. doses every 2 hours, with half the amount of chloral in a wineglassful of water every 2 hours, will control delirium and mania, but opium sometimes seems to be the only efficient remedy to accomplish this object, and also to counteract the accompanying prostration. The diet at first should be rice-water, toast-water, oatmeal gruel, etc.; then milk, chicken, mutton-broth or beef-tea; and later, more concentrated liquid diet and even alcoholic stimulants may be required.



Applying a Seton.



Seton.

BREAST PANGS (Angina Pectoris).—A sudden pain occurring in the parts covered by the

breast-bone and the throat, accompanied with a feeling of suffocation, and apprehension of death. The pain sometimes extends down the arms and through the back. *Treatment*: Summon a physician without a moment's loss of time; give 1 dr. of ether with ½ gr. of acetate of morphia; apply hot applications to the chest and stomach; likewise friction to the chest, back and sides with spirits; if the relief be only partial, the dose of ether may be repeated after twenty minutes. *Homeopathic*: Give aconite, in case of sharp pain in the region of the heart, going down the left arm (also bryo.); suffocative constriction of the chest, so distressing that the patient sweats from agony, pulse full, strong, throbbing, intense anxiety, with fear of death (also ars.); especially suited to persons of full habit; give arsenicum in great mental anxiety and fear of death, indescribable, agonizing pain in the region of the heart, extending up to the neck and top of the head, oppression and stitches in the heart, with fainting and anguish, when can breathe only when the chest is bent forward (also lach.); the attack is renewed or aggravated by the least motion (also bryo.). In administration, dissolve 12 globules or 3 drops of the liquid in 6 dessert-spoonfuls of water, and give a spoonful at a dose; or 8 globules dry on the tongue; in urgent cases, it may be repeated every 20 or 30 minutes until relief; then less frequently.

BREATH, Fetid.—Scarcely anything is more disgusting. *Treatment*: Various means depend principally on aromatics, which by their odor smother it for a time; but these require continual repetition, and are liable to interfere with digestion. The real cause of stinking breath may generally be traced to a diseased stomach, or to decayed teeth. When the former is the case, mild aperients should be administered; if these do not succeed, an emetic may be given. When rotten teeth are the cause, they should be thoroughly cleansed and then filled; or, if this is impracticable, they should be removed. (See *Dyspepsia*.)

BRONCHITIS.—An inflammation of the mucus lining of the bronchia, or smaller ramifications of the windpipe. In the mild form, it is called a cold on the chest. The symptoms are hoarseness, dry cough and fever, followed by expectoration of mucus, at first thin and afterwards thick; in the severe forms there is oppression at the chest, with more or less wheezing and rattling, and in the outset a sensation of rawness in the upper chest and windpipe; towards night, generally, the symptoms increase, sometimes giving rise to great distress. *Treatment*: A hot mustard foot-bath, with 10 gr. of Dover's powder, or a hot lemonade at bed-time will very often, during the first 24 hours, cut short the attack; a wet towel folded upon the chest and covered with a dry flannel, or a piece of oiled silk, to prevent evaporation and keep the clothing dry, will generally assist much in breaking up the cold; should these means fail or have been neglected, a brisk saline cathartic (a tablespoonful of Epsom salts or citrate of magnesia), should be given, with a few doses of spirits of nitre, 20 to 30 drops, with 3 drops of tinct. aconite in each, if there is much fever, and flax-seed tea or other demulcents, with frequent doses of some simple cough mixture to ease and loosen the cough; in many cases, ¼ to ½ tea-spoonful of syrup of ipecac, with half as much paregoric every 3 hours will be sufficient; or, a tea-spoonful of a mixture of equal parts of syrup of ipecac, syrup of tolu, and mucilage of gum Arabic, with 5 to 8 gr. of bi-carbonate of potash, and ¼ to ½ gr. of morphia to each oz.; should the pain in the chest be very severe, a mustard-plaster or friction with turpentine and sweet oil, with or without a little spirits of hartshorn, will be useful; with children especially, the chest may be covered with a hot poultice. *Homeopathic*: Give aconite at first, in the dry, irritative state, a dose every 2 hours; also during the inflammatory stage either singly or alternately with the aconite; give antimonium tart. when there is much wheezing in the chest, with difficulty of expectoration; a dose every 2 hours; an occasional dose of sulphur at night is of value.

CEREBRO-SPINAL MENINGITIS.—(See *Spotted Fever*.)

CHILBLAINS. — First, insist on the patient wearing large shoes which do not compress the feet; touch the toes with nitrate of silver; liniment of aconite is recommended; an ointment of lard and dry mustard rubbed in before the fire for 20 minutes will cure the trouble after a few applications; paint the affected parts with flexible collodion to protect them from the air; bathing in very hot water is efficacious; a strong solution of acetate of lead, 20 gr. to 1 oz. of water, is highly recommended; sulphurous acid is useful in mild cases; a local application of a thick paste composed of slacked lime, moistened with a very little water and common oil, is recommended as a good remedy; laudanum, taken internally in very small doses, of from 2 drops for young children, night and morning, up to 6 or 8 for adults, will also cure chilblains; anoint the affected part with either of the following formulæ: 1. Tincture of iodine, 1 oz.; Labarraque's solution of chlorinated soda, 2 oz.; mix; dry the foot before the fire.—2. Alcohol, 4 oz.; glycerine, 1 oz.; carbolic acid, 1 sc.; mix and make an ointment; anoint the chilblains thoroughly 2 or 3 times a day. *Homeopathic*: 1 part of mother-tincture of arnica to 8 of soap liniment, tamus communis, cantharides (1 part to 6 parts of camphor liniment), sulphurous acid, agaricus muscarius, may severally be tried before the skin has broken; but when that occurs, calendula lotion or ointment should be applied, using an occasional bread poultice when the irritation is very great; rubbing the feet with snow or ice water, and with a warm towel after, will promote a glow when the skin is unbroken, but is not of universal application.

CHOLERA, Malignant Asiatic.—The attack usually begins with sickness and purging; this discharge, however, is not bilious, as in ordinary cholera, but a thin, colorless fluid, like rice water; at the same time there is great prostration of strength, and cold, clammy sweats. In a short time dreadful cramps assail the extremities and afterwards the abdomen; the

body becomes bent, the limbs twisted, the countenance cadaverous, the pulse almost imperceptible and the eyes sunken; the patient sinks into a state of apathy, and unless a favorable change speedily takes place, soon expires from exhaustion. When there is reaction, the pulse gradually returns, the natural warmth of the body is restored, and the spasms and difficulty of breathing give way. Frequently, however, the reaction is accompanied by fever closely resembling typhus, which often terminates fatally in from 4 to 8 days. *Treatment*: 1. Equal parts of maple sugar and fresh-burnt, powdered charcoal, made into a stiff paste with lard, and divided into pieces the size of a filbert; take one, occasionally, swallowing whole.—2. Sulphuric acid, 3 dr.; nitric acid, 2 dr.; simple syrup, 6 dr.; water enough to make the whole weigh exactly 10 oz.; a single drop of essential oil of lemon may be added; take 1 tablespoonful in water, on the first appearance of the premonitory symptoms; follow by the free use of very cold water; in half an hour a second dose is to be taken.—3. Tincture of camphor, tincture of opium, tincture of rhubarb, compound, of each 1 oz.; mix the tinctures of camphor and opium first, to avoid precipitation, then add the tincture of rhubarb; the adult dose is 20 drops every hour till the patient is relieved. *Homeopathic Preventive*: Camphor, 1 dr.; rectified spirit, 6 dr.; dissolve, and preserve it in a well corked bottle; take 2 drops on a lump of sugar, sucked as a lozenge, 2 or 3 times a day. *Homeopathic Remedy*: As the last, repeating the dose every 10 or 15 minutes, followed by draughts of ice-cold water, until the symptoms abate.

CHOLERA-MORBUS.—The attack generally comes on suddenly and at night. It is characterized by vomiting and purging, spasmodic pain in the bowels, and sometimes cramps in the legs, rapid prostration of strength and coldness of the skin; the matter ejected from the stomach is at first the contents of it, but afterwards mucus and bile; the discharges from the bowels are thin fecal matter, very offensive. It mostly occurs in the heat of summer, and is incited by overloading the stomach, eating inordinately of certain fruits and vegetables, drinking sour, fermented liquors, sudden change of temperature, and checked perspiration. *Treatment*: Until the overloading of the stomach has been relieved by vomiting, give large and repeated draughts of warm water; then check, quiet, and support with opium and brandy; 30 drops of laudanum in a tablespoonful of brandy for an adult every hour until relief is obtained; or a more speedy relief from pain may follow a hypodermic injection of $\frac{1}{4}$ to $\frac{1}{2}$ gr. of sulphate of morphia in solution. *Homeopathic*: Give antimonium when there is violent vomiting and diarrhea, vomiting slime and bile, cramp-like pains in the stomach, tongue coated white, especially suitable after overloading the stomach, or after drinking sour wine; give arsenicum, if the symptoms are severe from the beginning, and attended with rapid prostration of strength, burning in the region of the stomach, (also nux v.), violent thirst, drinking little and often; give ipecacuanha, if nausea and vomiting predominate, stools having the appearance of being fermented, griping, pinching pain in the bowels; give veratrum alb. when there is violent vomiting with severe diarrhea, excessive weakness and cramps in the legs, cold sweat on the forehead, violent pain in the region of the navel, eyes sunken, countenance pale and expressive of acute suffering, pulse small and thread-like. In administration, dissolve 3 drops or 12 globules in a tumbler one-third full of water, and give 2 teaspoonfuls at a dose, or 8 globules may be taken dry on the tongue.

COLDS, To Prevent.—1. Watch for the first symptoms, and when convinced of their presence, exclude the external air from the mucous membrane of the nose by loosely plugging each nostril with a pellet of dry cotton; this will check the cold, and immediately check all irritation and sneezing.—2. As soon as there is an unpleasant sensation of chilliness, keep the room at such a temperature as will prevent this feeling, even if it requires 100° Fahr.; in addition, put the feet in water, half-leg deep, as hot as can be borne, adding hot water from time to time for a quarter of an hour, so that the water shall be hotter when the feet are taken out than when put in; dry them thoroughly and put on warm, thick, woolen stockings, even if it be in summer; for 24 hours eat no food, but drink any kind of warm teas, and at the end of that time, if not sooner, the cold will be effectually broken without any medicine whatever.—3. Sniff the fumes of ammonia or spirits of camphor every few minutes, as strong as can be borne; if the cold continue, take the following mixture: Glycerine, 4 oz.; whisky, 4 oz.; morphine, 1 gr.; 1 or 2 teaspoonfuls every hour till cured.—4. Syrup of squill, 2 oz.; tartarized antimony, 8 gr.; sulphate of morphine, 5 gr.; pulverized gum Arabic, $\frac{1}{4}$ oz.; honey, 1 oz.; water, 1 oz.; mix; for an adult, 1 small teaspoonful; repeat in half an hour, if it does not relieve; child in proportion.—5. The Turkish bath is recommended as a sure cure. (See *Turkish Bath* in HYGIENE.)—6. Peel a few onions, and cut them in very thin slices; place some sugar in the bottom of a bowl, then a layer of onions, cover thickly with sugar, and so on, until the onions are all used; cover the top well with sugar; place a plate over the bowl, and set away until the syrup is formed; take a teaspoonful or two every time the cough is troublesome, and on retiring.—7. Salicin, 20 gr. every 2 hours, has proved a very efficient remedy for colds in some cases.—8. Oxalate of cerium, 10 gr., 3 times a day, is highly recommended.—9. 4 tablespoonfuls of flaxseed, whole; 1 qt. boiling water; sweeten to taste; steep 3 hours in a covered pitcher; if too thick, put in cold water with juice of 2 lemons. *Homeopathic*: Give aconite for the first stage of irritation, in drop doses, repeated every 2 hours, and this may cut short any further symptoms; the same medicine will be called for when feverishness has set in; phosphorus when the windpipe is tender, and the voice hoarse and deep, a drop dose, every 2 or 3 hours; spongia, when the breathing is difficult, with wheezing, and also with tenderness of the windpipe, a drop dose every 2 or 3 hours; give

hepar sulphuris when there is loose and irritative cough, and when the uvula also is relaxed and the cough worse on lying down, a drop dose every 3 or 4 hours; for the chilly stage give camphorated spirits, 1 drop on a piece of sugar, repeated every ½ hour for 4 or 5 doses; for the dry, irritative stage, give aconite in drop doses every 2 hours, especially if the patient has been exposed to the action of cold wind; for the sneezing stage, with watering at the eyes and running at the nose, give mercurius, a drop every 2 hours, when there is no headache or depression; nux vomica when headache and pain over the brows and nose; arsenicum when there is much weakness, and if relaxation of the bowels is also present (a not uncommon accessory of cold in the head), a drop every 2 hours; putting the feet in hot water, drinking warm drinks without alcohol in them, an extra blanket on the bed, will help to drive away a cold. When there is the slightest suspicion of having taken cold, leave off cold bathing and use tepid water instead.

COLIC. — Violent shooting, griping pains, with a sense of twisting around the lower part of the belly; the skin of the belly drawn into knots, obstinate constipation; sometimes nausea and vomiting. *Treatment:* If there is evidence that the pain arises from anything eaten, empty the stomach with an emetic of a large teaspoonful of mustard or common salt, or 30 gr. of ipecac in a bowl of warm water, and to relieve the horrible pain give ½ teaspoonful of laudanum or chloroform in some peppermint water or ginger tea; or give ¼ gr. of sulphate of morphia in the arm by hypodermic injection; apply a large mustard poultice over the entire belly; repeat the laudanum or morphia every hour, till the pain is subdued.

COLIC, Bilious.—The paroxysms are sometimes caused by the passage of stones through the gall duct, and relief is only obtained when these reach the intestines; sometimes they appear to be the result of the irritant action of acrid, unhealthy bile. *Treatment:* The continued use of chloroform or opium, or both, is necessary, with hot fomentations, to relieve the pain; 5 gr. of bicarbonate of soda with ½ gr. of calomel, once in 4 hours, and a large blister over the right abdominal region, may be beneficial where symptoms of inflammation of the bowels set in.

COLIC, Painters'. — Caused by exposure to the poisonous influences of lead; the belly is shrunken and hard, and sometimes the intestines may be felt contracted into knots; the pain is lessened by pressure; there is obstinate constipation; and the suffering is most intense. *Treatment:* The pain should be relieved by full doses of chloroform, or some forms of opium, and mustard poultices and hot fomentations. When an attack comes on suddenly, give a full dose of laudanum, ½ to 1 teaspoonful, with 2 or 3 tablespoonfuls of Epsom salts, in a large tumbler of water, with ½ teaspoonful of dilute sulphuric acid, or of the aromatic acid (elixir of vitriol) added, with large, warm injections and hot fomentations repeated as may be necessary. The iodide of potash will eliminate the lead from the system, and may be used in doses of 5 to 10 gr., 3 or 4 times daily, for this purpose. The regular use of weak sulphuric acid lemonade, ½ to ½ teaspoonful of the acid to 1 pt. of sweetened water, is a preventive; the bowels being kept open by an occasional laxative. *Homœopathic:* If the colic is inflammatory, involving the bladder, give aconite; if there is great sensitiveness and cutting pains, give belladonna; if there is much trouble from wind, give chamomilla; if much nausea, give ipecac; if the nausea is accompanied with drowsiness, give opium. Administration: In violent cases repeat the medicine every 20 or 30 minutes, until relief is obtained; then extend the time to 1, 2 or 3 hours; dissolve 3 drops, or 12 globules in 8 dessertspoonfuls of water, and take 1 spoonful at a dose.

CONSTIPATION applies to that condition of the body in which the bowels act tardily, and in which the discharges are hardened. *Treatment:* When the affection is merely accidental or occasional, a dose of some aperient or cathartic, such as ½ oz. of Epsom salts, or a tablespoonful of castor oil or of the fl. ext. of rhubarb and senna, or 10 gr. of calomel with 2 gr. of podophyllin, is the only treatment necessary; but when it is habitual adopt a diet free from astringents, and consisting of a large portion of green vegetables and ripe fruit; particularly avoid the use of over-cooked, salted, or dried animal food; brown bread may be eaten, as it acts as a gentle laxative, from the bran it contains; the occasional use of aperient and emollient enemata may be had recourse to; the best remedy in habitual constipation is ½ dr. Epsom salts, dissolved in ½ pt. of water, adding 10 drops of elixir of vitriol; take 1 hour before breakfast; the smaller the dose the better it will operate. take until a cure is effected. In the treatment of the constipation of infants, castor oil, ½ teaspoonful occasionally, or manna, ½ to ½ oz., sucked at will, may be given. The introduction into the rectum (very gently), of a little slip of writing paper, parsley stalk, or suet, is a method sometimes adopted successfully by nurses. Friction on the stomach and bowels with a warm hand or a piece of soft flannel, should also be employed. *Homeopathic:* Nux vomica should be taken by those of a dark bilious temperament, who lead a sedentary life and indulge in rich living, when there is headache and nausea, and a sensation as if the bowels were going to act, but refuse to do so; a drop-dose twice or thrice daily; bryonia is adapted for those of a rheumatic habit, when the evacuations are too large, and when there is no inclination for a stool. dose as for nux; sulphur will assist the action of both nux and bryonia, especially when the piles exist; 3 gr. at bed-time, dry on the tongue.

CONSUMPTION.—A leading symptom in the first stage is cough, at first very slight, and only in the morning upon rising, but after a time occurring at times during the day, particularly on taking more than ordinary exercise, but for a considerable time with but little or no expectoration; later, there is pain in the breast, frequent and severe cough, shortness of breath, some increase in the circulation, and occasional spitting

of blood. There may be also hectic fever, chills and fever, with hot, dry hands and flushed cheeks. The paroxysms of coughing become more frequent, the amount of expectoration increases and becomes purulent and often mixed with blood, showing that abcesses have formed, the appetite varies, the flesh becomes softer, the cheeks grow pale and sunken, the eyes brilliant, night sweats become profuse, prostration and diarrhea follow, then death by exhaustion, or sometimes by suffocation or sudden hemorrhage. *Treatment*: Hygienic measures are of chief importance. Consumptives should avoid indoor and sedentary life; they should engage in active, outdoor business, and select a high and dry place of residence; their food should be generous, varied and nutritious, embracing a full allowance of meats; they should clothe warmly and secure abundant and regular rest and sleep; and so far as possible live in the open air and sunlight. Mix cod-liver oil and whisky, of each, 8 oz.; give it 3 times a day to sustain and strengthen the system. To check night sweats, promote the appetite and strengthen the system, give elixir of vitriol, 10 to 30 drops, with 1 or 2 gr. of quinine, 2 or 3 times a day, in some aromatic or sweetened water. Brandy in ½ oz. doses, or 30 drops of laudanum every 2 hours, will relieve the diarrhea. To relieve the pains of the chest, warm it or apply plasters. *Homeopathic*: The hygienic measures are the same as those adopted by the advocates of allopathy. The homeopathic medicines are as follows: Where there is a bright redness of checks, give aconite; if there is a scrofulous habit, with cough at night, short breath, and mucous rattling, give belladonna; if there is short, dry cough, with tickling in the chest, made worse by exercise, give phosphorus; if the cough is only during the recumbent position, going off when sitting up, give pulsatilla; if there is much hoarseness and dryness in the throat, give sulphur. In administration, where the cough and other symptoms are troublesome, repeat the medicine 3 or 4 times a day; but in general once or twice a day will be sufficient; take 8 globules dry on the tongue, or dissolve 12 globules or 3 drops of the liquid in 8 dessert-spoonfuls of water, and take a spoonful as a dose; the food should be of the most wholesome and nutritious quality; rare roast beef, mutton chops, good bread made for the most part of unbolted flour, vegetables and good, ripe fruits; milk is one of the very best articles of diet for a consumptive.

CONSUMPTION, Of the Bowels.—A tubercular disease of the mesenteric glands and of the follicles of the intestines; the belly becomes swollen and hard, the skin dry and harsh, the eyes red, the tongue strawberry colored, the breath foul, the stools clay colored and offensive, sometimes costive, sometimes extremely relaxed. *Treatment*: Animal food and other nutriment should be given in small quantities at short intervals; mild mercurials to amend the intestinal secretions, especially the combination of corrosive sublimate with tincture of bark, as, corrosive sublimate or bichloride of mercury, 1 gr.; tinct. cinchona, 2 fl. oz.; mix; take 1 teaspoonful after each meal; bathe in tepid salt water.

DANDRUFF (Furfura, or Pityriosis Capitis).—Scurf is a natural and healthy formation, and though it may be kept from accumulating, it cannot be entirely prevented. It is produced on every part of the body where hair is found, although, from the more active growth of hair on the scalp, the facilities for collecting, and the contrast of color, it strikes the eye most disagreeably in that situation. It may be removed, and should be removed, every day with the hair-brush; but occasionally an unusual quantity of scurf is produced; the daily use of some mild stimulating or detergent wash, with due attention to the stomach and bowels, will generally abate this annoyance. *Treatment*: 1. Corrosive sublimate, 5 gr.; water, 1 pt.; oil of bergamot, 10 drops; alcohol, 1 oz.; mix; use once a day as a hair-dressing.—2. Sulphur, 1 oz.; water, 1 qt.; mix, and shake every few hours for 1 day; the next morning carefully pour off and bottle the clear liquid, with which saturate the hair every morning for 2 or 3 weeks.—3. A simple but very effective remedy, when systematically adopted, is to rub the scalp briskly and thoroughly every night and morning with the balls of the fingers, loosening all scurf and stimulating the surface to healthy action. But if this (or any other) remedy is neglected or irregularly applied, the dandruff may return. *Homeopathic*: This consists in extreme cleanliness, the frequent use of warm water and soap, attention to diet and keeping the head cool; take every night one of the following: Cal., graph., lyc., sep., or sulph.

DELIRIUM.—A disordered state of mind in connection with fevers, diseases of the brain, etc.; indicated by sleepless mutterings, with a hot, flushed face; unusual brightness and sometimes bloodshot condition of the eyes, and a quick, jerking pulse; there is frequently a meaningless expression of face, picking at the bedclothes, etc. *Treatment*: This must be in harmony with the treatment of the disease with which it occurs. Usually cold applications to the head, and warmth to the extremities, are indicated. If persistent the hair may be cut short, and a mustard plaster or a blister applied to the back of the neck. Should these measures fail, 5 to 10 gr. of bromide of potash, with as much hydrate of chloral, and ½ to ½ gr. of morphia, or 10 drops of laudanum, may be given every 2 hours in sweetened water. In connection with this a teaspoonful of Epsom salts, or a Seidlitz powder should be given to keep the bowels open, and a drop or two of tincture of veratrum or of aconite root, every hour, in a spoonful of water, to relieve any feverishness.

DIABETES, Insipidus, or Polyuria.—In this complaint there is a morbid abundance of urine, the amount passed being largely in excess, when compared with the normal amount in a state of health. *Treatment*: Little can be done by way of treatment beyond an assiduous promotion of the general health; although belladonna has sometimes seemed in a marked degree beneficial; 1. Fl. ext. belladonna, 5 drops 3 times a day.—2. This disease may be much relieved by

a sponge-bath and brisk rubbing of the skin every morning. The increased action of the skin relieves the kidneys so much as to promptly check the secretion of urine.

DIABETES. Saccharine. —The symptoms observed in this generally fatal ailment are the passing of an excessive quantity of pale, straw-colored urine of high specific gravity, containing grape sugar; great thirst and hunger, obstinate dyspepsia, constipation, an unpleasant odor from the body, debility and emaciation; these symptoms vary in intensity according to the course and duration of the disease, which is frequently accompanied with fever, cough, and sometimes carbuncles, and generally ends in consumption or some organic disease. The flow of urine sometimes reaches as much as 8 gals. in 24 hours; the average quantity is 2 gals. *Treatment:* Great attention should be paid to diet, which should consist principally of digestible, broiled or roasted meat, gluten, bran bread, beef or mutton broth; if the thirst is extreme, it is best assuaged by drinking water acidulated with phosphoric acid; spirituous liquors as well as saline aperients should be eschewed; claret is, however, a suitable beverage; give small doses of laudanum, 3 or 4 times a day; the bowels must be regulated by means of mild aperients; warm baths are also of use, as they augment the secretion of the skin. The disease may be kept under by administering from 20 to 40 minims of tincture of perchloride of iron, 3 times a day.

DIARRHEA.—A purging or looseness of the bowels. Among the most common causes are the presence of irritating matter, worms or acidity of the stomach or bowels, and exposure to cold, especially to the feet, or sudden changes of climate or temperature. *Treatment:* In general, administer a mild aperient, rhubarb or castor oil. The dose of the first may be from 20 to 30 gr. in sugar, or made into a bolus; that of the second, from ½ oz. to ½ oz., with a little peppermint water. After the due operation of this medicine, opium, astringents, and absorbents may be taken with advantage, but not in excessive doses; the first and second are indicated when great irritability exists, and the third in cases of acidity. Chalk mixture, to which a few drops of laudanum have been added, or the compound powder of chalk and opium, are excellent medicines, and will generally quiet the bowels. In bilious diarrhea, characterized by the bright, yellowish-brown color of the dejections, 10 gr. of blue pill or calomel, assisted by mild diluents and demulcents and warmth, generally proves efficacious; ½ to 1 gr. opium is also useful in some cases. The diet should be light and non-irritating. Glutinous broths, beef tea and arrow root are among the best articles. To these may be added a little dry toast. Arrow root (genuine), either with or without a spoonful of brandy, will of itself cure ordinary cases, if accompanied with repose. Among external remedies, warm and stimulating fomentations, liniments, etc., to the epigastrium and abdomen, will be found useful. 1 or 2 spoonfuls of laudanum, used as a friction, will allay pain, and in many cases settle the bowels when other remedies have failed. Diarrhea has been very successfully treated by ice-water injections; after each stool inject from 1 pt. to 2 qts. of ice-water, which is allowed to run out again by slight pressure on the abdomen; then inject 1 gill to be retained. Flannel over the region of the bowels, and indeed good thick under-flannels, worn night and day, summer and winter, will assist very greatly in both the prevention and cure of chronic cases. *Homeopathic:* Arsenicum will relieve when there is much griping, very watery stools, and vomiting; china, if there is little pain, great weakness, and no vomiting, and the food passes almost undigested; mercurius when the griping pain is low down in the bowels, the stools green, and the patient strains after an evacuation; drop doses of the medicine chosen every 2 or 3 hours; camphorated spirit is very useful at the outset, when there is coldness of the body, prostration and crampy pains; unless it speedily relieves, it should be discontinued after 3 or 4 doses.

DIPHTHERIA. Precautions with.—Cleanliness in and around the dwelling, and pure air in living and sleeping rooms, are of the utmost importance where any contagious disease is prevailing, as cleanliness tends both to prevent and mitigate it; all filth from cellar to garret, and around the house, should be removed; drains should be put in perfect repair; dirty walls and ceilings should be lime-washed, and every occupied room should be thoroughly ventilated. Apartments which have been occupied by a person sick with the diphtheria should be cleansed with disinfectants, ceilings lime-washed, and woodwork painted; the carpets, bed clothing, upholstered furniture, etc., exposed many days to fresh air and sunlight. Many articles should be exposed to a high artificial temperature, to kill all germs of infection. When diphtheria is prevailing, no child should be allowed to kiss strange children, nor those suffering from sore throat; nor should it sleep with or be confined to rooms occupied by or use toys, handkerchiefs, etc., belonging to children having sore throat, croup or catarrh. If the weather is cold, the child should be warmly clad with flannels. The well children should be scrupulously kept apart from the sick in dry, well-aired rooms, and every possible source of infection rigidly guarded. Every attack of sore throat, cough, and catarrh should be at once attended to; the feeble should have invigorating food and treatment; the sick should be rigidly isolated in well-aired, sunlighted rooms; all discharges from the mouth and nose should be received into vessels containing disinfectants, as solutions of carbolic acid or sulphate of zinc. (See *Diphtheria* in HYGIENE.)

DIPHTHERIA.—A sudden and very dangerous disease of the throat, having in many respects a strong resemblance to croup. It commences with the general symptoms of an ordinary sore throat, and swelling of the glands behind the jaw; there soon appears on the red and swollen palate or tonsils a yellowish-white substance in form of a membrane, which in some cases, like croup, extends into the larynx or upper portion of the windpipe, and may cause death by suffocation. In others (the ulcerative form, or put-

rid sore throat), the parts attacked are rapidly destroyed by a gangrenous ulceration; in others (the malignant form), there is intense headache, vomiting and bleeding from the nose, mouth, stomach and bowels; the fauces seem covered with a thick, leathery deposit, at first yellowish, and afterwards ash-colored or brown, and unless death occurs speedily, apparently from an overpowering of the system from the violence of the disease, extensive sloughing occurs, with foul discharges, and a clammy coldness and insensibility often precede death. *Treatment*: No specific remedy has been discovered. 1. Open the bowels with a mild saline laxative, ½ oz. of citrate of magnesia or Rochelle salts.—2. Chlorate of potash should be used as a gargle, putting 2 teaspoonfuls in a tumbler of water, and using freely every hour; and a tablespoonful of this should be swallowed every two hours.—3. The great discovery of Behring, "antitoxine," is now the grand specific for diphtheria. Reports from hospitals and private practice all prove it one of the greatest achievements in science, reducing the mortality three-fourths. This treatment is derived from the injection in the veins of another animal of a culture of diphtheria bacilli, finally attenuated to such a degree that it becomes harmless when again applied to man, yet rendering his system "immune," or proof against the virus. It can be given safely only by physicians, who alone are capable of its administration.—5. Inhalation of the vapor or steam of a strong infusion of hops or salt will afford comfort, and the steam of lime-water is worthy of a trial.—6. Small pieces of ice may be swallowed freely during the earlier stages, and, later, iced wine or brandy, if it can be swallowed. Chlorine water should be given, prepared as follows: Chlorate of potassium, 20 gr.; hydrochloric acid, ½ dr.; water, 4 oz.; pulverize the potash and put in a dry vial; add the acid, corking the vial, to retain the chlorine set free by the reaction; after that has ceased, add 1 or 2 oz. of the water; agitate until all the chlorine is dissolved in the water; add water to make it the desired strength; give teaspoonful every 2 hours, as required. It ought to be of a green color, and it will lose that if not kept in a dark colored bottle, wrapped in colored paper, or kept in a dark place. The medicine ought to be freshly prepared every second or third day. *Homeopathic*: When there are ulcers in the mouth and throat, putrid breath, and swelled glands on the neck, give nitric acid; if a false membrane has formed on the tonsils and palate, and great dryness and thirst prevail, give bryonia; if, in addition to the dryness, the tonsils are bright red and swollen, and there is great difficulty in swallowing, give belladonna. Gargle the throat with dilute alcohol, carbolic acid, chlorate potassa, or hot water; inhale the vapor of aqua ammonia, or tincture of iodine, especially in croupal diphtheria; regulate the diet to suit the inclinations of the patient; beef tea, mutton or chicken broth may be taken liberally; good fresh milk is excellent. Administration: Of a solution of 12 globules to 6 dessertspoonfuls of water, give a spoonful every 2 or 3 hours until a change is apparent, then less frequently.

Inhalers.

DROPSY, Of the Abdomen.—This occurs more frequently in women and aged persons, in married than in unmarried females; it is often the consequence of the distension or pressure attending pregnancy, of difficult and instrumental labors, and of suppression of the puerperal secretions. It generally assumes an acute or inflammatory form. The pulse is hard, thirst increased, and the urine scanty; the skin warm, hot, colored, and resists the pressure of the finger; a dull sound is emitted by percussion, on examining the abdomen. *Treatment*: This depends upon the extent and nature of the disease; give mercurials and antimonials, at first, to act on the bowels, and subsequently as alteratives, or with opium, and push it so far as to affect the mouth; 10 gr. jalap and 2 dr. cream of tartar should be taken every other day to act on the bowels; the kidneys at the same time by an infusion of juniper berries; ½ dr. of fl. ext. of jaborandi at night will produce a copious perspiration, which will assist in diminishing the accumulation of fluid; warm vapor baths should be given, followed by brisk rubbing with a coarse towel to restore perspiration; also give a gentle tonic. *Homeopathic*: Give arsenicum, apis mellifica, dulcamara, sulphur, or china; either of which should be administered once in 4 hours.

DROPSY, Of the Chest.—The effusion of water in the chest, which so often takes place in pneumonia, may be greatly lessened by promoting the free action of the kidneys. *Treatment*: 1 oz. of bruised juniper berries, steeped for 2 hours in 1 pt. of hot water, which may then be poured off, and a tablespoonful or two of cream tartar added and drank through the day will be useful for this. When there is much effusion, and absorption of it does not take place, a puncture is sometimes made through the walls of the chest and the water drawn off. This operation is called *paracentesis thoracis*, and is generally, in uncomplicated cases, entirely successful. The chest also may be painted freely with tincture of iodine, and the iodide of potash given in 5 to 10 gr. doses 3 or 4 times daily, in a tablespoonful of the compound syrup of sarsaparilla. *Homeopathic*: If there is oppression of the chest, anxiety, and tendency to seek relief by leaning forward, give colchicum; difficulty of breathing after exertion, sensation of danger of suffocation on lying down, and constant inclination to sit up, bending forward a little, give arsenicum; sore and bruised feeling, with urine scanty and cloudy, give apis mel.; oppressed breathing, waking from sleep and throwing the arms about, give lachesis. In acute and urgent cases, repeat the remedy every 2 or 3 hours, until relief is obtained; then extend the time to 4 or 6 hours, as may be necessary; dissolve 12 globules or 3 drops in 10 teaspoonfuls of water, and give 2 teaspoonfuls as a dose.

DROPSY (Wind Dropsy). — Signifies a puffy swelling, caused by the introduction of air into the cellular, fatty tissue. This may occur after

wounds of the larynx, windpipe or lungs. Frequently it is exhibited as a result of fracture of the ribs; when the sharp ends of the broken ribs penetrate the chest, the air escaping from the lungs insinuates itself into the fatty tissue surrounding the wound, and may spread to all parts of the body, rendering the whole surface swelled and puffy, and oppressing the internal organs, especially the lungs. *Treatment*: Keep the patient, especially his ribs, as quiet as possible, as the motions of the ribs tend to increase the swelling and aggravate the complaint, and prevent inflammation of the chest by relieving any existing cough or pain, so that the breathing may be as easy as possible; by bleeding, if necessary; also, by purgatives, as follows: Calomel and rhubarb, in powder, of each, 10 gr.; podophyllin, 2 gr.; mix; to be taken in syrup or sauce, and followed by 1 tablespoonful of castor oil, if it does not operate in 4 hours; after the operation, 10 gr. of Dover's powder, or 1 gr. of opium should be taken that entire quiet may be insured.

DROWNING, Restoration from. — (See *Asphyxia.*)

DYSENTERY.—A disease arising from inflammation of the mucous membrane of the large intestines, and characterized by stools consisting chiefly of blood and mucus, or other morbid matter, accompanied with griping of the bowels, followed by straining at stool. There is generally more or less fever, and the natural faeces are either retained or discharged in small hard balls. The common causes are marsh miasms, improper diet, excessive exhaustion and fatigue, and, above all, exposure to the cold and damp air of night after a hot day. *Treatment*: Give gentle aperients, ½ oz. of castor oil or the same quantity of Epsom salts to cleanse the bowels; then dilute muriatic acid, 2 fl. dr.; sulphate of morphia, 2 gr.; water, 3 fl. oz.; mix; 1 teaspoonful 3 times a day. The symptoms, which frequently hang about for some time, are best combated by mild tonics and vegetable bitters; comp. tinct. of cinchona, comp. tinct. of gentian, of each, 1 oz.; mix; take 1 teaspoonful 3 times a day, before meals. *Homeopathie*: Mercurius corrosivus should be given for the acute symptoms, a drop dose in a dessertspoonful of water every 2 or 3 hours; an occasional dose of aconite will reduce any feverish symptoms and moisten the skin; arsenicum is of value in the chronic form, a drop dose 3 times a day.

DYSPEPSIA. — The common symptoms of dyspepsia are, want of appetite, sudden and transient distensions of the stomach, frequent eructations, heartburn, stomachic pains, occasional vomiting, and frequently costiveness or diarrhœa; sometimes the head is affected, and dimness of sight, double vision, floating specks and slight vertigo, are experienced, along with a multitude of other symptoms, depending on derangement of the functions of the nervous system. In the higher ranks of society it is caused by over indulgence in the luxuries of the table, late hours, or the want of proper exercise both of body and mind. In the studious, and those who lead a sedentary life, it is caused by excessive mental exertion or anxiety, or by the fatigues of business, and the want of sufficient bodily exertion and of pure air. In the lower orders of society it results from indebtedness, or a deficiency of proper food and clothing, bad ventilation, etc. *Treatment*: This depends less on medicine than on the adoption of regular habits of life. Moderation in eating and drinking, and in the indulgence of the passions; early rising, due exercise, and retiring to rest at an early hour, will do much to restore the tone both of the stomach and nerves; excessive study and mental exertion should be avoided, and recourse should be had to society and amusements; if the bowels are confined, mild aperients should be taken, and if diarrhœa is present, antacids and absorbents may be had recourse to; the stomach may be strengthened by mild bitters, tonics and stimulants, and baths may be taken, when convenient, to strengthen the nervous system. Among the aperient medicines most suitable to dyspepsia, are Epsom salts and phosphate of soda, each in the dose of ½ oz., dissolved in 1 oz. of water; give 1 or 2 Seidlitz powders in a state of effervescence, every day, until the costiveness is removed; among the antacids are the bicarbonates and carbonates of potassa and soda; either of which may be taken in doses of ½ teaspoonful dissolved in water; if the spirits are depressed, 1 or 2 teaspoonfuls of spirit of sal volatile will be more appropriate; and in cases accompanied by diarrhœa, a little prepared chalk; as bitters, the compound infusion of orange-peel or of gentian are excellent; comp. tinct. of gentian and water, of each, 8 fl. oz.; 3 fl. dr. of muriatic acid; mix; 1 teaspoonful every 4 hours. As tonics, small doses of bark or of sulphate of quinine, to which chalybeates may be added, as sulphate of quinine, 40 gr.; sulphate of iron, 20 gr.; aromatic sulphuric acid, 10 drops; mix; and with gum Arabic mucilage make 20 pills; take 1 pill before each meal, if there is pallor of countenance, or a low pulse, with no disposition to fever or headache. When dyspepsia depends on constipation or a deficiency of bile, inspissated ox-gall acts with almost specific certainty; when the liver begins to assume its healthy form, its employment should be discontinued. From its well known power in causing muscular contraction, strychnia affords the most powerful means of restoring the gastric functions. Use the following formula: Acetate of strychnia, 1 gr.; comp. tinct. of cardamoms, 3½ fl. dr.; alcohol and water, of each 2½ fl. dr.; enough syrup to make the whole 4 fl. oz.; mix; 1 teaspoonful 3 times daily. *Homeopathie*: Nux vomica is suitable for persons of a bilious temperament; it relieves nausea, flatulence and pain, constipation, headache, and sleepiness, with wakefulness early in the morning; it suits those who are confined indoors, who use their brain too much, and their bodies not enough; a drop dose in a dessertspoonful of water, 3 times daily; bryonia meets many of the nux symptoms, but there is more of a weight at the stomach after food than pain; there is less flatulence, and the constipation is characterized by the large size of the evacuations; a drop dose in a dessertspoonful of water 3 times daily; china relieves pain after food, with flatulence,

in subjects weakened by loss of humors, as of blood, or milk, or matter; and when there is a tendency to diarrhea and coldness of the abdomen and extremities; pulsatilla is more useful when there is an aversion to rich or fatty food, a very foul taste in the mouth and a white fur on the tongue, when the patients are women, and of fair complexion, especially if the monthly flow is irregular or suppressed; arsenicum is suitable when there is burning pain at the stomach after the smallest quantity of food or stimulant, when the tongue is dry, and rather of a clean glazed red than furred, when there is thirst and relaxation of the bowels, when stimulants or highly spiced food have been freely indulged in, and if the stomach and bowels (not the liver) are especially at fault.

ECZEMA.—This is an eruption of minute vesicles, closely crowded, often running into each other, so as to form on being ruptured a moist sore, which becomes more or less covered with scabs, attended, usually, with feverishness and restlessness. *Treatment*: Light, nutritious diet, cooling drinks, and saline laxatives, as Rochelle salts, cream of tartar, etc., and warm or tepid baths of bran-water, elm-bark or flax-seed infusions, with 20 gr. of bicarbonate of soda to 4 oz. of the wash. If there is inflammation and burning, lime-water and linseed oil in equal parts, with the addition of 2 or 3 gr. of carbolic acid to 1 oz. of the mixture is an excellent application; later, use benzoated oxide of zinc ointment. In chronic cases cover the inflamed surface with oiled silk or rubber cloth, these being removed several times daily and the surface washed with a lotion of equal parts of glycerine and water. If the system is debilitated, use tonics in some form. Another good application is citrine ointment, 2 dr.; olive oil, 1 oz.; sulphate of morphia, 2 gr.; mix, and make an ointment; rub this ointment faithfully into the parts affected with eczema 2 or 3 times a day.

ELEPHANTIASIS.—The legs and feet are affected, becoming rough, scaly, and swollen to great size by serous infiltration, the skin growing thick and insensible. Compression is found to give but slight relief; nor do surgical processes, as ligature of the principal artery of the limb, appear to be successful. Electricity, by using both induced and continuous currents, will sometimes entirely remove the infirmity. The continuous currents appear to have the effect of softening, and to a certain extent liquifying, the indurated tissues, while the intermittent currents cause a reabsorption of the tissues thus prepared.

ERYSIPELAS, or ST. ANTHONY'S FIRE.—The symptoms are fever, delirium, vomiting, pulse strong or weak as the fever inclines to the inflammatory or typhus kind. By or before the fourth day the skin in some one part becomes red and inflamed, which is soon extended to others, the parts affected being swollen and bright scarlet. If the face is attacked, it spreads to the scalp, and the eyelids sometimes swell so as to prevent the patient from seeing; after a longer or shorter period the eruption ends in watery vesicles, or branny scales. *Treatment*: Tincture of iron, when there is debility (and this is very frequently the case), has quite a reputation both as a local application to arrest the spread of the inflammation, and, internally, in doses of 10 to 30 drops, every 2 hours, as a tonic and for constitutional effect. Quinine is also an excellent remedy, given internally in the dose of 4 to 5 gr., twice a day; and also made into paste as an external application. Diluted alcohol and tincture of iodine are also good external applications. A milk diet, or this with beef-tea where there is much prostration, is the most suitable. The patient must be kept clean, and the room should be large and fully ventilated. If a case of labor occur near by at the time, the patient should be sent away or carefully kept from the woman, as the latter is then particularly liable to take it, or to be attacked with puerperal fever. *Homeopathic*: Belladonna for the simple cases when there is great redness and irritation, and especially when the head and face are attacked, and delirium present; a drop dose every 2 or 3 hours; rhus is indicated when the vesicles appear and the inflammation wanders from part to part; drop dose every 3 or 4 hours; arsenicum will be required when matter forms and there is great prostration; a drop dose every 3 hours; dusting flour or whiting over the affected part is a simple and good application; in some cases hot fomentations will give great comfort.

ERYTHEMA, or INFLAMMATORY BLUSH.—This appears in slight, superficial, irregular red patches, most frequently on the face, chest and extremities, often with well-defined raised borders, not very sore, usually disappearing on pressure, but quickly returning again. *Treatment*: 1. The stomach and bowels may need attention, antacids and laxatives being required, as rhubarb and magnesia, 1 dr. of each, or ½ oz. of Rochelle salts, or citrate of magnesia, with light, unstimulating diet; bathe with bran-water and bicarbonate of soda, 1 dr. to the pt., or sponge frequently with sweet milk and water, and after entire drying, dust thoroughly with finely powdered starch or equal parts of starch and oxide of zinc, or apply cold cream, or lime-water and oil, or the benzoated ointment. When associated with a rheumatic constitution or other vice of system, the necessary constitutional remedies should be used. For the "chafing" of children, frequent bathing, careful drying, and then dusting with equal parts finely powdered starch and lycopodium, is usually sufficient.—2. 1 gr. of sulphate of atropia rubbed up with 1 oz. of glycerine forms an excellent application.

FAINTING.—This results from excessive grief, joy, anger, fright, any sudden or violent emotion, loss of blood, or other exhaustive discharges, diseases of the heart, etc.; with some persons odors of different kinds, and the sight of unpleasant objects will occasion it. *Treatment*: Lay a person who has fainted down in a current of air, or where the air from an open window or door will play upon his face; prevent a crowd closing around; the clothes also may be opened, cold water sprinkled upon the face, hands and chest, and some pungent substance, as smelling salts, camphor, aromatic vinegar,

etc., applied to the nostrils; as soon as able to swallow, give a little fresh water, or spirits and water. Persons who faint easily should avoid crowded rooms and places where the air is close.

FAT.—There are three modes by which fat can be reduced: Diet, exercise and specific medicines. The patient may eat lean mutton, beef, veal, lamb, tongue, sweetbread, soups, not thickened, beef tea and broths, poultry, game, fish, cheese, eggs, bread, in moderation; also greens, spinach, watercress, mustard and cress, lettuce, asparagus, celery, radishes, French beans, green peas, Brussels sprouts, cabbage, cauliflower, onions, broccoli, sea-kale, jellies, flavored, but not sweetened, fresh fruit in moderation, without sugar or cream, and pickles. He may not eat fat bacon and ham, fat of meat, butter, cream, sugar, potatoes, carrots, parsnips, beet root, rice, arrowroot, sago, tapioca, macaroni, vermicelli, semolina, custard, pastry and pudding of all kinds and sweet cakes. He may drink tea, coffee, cocoa from nibs, with milk, but without cream or sugar, dry wines of any kind, in moderation, brandy, whisky, or gin, in moderation, without sugar, light bitter beer, Apollinaris water, soda water and seltzer water. He may not drink milk, except sparingly, porter and stout, sweet ales, sweet wines; as a rule, alcoholic liquors should be taken very sparingly, and never without food. Among specific medicines, certain natural mineral waters are the best. Sea water is the best of all, as taken internally it acts as a diuretic and purgative, particularly the latter. A small glassful of it should be taken three times a day in a little fresh water or milk. Sea-water baths are also to be resorted to, free exercise should be practiced. 5 drops of Fowler's solution 3 times a day, will sometimes restore the patient to health in 2 months. Turkish baths have a reputation for reducing obesity.

FEET. Cold.—Sometimes cold feet come from over-action of the brain. In such a case use the brain less and the feet more. Many persons suffer from cold feet simply from a neglect to keep them clean. Warmth may be brought by washing and rubbing the feet in warm water every day. After the skin has become soft, a good washing with warm water twice a week during cold weather will greatly contribute to a healthful condition of the feet as well as to the personal comfort. Warm stockings or shoes, which compress the feet and render the separate action of each toe impossible, will not keep the feet warm.

FEVER AND AGUE, or INTERMITTENT FEVER.—There are several varieties, differing from each other in the length of time that elapses between the attacks. There is one called *quotidian*, occurring every 24 hours; another named *tertian*, every 48 hours; and the third, *quartan*, the interval lasting 72 hours. There is a very severe form of it called *congestive*, which is quite fatal and requires energetic treatment. The symptoms commence with yawning, stretching and uneasiness; this is succeeded by slight shiverings, that end in a violent shaking of the whole body; this is the cold fit, and is immediately followed by the fever; the pulse rises, the skin becomes hot, with pain in the head, tongue white, and all the marks of fever, terminating in a profuse sweat, which leaves the patient in his natural state, though somewhat weakened. *Treatment*: In the cold stage give hot, stimulating drinks; use the hot foot bath, and put the patient to bed, with hot bricks or bottles of hot water to the feet, sides and back; administer a teaspoonful of chloroform or a half teaspoonful of laudanum to cut short the paroxysm. In the hot stage give 20 or 30 drops of spirits of nitre, or a tablespoonful of the spirits mindererus every hour until the fever subsides; bathe the head and hands occasionally, and even the whole body, if agreeable to the patient, with water; when the sweating sets in, rub the patient with dry towels; in the outset of the paroxysm, if the bowels are constipated, give an active cathartic, as the infusion of senna and salts, or 3 or 4 cathartic pills; as soon as the fever has subsided, give quinine in 3 gr. doses every 4 hours, until some ringing in the ears is produced or the time for the next paroxysm past; the quinine may be taken in pills or in powder packed in capsules, 4 to 6 gr. twice a day. Iodine may be substituted for quinine, in doses of 12 to 15 minims for adults, 3 times a day; for children 5 to 10 minims, 3 times a day. The best form in which to take it, is as follows: Comp. tinct. of iodine, 6 dr.; syrup of acacia, 18 dr. *Homeopathic*: China in those cases where the complexion is jaundiced, the liver affected, or bilious diarrhea present; a dose every 3 hours; arsenicum, when the ague is accompanied by burning pain in the stomach, sickness, neuralgia, pains of the face and head, and if quinine should have failed or been given in excess, if dropsy is present; a dose every 4 hours; ipecacuanha, having a periodic action, will also be curative, especially when nausea and vomiting, oppressed breathing, and watery diarrhea are characteristic of the paroxysm; a dose every 3 or 4 hours; sulphur will remove the tendency to any recurrence of slight attacks, after the use of the first mentioned medicines; a dose 3 times daily. The medicine should be given in the intervals between the attacks, and not during.

FEVER, Ague Cake from.—A common name for an enlarged spleen, showing the cause of the complaint, as it results from ill-treated or obstinate intermittents. *Treatment*: If the bowels are constipated, give a dose of compound rhubarb pills, or a blue pill at bed-time, and a seidlitz powder, or dose of salts in the morning, and follow with 3 to 5 gr. of quinine in 20 drops of aromatic sulphuric acid in a wineglass of sweetened water 3 times daily, for a few days. If there is pain, apply a blister or repeated mustard plasters. If the case prove obstinate, give Fowler's solution of arsenic in 3 drop doses, 3 times daily, which may be persisted in for weeks.

FEVER, Bilious or Remittent.—A fever which occasionally abates, but does not entirely cease before a fresh attack comes on, so that the patient is never entirely free. For several days there is a feeling of debility, headache, lack of appetite, furred tongue, bitter taste in the mouth

in the morning, with pains in the joints and general uneasiness; nearly always a distinct chill or rigor, sometimes slight and brief, at other times severe and prolonged; there is generally but one well-marked chill, the returns of the fever not being preceded by a cold stage; at certain periods of the day there is a regular increase in the febrile symptoms, after which the fever moderates but does not subside. *Treatment*: First, give an emetic, 20 gr. of ipecac, or a large teaspoonful of mustard, in ½ gill of tepid water; its operation may be greatly aided by large and frequent draughts of warm water or boneset tea. Through the course of the fever, when the skin is hot and dry, sponge the whole body several times a day with tepid saleratus water; apply to the head cold water; iced drinks and iced lotion to the head, are frequently beneficial. Give 2 drops tinct. of aconite every 3 hours till the fever subsides. As a cooling febrifuge, administer 3 half Seidlitz powders during the day, if the bowels are at all constipated; but if they are sufficiently free, use the effervescing powders in the same manner. If there is headache or vomiting, apply mustard to the back of the neck or over the stomach. If the Seidlitz powders are not sufficient to keep the bowels open, use 2 or 3 comp. cathartic pills, or a tablespoonful of Epsom salts occasionally; and during the remissions give quinine as directed for ague. *Homeopathic*: Pale, yellow, earthy color of the face, yellow fur on the tongue, fetid breath, sore lips, gums and teeth, give mercurius; chill, followed by fever, hot skin, great thirst, red face, short breath, and very nervous, give aconite; low-spirited, out of humor, dizzy, putrid taste, no appetite, sour belchings, and loose bowels, give sulphur.

FEVER, Breakbone.—This fever, also called *Dengue* and *Rheumatic Scarlatina*, is characterized by great pain in the limbs, much general distress and watchfulness. *Treatment*: The expectorant plan, relieving urgent symptoms, and promoting as much as possible the patient's comfort and strength, is best adapted to secure a favorable result. It is indeed treated on general principles, like other fevers, and needs no special directions.

FEVER, Relapsing.—On from the fifth to the eighth day of this fever there occurs a copious sweating, with which all the symptoms cease, and the patient may feel well enough to get up and walk about; on the fourteenth day a sudden relapse occurs, which runs a similar course to the first attack; 3, 4, or more relapses may occur, and the patient may die from sudden prostration or exhaustion. It prevails generally as an epidemic, and recoveries from it are slow. *Treatment*: A Seidlitz powder, or rhubarb and magnesia at the beginning, and, if the headache is severe, mustard to the back of the neck and spine, cooling draughts, citrate of potash in 30 gr. doses in a glass of water, or the effervescing draught, 20 gr. bicarbonate of soda with 15 gr. tartaric acid, or a tablespoonful of lemon juice in a glass of water, may be freely used, until sweating occurs, when quinine, in 2 gr. doses, every 4 hours, with beef-tea, wine-whey, etc., should be given; bathe with salt and water, or spirits and water, with fresh air, and a good diet, with the continued use of tonics.

FEVER, Spotted, or Cerebro-Spinal Meningitis.—This disease sets in suddenly, commences with chill, followed with fever, violent headache, restlessness, and great prostration; as the disease progresses, irregular, purplish spots, varying in size from a pin's head to large patches, appear on different parts of the body. *Treatment*: On account of the sudden and great prostration, great attention must be paid to supporting measures. 1. If there is costiveness, clear the bowels with calomel, 10 gr.; aloes and rhubarb, of each, 5 gr.; mix, and give in syrup or sauce; bathe the head frequently with warm water; if there is nervous irritation, give ⅛ gr. of morphia, 2 or 3 times in the 24 hours; if the fever is high, give 5 gr. of quinia at bedtime, and 5 gr. at 11 A. M. — 2. The Calabar bean has been highly recommended in this complaint, and also the spurred rye or ergot, given in the following form: Tinct. of Calabar bean, 1 fl. oz.; fl. ext. of ergot, 1½ fl. oz.; mix; ½ teaspoonful every 2 hours; give wine freely to support the patient. *Homeopathic*: Frontal headache, double vision, muscular weakness, give gelseminum; chill, fever, restlessness and thirst, give aconite; stupor, slow breathing and slow pulse, give opium. Either of the above remedies, dissolve 10 globules in a tumbler ½ full of water, and give 2 teaspoonfuls every 2 or 3 hours, until improvement sets in, then lengthen the intervals between the doses. Diet the same as advised under inflammation of the brain.

FEVER, Typhoid.—The first symptoms are like those of other fevers, but more gradual in their development. For several days before its actual beginning the patient droops, loses his appetite, and his sleep is unrefreshing at night; a chill then ushers in the attack, with pulse ranging from 80 to 120; furred tongue; headache and pain in the back; sometimes diarrhea and swelling of the belly; and sometimes nausea and vomiting. *Treatment*: Give the patient good air and frequent spongings with water; if there is much constipation, give a teaspoonful of castor oil, after which no laxatives will generally be required; if the fever is high, give 30 drops of spirits of nitre every 2 hours, and apply cloths wrung out of vinegar and water, or ice water, to the head; should there be excessive action of the bowels, control with chalk mixture, or teaspoonful doses of spiced syrup of rhubarb with a few drops of laudanum or paregoric; give none but liquid nourishment, as toast-water and rice-water, for the first few days; then milk, light porridge, and, later, beef-tea, mutton or chicken broth; if there be much prostration or debility, wine-whey, milk-punch and egg-nog; sleep must be secured by opium or Dovers powders at bed-time; if necessary, by chloral or bromide of potash, 10 grains of each, given at bed-time in a wineglass of camphor-water, and repeated every 2 hours, until the desired effect is produced; if there is great soreness and tenderness of the bowels, especially in the right side, low down, apply hot fomenta-

tions, or light, hot poultices of hops and bran; the mouth must be frequently gargled, or, when the patient is too weak for this, washed with a solution of chlorate of potash, 1 dr. to a tumblerful of water; and quinine in 2 gr. doses, 2 or 3 times a day, should be given as a tonic, especially in the latter stages. Should there be symptoms of perforation of the bowels on account of too deep ulceration of Peyer's glands, give oil of turpentine, 5 drops, mixed with laudanum, 10 drops, 3 times a day; and keep the patient perfectly quiet. *Homeopathic*: As soon as the disease becomes clearly defined, give opium; repeat this once or twice, and if no change be effected, give arnica; if still there is no improvement, give veratrum, particularly when there is clammy sweat on the forehead, with coldness of the extremeties, great weakness, and unequal, laborious, rattling respiration; if these symptoms increase, the pulse become irregular and the tongue dark brown or black, give arsenicum; alternate the administration of the last two medicines every half hour; if temporary blindness is complained of, give belladonna; bryonia, rhus, and senega will be found useful, and in severe cases sulphur, followed by lycop., lachesis, phosph., ammon. c.

FEVER, Typhus.—The symptoms are languor, alternate flushes of heat and chills, pain in the head, difficulty of breathing, frequent weak and sometimes intermitting pulse, the tongue dry and covered with a brown fur, the forehead covered with sweat, while the hands are dry and glow with heat, the patient talking wildly. *Treatment*: In regard to principles and methods of treatment see *Typhoid Fever*; for there is no material difference in this respect between the two fevers. *Homeopathic*: When there is headache, giddiness, nausea, vomiting, watery, yellow greenish, slimy evacuations, give ipecacuanha, or 3 globules in a teaspoonful of water, every 3 or 4 hours; when frequent shivering, bitter taste, whitish tongue, loss of appetite, nausea, vomiting of mucus, slimy evacuations, give 2 globules of the 6th potency of pulsatilla in a little water every 3 to 6 hours; if the spasms are confined to the stomach, and there is painful pressure and tension in the epigastrium, a sensation as if the limbs were bruised, and nervous excitability with slight delirium, give nux vomica, 2 globules of the 6th potency every 12 hours; when there is a pale or yellowish appearance of the face, severe headache, a thickly coated tongue, bitter or foul taste, little thirst, dry burning skin followed by profuse sweats, extreme restlessness and anxiety, give mercurius, 3 globules of the 6th potency, in a little water, every 2 hours; cinchona is useful in the 1st stage, and china in the advanced stage of the disease; give globules of the 3rd potency every 6 hours; when inflammatory symptoms declare themselves, aconite, belladonna, bryonia and rhus will generally be found useful.

FEVER, Yellow.—A disease of warm climates. The symptoms are, first, the headache, weakness, and lassitude common to all fevers; the mouth is clammy, the tongue furred, and the skin hot, dry and hard to the touch; the eyes and skin yellow; then bilious vomiting; a great determination of blood to the head; the pupils are dilated; as delirium sets in, dark spots break out on the body; in fatal cases this is followed by the black vomit or dark-colored bile, and the tongue, gums and teeth are covered with a black, thick fur; blood bursts from the mouth, ears, nostrils and bowels. *Treatment*: Move the bowels with some mild cathartic, as ½ oz. salts, of rhubarb and magnesia, or of the citrate of magnesia. Some physicians precede this with 10 gr. calomel. If there is a chill, put the feet in a hot mustard bath, give warm cordial baths, and apply hot bricks, bottles of water, etc. Apply hot mustard fomentations over the abdomen, and give ice, iced champagne, lime water, or charcoal water, to relieve the vomiting. During the hot stage sponge freely with cold or tepid water. In the collapse, give stimulants, wine, brandy or whisky, with concentrated liquid food and quinine in 5 gr. doses twice a day. *Homeopathic*: In the first stage, when there is fever and thirst, red face, rapid pulse and dry skin, give aconite; headache, red eyes, coated tongue and cracked lips, give bryonia and belladonna; yellow face, pointed nose, sunken eyes and dull, throbbing headache, give arsenic; eyes sensitive to light, palsied limbs, pain, dizziness and drowsiness in the head, give mercurius. In urgent cases repeat the remedy every ½ hour or hour, but generally give a dose once in 2 or 3 hours; dissolve 3 drops or 12 globules in a tumbler ½ full of water, and give 2 teaspoonfuls at a dose, or 8 globules may be taken dry on the tongue; the diet must be mild and unirritating; a little thin gruel, made of rice or wheat flour, may be taken if the stomach will retain it; as a drink give pure, fresh water, toast-water, barley-water, or a little weak black tea; all alcoholic stimulants must be discarded; as the disease abates and the appetite returns, use the utmost care in changing to a more substantial or stimulating diet; the room should be well ventilated, and the sunlight freely admitted; the utmost care in regard to cleanliness should be observed, and the patient's entire body frequently sponged with tepid water.

FITS, Epileptic.—There is temporary loss of consciousness, strong spasms, and intervals between the fits; the patient falls down, senseless and convulsed, struggles violently, has a turgid and livid face, foams at the mouth, bites his tongue, and appears to be at the point of death; in from five minutes to a half hour, by degrees, these symptoms diminish; and then the patient falls into an apparent sleep. In a short time more he recovers, and is apparently well. *Treatment*: Little can be done during the attack, other than to prevent injury from the violence of the convulsions. To prevent the tongue being bitten, place a piece of soft wood, cork or leather, between the back teeth. Unbutton the clothing, and give, during the intervals, bromide of potash in doses of 25 gr., or ½ that amount of bromide of ammonia 3 times a day, in a glass of sweetened water. To build up the system, give the following: Citrate of iron and quinia, 1 dr.; sherry wine, 2 fl. oz.; mix; give 1 teaspoonful 3 times a day. *Homeopathic*: Medi-

eal treatment should be chiefly applied during the interval between the fits; and consists of the use of such medicines as belladonna, calcarea, cuprum, ignatia, nux vomica, opium, cina, sulphur, arsenicum, and phosphorus; the choice of the medicine will depend upon the peculiar character of each individual case, and this choice should always be made by the medical attendant.

GALL-STONES.—Generally found in the gall bladder, but occasionally in the larger biliary ducts. They vary in size from a grain of wheat to a large hazel-nut; and some have been found as large as a hen's egg, roundish or angular in form, and having the feel and consistence of soapstone. The pain is felt about three inches to the right, and a little below the point of, the breast-bone; is of a continuous, dull, aching character, at times becoming most excruciating. The paroxysms cause nausea and vomiting, cold sweat, small, frequent pulse, pallid face, and great exhaustion; the attacks usually come on without warning, continue from 1 to 3 hours, and stop suddenly, as the stone escapes through the duct. Attacks having once occurred are liable to be repeated. *Treatment*: 1. Sulphate of morphia, ¼ to ½ gr.; dissolve in ½ dr. of warm water and inject under the skin of the arm with hypodermic syringe; keep the patient under the influence of this narcotic by repeating the injection 2 or 3 times in 24 hours until the obstruction has passed the gall-duct.—2. The prolonged hot bath is often of signal benefit.—3. To promote the solution of the gall-stone, give muriate of ammonia, ext. of dandelion, of each, ½ oz.; water, 6 fl. oz.; mix; a dessertspoonful 3 times a day.—4. oil of turpentine, 3 fl. dr.; sulphuric ether, 2 fl. dr.; mix; ½ teaspoonful night and morning. *Homeopathic*: Give 4 oz. of warm olive oil as soon as the pain appears; apply cloths wrung out of hot water, or a bag of heated salt, to the locality of the pain, and give a warm bath. At the same time give either aconite, belladonna, china, nux vomica, sulphur, or camomilla. Of the appropriate remedy dissolve 3 drops or 12 globules in 10 teaspoonfuls of water and take 2 teaspoonfuls every 20 minutes, until relief is obtained.

GIDDINESS, or VERTIGO.—All objects, or the individual himself, seem to be turning round; the difficulty usually depends upon derangement of the stomach, but sometimes from congestion of the brain; it often announces an attack of apoplexy, or some other disease. *Treatment*: 1. Sulphate of quinia, 1 dr.; divide into 12 equal powders; 1 powder to be taken at 11 A. M., and another at bedtime, every day, until the symptoms are relieved. The other bitters have also proved useful, especially strychnia.—2. Acetate of strychnia, 1 gr.; comp. tinct. cardamom, ½ fl. dr.; alcohol, water, of each, 2½ fl. dr.; enough syrup to make 4 fl. oz.; mix; a teaspoonful twice a day. In the vertigo of the aged, the following formula is excellent: Corrosive sublimate, 1 gr.; glycerine, 1 oz.; comp. tinct. cinchona, 3 fl. oz.; oil of peppermint, 25 drops; mix; a teaspoonful in a wineglass of water 3 times a day. *Homeopathic*: If caused by close study, and there is dimness of sight, and whizzing in the ears, and constipated bowels, give nux vomica; if caused by a fall, blow, or mechanical injury, give arnica; when it arises from a disordered stomach, and there is nausea and repugnance to food, give pulsatilla; when from suppression of cutaneous disease, or old ulcers, give sulphur. If the attack is sudden and severe, dissolve 12 globules in 10 teaspoonfuls of water, and give 2 teaspoonfuls every ½ hour or hour until improvement sets in, then less frequent. In less urgent cases, 6 or 8 globules may be taken dry on the tongue 3 or 4 times a day. Persons of full habit, who are subject to attacks of vertigo, or rush of blood to the head, should abstain from all stimulants, even tea and coffee, be moderate in their eating, rise early, bathe frequently, and take plenty of exercise in the open air.

GOUT.—The symptoms are pain in the small joints, generally in the ball of the great toe, the parts swollen and red, the attack coming on in the night; in the advanced stages, chalky lumps are formed in the joints. *Treatment*: If the patient be young and vigorous, having the disease for the first time, bleed and purge him; confine him to a low diet, and treat it exactly as an inflammation arising from any other cause. To procure sweating, 10 gr. of Dover's powder may be taken on going to bed. The use of the wine of colchicum, of the pharmacopœa, a teaspoonful 3 times a day, will frequently carry off the paroxysm, and mitigate the symptoms. If the disease leaves the extremities and flies to the stomach, apply mustard poultices and blisters to the soles of the feet and ankles, give large doses of ether and laudanum, hot wine, brandy, etc., and endeavor by all such means, (including the hot bath), to send it back again; if transferred to the head, and apoplexy produced, take away 15 or 20 oz. of blood immediately, and give active purgatives, as 10 or 15 gr. of calomel, followed by senna tea or Epsom salts. *Homeopathic*: Give aconite to mitigate the feverish symptoms and pain consequent on an acute attack of gout; a drop dose every 2 or 3 hours; following it up with nux vomica, when the patient is of a bilious temperament, with confined bowels and a headache, a drop dose every 3 or 4 hours; or pulsatilla when the pains wander about much, and the foot is red and swollen, with relaxation of the bowels, and a bitter taste in the mouth; a drop dose every 3 or 4 hours.

HANGING, Apparent Death from.—The cause of death by hanging, results from the pressure of the rope or ligature employed on the jugular veins returning with their impure blood from the head to the heart; this pressure causes a rapid collection of blood in the veins of the head, face, and on and in the brain; the arterial supply of blood to these parts causes a rapid distension of the veins, which goes on for a few seconds, till their coats burst, their contents effuse into the cavities of the brain, press on the vital nerves and produce death; at the same time, the blood, checked at the points of external pressure, forms a clot in the jugular veins, presenting a barrier to the return of blood should the ligature be removed. *Treatment*: Immediately cut down the body, or hold

it up while another cuts the cord, and remove the stricture from the throat; lay the body on its back, then inflate the lungs. (See *Asphyxia.*) While the lungs are being inflated, as soon as possible, by hot bricks or flannels, bring heat to the spine, feet and thighs, continuing at short intervals the artificial respiration, the frictions, and cold affusions on the face.

HAY FEVER.—Emanations from new-mown hay, blossoming roses, and perhaps other vegetable growth, seem to produce in some persons sniffles and bronchial irritation. *Treatment:* Hot baths in some cases and quinia in others, have given marked relief. Sulphate of quinia, 4 gr.; concent. tinct. of gelseminum, 6 drops; mix; take this amount in a little water or sweetened milk every 4 hours. But this affliction is so difficult to control, that many yearly victims go regularly to high altitudes or summer resorts among the mountains, which affords them relief.

HEADACHE.—When headaches are habitual, and proceed from a torpid liver, first endeavor to excite the biliary function to a more healthy action by taking 3 or 4 3 gr. blue pills at intervals of as many hours, and follow with a Seidlitz powder, the citrate of magnesia, or 2 gr. of calomel and ½ to ½ gr. of morphia, in 20 gr. of bicarbonate of soda, with 2 gr. of powdered ginger as a corrective; take this at bed-time; if necessary, its action may be favored by a Seidlitz powder or ½ oz. of Rochelle or Epsom salts. When the consequence of some indigestible food, a mild emetic of 15 gr. of ipecacuanha, dissolved in some warm water, and the vomiting encouraged by draughts of tepid water, should be taken before the pain has extended over the whole head. Whatever may be the cause of the headache, the new remedy, guarana, will give relief, in doses of ½ oz. of the fl. extract, or 15 gr. of the powder, mixed with hot water, cream and sugar. Nervous headaches are relieved by nervous tonics and stimulants, as bark, cascarilla, calumba and gentian, camphor, ammonia, ether and wine, the latter in a state of considerable dilution. A cup of strong coffee or strong green tea often acts like a charm. Small doses of tincture of henbane have often a like effect. 20 or 30 drops of laudanum, or, preferably, half that number of black drop, or acet. tinct. of opium, may be taken with advantage as an anodyne, and to induce sleep. Soaking the feet in very warm water, in which a spoonful of mustard has been stirred, is also beneficial in drawing the blood from the head. 2 teaspoonfuls of powdered charcoal, well stirred in ½ glass of water, and drank at once, is a valuable remedy in sick headache from sour stomach, flatulence, etc.; but rest is the best cure. *Homeopathic:* Nux vomica relieves the nausea as well as the headache; a dose or two will often greatly assist the cure by relieving the congestion of the liver, as well as acting on the brain; mercurius will give relief when the complexion is sallow, and there is a tendency to diarrhea; aconite will relieve when there is much throbbing, and the skin is hot and dry, the patient thirsty, the pulse frequent, and there is much restlessness of the whole system; take a drop dose every 2 or 3 hours; give belladonna where the head seems full, the cheeks and forehead brightly red, the eyes suffused and intolerant of light, the patient feeling that if the headache were relieved the whole system would be restored to health; dose as for aconite; nux vomica will give relief when stimulants have been used too freely, or the brain over-worked.

HEARTBURN.—Heartburn is a pain or burning sensation in the stomach, and a symptom of dyspepsia; frequently accompanied by anxiety, faintness, inclination to vomit, gnawing in the stomach, sour eructations, or gulping up a watery, tasteless fluid. It often arises from the irritation of worms or the use of acrid or pungent food and drink. *Treatment:* 1. Charcoal biscuits, or charcoal in capsules, 2 or 3 dr. to be taken every day.—2. Powdered rhubarb, 1 dr.; bicarbonate of soda, 1½ dr.; oil of spearmint, 4 drops; water, 4 oz.; mix; a tablespoonful before each meal. *Homeopathic:* Gulping up a sour bitter fluid at night, nausea after meals, and constipation, give nux vomica; eructations of what has just been eaten, and gnawing in stomach, give pulsatilla; rancid gulpings, sour belchings, and after dinner sleepiness, give phosphorus; water in the mouth with empty retching and pressure in the stomach, and great fullness after meals, give china. Take 6 or 8 globules dry on the tongue ½ hour before each meal, for 3 days; omit the medicine for a few days; if no better, select another remedy, and take it in the same way.

HEART, Fatty Degeneration of the.—A term used to denote a change of the substance of the heart from muscle to fat. Another disease, sometimes called ossification of the valves of the heart, or of the arteries, consists in a similar change into a limy substance, and is properly denominated *calcareous* degeneration of the heart. In these cases, there is much weakness in the heart itself, as well as in the circulation, and in the whole general physical system. *Treatment:* The following tonics are deemed appropriate, and may retard and alleviate, although complete recovery may be impossible: 1. Tinct. of chloride of iron, tinct. of digitalis, sweet spirits of nitre, of each 10 drops; mix, and take in 1 fl. oz. of infusion of quassia, 3 times a day.—2. Tinct. of digitalis, tinct. of valerian, of each, 1½ fl. oz.; tinct. of chloride of iron, 1 fl. oz.; mix; take 25 drops 3 times a day.

HEART, Inflammation of, or Carditis.—This inflammation is frequently associated with acute rheumatism; the heart, being itself a muscular structure, sympathizes with the rheumatic inflammation of the other muscles. In carditis, the inside of the heart is chiefly affected, or, rather, its valves, which, being roughened and thickened by the inflammation, communicate to the ear of the listener a peculiar bellows sound by which this disease may be recognized; for the other symptoms of pain and discomfort are not so severe as when the outside of the heart, or its investing membrane, the pericardium, is inflamed. In inflammation of this membrane, or *pericarditis*, the patient's deportment

seems strange, there is a distressed aspect generally, palpitation, pain at the pit of the stomach, difficulty of breathing, stiffness and pain in left shoulder and arm, and sometimes delirium; and when the ear is laid over the region of the heart, in auscultation, a rubbing sound, called the "to and fro" sound, is distinctly heard. *Treatment*: The same as of acute rheumatism, modified to meet the emergency. Bleeding must be employed, if the general state of strength and excitement show it to be demanded, and that it can be borne; cupping between the shoulders is advisable in all cases; full doses of opium should be given at bedtime, to insure sleep; and calomel, with smaller doses of opium, in such quantities as the severity of the disease may demand during the day; purgatives given so as to clear out the abdominal viscera. Blood or cup the instant any abnormal sound is heard in the region of the heart; when the acute state has subsided, blisters will hasten the absorption of effusion or deposit of lymph.

HEART, Palpitation of.—Usually the result of some functional derangement rather than an organic disease. Women are more subject to it than men, and those of a nervous temperament and relaxed habit much more so than those of robust constitution. *Treatment*: to be governed by the cause of the trouble. If dyspepsia, hypochondria, hysterics, etc., these diseases require their usual treatment; when cured the palpitation will stop. When caused by an impoverished condition of the blood, some form of iron in one of the following formulæ: 1. Tinct. of chloride of iron, 2 fl. dr.; dilute phosphoric acid, 3 fl. dr.; essence of lemon, 1 fl. dr.; simple syrup, 2½ fl. oz.; enough water to make of the whole 6 fl. oz.; mix; take 1 tablespoonful after each meal.—2. Sulphate of quinia, reduced iron, of each, 1 dr.; acetate of strychnia, 1 gr.; enough ext. of gentian to make 60 pills; 1 pill before each meal, and also 1 pill at bedtime; these may be continued for weeks. The diet should be nourishing, roast and broiled meats, with regular, moderate exercise in the open air. Bathing and friction with a coarse towel or the flesh-brush, and regular habits of life will materially aid in effecting a cure. *Homeopathic*: If excited by motion or talking, and there are stitches over the region of the heart, give digitalis; if there is intermitting pulse, a feeling of anguish about the heart, and of fullness with throbbing headache, give belladonna; if the beating is very violent, with great agitation, upright position for the sake of breathing more easily, *orthopnea*, anxious expression of the countenance, give aconite. Dissolve 12 globules or 3 drops of the liquid in a tumbler of pint full of water, and take a dessertspoonful every ½ hour or hour in urgent cases; in chronic cases 2 or 3 times a day will suffice.

HICCOUGH.—A convulsive movement of the diaphragm and parts adjacent. The common causes are flatulency, indigestion, acidity and worms. *Treatment*: It may generally be removed by the exhibition of warm carminatives, cordials, cold water, weak spirits, camphor julep, or spirits of sal-volatile. A sudden fright or surprise will often produce the like effect. A pinch of snuff, a glass of iced soda water, or an ice cream, will also frequently remove this affection. Where other means fail, 20 or 30 gr. of chloral may be tried in a glass of ice-water. Temporary hiccough may be checked by holding the breath a few moments.

HOARSENESS.—1. Slowly dissolve and swallow a lump of borax the size of a garden pea, or hold about 3 or 4 gr. in the mouth for 10 minutes before speaking or singing.—2. Horseradish will afford instantaneous relief in most obstinate cases of hoarseness. The root possesses the most virtue, though the leaves are good till they dry. The root is best when it is green. —3. Bake a lemon or sour orange for 20 minutes in a moderate oven, open it at one end, dig out the inside, sweeten it with sugar or molasses, and eat.

HYPO, or HYPOCHONDRIASIS.— This is the depression of spirits or "blue devils." It chiefly affects persons of the melancholic temperament, and is commonly induced by hard study, irregular habits, want of proper social intercourse, living in close apartments, and insufficient out-of-door exercise. *Treatment*: Similar to that recommended for dyspepsia, observing, however, that success depends more on engaging and amusing the mind, than in administration of medicine.

INSANITY. — The studious, very nervous, and those who are engaged in sedentary or in-door occupations, or who indulge in irregular or vicious habits, as well as fast livers, are the most liable to this affection. It also frequently arises from disordered physical health. It is sometimes inherited. *Treatment*: Change of scene, out-door exercise, agreeable company, pleasing mental occupation, and due attention to diet, clothing, ventilation, etc., with the judicious use of some mild aperient medicine and tepid bathing, will generally alleviate, and frequently effect a cure. *Homeopathic*: If uneasy, with desire to change from place to place, and there is a suicidal tendency, give nux vomica; if fearful, and inclined to start, and stupid with spasmodic movements and trembling, and a slow pulse, give opium; face flushed and hot, eyes brilliant, pupils dilated, give belladonna; febrile symptoms, with full pulse and hot and dry skin, give aconite. Give 8 globules, or 1 drop of the liquid medicine, on a little sugar, once or twice a day, according to the violence of the symptoms; the diet should be plain and simple; all stimulating food and drinks of every kind should be avoided; frequent ablutions and change of clothing are essential.

ITCH.—This arises from a little insect called the *acarus*, or *sarcoptes hominis*, which burrows and deposits its eggs in the skin. The itching, always severe when approaching the fire or getting warm in bed, often becomes intolerable; this irritation induces papillæ, which soon pass into vesicles, and finally into pustules, which break under the patient's scratching, and the poisonous lymph still further propagates the eruption, the face being the only part of the body free from attack. *Treatment*: After thoroughly washing the entire body with soap

and water, strong sulphur ointment, or one composed of 2 dr. of sulphur, 1 of carbonate of potash, and ½ dr. oil of bergamot, to 1 oz. of lard, should be well rubbed in. The ointment should remain on over night, and be removed in the morning by a warm bath and plenty of soap. 2 or 3 repetitions of this is generally sufficient.

ITCH, Barber's, or Sycosis.—Little pimples on the hairy parts of the face and nape of the neck, with matter at the top, and have the shaft of a hair passing through them; are of a pale yellowish color, and in a few days burst; the matter forms into hard, brownish crusts, which fall off in 1 or 2 weeks, leaving purplish, sluggish pimples behind, which disappear very slowly. *Treatment:* Shaving had better be discontinued and the beard merely cropped off with scissors; all intemperance in eating and drinking and exposure of the face to heat, must be avoided; a light, cool diet will do much toward curing the disease. The nitrate of mercury ointment, or the iodide of lead ointment, or carbolized oil (1 part carbolic acid to 10 of olive or linseed oil), with frequent sponging with carbolic acid soap suds, are useful applications.

ITCHING, or PRURITUS.—Caused by a morbid sensibility of the nervous system, similar to what exists in hysteria. No local disorder is perceptible; the skin retains its wonted appearance, yet its nervous excitability occasions unspeakable torment. *Treatment:* Tonics and anodynes are required; give 10 drops of Fowler's solution of arsenic, in ½ oz. of water, 3 times a day, after meals; and ½ dr. of McMunn's elixir of opium, in a little sweetened water, once in 3 days. Apply locally lemon juice or vinegar mixed with an equal quantity of water; or chloral hydrate, ½ dr.; water, 4 oz.; mix. *Homeopathic:* The free use of the flesh-brush over the body will often greatly relieve the suffering, or the warm bath and soap will be found beneficial. Bathing with dilute alcohol will often allay the irritation. A dry state of skin, with burning heat, give arsenic; if the itching begins and spreads while undressing, give nux vomica; worse at night and when warm in bed, give mercurius; a biting sensation, like ants creeping over the skin, give pulsatilla.

ITCH, Seven Years', or Prurigo.—Small pimples, almost the natural color of the skin, attended with great itching, at times so intense that those suffering from it scratch and tear themselves until the blood flows; usually worse towards evening. *Treatment:* Hot salt water and sulphur baths, or, when it can be had, the Turkish bath, with tonics and good, plain nourishing diet, with saline laxatives or cream of tartar and sulphur, to keep the bowels open. The itching can be much relieved by bathing with bran water, carbolic acid, soap-suds, etc. One of the following formulæ makes a good wash: 1. Glycerine, 4 oz.; carbolic acid, 1 dr.; ext. belladonna, 20 gr.; water, ½ oz.; mix. — 2. Camphor and chloral hydrate, of each, 1 dr.; rub together till it becomes liquid; then add cold cream, 2 oz., and make into an ointment.

JAUNDICE.—The most prominent symptoms are yellowness of the skin and whites of the eyes, saffron colored urine, and whitish or clay-colored stools, impaired appetite, a loathing of food, a bad condition of the stomach, sickness and vomiting, a bitter taste in the mouth, some stupor and a dull pain in the right side. *Treatment:* An emetic in the early stage will often break it up by restoring the functions of the liver, from the shock caused to it by vomiting; also, if the result of obstruction by a gall-stone, the relaxing effect on the duct may enable the stone to pass. 2 gr. of calomel with 20 gr. of carbonate of soda at bed-time, have the effect of promoting an increased secretion of bile, and are useful in this affection. In cases of slow recovery, 3 or 4 drops of nitro-muriatic acid will hasten recovery. The warm bath is excellent, and the acid bath, made by mixing 3 parts of muriatic acid with 2 of nitric acid, and adding as much of this mixture to water as will make it like weak vinegar, is valuable in obstinate cases. Only a quart of water need be used, and the solution applied with a sponge. *Homeopathic:* Pain in region of liver, skin very yellow, tongue thickly coated, clay colored feces, give mercurius; obstructed duct, as in gall-stone, nausea, and fullness and soreness of liver, give podophyllum; sour and bitter taste in the mouth, swelled belly, weak, faint spells and flashes of heat, give sulphur; high fever, scanty urine, with acute stitches in side, give aconite; Of a solution of 12 globules or three drops in 10 teaspoonfuls of water, give 2 teaspoonfuls every three hours; or 8 globules may be given dry on the tongue at a dose; in chronic cases, repeating the medicine night and morning will be sufficient; the diet advised under *Inflammation of the Liver*, will be found suitable in this disease.

KIDNEYS, Bright's Disease of.—So named from Dr. Bright, the first to draw attention to this singular affection, the chief characteristic of which is the presence in the urine voided from the bladder of a greater or less amount of albumen, separated from the blood. The symptoms are pain in the back and loins, at first slight and occasional, but becoming heavy, dull and settled, accompanied with restlessness and fever, loss of appetite, hectic flushes and general disturbance; these are succeeded by enlargement of the loins, swellings, and finally a state of general dropsy. Heat applied to the urine will at once indicate its character; for the albumen will become coagulated, and, according to the amount present, will be seen floating in the water. *Treatment:* A warm bath, followed by friction over the loins with weak mercurial ointment, containing 1 dr. of camphor to 1 oz. of ointment. The bowels also should be regulated by some gentle laxative, as ½ oz. cream of tartar dissolved in flaxseed tea, or the same amount of Rochelle or Epsom salts. When there is considerable debility, give 5 gr. of quinia every forenoon at 11 o'clock, and the same dose at bedtime; or, give from 10 to 20 drops of the muriated tinct. of iron 3 times a day, before meals. *Homeopathic:* During the febrile symptoms, give aconite; if complicated with pneumonia or bronchial symptoms, give phosphorus; burning pain in kidneys, running along in the ureters to the bladder, scanty, dark urine,

with constant desire to urinate, and burning pain in the bladder, give cantharides; dropsical swelling in rheumatic and gouty subjects, and white sediment in urine, give rhus toxicodendron. In acute cases it may be necessary to repeat the remedy every 3 hours, but in the chronic form it will be sufficient to give it night and morning. Dissolve 3 drops or 12 globules in $\frac{1}{2}$ of a tumbler water, and take 2 teaspoonfuls at a dose. In the inflammatory stage, the diet should be plain and simple; in the chronic form, the patient should be supported by a nourishing diet; well cooked tender beef, mutton chops, fowl, and fresh cooked vegetables, puddings, bread and milk, etc.; all alcoholic liquors should be strictly avoided; daily ablutions and frequent out-door exercise are highly commendable, but excesses of every kind should be avoided.

KIDNEYS, Inflammation of.—The acute form begins with cold chills and rigors, followed by fever and pain. The pain frequently extends to the bladder, the loins and the thighs. The urine is scanty, high-colored, sometimes bloody, and can only be passed drop by drop. In the loins is a sense of heat, gnawing and constriction; the bowels are either constipated, or relaxed by diarrhea. A numbness of the thigh, and drawing up of the testicle on the affected side, are marked and peculiar symptoms. In some cases there is further derangement of the stomach and bowels. The skin is hot and dry, pulse hard and frequent. In the chronic form there is a dull, heavy pain in the kidneys, with a sensation of weakness of the back; the water is passed often, and in small quantities; is sometimes white and milky, and, upon standing, deposits sediment. *Treatment:* Put the feet in a hot mustard bath, or mustard drafts upon them; apply a large mustard poultice upon the small of the back, and follow it up with hot fomentations of stramonium leaves and hops, or stramonium and wormwood or tansy; let perspiration be induced as soon as possible by 2 drops of tinct. of aconite root, repeated every hour; the bowels, if costive, must be opened by $\frac{1}{2}$ oz. of Epsom salts or cream of tartar, or by copious injections of warm water, containing 1 tablespoonful of salt to the quart. The drinks must be mucilaginous and diuretic. The marshmallow-root, slippery-elm bark, flaxseed, mullein, elder blows, are all valuable. If the disease is caused by gravel, 20 drops of liquor potassa largely diluted with flaxseed or juniper berry tea, will be serviceable. In the chronic form, infusions of buchu, uva ursi, or pepsissewa, may be freely used, and an alkaline sponge bath every day; over the kidneys apply frequent mustard plasters, or rub on a few drops of croton oil every few days. The food should be at first very light and farinaceous, then plain and nutritious, and exercise in the open air be taken; but avoid exposure to cold and dampness. *Homeopathic:* At first, when there is hot skin, quick pulse and intense thirst, give aconite; where there is throbbing sensation over kidneys, heavy feeling in loins, with chilliness, heat and perspiration alternating with each other, give mercurius; pains shooting from kidneys to bladder, appearing and disappearing suddenly, urine scanty and of a bright yellow color, give belladonna. In the acute stage, the remedy may be repeated every 2 hours until improvement sets in; then extend the time to 4 hours; dissolve 3 drops of the liquid or 12 globules in $\frac{1}{2}$ of a tumbler of water, and give 2 teaspoonfuls at a dose.

LEPROSY.—This terrible disease appears in circular, red, scaly patches, of various sizes, on the arms and legs, and sometimes on the breast and shoulders. The margin of the patch is generally the highest, reddest, and most scaly. The scales are sometimes of silvery whiteness. *Treatment:* This is very difficult to cure. Internally, arsenic in form of Fowler's or Donovan's solution, 8 to 15 drops thrice daily, should be continued until some constitutional effect is noticed. Bathing and friction with the hand should be practiced, and tar ointment, citrine ointment and a lotion of glycerine and carbolic acid, 1 dr. carb. acid to 2 oz. glycerine, should be applied, and the parts protected by covering them with rubber or gutta percha cloth.

LICHEN. — An affection of various forms. Small, round or pointed pimples, reddish or purplish, appear on the face, neck, etc., distinct or in clusters, accompanied with itching and tingling, followed by a slight scaly formation as they subside. In the form called "prickly heat" the eruption is not generally so prominent, but is usually of a bright red color, and very irritable. *Treatment:* In the first mentioned form, tonics and alteratives are frequently required. Fowler's solution of arsenic may be tried in 3 drop doses 3 times daily, omitting it occasionally if headache, nausea, diarrhea or puffiness of the face occur. The diet must be regulated; greasy food must be avoided, and $\frac{1}{2}$ oz. Epsom salts, or cream of tartar and sulphur, used if the bowels are constipated. For "prickly heat" use tepid salt-water baths, and sponge frequently with bran water, with a teaspoonful of bicarbonate of soda or borax to the pint, and 15 to 20 gr. of carbolic acid, when the irritation is severe.

LIGHTNING STROKE.—Never, during a storm of thunder and lightning, fly to the dangerous cover of a tree, pillar, hay-rick, wall or hedge. Also avoid the vicinity of metal objects; when in the house do not sit or stand near the windows, doors or walls, but place yourself in the middle of the room, unless there should be a lamp or chandelier hanging there; keep away from the neighborhood of fireplaces. *Treatment:* If a person is struck, immediately strip the body and throw bucketfuls of cold water over it for ten or fifteen minutes; continued frictions and inhalations of the lungs must also be employed.

LIVER, Inflammation of, or Hepatitis.—In the acute form, there is a dull pain in the right side below the rib, an inability to lie on the left side, pain in the right shoulder, and a sallow complexion. In the chronic form, its approaches are so gradual that it is difficult to determine its nature. It commences with all the symptoms of indigestion and ends with jaundice or dropsy. *Treatment:* Hot fomentations should be applied freely over the liver and a brisk saline cathartic, a tablespoonful of salts, or a salts and senna

draught, should be given, after which the bowels should be kept open daily by teaspoonful doses of Rochelle salts or rhubarb and soda, or magnesia, with cooling drinks, to allay feverishness and promote free action of the kidneys. Repeated blisters or mustard plasters may be used, with mineral acids and bitter tonics, during convalescence. The diet should be light, gradually improving as convalescence progresses. Should abcesses form, use warm poultices. In chronic cases, for the tenderness over the liver, apply mustard poultices and dry cups, and to move the bowels, give 2 gr. podophyllin in 1 oz. fl. extract of rhubarb and senna, of which give a teaspoonful, 3 times daily. Frictions over the stomach and liver with nitromuriatic acid, diluted to the strength of strong vinegar, and a foot bath of the same may be used. *Homeopathic*: A feeling of fullness and pain, with nausea and bilious vomiting, and bitter taste in the mouth, give podophyllum; violent fever, with stitches in the side, restlessness, anxiety, giddiness and headache, give aconite; tenderness over the liver, yellow skin, and inability to lie on the right side, give mercurius. In urgent cases, the remedy may be repeated every 2 hours, until improvement begins; then extend the time to 4 hours; dissolve 12 globules or 3 drops of the liquid in 8 dessert-spoonfuls of water, and take a spoonful at a dose; all greasy food should be avoided; rice, oatmeal, tapioca, plain puddings, simple toast, vegetables and fruits, should constitute the diet.

LOCKJAW, or TETANUS.—There are two varieties of this disease, the *traumatic* and *idiopathic*. Traumatic lockjaw is a very dangerous malady, and is usually caused by wounds, the irritation of splintered bones, and sometimes follows amputations. Idiopathic lockjaw proceeds from constitutional causes, and is far less dangerous than the former. It may arise from debility of the nervous system, and from affections of the brain. The disease commences with stiffness and pain in the neck and jaws as if from a cold; the voice is husky; there is difficulty in protruding the tongue, and in articulating; the muscles of the jaws and throat become rigid, with great difficulty in swallowing; a pain at the pit of the stomach succeeds these, shooting to the back, with difficulty of breathing; as the disease advances, the paroxysms become more frequent, the jaws locked, the breathing obstructed, and the patient dies from exhaustion or suffocation. *Treatment*: All wounds made by nails and other sharp instruments, especially in the bottom of the foot or in the palm of the hand, should not be allowed to heal up too quickly; such wounds should be thoroughly cleansed with a solution of chlorinated soda, 1 teaspoonful to 6 of water, and compresses, wet with the same, bound to the parts. When there is a foreign body in the wound, as dirt, rust, a splinter, or a piece of bone, it should at once be cut out.

LUNGS, Bleeding from, or Hemorrhage.—Let the patient at once go to bed, and keep perfectly quiet, avoiding movement of any kind as much as possible; the attendants should endeavor by their manner and conversation to cheer and encourage the patient; cloths wet with cold or ice water should be applied to the chest and throat, and small quantities of cold or iced water, or ice lemonade, or small bits of ice may be given; or he may swallow a little salt or vinegar; but under no circumstances must he have any warm drink, or be taken into a warm room. *Homeopathic*: During the attack, and for some time after, keep the patient perfectly quiet. And when the case is violent, tie a handkerchief around the upper part of the left arm as tightly as it can be borne, and another around the upper part of the right thigh; and if this does not arrest the bleeding, ligate the right arm and left thigh in the same way. So soon as the hemorrhage stops, loosen the bandages gradually. If there is much fullness of chest with palpitation of heart, restlessness, anxiety, and nervous excitability, give aconite; red flushed face, difficult breathing, pain between the shoulders, give ferrum; dry cough, especially at night, disturbed sleep, awaking with a wild, staring look, give hyoscyamus; congestion of the head and face, tickling in the throat with cough and bloody sputa, giddiness while stooping down or rising up, taking cold easily, give belladonna.

MERCURIAL DISEASE, or HYDRARGISM.—This results from the injudicious or excessive use of mercury, or exposure to the fumes of this metal. The common and leading symptoms are a disagreeable coppery taste; excessive salivation; sponginess, tumefaction, and ulceration of the gums; swollen tongue; loosening of the teeth; exfoliation of the jaws; remarkably offensive breath; debility; emaciation; ending, when not arrested, in death from exhaustion. *Treatment*: The principal remedy is iodide of potassium, 10 to 15 gr., 3 times a day; the following tonics are useful helps: 1. Iodide of potash, 4 dr.; comp. syrup of sarsaparilla, comp. tinct. of gentian, of each, 1 fl. oz.; mix; a teaspoonful before each meal.—2. Sulphate of quinia, reduced iron, of each 1 dr.; acetate of strychnia, 1 gr.; sufficient extract of gentian to make 60 pills; mix; 1 pill to be taken before each meal, and 1 at bedtime.

MORTIFICATION.—The part affected feels cold, moist, and inelastic; the skin becomes marked with dull purple spots; small blisters next rise, which eventually become black, and emit a fetid odor; a line of demarcation now appears; there is a rapid prostration of strength; the spirits are greatly depressed; the face looks care-worn; the pulse is small, quick and feeble; the body is covered with a cold perspiration; and an attack of hiccough, more or less loud, will proclaim approaching death; if the mortification is trifling in extent, constitutional disturbances are only slightly indicated. The mortification of old age, dry or senile gangrene, usually attacks the feet or the hands. A small black spot is first seen, which spreads over the entire part. *Treatment*: If the cause be inflammation, it must be treated as such; then tonics, bitters and a nourishing diet must be used; 3 gr. of quinine in 20 drops of the tincture of iron, or when quinine cannot be taken, the tincture of nux vomica should be given in 10

drop doses, with beef-tea, porter, ale, etc. Opium in grain doses, repeated as required; or chloral in 10 gr. doses, in like manner, may be necessary to relieve pain and quiet nervousness. To remove the stench, a charcoal and flaxseed poultice may be applied, with frequent cleansing by pouring over the part a weak solution of carbolic acid, 1 dr. to a pint of water. Keep the patient surrounded with an abundance of fresh air.

MOUTH. Inflammation of, or Stomatitis.—It begins with small red elevations, with minute, white, pearly points or vesicles on them, which soon break and allow serum to escape, leaving little rounded ulcers of grayish color, with more or less thickened edges, and surrounded with redness; they appear first on the inner surface of the lips and gums, and then on the cheeks, edges of the tongue, and soft palate; in severe cases, there is often fever, thirst, nausea, and vomiting, offensive breath, and high-colored urine, with constipated bowels or diarrhœa; in the milder attacks, some, or all, of these may exist in a mild degree; it may last but a few days or continue for weeks. *Treatment:* In mild attacks, all that may be required is to regulate the diet, and gargle or wash the mouth with infusions of elm-bark, flaxseed, marshmallow, or quince seeds, to which 1 dr. to the pt. of chlorate of potash solution is added, and touching the ulcers occasionally with a mixture of one part borax to two of honey; or prepared chalk rubbed up in glycerine to the consistence of a thin paste. If the bowels are costive, ½ oz. of Epsom or Rochelle salts may be given, or 10 gr. of rhubarb, with twice as much magnesia. In severe cases, or where the ulcers prove obstinate, a gargle may be used of 2 dr. of chlorate of potash in 4 oz. of water, and 1 teaspoonful of it given internally, 4 to 5 times daily; the ulcers may be touched occasionally with the solid nitrate of silver (lunar caustic), or with alum in substance, and quinine, 3 gr. in 10 drops tincture of iron, given 3 times daily, and even stimulants, as wine-whey, milk-punch, brandy and eggs.

NERVOUSNESS.—The derangement of health, and the complication of disagreeable sensations which are popularly described under this name, are indicative of the vital system being out of order, that its energies are failing or overtasked, and that the functions of some of its organs are languidly or imperfectly performed. *Treatment:* This consists mainly in restoring the healthy action of the stomach and bowels, and in the use of proper exercise. The stomach should not be overloaded with indigestible food, and the bowels should be occasionally relieved by the use of a mild aperient, in the following form: Bicarbonate of soda, 1 dr.; powdered rhubarb, ½ oz.; essence of peppermint, 2 fl. dr.; enough water to make 4 fl. oz.; a tablespoonful every 4 hours, until the bowels are free. Milk with lime water should be the food 3 times a day, till cured; celery is another good cure, taken as much as desired, green or cooked.

NETTLE-RASH.—An eruption of round red or white elevated patches, attended with intense burning, itching and tingling; sometimes it continues in one place for hours, but more frequently it disappears in a few minutes, and again makes its appearance in some other place. *Treatment:* If caused by anything eaten, give an emetic, or a brisk saline cathartic, ½ oz. of Epsom salts or citrate of magnesia, preceded, if there be torpid condition of the liver, with 3 gr. of blue-mass, or 1 gr. of calomel and 10 gr. of bicarbonate of soda; or in children, 2 or 3 gr. of mercury with chalk, followed with 1 dr. each of rhubarb and magnesia, or of magnesia and charcoal. A warm salt-water bath, or sponging with vinegar and water, glycerine and rose-water, 1 part to 6, or bran-water and bicarbonate of soda, or strong carbolic acid soap-suds, will relieve the itching. The diet must be regulated, and the tonic effect of quinine, 2 gr. repeated 3 times a day, may be used to prevent a return of it. *Homeopathic:* Aconite will give relief when the rash is due to a chill; a drop dose every 2 or 3 hours; pulsatilla when either digestion or menstruation are at fault; dose as for aconite; rhus when the itching is excessive, worse in bed and the patient rheumatic; dose as for aconite; Sponge the skin with hot water, or take a warm bath, if it is not too soon after a meal; after the attack, all exciting causes must be inquired into and removed; Turkish baths will prevent the recurrence of attacks; the chronic form of nettle-rash should be treated by a medical practitioner, as there is sometimes a history of gout traceable.

NEURALGIA. — Acute, shooting or darting pains. The pain can always be distinguished from any other by being neither augmented by motion nor relieved by rest, and by being unaffected by pressure, unless, as sometimes occurs, inflammation should exist at the same time. It may affect any of the sensitive nerves, and has received different names according to the seat of it. Thus, tic doulloureux is facial neuralgia; hemicrania, that affecting the side of the head; sciatica, that of the hip; pleurodynia, of the pleura; and gastrodynia, of the stomach. *Treatment:* When from a local cause, as in tic doulloureux, sometimes upon decay of the teeth, the cause must be removed. Laudanum, tincture of arnica, or tincture of aconite root, may be applied by saturating a cloth with them, and applying over the seat of pain, covered with oiled silk to prevent evaporation; chloroform may be in like manner applied. Mustard plasters, and flannels steeped in hot water, will often give prompt relief. In obstinate cases a blister may be applied, and the blistered surface sprinkled with 1 gr. acetate of morphia; or ¼ gr. morphia in solution may be injected hypodermically. The inhalation of ether and chloroform may also be resorted to. Of internal anodynes none are superior to belladonna. Opium and belladonna may be given conjointly in doses of ½ to 1 gr. of opium and ½ to ¼ gr. of belladonna every hour, until some effect is produced, when the time may be lengthened. Quinine, iron and strychnine are a most efficient tonic combination taken in the following form: Sulphate of quinia, reduced iron, of each 1 dr.; sulphate of strychnia, 1 gr.; enough ext. of gentian to make 60 pills; take 1 pill before each meal, and also at bed time. Generous diet, change of air, and sea bathing,

etc., will assist in curing this; great benefit is at times derived from covering the part with carded cotton, and then enveloping in flannel bandages; also, by cutting a thick slice of bread, soaking one side for a minute in boiling water, and rapidly sprinkling cayenne pepper over the hot side; apply, while still smoking hot, to the painful surface. The operation of acupuncture is very efficacious in some cases of neuralgia; this is done by running in 5 or 6 needles with a rotatory motion. *Homeopathic:* Cutting and tearing pains, worse in the afternoon, with convulsive jerkings and intolerance of noise and light, give belladonna; if the part is hot and red, with febrile symptoms, anxiety, giddiness and restlessness, give aconite; nervous symptoms, intolerable pain with despairing feelings, twitching of muscles, delirious, continually talking, with eyes wide open, give stramonium. In acute cases and where the suffering is great, repeat the medicine every hour until relief is obtained; then extend the time to 3 hours, or as the case may require; of a solution of 12 globules or 3 drops in 12 teaspoonfuls of water.

NIGHTMARE.—The symptoms are generally well understood, and they are caused by the effects of too hearty or indigestible suppers eaten too short a while before going to bed. *Treatment:* This must be mainly preventive. The diet should be simple and well regulated, and the supper light, and the evening spent in some pleasant recreation or amusement; avoid sleeping on the back or in constrained, uneasy positions; the bowels should be kept regular by mild laxatives when required, and as much outdoor exercise as possible taken.

NOSTRILS, Diseases of.—1. (*Imperforate Nostrils.*) The nostrils are sometimes imperforate, owing to congenital malformation. *Treatment:* The passage may be restored by a cautious incision, and must be kept open with bougies. If, however, the obstruction be seated far back, it ought not to be meddled with.—2. (*Rhinorrhœa or Ozæna.*) A purulent or sanious discharge from one or both nostrils; it is but a symptom, and it will be necessary to consider the diseased conditions on which it may depend. *Treatment:* Remove to a dry, bracing atmosphere; take aperients, bark with mineral acid, and inhalation every evening of the steam of boiling water, to which 20 or 30 drops of creosote have been added.—3. (*Scrofulous Rhinorrhœa.*) Generally begins in early life, and depends on inflammation or ulceration of the mucous membrane. *Treatment:* Use a large syringe daily to wash out all clots and collections of matter with a copious stream of warm water, to which a little chloride of zinc may be added; a leech or two should be applied to the inside of the nostril if the bridge of the nose is tender, or if there are any marks of obstruction about the lachrymal duct; the citrine ointment, 1 dr. mixed with 1 fl. oz. of warm liquid lard, may be applied by a camel's hair brush, and bark, iodide of potassium, cod-liver oil, and other anti-scrofulous remedies administered in tedious cases.—4. (*Syphilitic Ozæna.*) The presence of foreign bodies should always be inquired into in any case of discharge from the nostrils; the examination may be facilitated by chloroform, and by the ear speculum, or dilating the nostrils with forceps.

ONANISM, or MASTURBATION.—A habit generally formed in early life, about the age of puberty, and taught by the older to the younger, by the guilty to the innocent. Youth know not the evil consequences of this vice, and must be watched and taught to shun the practice; it must be prevented, or broken up in its incipiency, by timely instruction and proper management; if it is once firmly established, it will be extremely difficult to eradicate. The practice is often produced by uncleanliness, or irritating eruptions. *Treatment:* Abandon at once the practice that has induced the emissions; the patient should restrain his thoughts from all lascivious subjects, and avoid the reading of all books that tend in any way whatever to excite this passion; he should make use of frequent ablutions, and take regular active exercise in the open air, sleep on a hard bed or mattress in a well-ventilated room, and rise early in the morning; the diet should be plain but nutritious; very little animal food should be taken, and no stimulating condiments used; the suppers should be light and early; all stimulating drinks of whatever kind, even tea and coffee, should be strictly avoided, as well as tobacco in all its forms.

OPIUM HABIT.—Opium holds its victims with a power well-nigh resistless. No other drug can compare with it in this respect; and no other has yet been discovered to take its place. *Treatment:* Where this habit has existed for a comparatively brief period and patients are young and strong, the best plan is to stop it at once, and sustain the strength with food and tonics until recovery; where the habit has been existing several years, and the patients are old and weak, such a course would be highly dangerous, and might prove fatal. These should adopt a gradual and systematic reduction of the opiate dose, supplying its place as much as possible, with a tonic in one of the following forms: 1. Take sulphate of strychnia, 1 gr.; water, 2 fl. oz.; simple syrup, 6 fl. oz.; mix, and take 1 teaspoonful 3 times a day.—2. Sulphate of quinia, 30 gr.; dilute sulphuric acid, 10 drops; water, 2 fl. oz.; tinct. of chloride of iron, 2 fl. dr.; mix, and take 1 teaspoonful 3 times a day. Chloral hydrate in ½ dr. doses, or bromide of potassium, with the same dose, or tinct. of hyoscyamus in the dose of 1 fl. dr., are used occasionally to quiet the nerves and produce sleep. The chief curative agent is a determined will. "They that endure to the end, shall be saved."

PARALYSIS, or PALSY.—This may involve the power of motion or feeling, or of both, in the whole body, or may be partial or local, affecting certain portions only. The following are among the most frequent varieties: *Hemiplegia:* Palsy affecting one entire side of the body; *Paraplegia:* Palsy of the lower half of the body, chiefly affecting the legs and leaving the rest of the body free; *Palsy of the Face:* In which there is loss of motion or sensation in certain muscles, according to the nerves affected, and giving rise sometimes to muscular twitchings, especially during eating and speaking; strabismus or

squinting, in which one or both eyes may be drawn from their proper line of vision, is sometimes present, as a symptom in this complaint. The most severe paralytic strokes occur without the slightest appreciable warning or suspicion as to their approach. A non-professional could form an opinion as to a probable fit of palsy only by constant headache, confusion of ideas, loss of memory, impaired vision, deafness, constant drowsiness, and a pricking sensation in that part about to be attacked. *Treatment:* A sudden and severe attack of palsy requires the same treatment as apoplexy (see *Apoplexy*). When the bowels are obstinately constipated, the compound cathartic, or compound colocynth pill, or even croton oil, with stimulating injections, may be necessary; when the bladder is affected, there is often a painful retention of the urine; in such cases use the catheter twice a day; when there is suppression of the secretion, draughts of linseed tea, with 5 gr. of nitre and 10 drops of tincture of cantharides should be given 3 times a day. When the inflammatory symptoms have subsided, and in cases of marked debility from the beginning, strychnia, cautiously used, may be tried; strychnia 2 gr.; extract belladonna 8 gr., with extract of gentian and conserve of roses enough to make into 50 pills, may be used in doses of 1 pill 4 times daily. In some cases, electricity is useful. In local paralysis, use the following formula: Sulphate of strychnia, 2 gr.; chloroform, 1 oz.; mix; apply half, night and morning, by brisk friction to the part. *Homeopathic:* Partial palsy of face and limbs, giddiness, weak eyesight and memory, and noise in the ears, give nux vomica; head congested with blood, spasm on one side of the body, palsy of face, give belladonna; loss of motion, but not of sensation, palsy of throat and eyelids, give gelseminum. In administration, in acute cases, dissolve 12 globules or 3 drops of the dilution in 10 teaspoonfuls of water, and give 2 teaspoonfuls every 3 hours; in the chronic form, 8 globules may be given once a day for a week, then omit for a few days.

PEMPHIGUS, or POMPHOLIX.—Large blisters, from the size of a pea to an inch or more in diameter, form on almost any part of the body, and break in a day or two, leaving a raw surface, which soon becomes covered with a thin crust; the eruption is generally preceded with feverishness for a day or two, and itching of the skin. *Treatment:* Good diet and tonics, with frequent bathings; the blisters should be punctured to allow escape of the water they contain, without removing the skin, and water dressings, or weak lead water and laudanum, and, later, the ointment of oxide of zinc should be applied.

PLAGUE.—The symptoms are of two orders, local and general; in severe cases, the general symptoms precede the local; the patient is suddenly seized with high fever, which, in some instances, is ushered in by a prolonged shivering fit; the pulse beats 130, or even more, and the temperature of the body rises to above 107.6° F. The nervous agitation which sometimes ushers in the attack is a very remarkable symptom; it is a prolonged, regular shake, lasting from six hours to three days. In the usual course of plague, however, the local precede the general symptoms; the patient first complains of pain in the groin, the armpit, or the neck, and a swelling is found there, which rapidly increases and usually suppurates by the seventh or eighth day; at the same time carbuncles may show themselves, and in bad cases petechiæ, purple spots. *Treatment:* Support the patient's strength as much as possible and sometimes nature will conquer.

PLEURISY.—The symptoms are most frequently shiverings, succeeded by high fever, with a peculiarly hard, resisting pulse, sharp, stabbing pain in the side, generally just below the nipple, but sometimes extending back, hurried and interrupted breathing, short, dry cough; the pain is considerably aggravated by motion, coughing, or an attempt to take a long breath; the patient lies upon his back or well side, his countenance full of anxiety, fearing motion, often crying out from the torture; later, he will prefer to lie on the diseased side, as this leaves the healthy one more free for breathing. *Treatment:* The entire affected side should be covered with a fomentation of a sufficiently large flannel wrung out of hot mustard water. After a brisk cathartic, as 3 or 4 compound cathartic pills, or senna and salts, a hypodermic injection of ¼ gr. of sulphate of morphia in ½ dr. of hot water should be administered under the skin of the arm, and tartar emetic given in 1-10 gr. doses every 3 hours. To procure sleep, and at the same time promote sweating, Dover's powders may be given in 8 gr. doses twice a day. As soon as the heat of the skin has subsided, if the pain continues, a large blister may be applied, and if necessary, may be repeated with excellent effect. *Homeopathic:* Give aconite for the chills, a drop dose every 2 hours, followed by bryonia for the catching pain in the side; they can be alternated, especially during the feverish symptoms. Hot fomentations to the side are absolutely necessary; the patient should be kept in bed, on a light diet, without stimulants; when there is effusion of fluid in the chest cavity (which is indicated by greater distress of breathing, bulging of the affected side, and a dull sound, if on the left side, when tapping the chest walls), such a condition requires medical advice.

PNEUMONIA, or LUNG FEVER.—The symptoms are pain in the chest and difficulty of breathing, cold chills, headache, thirst, and all the general indications of fever, attended with heat of the surface of the chest, great debility, anxiety, and a dry, hard cough; the tongue is furred, and the pulse quick and small; about the third or fourth day a reddish, or rusty colored expectoration takes place, when the cough loses its hard, dry sound, and becomes loose. *Treatment:* A full dose of Epsom salts or citrate of magnesia should be given to unload the bowels. Tartar emetic, in ½ gr. doses, may be given every 2 hours, until the pulse is brought down and the fever abated, and then ½ dr. doses of wine of ipecac substituted; mustard plasters may be applied over the chest, and repeated, or alternated with some stimulating liniment; or, the chest may be covered with a hot poultice. If the cough is troublesome, some simple cough mix-

ture may be used, as paregoric, syrup of squill, mucilage of gum Arabic, of each 1 oz.; mix; take a teaspoonful 3 or 4 times a day; the diet during the earlier or febrile state should be light and unstimulating, consisting mainly of weak broths and gruels; as the disease progresses and the strength of the patient indicates, it should be increased; later, when the expectoration is free, tonics and even stimulants may be required; when in the progress of the ease, the inflammation assumes a typhoid form, a sustaining treatment and stimulants may be required. *Homeopathic:* Give aconite at the outset, a drop dose every 2 hours, when there are chills and dry cough, also when the chills give place to the feverish symptoms; then it can be alternated with phosphorus, indicated by difficulty of breathing, pain in the chest, and rusty or plum-colored expectoration; a drop dose every 2 hours; bryonia may be given when there is much pain in the side, and if the complexion looks yellow, a drop dose every 3 hours; antimonium tart., when the cough is looser, but the phlegm causes a suffocating feeling; a drop every 3 hours.

POISONING.—When a person is discovered to have swallowed poison, unless vomiting has already occurred, empty the stomach by an emetic that can be most readily and quickly obtained, and is prompt and energetic, but safe in its action; for this purpose, there is, perhaps, nothing better than a large teaspoonful of ground mustard in a tumblerful of warm water. If the mustard is not at hand give 2 or 3 teaspoonfuls of powdered alum in syrup or molasses, and give freely of warm water to drink; or give 20 gr. of sulphate of zinc (white vitriol), or of ipecac, in a large cup of warm water and tickle the throat with the finger, or with the feather end of a quill; copious draughts of warm water or mucilaginous fluids should be given to keep vomiting up until the poisonous substances have been thoroughly evacuated, and then suitable antidotes should be given. If vomiting cannot be produced, the stomach pump should be used; if a stomach pump cannot be procured, the following means may sometimes be advantageously resorted to: Pass into the stomach one end of a piece of rubber gas tubing, 2½ to 3 feet long, and holding the other end above the level of the mouth, pour in water until the stomach and the tube are filled with it, when by suddenly lowering the end of the tube below the level of the stomach the water will flow out, and empty the stomach; repeat as often as may be required; then treat the case according to the following directions (*look the list through, if not instantly found*):

Acids.—The symptoms of poisoning by acids are intense, burning pain in throat, mouth and stomach, vomitings of highly acid fluids, mixed with blood, purging, sinking, and, if not relieved, stupor and death. For poisoning by such acids as *acetic, citric, muriatic, nitric, oxalic, sulphuric, tartaric*, etc., give either of the following to neutralize: 1. Warm soapsuds. — 2. Magnesia in water.—3. Powdered chalk, mixed in warm water. — 4. Wood-ashes, soda, potash, gruel, linseed tea, or rice-water. Carbolic acid is neutralized by saccharate of lime.

Acid, Prussic or Hydrocyanic, Laurel Water, Cyanide of Potassium, Bitter Almond Oil, etc.—One of the results of poisoning by these fatal drugs, is a peculiar odor of the breath. Weak solution of chloride of lime or soda, or spirits of hartshorn largely diluted, may be given and the vapor of the latter cautiously inhaled; give a cold affusion, and chloroform in ½ to teaspoonful doses in glycerine or mucilage, repeated every few minutes until the symptoms are ameliorated. Artificial respiration may aid recovery.

Aconite.—For poisoning by this and other *Acronarcotics*, such as *Arnica, Colchicum, Conium, Digitalis, Ergot, Gelseminum, Helleborus, Hyoscyamus, Veratrum*, etc., evacuate the stomach at once; give strong *coffee*, or dilute *vinegar;* large injections of soup and water, or of salt and gruel, should be given to clear the bowels and assist in getting rid of the poison.

Alcohol, Brandy, and other Spirituous Liquors.—After emptying the stomach, pour cold water on the head and back of the neck, rub or slap the wrists and palm, and the ankles and soles of the feet, and give strong, hot coffee, or aromatic spirits of hartshorn, in teaspoonful doses in water. The warmth of the body must be sustained.

Alkalies and Their Salts, such as Concentrated Lye, Wood Ash Lye, Caustic Potash, Ammonia and Hartshorn.—The symptoms of poisoning by these are a caustic, acrid taste, excessive heat in the throat, stomach and intestines, vomiting of bloody matter, cold sweats, hiccough, purging of bloody stools. Use, 1. Dilute vinegar. — 2. Lemonade. — 3. Sour milk. — 4. Mucilaginous drinks. — 5. Sweet-oil.

Amylene.—The same as for chloroform.

Antimony and its Preparations, such as Tartar Emetic, Antimonial Wine, and Kerme's Mineral.—Astringent infusions, such as of gall, oak-bark, Peruvian bark, etc., act as antidotes and should be given promptly; or very strong green tea; to stop the vomiting, apply mustard to the pit of the stomach and give by the mouth or hypodermic injection, ¼ gr. of morphia.

Arnica.—(See *Aconite.*)

Arsenic and its Preparations, such as Ratsbane, Fowler's Solution, etc.— Tincture of chloride of iron, 1 dr.; bicarbonate of soda or potash, the same; tepid water, a teacupful; mix. The mixture may be given almost *ad libitum.*

Belladonna, or Deadly Nightshade.—There is no known antidote; give a prompt emetic, and brandy, opium, and strong coffee to sustain the strength.

Bismuth.—Albumen, milk, sugar and mucilaginous drinks.

Bites and Stings.—(See this head in *Surgery.*)

Brucia.—(See *Strychnine and Nux Vomica.*)

Calabar Bean.—Give emetics and hypodermic doses of atropia, 1-60 gr. in ¼ dr. of warm water.

Camphor. — Emetics, stimulants, wine and opium.

Cantharides.—Emetics, white of eggs, castor oil, gruel, demulcent drinks, and full doses of camphor,

Chloral Hydrate.—Keep the body and extremities warm; use artificial respiration, if necessary; give strychnia hypodermically, 1-30 to 1-20 gr. every hour; try electricity to neck and pit of stomach; also strong coffee.

Chloroform.—Invert the body (standing the patient on his head), keep the mouth open and the tongue out; use artificial respiration; also galvanism and stimulants to spine.

Chromium.—Carbonate of magnesia or chalk in milk, albumen, or water.

Cobalt, or Fly Powder.—Give an emetic, followed by the free administration of milk, eggs, wheat-flour and water, and mucilaginous drinks.

Cocculus Indicus.—Give emetics, mucilaginous drinks and stimulants.

Colchicum.—(See *Aconite.*)

Copper or Blue Vitriol, Verdigris or Pickles, or Food Cooked in Foul Copper Vessels.—Give large doses of simple syrup as warm as can be swallowed, until the stomach rejects the amount it contains; also the whites of eggs and large quantities of milk.

Croton Oil.—Give opium, stimulants, demulcent drinks, and external counter-irritation.

Digitalis or Foxglove.—(See *Aconite.*)

Ergot.—(See *Aconite.*)

Ether.—Expose the patient to a current of air; give a cold affusion; use artificial respiration.

Gelseminum or Yellow Jessamine.—(See *Aconite.*)

Gold and its Preparations.—Give sulphate of iron and mucilaginous drinks.

Hellebore, Indian Poke, or Veratrum.—(See *Aconite.*)

Hemlock.—(See *Aconite.*)

Henbane, or Hyoscyamus.—(See *Aconite.*)

Indigo, Sulphate of.—Give magnesia and milk.

Iodine.—Free emetic, prompt administration of starch, wheat flour, or arrow-root, beat up in water.

Iron, Chloride and Sulphate of.—Give magnesia and copious diluent drinks.

Lead Preparations, such as Acetate of Lead, Sugar of Lead, Dry White Lead, Red Lead, Litharge or Pickles, Wine or Vinegar sweetened by Lead.—Give alum in water, 1½ oz. to a qt.; or Epsom salts or glauber salts, 1 oz. of either in a qt. of water; or dilute sulphuric acid, a teaspoonful to a qt. of water; if a large quantity of sugar of lead has been recently taken, empty the stomach by an emetic of sulphate of zinc.

Lobelia.—Give emetics, purgatives, stimulants, and anodynes.

Mercury Preparations, such as Corrosive Sublimate (frequently found in Bug Poisons), Red Precipitate, and Chinese or English Vermilion.—If vomiting does not already exist, an emetic must be given immediately, the whites of eggs in continuous large doses, and infusion of catechu afterwards, sweet milk, mixtures of flour and water in successive cupfuls, and, to check excessive salivation, put ½ oz. of chlorate of potash in a tumbler of water, and use freely as a gargle, and swallow a tablespoonful every hour or two.

Methylene, Bichloride of.—(See *Chloroform.*)

Mushrooms.—Give emetics and ½ dr. doses of chloroform every hour till relief.

Opium and its Preparations, such as Morphine, Laudanum, Paregoric, together with Soothing Syrups, and Godfrey's Cordial.—Empty the stomach; give very strong coffee without milk; put mustard plasters on the wrists and ankles; use the cold douche to the head and chest; if the patient is cold and sinking, give brandy, or whisky, and ammonia; belladonna may be given in doses of ½ to 1 teaspoonful of the tincture, or 2 grains of the extract, every 20 minutes, until some effect is observed in causing the pupils to expand; use warmth and friction, and if possible prevent sleep for some hours by walking the patient about, and if necessary switches may be freely used; as a last resort use artificial respiration. Galvanism may also be tried.

Phosphorus.—An emetic should be promptly given; also copious draughts containing magnesia in suspension, and mucilaginous drinks; follow the general treatment for inflammatory symptoms.

Poison Oak.—Bruise slightly a handful of white ash leaves; add new milk enough to cover; simmer 10 minutes, and apply as hot as can be borne 3 times a day. Use Labarraque's solution of chloride of soda; when the skin is unbroken it may be used clear 3 or 4 times a day; in other cases dilute with 3 to 6 parts of water.

Shell Fish.—(See *Mushrooms.*)

Silver, Nitrate of, or Lunar Caustic.—Give freely of a solution of common salt in water, which decomposes the poison, and afterwards flaxseed or elm-bark tea, and after a while, a dose of castor oil.

Stramonium.—1. Coffee.—2. Vinegar.—3. Lemonade. Give in large quantities.

Strychnine and Nux Vomica.—Give, if obtainable, 1 oz. or more of bone charcoal mixed with water, and follow with an active emetic; then give chloroform in teaspoonful doses, in flour and water or glycerine, every few minutes while the spasms last, and afterwards brandy and stimulants, and warm the extremities if necessary; freely and promptly administer oil, melted butter or lard.

Tin Preparations, such as Chloride of Tin, Solution of Tin and Oxide of Tin or Putty Powder.—Empty the stomach, and give whites of eggs in water, milk in large quantities, or flour beaten up in water, with magnesia or chalk.

Tobacco.—After the stomach is empty apply mustard to the abdomen and to the extremities, and give strong coffee with brandy and other stimulants, with warmth to the extremities.

Woorara, or Curara.—Suck the wound immediately, or cut it out and tie a cord around the limb, between the wound and the heart; apply iodine, or iodide of potassium, and give it internally, and try artificial respiration.

Zinc Preparations, such as Oxide of Zinc, Sulphate of Zinc, White Vitriol, Acetate of Zinc, etc.—The vomiting may be relieved by copious draughts of warm water; carbonate of

soda, administered in solution, will decompose the sulphate of zinc; milk and albumen also act as antidotes.

POX, Chicken.—An eruptive disease, consisting of smooth, semi-transparent vesicles, of various sizes, which become white and straw colored, and about the fourth day break and scale off, without leaving any permanent mark behind them; in hot weather the discharge sometimes becomes purulent, and at others the eruption is attended with considerable fever. *Treatment*: Adopt a light, vegetable diet, and administer mild saline aperients and cooling drinks.

POX, Cow.—This is the usually mild form of disease that follows vaccination. (See *Vaccination* in HYGIENE.) In case the inflammation of the part becomes excessive, or very painful, it should be kept down by alcoholic lotions.

POX, Small.—This comes on with the usual symptoms of inflammatory fever; about the third day red spots, resembling flea-bites, make their appearance on the face and head, and gradually extend over the whole body; about the fifth day small circular vesicles, depressed in the centre, surrounded by an areola, and containing a colorless fluid, begin to form, when the feverish symptoms abate; about the sixth day the throat becomes sore; about the eighth day the face is swollen, and about the eleventh day the pustules acquire the size of a pea, and cease to enlarge, the matter which they contain becomes opaque and yellow, a dark central spot forms on each, the swelling of the face subsides, and secondary symptoms of fever come on; the pustules become rough, break and scab over, and a dark spot remains for some days, often followed by permanent indentations. At the end of the sixteenth or eighteenth day the symptoms usually disappear. In the confluent small-pox, a severer form of the disease, the pustules coalesce, the eruption is irregular in its progress, and the inflammatory symptoms more severe. *Treatment*: As soon as the febrile symptoms become marked the patient should take ½ oz. of Epsom salts, and after their operation ½ dr. of sweet spirits of nitre 3 times a day; place the patient on a mattress, in a cool and well-ventilated apartment, and antiseptic cooling drinks should be freely administered; when the convulsions occur, or great irritability exists, small doses of morphine, opium, or camphor may be administered, and obstinate vomiting arrested by effervescing saline draughts; when the skin is pale and cold, the pulse weak, and the eruption languidly developed, the warm or tepid bath is often serviceable; paint over the face a solution of India rubber in chloroform; the latter quickly evaporates, and an elastic film of India rubber remains, which almost entirely removes the itchiness of the pustules and prevents pitting. Warm sea-bathing tends to remove the marks, whether recent or old. *Homœopathic*: begin with aconite during the primary fever; if this drug does not lower the pulse, or cause the skin to act, at once resort to veratrum viride in the first decimal dilution; drop doses every hour until perspiration breaks out; antimonium tart. will be required when the eruption comes out, alternated with veratrum viride when the pulse rises during the pustular stage; a dose every 3 hours; belladonna controls brain symptoms and inflammation of the eyes; a dose every 2 or 3 hours; mercurius should be used if the throat is much inflamed, the glands of the neck enlarged, or dysenteric diarrhœa comes on; a dose every 3 hours; sulphur will close the treatment when the pustules dry up and scabs form; a dose every 4 hours.

PURPURA (Purpura Hemorrhagica). — This affection is characterized by a spotted eruption. The spots are owing to extravasations of blood under the skin or membranes of the body. There may be bleeding also into its different cavities, and through its outlets. This disease is very similar to, but not identical with scurvy. Similar spots exist in both these diseases; also in spotted fever, or cerebro-spinal meningitis; and indeed in low states of typhus and typhoid fevers, and in many other diseases. *Treatment*: Doses of lemon-juice, or dilute sulphuric acid, 10 drops 4 times a day, with nourishing diet, including a liberal allowance of fruit and vegetables, comprise the principal means of cure. Ergot internally, in ½ dr. doses of the fl. ext. every hour, and the local application of persulphate of iron are valuable remedies for the bleeding.

RHEUMATISM, Acute. — The symptoms are high fever, sometimes preceded by shiverings, with a full bounding pulse, furred tongue, profuse sweat, which has a sour smell; scanty and high-colored urine, with brick-dust sediment; and swelling of the joints, with slight redness, great tenderness and pain, which is particularly agonizing when the patient attempts to move; it often changes suddenly from one part of the body to another, and sometimes attacks different portions at the same time, sometimes the heart, causing serious and even fatal consequences. *Treatment*: Open the bowels freely with calomel, aloes, and rhubarb, 10 gr. of each; keep them open by repeated small doses of Rochelle or Epsom salts; give 15 gr. each of the nitrate and bicarbonate of potash every 3 or 4 hours, with 20 drops of laudanum, to ease the pain; bathe the swollen joints with some active, penetrating liniment, as 3 parts volatile liniment and 1 part each of chloroform, tincture of arnica and of aconite root, and then cover with raw or carded cotton and surround with a woolen roller bandage; lemon juice in tablespoonful doses 3 or 4 times daily has been found highly useful in some cases; also salicine or salicylate of soda, 15 gr. 3 times a day, or quinine, 5 gr. twice a day. Flannel should be worn next the skin, the feet kept warm and dry, and all exposure to wet and cold avoided. Kerosene oil is a good local application, 1 pt. to 2 oz. of aqua ammonia. Another good local application is made as follows: Take a pint of the spirits of turpentine, to which add ½ oz. of camphor; let it stand till the camphor is dissolved; then rub it on the part affected. *Homeopathic*: Aconite should commence the treatment, a drop dose every 2 or 3 hours, followed by bryonia, given in alternate doses every 2 hours, abandoning the aconite occasionally when the fever does not run so high.

RHEUMATISM, Chronic. — More common in

persons of advanced age. There is little or no fever, but it usually lasts a long time, and causes much suffering. There are stiffness and lameness, after being at rest, and inability to move, at first, without pain, but usually this disappears as soon as the patient grows warm with exercise. There is not generally as much swelling in the joints as in the acute form. *Treatment*: Surround the part with a large, hot bran poultice, made with a strong decoction of hops, or of arnica, or laudanum may be liberally added before applying; occasionally benefit is derived from sprinkling it freely with mustard, or the poultice may be preceded by the liberal application of an embrocation of equal parts of camphorated oil, hartshorn, chloroform and laudanum; or equal parts of opodeldoc, arnica, laudanum and chloroform, well rubbed in; renew this 3 times a day; regulate the bowels with ½ oz. of Epsom salts or take a compound rhubarb or a compound colocynth pill and 2 tablespoonfuls of the following mixture, every 4 hours: 1 dr. of powdered guaiacum; 6 dr. ammoniated tincture of guaiacum; 1 dr. of powdered gum Arabic; 5 oz. of camphor mixture; mix the gum Arabic and guaiacum in a mortar, and make into an emulsion with a little of the camphor water; add the tincture; shake well together, and finally mix the rest of the camphor water to make a 6 oz. mixture. Or iodide of potash in doses of 10 gr. 3 or 4 times daily, in a tablespoonful of syrup of sarsaparilla, or a wineglassful of the compound decoction, to which 20 drops of the wine of colchicum has been added. Another remedy is electro-magnetism or galvanism; and still another is the Turkish bath. Wrapping rheumatic joints in carded cotton, and surrounding this with flannel bandages, is often beneficial in obstinate and long-continued cases. Celery cut into bits, boiled in water until soft, and the water drank by the patient, is a good remedy. Another: Put new milk, with a little flour and nutmeg, into a saucepan with the boiled celery; serve it warm with pieces of toast; eat it with potatoes, and the ailment may soon yield. *Homeopathic*: Bryonia will suit cases that are improved by warmth, increased by movement, accompanied by gastric derangement; a drop dose every 4 hours; rhus is indicated when the pain is worse during rest or on first moving the affected part, and generally aggravated by the warmth of the bed, but not always; a drop dose 3 times daily; pulsatilla should be taken when the pains wander about much, and when the feet, hands and hip joints are chiefly affected; a drop dose 3 times daily; sulphur should be taken at bed-time when the pains are worse at night, when the skin is dry and harsh, and if perspiration or eruptions of skin have been suppressed; 2 gr. dry on tongue night and morning.

RHEUMATISM. Of the Loins. or Lumbago.—It is distinguished from inflammation of the kidneys, by the pain being aggravated on stooping. *Treatment*: This consists of strong stimulant embrocations or liniments, or of blisters over the parts affected, with active aperients, warmth, and diaphoretics at bedtime; the hot or vapor bath often gives almost immediate relief.

RHEUMATISM, Of the Thigh, or Sciatica.—Regulate the bowels; apply a hot external application; give a tonic, with anodyne internal remedies. Give ¼ to ½ gr. of morphia, internally or by hypodermic injection, or 1-60 gr. of atropia in solution. A good, hot application is made as follows: Boil a small handful of lobelia in ½ pint of water till the strength is out of the herb, then strain it off and add a teaspoonful of fine salt; wring cloths out of the liquid as hot as possible, and spread over the part affected.

RINGWORM (Favus, or Tinea Favosa).—This appears in circular patches of little pustules, which form scabs, leaving a red pimply surface, and destroying the bulbs of the hair; it spreads rapidly, and is very infectious. It chiefly affects the neck, forehead, and scalp of weakly children, and may sometimes be traced to uncleanness, or contact with the disease. *Treatment*: Shave the part, and keep it clean with soap and water, at the same time that an occasional mild saline aperient is administered, and a light nutritious diet, of which rare beef and ripe fruits should form a portion, should be rigorously adhered to. When the scabbing commences, use dressings of tar ointment, or of the ointment of nitrate or red oxide of mercury. *Homeopathic*: If the eruption cause burning and itching, and its vesicles are small and watery, like those of ivy, give rhus tox.; if it comes out on the arms, has a raw, sore feeling, tending to form ulcers, give mercurius; 8 globules, or 1 drop in a teaspoonful of water may be taken at a dose.

ROSEOLA (Rose Rash).—Bright, but generally dark or deep-red spots, irregular in shape and size, appear over any part of the body, with, generally, but little fever. Sometimes mistaken for erysipelas, or scarlet fever, or measles, but may be distinguished by the absence of the fever of the two former, and sore throat and inflamed eyes of the latter. *Treatment*: A dose of rhubarb, 10 gr., and magnesia, 20 gr.; or a small dose of Rochelle or Epsom salts, and attention to the diet, is all that is usually required. It is generally of short duration.

RUPIA.—With some fever, watery blisters form, followed with dirt-colored scabs; upon the removal of which, unhealthy, eating sores are left, which, upon drying, form crusts. *Treatment*: Local cleanliness must be observed; astringent dressings, as white vitriol or nitrate of silver, 1 dr. to 3 oz. of soft water with 10 gr. of carbolic acid, should be applied to the sores; tonics, as quinine and iron, 1 gr. or 2 of each, 3 times a day, must be given; or doses of sulphocarbolate of soda in an infusion of gentian will do.

SALIVATION (Mercurial Sore Mouth).—Those who take calomel as a medicine sometimes have a sore mouth, and frequently attribute their salivation to their eating butter or grease, or drinking cold water; but the only thing that needs to be forbidden to a patient who has taken calomel, is salt; for salt is a *chloride* of sodium, and there is danger that, by adding another portion of chlorine, it may change calomel, which is a *protochloride* of mercury, into the *bichloride*,

or corrosive sublimate, a virulent poison, and one which often salivates. Its approach may be known by the "coppery" taste in the mouth; the gums become red, swollen and sore; the teeth tender; the flow of saliva greatly increased; the tongue may swell, the cheeks and throat may grow sore and painful; the breath becomes offensive, and in severe cases the teeth become loose and fall out; there also may be fever and constitutional disturbances. *Treatment*: Slight cases will get well in a few days without any treatment. As a mouth wash use saturated solution of chlorate of potash; put ½ ounce in a tumbler of water and use freely as a gargle, and swallow a mouthful every 3 hours; a portion only of the potash will dissolve; and water can be added to it regularly after using from it, until it does all dissolve; if the bowels are constipated, take frequent small doses of Epsom salts, or of a mixture of equal parts of sulphur, cream of tartar, and simple syrup.

SCURVY.—The symptoms are languor, weakness and depression of mind; the face and skin are pale and bloated, and the breath is fetid; the gums are swelled, soft, red and spongy, and bleed; the teeth get loose and often fall out; the skin becomes covered with purple spots, and these sometimes spread and run into each other; ulcerous sores break out on the body, which discharge thin, offensive matter; the pulse is weak and soft, and all the secretions have an offensive smell; in bad cases blood is discharged from the bladder, bowels, womb, nose and mouth, and exertion may be followed by fainting and sudden death. *Treatment*: This consists mainly of a diet consisting of an abundance of fresh meat and vegetables, with acid fruits, and where the debility is great acid wines and malt liquors; the utmost attention must be paid to cleanliness, and the bowels kept regular by tamarinds and prunes stewed together, or lenitive electuary, and by ½ oz. of Epsom salts, where stronger remedies are required; the mouth is to be treated with a solution of chlorate of potash and tannin in diluted glycerine, 1 part to 4 of water, followed by a gargle of infusion of sage, with a little alum and tincture of myrrh; for contractions of the limbs, bathing freely with hot vinegar and soap liniment, and active rubbing should be made use of; for the breath, use chlorate of potash in 10 gr. doses every 4 hours, and for pain at the heart and oppression of breathing, tablespoon doses, as often, of a mixture of ½ oz. spirits of nitre and 2 fl. dr. each of sulphuric ether and aromatic spirits of ammonia in 3 fl. oz. of camphor water; in addition to these, change of air and a frequent bath will prove very beneficial. *Homeopathic*: Aconite, arnica, or phosphorus are the chief internal remedies, a dose of which may be given every ½ hour or hour until relieved; where these fail, a solution of persulphate of iron, tannin, sugar of lead, or creosote will usually succeed; saturate a little compress of lint with the medicine, and introduce it into the cavity of the gum; in some cases it may be necessary to plug the cavity; first remove all coagulated blood, pack the cavity with dry wheat flour, and allow it to remain.

SEA-SICKNESS.—1. To prevent this observe the following rules: Do not go on the steamer in a nervous or exhausted condition; have every preparation made at least 24 hours before starting; eat a good hearty meal 3 hours before sailing, of wholesome food; select a berth as near the centre of the vessel as possible; in going to Europe be on the starboard side, and in returning on the port side, which will be the sunny side; go on board sufficiently early to arrange such things as may be wanted for the first day or two, so that they may be easy of access; then undress and go to bed before the vessel gets under way; if subject to nausea, retain the horizontal position the entire passage if necessary; eat regularly and heartily, without raising the head for at least 1 or 2 days; on the first night out take some mild laxative medicine, and be careful to keep the bowels open for the remainder of the voyage; after having become so far habituated to the sea as to be able to take meals at the table and go on deck, never think of rising in the morning until something has been eaten; if subsequently during the voyage the sea should become unusually rough, go to bed before getting sick; do not try to keep on deck.—2. Dissolve 1 oz. of bromide of sodium in 4 oz. water; take 1 teaspoonful 3 times a day before eating; begin taking this 3 days before embarking.

SHOCK.—Prostration, or collapse, which signifies depression of the powers of life, which follows any severe injury. The usual symptoms are, that the patient lies cold, and half unconscious, with a feeble pulse and imperfect sighing respiration; nausea and vomiting, hiccup, suppression of urine, and in children convulsions are also very frequent symptoms. The duration of these symptoms is various. Sometimes these symptoms pass off quickly; but they remain even for 48 hours before reaction is established. *Treatment*: Give stimulants, of which hot brandy and water is the best; and nourishment, such as beef-tea; put blankets, heated bricks, or bottles of hot water under the armpits and between the thighs. Vomiting may be allayed by soda water with brandy, by sucking ice, by a full dose of opium, by an opiate enema, or by a mustard poultice to the epigastrium. Hiccup may be relieved by small doses of Hoffman's anodyne. Convulsions, delirium and coma are to be treated according to the state of the circulation; by ammonia and stimulants while it is depressed; but by a very cautious purging and cold to the head, after the circulation is restored, and the pulse is firm.

SPERMATORRHEA (Involuntary Nocturnal Emissions).—Much needless anxiety has been created in regard to this affection by quack books and quack lecturers. Persons of pure minds, correct habits and excellent health, occasionally have nocturnal emissions; yet by these empirical instructors and their publications they have been assailed with terrific descriptions of broken down constitutions, ruined health, and premature dissolution; and exhorted to take care of themselves in season. Now, if these emissions occur only a few times in a month, or even once or twice a week, they do

not imply any danger. But when they occur every night, or oftener, they need attention. *Treatment:* Cultivate strict chastity in thought, word and deed. For medicines, the following, in their appropriate doses, have been highly recommended: Bromide of potassium has the most recent, and the highest reputation, taken 3 times a day in from 15 to 30 gr. doses; next the tinct. of hops, 2 fl. dr. 3 times a day; then come conium and belladonna, 15 drops of the fl. ext. of either, 3 times a day; and camphor water, 1 dr. of tinct. of camphor mixed with 2 dr. of sugar and 8 oz. of water, may be drank so as to use 2 or 3 dr. in 24 hours. Frequent bathing in lukewarm water, a bland, cooling diet, avoiding spirit, and taking meat sparingly, and tonics, if the patient is much debilitated, will be in order. (See *Onanism.*)

STAMMERING (Blæsitas).—This may depend on some organic affection, or slight malformation of the parts immediately connected with the utterance of vocal sounds; but, much more frequently, it is a mere habit. *Treatment:* When the latter is the case, it may be removed by perseveringly adopting the plan of never speaking without having the chest moderately filled with air, and then slowly and deliberately. Rapid speaking must not be attempted until the stammering is completely subdued. Nervous excitement must be avoided, and the general health attended to, as circumstances may direct. Another plan is to go into a quiet room; take up an interesting but not excitable book; read aloud for 2 hours, keeping the teeth together. Stammering depending on elongation of the uvula, and other like causes, may be removed by a simple surgical operation.

STARVATION, Apparent Death from.—Where the functions of life have been suspended from want of sustenance, food must be given very cautiously at first; give, repeatedly, small injections of warm milk, and after a little add to the injections chicken broth or beef tea; as the patient begins to revive, give him a few drops of warm milk every 2 or 3 minutes, and gradually increase the quantity as improvement takes place; soon a little broth, thin gruel, or rice-water may be taken; be careful not to give too much food under the circumstances, as it endangers life.

STOMACH-ACHE (Gastralgia).—A painful affection of the stomach, having a neuralgic character. It is characterized by spasmodic pains occurring in paroxysms and varying in intensity; usually commences with a feeling of pressure in the stomach, frequent yawning, coldness of the extremities, and general discomfort; sometimes, however, without previous warning the patient is seized with violent pain in the region of the stomach, of a cramp-like character; sometimes the pain is relieved by pressure against the stomach, while in other cases pressure increases it; the attacks usually last from 1 to 6 hours, and end in belching large quantities of wind and sometimes by vomiting sour, watery fluids. *Treatment:* If the stomach is too full, by reason of the patient's having eaten too heartily, or of some indigestible substances, give the following: Ipecac, 20 gr.; water, 1 oz.; mix, and make a draught; let it be followed by copious draughts of warm water every 15 minutes till the stomach has been cleared; if pain continues after the operation, take sulphate of morphia, ½ gr.; warm water, ½ dr.; dissolve the morphia in the water and give internally or by hypodermic injection in the arm. The following combinations have also been recommended: 1. Tinct. of opium, tinct. of capsicum, tinct. camphor and sulphuric ether, of each, 3 dr.; chloroform, 1 dr.; mix; 1 teaspoonful every ½ hour, until the pain is relieved. — 2. Ext. of belladonna, 5 gr.; sulph. of quinia, 30 gr.; with ext. of valerian make 15 pills; 1 pill 3 times a day. *Homeopathics:* If there is much cramp in the stomach, give belladonna; if constipation and sour belchings, give nux vomica; if the pain is spasmodic and relieved by bending double, and by hard pressure, give colocynth. Administration: Dissolve 3 drops or 12 globules in 6 dessert-spoonfuls of water, and give a spoonful every ½ hour in urgent cases, until relief is obtained; then repeat less frequently or discontinue the medicine.

STOMACH, Belching of Wind from.—Its most common cause is indigestion. *Treatment:* Select proper articles of food; rich vegetables, peas, beans, under-cooked potatoes, and indigestible fruits should be especially avoided, as well as large quantities of weak and warm liquids; the diet should consist principally of animal food, carefully but not over-cooked, with a sufficient quantity of mealy mashed potatoes, and Graham bread, moderately seasoned with common salt and spices; the most suitable beverages are toast-and-water, and a little good coffee. Take charcoal in ½ dr. doses, in capsules or mixed with syrup or water. (See *Dyspepsia.*)

STOMACH, Inflammation of.—In the acute form, which results from irritating substances taken into the stomach, there is burning pain, thirst, restlessness, constant vomiting, prostration, a quick, and usually small pulse, incessant retching, a sunken countenance, hiccough, cold hands and feet, and a damp skin; in the more common chronic form, there is generally pain and uneasiness, increased by food or pressure, and frequent belchings; the meals are frequently vomited, and the appetite irregular; the urine scanty and high-colored, and the tongue red and coated with whitish fur in the center. *Treatment:* In the acute form, having gotten rid of the irritating substance, apply mustard poultices over the stomach, along the spine, and to the extremities; also hot fomentations and poultices of hops or stramonium; give ice in small pieces, or iced water, in ½ to teaspoonful doses, or lime-water and sweet milk in equal quantities; also 3 drop doses of tincture of aconite root, to control the fever; when the acute inflammation has subsided, and in the chronic form, apply blisters or counter-irritation with croton oil externally, with subnitrate of bismuth, in doses of 5 to 10 gr., and cold compresses over the stomach every night; while there is tenderness, the nourishment must be simple, consisting of little more than bland nutritive drinks, in small quantities at a time; in 2 or 3

weeks, a more nourishing diet may gradually be resumed. *Homeopathic*: For fever, give aconite; nausea and vomiting, give ipecac; sensitiveness and burning, cutting pains, give belladonna; red and swelled face, tongue red, clean, and tremulous, give nux vomica; eyes sunken and glazed, lips bluish and dry, great thirst, and stomach very sore, give verat. alb. Administration: In urgent cases repeat the medicine every hour at first and extend the time as the patient improves; dissolve 3 drops or 12 globules in 10 teaspoonfuls of water, and give a teaspoonful at a dose.

STOMACH, Sickness at the, or Vomiting.—Generally induced by acidity or irritability of the stomach, by distress of mind or injury of the brain, and by any organic disease of the stomach. *Treatment*: Treat the disease which induces it. If from acidity, lime water and sweet milk, in tablespoonful doses, is a simple and efficient remedy. If from irritating substances, they should be got rid of by an emetic. Some aromatic, as ginger, spearmint, peppermint or spice tea will do; some cordial or stimulant, as brandy, champagne, tincture of ginger, paregoric, etc., will answer well; also strong coffee, without sugar or milk. When it persists obstinately, without any appreciable cause, and in spite of all ordinary measures, a mustard plaster, or spice poultice, should be placed over the stomach, and if this does not relieve, a blister should be applied, and the blistered surface, after the skin is removed, should be sprinkled with $\frac{1}{4}$ gr. of morphia, or $\frac{1}{8}$ gr. of morphia in solution, may be injected hypodermically. The vomiting of children may sometimes be stopped by wetting a cloth with equal parts of spiced vinegar and laudanum, and applying over the stomach. *Homeopathic*: Give petroleum and oculus; place a broad flannel bandage around the abdomen, keep the horizontal position, the stomach neither too empty nor too full; ipecacuanha, when the stomach chiefly is at fault, and the nausea continues after the vomiting has ceased; arsenicum, if the vomiting is accompanied by pain in the stomach and diarrhea; nux vomica, when the vomiting is connected with derangement of the liver; give of the medicine selected, a drop dose in a dessert-spoonful of water every hour until the vomiting and nausea ceases, then every 2 or 3 hours.

STOMACH, Vomiting of Blood from.—Usually preceded by a sense of weight, fullness, pain and uneasiness in the region of the stomach; saltish taste in the mouth; nausea, faintness, debility, giddiness and confused feeling about the head; when the blood is not thrown up, but carried off through the bowels, the stools will be black. *Treatment*: Ice, internally by swallowing small pieces; and externally, by applying a light ice poultice over the pit of the stomach. If the vomiting continues, change to a mustard poultice over the stomach, and give $\frac{1}{4}$ gr. of sulphate of morphia by hypodermic injection or by the mouth. The following astringents are excellent auxiliaries for checking this hemorrhage: 1. Sugar of lead, 2 gr.; acetate of morphia, $\frac{1}{4}$ gr.; mix, and take 2 or 3 times a day, if necessary.—2. Alum in powder, 8 gr.; powdered opium, 1 gr.; mix, and take every 3 hours.—3. Ipecac, 2 gr.; stir this amount into $\frac{1}{2}$ oz. of water and take every $\frac{1}{2}$ hour until nausea is produced.—4. Fl. ext. of ergot, 1 dr.; take every hour.—5. Gallic acid in 15 gr. doses 3 times a day, or tannic acid in 5 gr. doses, as often. *Homeopathic*: For febrile symptoms, give aconite; great paleness, and faintness, with nausea, give ipecac; dark looking blood, the patient quiet, free from pain, but pale and weak, give ergot. Administration: If the bleeding is active, repeat the medicine every hour until checked; then every 4 hours. Of a solution of 3 drops or 12 globules in 8 dessert-spoonfuls of water, give a spoonful at a dose; or 8 globules may be taken dry on the tongue; for several hours after an attack no food should be eaten; then a little thin gruel, corn-starch, tapioca or fresh milk may be taken; all food and drink should be taken cool; in urgent cases, dry cups placed below the ribs, or cloths wrung out of cold water and applied to the lower part of the abdomen, will be found of benefit.

STRICTURE OF URETHRA.—Generally occurs in persons with some permanent obstruction; exposure to cold, and indulgence in drink, favor an attack. The symptoms are sudden retention of urine; great straining and desire to urinate; the bladder becomes distended, the countenance anxious, the pulse quick, the skin hot; at last the bladder may burst. *Treatment*: A catheter should be introduced at once, as large an instrument as the parts will admit. Relaxation of the spasm may also be produced by bleeding, warm bath, Dover's powder, laudanum enemata, and cold water upon the genitals; should these means fail, and life be endangered, the bladder must be punctured from the rectum by a surgeon.

ST. VITUS' DANCE (Chorea).—The symptoms are constant involuntary and irregular twitchings and movements, most frequently of some portion of the muscles, and often confined to one side, but sometimes affecting almost the entire body; sometimes apparently produced by fright, nervous debility or fatigue. *Treatment*: Good diet, salt water bathing, and regular and systematic exercise will often effect a cure; occasionally iron, 5 to 20 drops of the muriated tincture, or 3 to 5 gr. of the citrate, or phosphate, or the citrate of iron and quinine, 3 to 4 times daily, is beneficial; in obstinate cases, Fowler's solution of arsenic, 3 drops, 3 times daily, has effected cures; if these means fail, 3 to 10 gr. of chloral, with as much bromide of ammonium, 3 times daily, should be tried, with the cold douche, or dashing cold water against the body, especially against the spine. *Homeopathic*: Belladonna, if the face is implicated, the patient stammers and has headache, trembling of the limbs, which scarcely allows her to walk; suitable to girls; give stramonium, if the convulsive motions are often crosswise or violent all over, there is an extreme degree of nervousness, the patient moves about rapidly, wants to go fast, loss of memory. The application of electricity will be found to have a salutary effect in this disease when judiciously adminis-

tered. Administration: 1 drop or 6 globules in a teaspoonful of water, every evening, for a week; then omit the medicine for a few days, and if no improvement takes place, select another remedy, and give it in the same way.

SUFFOCATION.—Remove to fresh air, and dash cold water over the head, neck and chest; carefully apply hartshorn or smelling salts to the nostrils, and when the breathing is feeble or has ceased, resort immediately to artificial respiration. (See *Asphyxia.*) Keep up the warmth of the body, and as soon as the patient can swallow, give stimulants in small quantities.

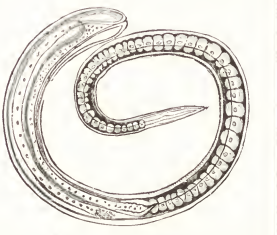
SUN-STROKE.—The treatment is similar to that required in apoplexy. Cold ablutions should be poured over the whole person and ice applied to the head, in the case of a robust person; otherwise hot applications, or alternate hot and cold are better; if hot water cannot be obtained at first, bathe the head with tepid water, and, with the hands moistened, rub the extremities, the neck, and the whole length of the spine, rubbing in a downward direction to draw blood from the head; as soon as boiling water can be obtained, put a dry blanket around the body; wring flannels from the hot water and apply them quickly to the region of the stomach, liver, bowels, and spine over the blanket; immerse the feet in hot water, or wrap them in hot flannels as far as the body; re-wring the flannels once every 5 minutes for ½ hour or more; then remove them and apply cool water in the same way; dry well and rub the surface lightly and briskly with the hand until a glow is produced; use 1 teaspoonful of salt to every quart of hot water; have the feet made bare and rubbed or slapped, and in extreme cases apply mustard poultices; give internally whisky in hot water, or use a little ammonia or hartshorn in hot water; as the patient convalesces, give at first lime water and milk, ½ lime water to ¾ milk. *Homeopathic:* Great thirst, headache, red face, and nervous excitement, give aconite; headache, aggravated by motion, peevishness, faintness, nausea, and costiveness, give bryonia; fullness, splitting headache, giddiness, and sore eyes, give belladonna. Administration: In sudden and severe cases, give 8 globules in a little water every 20 minutes until relief is obtained, then less frequent, say once every 3 hours. The patient may be allowed cold water to drink, but it should be taken in small quantities at first; cloths wrung out of cold or ice water may be applied to the head as directed under inflammation of the brain.

TETTER, or HERPES.—This is characterized by an outbreak of small vesicles appearing in groups; as the vesicles increase in size, the fluid which they contain dries into scabs and scales off; the eruption is accompanied by a burning, crawling or smarting sensation, which is often very annoying to the patient. It is not contagious. Another form appears in patches on the face or neck, on the hands and wrists, and in the joints. The patches are rough, incline to crack, and have a raw appearance; the fluid from the surface dries and is thrown off in bran-like scales; its duration is often protracted. It is caused by immoderate use of rich and indigestible food, and a morbid condition of the cutaneous excretions. *Treatment:* Commence with a bilious cathartic and alterative, as calomel, 10 gr.; podophyllin, 2 gr.; aloes, rhubarb, of each, 5 gr.; mix, and take in syrup or sauce. After the operation use the following tonic: Arsenious acid (white arsenic), sulphate of strychnia, of each, 1 gr.; sulphate of quinia, tartrate of iron and potash, of each, 1 dr.; mix, and make 40 pills; 2 pills to be taken every day, 1 at bedtime, and 1 at 11 A. M. Take special care of the skin by bathing the whole body in a warm room every morning in tepid water, to which has been added bicarbonate of soda, 1 dr. to the pint. If there is much smarting, apply carbolic acid water in the following form: Carbolic acid, in crystals, 1 dr.; water, 1 qt.; mix. *Homeopathic:* Much burning at evening, the parts very dry and rough, like parchment, or fish scales, give arsenicum; appearance like the eruption produced by ivy, skin thick and hard, with stinging and tingling, give rhus tox.; scabby and scurfy, and cracking open after washing, give sulphur. In acute cases, give 8 globules or 1 drop in a spoonful of water 3 times a day; in the chronic form, a dose every evening will be sufficient.

THROAT, Inflamed.—Sore throat is one of the commonest affections, and is met with in every grade, from a simple dryness, and slight heat, or sensation of rawness and hoarseness, to a total loss of voice from ulceration of the vocal cords and constant soreness, with expectoration of a puriform secretion, sometimes with difficulty got rid of. From the frequency of the affection among clergymen and public speakers, it received the name of "clergyman's sore throat." *Treatment:* Use gargles of alum and sage tea, flaxseed and slippery-elm infusions, mild liquid diet, and a mild cathartic, as calomel, aloes, rhubarb, of each 5 grs.; mix and take in syrup or capsule at bedtime; if it does not operate by morning, take ½ oz. of Epsom salts or of castor oil. Pour a few drops of spirits of camphor on a lump of sugar, and allow it to dissolve in the mouth every hour. Wet compresses to the throat are the best remedies known; double a towel 2 or 3 times, so as to make a pad that will fit snugly under the chin and over the throat, and let it extend around from ear to ear; bind a thickly-folded towel over the wet pad, having the towel wide enough to overlap the edges of the pad; it may be put on cold or warm; when cold, it soon becomes warm from the heat of the skin, and is really a warm vapor bath; when the pad is taken off, the throat should be washed in cold water to close the pores, and then well dried with a towel. *Homeopathic:* Phosphorus is suited for the weakness and loss of voice, especially if the patient has been weakened, and there is any tendency to consumption; a drop dose every 4 hours; carbo vegetabilis, for hoarseness of voice, with dry spasmodic cough, and raw feeling in the windpipe; a drop dose every 4 hours; hepar sulphuris, for weakness of voice and loose cough with much expectoration; a drop dose every 4 hours.

TRICHINÆ.—Trichina is the term applied to

a minute, slender, and transparent worm, scarcely 1-20th of an inch in length, which exists in the muscles of swine. The young worms



Sexually Mature Female Trichina Spiralis (*Magnified*).

at first range freely through the stomach and intestines, remaining for a short time within the lining membrane of the intestines, causing irritation, diarrhœa, and sometimes death, if present in sufficient numbers. As they become stronger they penetrate the walls of the intestines to effect a lodgement in the muscles, causing intense pain and severe cramps, and sometimes tetanic symptoms. After 4 weeks' migration they eneyst themselves permanently on the

The Trichina in its Cyst (*Magnified*).

muscular fibre, and begin to secrete a delicate sac which gradually becomes calcareous. In this torpid state they remain during the person's lifetime. *Treatment:* Nothing has ever been discovered which will counteract the effect of trichinæ or kill them after they have once found their way into the muscles of a person. The only thing is to take quinine, if at all feverish, and seek strength.

VOICE, Loss of, or Aphonia. — *Treatment:* When caused by catarrh or excessive hoarseness, give one of the following: 1. Sulphate of zinc, 4 gr.; water, 1 fl. oz.; mix, and use as an inhalation.—2. Chloride of ammonium, ½ oz.; syrup of wild cherry, 3 fl. oz.; mix; 1 teaspoonful, 3 times a day.—3. Sulphate of strychnia, ½ gr.; water, 2 fl. oz.; syrup of tolu, 1 fl. oz.; mix; a teaspoonful, 3 times a day.—4. Dip a piece of thick paper in a solution of saltpeter, and dry it, then cover it over with comp. tinct. of benzoin; cut it up into pieces 3½ by 1½ in., and make into cigarettes. *Homeopathic*; Accompanied by feelings of suffocation, as if there was not air enough, irritation of the larynx and heat on the top of the head, give sulphur; great hoarseness, burning and tickling in throat, dry cough, but moist skin, give mercurius; a sensation of great weakness in the throat, palsied glottis, difficulty of swallowing and soreness, give gelseminum. Administration: In acute cases the remedy may be taken once or twice a day; but in chronic cases it should not be repeated oftener than once a day, or once in 2 days; give the medicine dry, 8 globules at a dose.

URINE, Bloody, or Hæmaturia. — The seat of the hemorrhage may be either the kidneys, or the prostate or bladder. That from the kidney may be caused by the irritation of stone, or by blows on the loins, by scarlet fever, and by other diseased states of the system. Hemorrhage from the prostate or bladder may be caused by the rude introduction of instruments, or by the irritation of stone; or by the existence of an ulcer or tumor, of which it is often the earliest sign. When the blood is derived from the bladder, the pain in the back and other signs of irritation that accompany the bleeding from the kidney, will not be present. *Treatment:* When hemorrhage from the kidneys is attended with inflammatory symptoms, cupping, purging, and the acetate of lead are indicated; when with symptoms of debility, the dilute sulphuric acid, alum, or gallic acid. Cold may be applied to the loins and hips by means of bladders of ice. In hemorrhage from the bladder a catheter should be passed and retained there. If the hemorrhage is obstinate, the bladder may be injected with cold water containing 1 sc. of alum to each pt.; and if much blood has coagulated there, it may be necessary to repeat injections of water. Small doses of turpentine will sometimes check a hemorrhage from the bladder which resists all other means.

URINE, Incontinence of (Enuresis). — Pregnant women, and children with worms, are the most frequent sufferers. It also occurs in old people from debility of the neck of the bladder, and is a common symptom of stone. *Treatment:* When resulting from gravel or inflammation, the cause must be relieved. Children should be allowed to drink but little in the evening, and required to empty the bladder before going to bed, and again after 2 or 3 hours' sleep. Chloral in 3 to 5 gr. doses, at bed-time, and tincture of belladonna in 1 to 3 drop doses, with 3 to 5 drops of tincture of iron, 2 or 3 times daily, are sometimes useful. If troubled with worms, see *Worms*. In debility or paralysis of the neck of the bladder, 5 drops tinct. of cantharides, and 12 drops of tinct. of iron, 2 or 3 times daily, will sometimes be beneficial. Pregnant women should use mild laxatives, and lie down as much as possible.

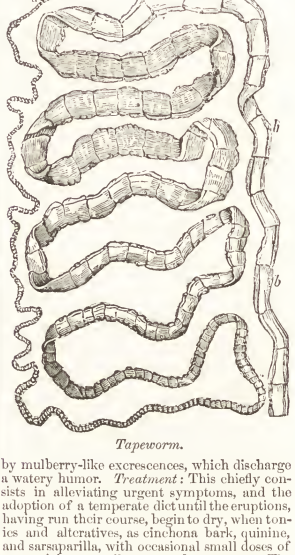
URINE, Retention of (Dysuria).—Give a warm bath, or apply hot fomentations over the lower part of the belly and to the parts. Relief is also afforded by large anodyne injections, if caused by inflammation of the neck of the bladder. In addition, leeches may be applied to the perineum. If from paralysis of the bladder, and during the low stages of typhoid fever, etc., the catheter must be used.

URINE, Suppression of (Ischuria).—The symp-

toms are restlessness, with a slight pain in the loins and bowels perhaps. No water is made and none is in the bladder. After a time, nausea and vomiting may come, and drowsiness, wanderings of mind, hiccough, stupefaction and death. Before death the perspiration has a strong smell of urine. *Treatment:* Let the patient be placed in a hot bath, and afterwards apply hot fomentations over the lower portion of the belly, and cups or mustard plasters over the kidneys. Let the bowels be opened by saline laxatives, and warm diluent drinks, as flaxseed or watermelon-seed, or juniper-berry tea be freely given, with 15 to 30 drops spirits of nitre, or 20 to 30 gr. of the acetate or citrate of potash, or 15 of the nitrate of potash, every 2 hours, with occasional doses of 6 to 10 gr. Dover's powder. If drowsiness or convulsions set in, cups to the spine, mustard to the extremities, leeches to the head, and even free bleeding from the arm must be resorted to.

WORMS.—These parasites are generated and nourished in the human intestinal canal. They cause griping pains, especially about the navel, acid eructations, slimy stools, occasional nausea and vomiting without any manifest cause, heat and itching about the anus, tenesmus, emaciation, disturbed dreams, grinding of the teeth during sleep, pallor of countenance, discoloration round the eyes, feverishness, headache, vertigo, etc. *Treatment:* In ordinary cases, 10 gr. of calomel over night, followed by ½ oz. of castor oil the next morning, is good. Oil of turpentine is useful against nearly every variety of worms, taken in the following form: Oil of turpentine, castor oil, and mucilage of gum Arabic, of each ½ oz.; mix and take fasting. For tapeworm, take a decoction of ½ lb. of pomegranate root bark, yielding 12 fl. oz. of liquid; take 1 tablespoonful of castor oil in the evening, and the following morning, after coffee, a third of the contents of the bottle, another third half an hour later, and the remainder in yet another half hour. If there is no operation, take 1 drop of croton oil in a teaspoonful of sweet oil, repeated every ½ hour until movement. If the head (see *a* in the engraving) of the worm does not come away, the process must be entirely repeated, after a few days.

YAWS.—A peculiar contagious disease of the skin, occurring but once in life, characterized



Tapeworm.

by mulberry-like excrescences, which discharge a watery humor. *Treatment:* This chiefly consists in alleviating urgent symptoms, and the adoption of a temperate diet until the eruptions, having run their course, begin to dry, when tonics and alteratives, as cinchona bark, quinine, and sarsuparilla, with occasional small doses of mercurials, generally prove advantageous. The master yaw, which frequently remains troublesome after the others have disappeared, may be dressed with the ointment of red oxide of mercury, or of nitrate of mercury, diluted with an equal weight of lard.

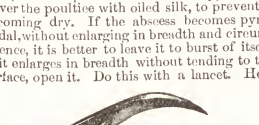
—o—

SURGERY.

The descriptions of surgical operations herein are not intended to include all that a skilled surgeon would perform, but only such as an amateur might possibly undertake in some great emergency, distant from professional help, when in many cases a life might be saved or distress alleviated, by assistance guided by right principles. The more serious the operation the more danger of failure by the unskilled.

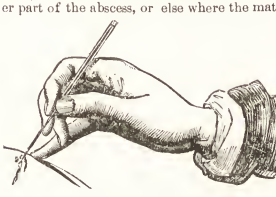
ABSCESS.—A collection of purulent matter in some tissue or organ, the result of diseased action. Abscesses may be either superficial or deep-seated. When of rapid formation, and with considerable inflammation and a throbbing sensation, they are called acute; when of slow formation, and of doubtful origin, they are called chronic. Suppuration is indicated by abatement of the fever and pain. The tumor becomes softer and paler and projects in a pyramidal form. *Treatment:* Remove, if possible, the morbid state of constitution on which the abscess depends, by purgatives, and hasten suppuration by warm poultices. In abscesses from local injury, all thorns, splinters, etc., should be removed. The poultices should be large, soft and light, and may be made of bread and water, or linseed meal, or of bran sewed up in a flannel bag, which may be dipped in boiling water at

often as they become cold. When required very light, use the powdered bark of slippery elm. Cover the poultice with oiled silk, to prevent it becoming dry. If the abscess becomes pyramidal, without enlarging in breadth and circumference, it is better to leave it to burst of itself. If it enlarges in breadth without tending to the surface, open it. Do this with a lancet. Held



Abscess Lancet.

like a pen, it should be gently plunged in at a right angle to the surface, till it has entered the cavity, and the aperture may be enlarged sufficiently as the instrument is being withdrawn. The puncture should be made either at the lowest part of the abscess, or else where the matter



Opening an Abscess.

points most decidedly and the skin is the thinnest. No rude attempts should be made to squeeze out the matter.

ACCIDENTS.—The chief requisite, in case of accidents, is presence of mind. Find out from the injured person, if sensible and able to speak, or from bystanders, the cause and such other particulars of the injury as can be learned without delaying any help that may be required. If the person is insensible, remove as quickly as possible the neck-tie, collar, etc.; open all clothing pressing tightly upon the neck, chest or abdomen, and lay him on the side, rather inclined forward than back, with the head slightly raised. In this position he can breathe more easily than if placed on the back. As a restorative, dash a little cold water on the face and chest, and try camphor or smelling salts. If able to swallow, give him cold water to drink, and if much prostrated, a very small quantity of spirits. Do not allow stimulants to be poured down him. If there is bleeding, ascertain its source, and use prompt measures to arrest it. (*See Bleeding.*) Allow no one seriously injured to be bled, at least until reaction has been established. Examine carefully if there are any serious bruises or sprains, or any bones dislocated or broken, and, if so, see that the position is made as comfortable as possible, using only cold water until suitable dressings can be applied.

ANÆSTHETICS.—Agents which diminish or destroy sensibility, or relieve pain. Among the most useful, safe and powerful are chloroform, ether, nitrous oxide, and intense cold. The mode of administration is by causing the patient to inhale their vapor mixed with air. Sometimes they are poured on a sponge or handkerchief, or a piece of lint, either of which is then applied to the mouth and nostrils of the patient in such a manner that the air which passes into his lungs is saturated with the vapor. The use of nitrous oxide gas is almost wholly confined to operations in dental surgery. To prevent accidents in the administration of chloroform, add 1 part of rectified oil of turpentine to 5 parts of chloroform, or give a full dose of whisky before the anæsthetic. (See chloroform in *Poisoning.*) Freezing may be accomplished by applying a spray of ether, by means of an atomizer, or by a freezing mixture composed of equal parts of pounded ice and salt, or two parts of snow to one of salt; mix quickly, put into a gauze bag and apply to the part to be frozen; in 3 to 6 minutes the skin will become white and glistening, when the bag should be removed and the operation performed. Freezing should not be continued more than 6 minutes at a time, as the tissues may be hardened, though usually no harm results from repeated freezing, if proper care is used in thawing the frozen part by frequent wetting with cold water, until the natural feeling is restored. Rapid breathing has been successfully employed as an anæsthetic. The patient should commence to breathe as rapidly as possible. As soon as his face begins to get red, the surgeon can cut. It is alleged that although the knife is heard to rip through the flesh, no pain is felt.

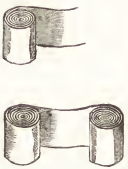
BLACK EYE.—There is nothing to compare with a tincture or strong infusion of capsicum annuum, mixed with an equal bulk of mucilage or gum Arabic, and with the addition of a few drops of glycerine. This should be painted all over the bruised surface with a camel's hair pencil, and allowed to dry on, a second or third coating being applied as soon as the first is dry. If done as soon as the injury is inflicted, the treatment will invariably prevent the blackening of the abused tissue. The same remedy has no equal in rheumatic, sore or stiff neck.

NOSE BLEEDING.—The only reliable remedy for bleeding at the nose is to move the jaws rapidly. This has been known for years, but a modern fad has made it much more easy to adhere to the prescription. If a person who is suffering from severe hemorrhage of this character will chew gum viciously for a minute or two, the bleeding will entirely cease, and it is important for him to keep some gum in his pocket, so that when the feeling of fullness which proceeds the renewal of attack comes on he can avert the danger in a few minutes.

STYE IN EYE.—Poultices, warm water, etc., no doubt do good in the end, but such applications have the great disadvantage of prolonging the career of these unsightly sores, and encouraging the production of fresh ones. The local application of tincture of iodine exerts a well-marked influence in checking the growth.

To apply it, the lids should be held apart by the thumb and index finger of the left hand, while the iodine is painted over the inflamed spot with a fine camel's hair pencil. Care must be taken that the iodine does not touch the eye itself. The lids should not be allowed to come in contact until the part touched is dry. A few such applications in twenty-four hours are sufficient.

ly necessary. 1. Wounds and broken bones come without warning. The occasions for the use of bandages are therefore often very sudden and peremptory. For this reason a moderate supply should be kept on hand in every house. They should be made of cambric, and wound snugly in cylindrical rolls, 6 or 8 yds. long by 2 in. wide. The other sizes, narrow ones for the fingers, and broad ones for the trunk, may be



Single and Double Rolls.

Bandage for Head.

Bandaging.

BANDAGING.—The art of bandaging has been made too difficult. Its teachers have given very minute directions for an exact application of this covering to every part of the human body; whereas, with ordinary mechanical skill, but little more than a few brief general rules are real-

left to extempore preparation. To roll, a bandage is held loosely in the left hand, with a slight pressure of the left thumb to insure snugness, while it is turned by the thumb and finger of the right hand (as seen in the illustration). The double roll is convenient to make a reverse. — 2.

In applying a bandage, keep both edges smoothly down upon the part. — 3. If it tends to go off one side, so as not to cover completely, place your finger on it (see illustration), and turn it back, or make a reverse, as it is termed. In this way you can oblige it to go where you want it, and at the same time to lie smoothly.—4. When you come to a joint, let your bandage describe the figure of 8. (See illustration, Knee and Ankle.) In other parts than the extremities, pins or stitches may be used to keep the bandage in place, or confine it when you wish to turn it in a different direction.

BITES AND STINGS, Of Insects. — Those of bees, wasps, hornets, etc., although generally painful, and causing much outery and disturbance, are rarely attended with fatal results. *Treatment*: The pain and swelling may generally be promptly arrested by bathing freely with a strong solution of equal parts of common salt and baking soda, in warm water; or by the application of spirits of hartshorn; or, the instant any one is stung, wet some eut tobacco and lay it at once on the spot. Hold it there a few minutes and the eure is complete. Camphor is a good remedy to use in a case of a bite by the tarantula.

BITES AND STINGS, Of Reptiles. — Of these the rattlesnake, the cobra di capello, the whipcord snake, and the viper of our own country are among the most dangerous. The infliction of the wound is followed by instant and acute pain, discoloration and swelling of the part, sickness, fainting, pain in the back, difficulty of breathing, spasms, extreme drowsiness, coma, and, in fatal cases, death, within two hours. *Treatment*: Hitherto no antidote has been discovered, but the precautionary measures consist in, 1st, preventing absorption of the virus into the blood; 2d, in removing as much of the poison as possible from the wound; and 3d, by counteracting the symptoms with anti-spasmodics and stimulants. Although there is a natural repugnance to suck a venomed wound, the most deadly animal poison is perfectly innocuous unless brought into contact with a cracked or abraded surface in the mouth. Directly after receiving the injury a tourniquet must be put round the limb, above the wound, the part washed well and quickly with warm water, at the same time forcing out with the fingers any blood or exudation that may appear; then cup the surface; if proper cupping glasses are not ready, apply the lips and suck the wound with steady exhaustion, spitting and washing the mouth before again repeating the process, which should be continued for ten minutes. The punctures are then to be treated with lunar caustic and a hot poultice applied. Fainting, difficulty of breathing and symptoms of collapse are to be met by doses of ether, brandy and ammonia, or valerian, lavender and musk, repeated every ten or fifteen minutes. Electricity may be applied to the spine, or, if not at hand, friction with mustard along the spinal column. For drowsiness and coma, the patient must be kept constantly walking, and cold water occasionally dashed in the face. Should much constitutional disturbance manifest itself subsequently, adopt a course of sarsaparilla, compound decoction, alternated with 5 drops of Fowler's solution of arsenic every 6 hours; at the same time a liberal diet, such as wines and tonics, as the case may demand. A good remedy is to apply externally to the wound by saturating lint or batting, 30 gr. iodide potassium, 30 gr. iodine and 1 oz. water. Carbolic acid, diluted and administered internally every few minutes, is said to be a good remedy; or ammonia, diluted and injected into the circulation. A decoction made from the powdered root or green leaves of the common male fern, is also recommended.

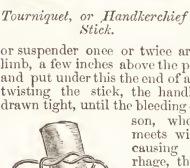
BLADDER, Inflammation of.—This may result from blows or other injuries, the presence of stone or gravel, irritating diuretics, or from decomposing urine retained by stricture. There is pain, frequent desire to pass water, with burning pain and great straining, to pass but a very small stream; fever and chills, and frequently nausea and vomiting; in bad cases the urine may be mixed with matter and blood. *Treatment*: The pain may be so severe as to need opium, or some other narcotic, for its relief. 25 drops of laudanum, or ¼ gr. of morphia, or a teaspoonful of tincture of hyoscyamus, may be given every 2 hours, or a suppository containing ¼ gr. of morphia and ½ gr. of extract of belladonna, may be similarly repeated. Cloths wrung out of hot water, or hot poultices of bran and hops, should be applied freely over the region of the bladder and to the perineum. Warm hip baths will also be soothing. Flaxseed tea should be given freely, with occasionally 15 drops spirits of nitre. The bowels should be kept open with castor oil or other mild laxative. In chronic cases injections into the bladder may be necessary. Sulphates of quinia and cinchonidia, in affections of the bladder, have proved eminently useful. The following are also frequently employed: 1. Powdered opium, 12 gr.; powdered camphor, 30 gr.; ext. belladonna, 3 gr.; cocoa butter, enough to make 6 suppositories; use one each night before retiring.—2. Balsam copaiba, 4 dr.; benzoic acid, 4 sc.; gum Arabic; sugar, of each, 2 dr.; oil of checkerberry, 20 drops; camphor water, enough to make of the whole 8 oz.; mix; a tablespoonful every 4 hours.

BLEEDING. — An escape of blood from any part of the system is termed a hemorrhage. Hemorrhages may be arterial or venous. Bleeding from the veins may be recognized by the dark-red color and steady flow, and is less dangerous than that from an artery, which spirts and is light-colored, and requires prompt action to save life. The bleeding from wounds, if extensive, should be arrested by tying the ruptured blood-vessels; where this cannot be done, and in less important cases, by the application of styptics, as creosote, infusion of galls, compound tincture of benzoin, etc. But the most efficient application in all such cases, is the persulphate of iron, either in powder or solution. A pledget of lint or cotton or several thicknesses of soft cloth wet with the solution, and applied to the bleeding surface, or the powder applied to it and covered with a soft compress, will often arrest

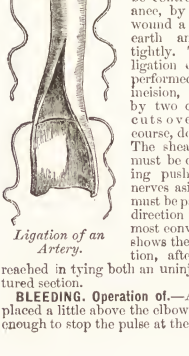
bleeding from vessels even of considerable size.

BLEEDING. From the Arteries. — This must first be controlled by pressure, torsion (twisting the ends of the vessel), or tying it. Pressure may be made in the wound where the bleeding occurs, or between the wound and the heart, either with the finger, or with a tourniquet. The finger may be pressed firmly upon the spot from which the blood spirts, or upon some point a few inches nearer to the heart, where the beating of the vessel can be felt. Any article may be used to make pressure over the vessel. Sometimes the bleeding can be controlled, until a surgeon comes, by plugging and binding the wound with lint, cotton, or a bit of sponge, or soft cloth suitably folded or twisted; or this and pressure on the vessel may be combined. If the bleeding is from any point below the middle of the thigh, or from the arm, pass a handkerchief or suspender once or twice around the injured limb, a few inches above the place of bleeding, and put under this the end of a stick; when, by twisting the stick, the handkerchief may be drawn tight, until the bleeding ceases. If a person, when by himself, meets with an accident causing serious hemorrhage, the bleeding may be controlled until assistance, by placing on the wound a handful of dry earth and grasping it tightly. The operation of ligation of an artery is performed by making an incision, 3 in. in length, by two or three cautious cuts over the artery's course, down to the artery. The sheath of the artery must be opened after having pushed all veins or nerves aside. The needle must be passed in whatever direction the operator finds most convenient. The cut shows the method of ligation, after the artery is reached in tying both an uninjured and a ruptured section.

Finger Pressure.

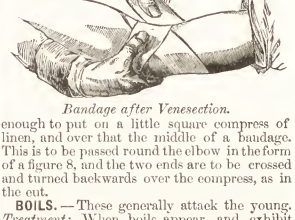


Tourniquet, or Handkerchief Stick.



Ligation of an Artery.

BLEEDING. Operation of.—A ligature being placed a little above the elbow, but not tightly enough to stop the pulse at the wrist, the operator places his thumb on the vein a little below the intended puncture, and then pushes the lancet obliquely into the vein, making it cut directly outwards. When sufficient blood has been taken, the surgeon unties the ligature and places his thumb on the bleeding aperture. Next he puts a little bit of lint on the wound, and secures with a strip of plaster, only removing his thumb sufficiently. Then he removes his thumb



Bandage after Venesection.

enough to put on a little square compress of linen, and over that the middle of a bandage. This is to be passed round the elbow in the form of a figure 8, and the two ends are to be crossed and turned backwards over the compress, as in the cut.

BOILS. — These generally attack the young. *Treatment*: When boils appear, and exhibit persistency by daily enlargement and increasing pain, suppuration should be promoted by warm poultices of bread and linseed meal, to which a little fat or oil may be added; or warm and stimulating embrocations, or exposure to the vapor of hot water, or the application of stimulating plasters, may be adopted. When the tumor is ripe, the matter should be evacuated by gentle pressure, and the boil dressed with a little simple ointment spread on a piece of clean linen. The diet may be full and liberal till the discharge of the matter, when it should be lessened, and the bowels kept gently open by saline purgatives, as Epsom salts or cream of tartar. When there is a disposition in the constitution to boils, the bowels should be kept regular, and tonics had recourse to.

BRUISES.—To prevent inflammation, cold lotions may be applied. The best of these are lead water and vinegar, or spirits and water; or better, when at hand, a lotion of arnica (tincture of arnica, 1 part, water, 6 parts). If severe inflammation sets in, low diet and cooling purgatives may be required. If suppuration occurs, warm fomentations or poultices should be applied. A good wash is carbolic acid in solution, 10 gr. acid to the oz. of water.

BUBO.—A tumor resulting from the enlargement of the gland, usually in the groin, and very painful. It may be caused by injury or over-exertion; or from the specific virus of gonorrhœa or syphilis. *Treatment*: Non-specific bubo will ordinarily require nothing more than rest and cooling lotions. If the bowels are constipated, saline laxatives should be used. If the tumor is highly inflamed and very tender, leeches may be applied. Hot fomentations and poultices may be applied, and the tumor lanced if matter forms.

BURNS.—Apply a solution of soda to the burnt surface, to relieve the pain. The part burned must be immediately covered with a double fold of wadding, the woolly side next the skin. Should pieces of the dress adhere to the cuticle, cut all the loose edges off, and lay wadding over what remains. If there is much prostration of strength, every ½ hour give draughts of a tablespoonful of brandy, ½ teaspoonful of sal volatile, 20 drops of ether, in a wineglassful of water; at the same time, to counteract the shivering and sense of cold that follow such accidents, apply heated bricks, or bottles of hot water, to the feet, thighs, and armpits. Should the pain continue an hour after encasing the part in wadding, give 40 drops of laudanum in one of the above draughts, and repeat, if necessary, in an hour. This dose applies to adults; to a child of from 5 to 12 years, from 5 to 10 drops. When the wadding becomes moist, on no account remove it, but put on another layer. The burnt surface must be kept constantly covered till the new cuticle has formed and the dressings fall off. When neither wadding or cotton can be procured, cover the part with handfuls of flour, or any harmless, impalpable powder, adding more whenever moisture appears. When the healing state of the burn warrants, apply a poultice. When softened and removed, the part is to be again dusted lightly, or treated with the wadding. The blister of a burn should on no account be broken. A cloth dipped in a solution of alum, 4 oz. to a qt. of hot water, and applied immediately to the burn, will also relieve the pain. As soon as it becomes hot or dry, replace by another, and repeat as often as the cloth dries, which at first will be every few minutes; even 24 hours will show the advantage of this treatment.

CANCER.—This is a malignant and nearly incurable disease, which may attack almost any portion of the body, but with women the glandular structures, and of these the breasts and womb, and in men the lower lip, are the most common seats of it. *Treatment*: The diseased part must be cut out. Where a cancerous tumor cannot be cut away, it may sometimes be removed by caustics; but this method is slower and more painful, and generally not so successful. Chloride of zinc, in some form, is the caustic most relied upon. Cut a hole in a piece of sticking plaster as large as the tumor to be removed, and over this the caustic may be applied. By this means the tumor gradually becomes separated, but the danger is that although removed from its present place, it may appear again elsewhere.

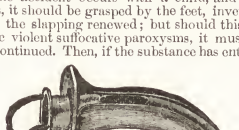
CARBUNCLE.—An exaggerated boil or collection of boils. *Treatment*:; Similar to erysipelas. To produce a full discharge of bile and urine, take the following: Calomel, 40 gr.; comp. ext. colocynth, 60 gr.; mix, and make 10 pills; take 2 pills once every 12 hours, till they operate. Opiates may then be given to allay pain, and bark with nitric acid to recruit the strength. Fomentations and poultices should be used to hasten suppuration. It is usually better to defer cutting till suppuration; then thoroughly cut through; after this apply warm poultices. Carbolic acid passed through the skin over the carbuncle by a hypodermic syringe, and allowed to saturate the sore thoroughly, is recommended. The skin becomes white, hard and dead, in a few days sloughs off, the interior mass becomes loose, and is easily removed.

CARIES.—An inflammation of the bone with softening, leading to ulceration. It is attended with pain and swelling, and after ulceration there is a fœtid discharge with portions of the bone. *Treatment*: Fresh air, tonics and alteratives; then remove those portions incapable of repair, and endeavor to establish healthy granulations. It may be necessary to remove portions of bone which are disintegrated, and apply escharotics to the surface.

Caries of Bone.

CHANCRE.—A venereal ulcer, mostly on or near the sexual organs, with well defined edges, looking as though the skin had been punched out. They are frequently attended with suppuration of the glands of the groin. *Treatment*: The thorough application of solid nitrate of silver or nitric acid, which last may be applied a single drop at a time, with the uncovered end of a match to every part of the sore, or deliquesced carbolic acid in like manner, to destroy the virus, and the subsequent use of gently stimulant and astringent washes; 3 gr. of alum or sulphate of zinc, with as much carbolic acid to 1 oz. of water, is usually all that is needed, sufficient care being had to prevent the contact of other parts, by the use of small pledgets of lint wet with the lotion. If the ulcer spreads, the use of quinine and iron tonics will be of service.

CHOKING.—A violent slap with the open hand between the shoulders, if given immediately, will frequently dislodge any foreign body. If the accident occurs with a child, and this fails, it should be grasped by the feet, inverted, and the slapping renewed; but should this induce violent suffocative paroxysms, it must be discontinued. Then, if the substance has entered



Double Tube for Insertion into the Windpipe.

the windpipe, nothing but cutting into the windpipe (called the operation of *Tracheotomy*) by a surgeon will do. If food has stuck at the entrance of the gullet, the substance may be reached and extracted with the forefinger, or

seized with a pair of pincers. Should this fail, excite vomiting by passing the finger to the root of the tongue or tickling the throat with a feather. By suddenly dashing in the face a basin of cold water, the shock and the involuntary gasp may move the substance up or down. If this cannot be done, seize a fork, a spoon, a penholder, pencil or quill, and push the article, if not too large, down the throat. If it be low down in the gullet, give an emetic of sulphate of zinc, 20 gr., in a couple of tablespoonfuls of warm water.

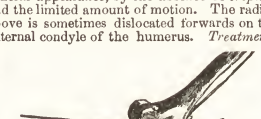
Securing Tube in Trachea.

CORNS.—These horny indurations of the skin have a nucleus, very sensitive at the base, and occur on the exposed portions of the joints of the toes. The common cause of corns is pressure or pinching from wearing tight, stiff or ill-fitting shoes. Frequently they are aggravated by some constitutional taint. *Treatment:* Soak the corns for some minutes in warm water; then pare closely with a sharp penknife, and bathe with dilute arnica tincture. If this does not do, bind cotton on the corn at night, and saturate it with spirits of turpentine. If this is not sufficient, paint, the corn with tincture of iodine, 2 or 3 times a day. If this fails, after paring the corn, place upon it a small, circular piece of leather or buckskin, spread with some emollient plaster, and have a hole in the center corresponding to the size of the corn; now touch it with nitric acid, by means of a small glass rod or wood toothpick, due care being taken not to allow the liquid to come in contact with the neighboring parts. Repeat this daily until it be sufficiently softened to admit of removal. If these all fail, any one of the following is recommended.—2. Apply, morning and evening, a drop of perchloride of iron by means of a bit of straw, for 15 days.—3. Take a lemon and roll it until soft; cut a thick slice and bind it on the corn on retiring at night. In the morning, if the corn is white and disintegrated, pull it out with your finger-nails. Sometimes several applications will be necessary.—4. Soak the feet, and bind on baking soda, dampened, and in the morning you will be surprised to find the soreness all out of your corns.—5. (*Pomades for Corns.*) Savine ointment, 1½ oz.; verdigris (in fine powder), ½ oz.; mix.—6. Dried carbonate of soda, ½ oz.; lard, 1 oz.; smalts (to color), q. s.; mix. The above are applied on a piece of rag, and renewed night and morning. Sold under various names.—7. (*Liquid Solvents.*) A saturated solution of salt of tartar or pearlash. It is commonly obtained by exposing the article, contained in a jar or wide-mouthed bottle, in a damp place, until it forms an oil-like liquid.—8. Caustic potassa, 1 dr.; alcohol, 1 fl. oz.; mix, in a stoppered phial, and agitate until solution is complete. The corns are either moistened with the above, or a small piece of lint, or rag, of the size of the corn, is moistened with them and bound on, care being taken, particularly with the last one, that the liquid does not touch the surrounding parts.

CRAMPS.—These may result from various causes, and may affect the muscles of a part only, or of the entire body. *Treatment:* Brisk friction, whether the cramps be general or local. For general cramps, put the patient in a hot bath, and use friction while in the water. For local cramps, use an embrocation of camphorated oil, spirits of turpentine and spirits of hartshorn; or the volatile liniment, 1 part spirits of hartshorn and 2 of sweet oil; or liquid opodeldoc and tincture of arnica, rubbing in the direction of the muscles, and apply to the extremeties. For cramps in the stomach and bowels, use hot friction, apply hot mustard or fomentations, and 25 drops of laudanum, with a teaspoonful of aromatic spirits of hartshorn, and ½ teaspoonful of essence of peppermint in sweetened water; or ½ teaspoonful of chloroform with as much spirits of lavender; or, in the absence of these, 1 oz. of brandy in some warm water.

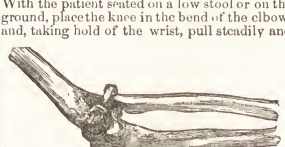
DISLOCATIONS.—Dislocations, like amputations, are of such importance that they usually require a surgeon to attend to them. The methods would be so innumerable, and the directions so extended, that it will only be attempted to give a faint idea of what might be done. Therefore, only a few cases of resetting will be considered; such as the elbow, the fingers, etc.

1. (*The Elbow.*) The common form is the dislocation of both the bones of the forearm backwards. It may be distinguished from fracture of the upper bone, which it resembles in general appearance, by the absence of *crepitus* and the limited amount of motion. The radius above is sometimes dislocated forwards on the external condyle of the humerus. *Treatment:*



Dislocation Backwards of the Elbow.

Simple extension, the elbow being kept straight. With the patient seated on a low stool or on the ground, place the knee in the bend of the elbow, and, taking hold of the wrist, pull steadily and



Dislocation Forwards of Head of Radius.

firmly, at the same time bending the arm gently, and the bones will in most cases return to their places without difficulty.—2. (*The Fingers.*)

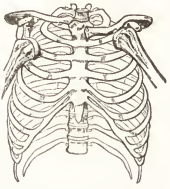
These are difficult to manage, but the general principles of simple extension are all that are usually employed.—3. (*The Jaw.*) Is caused by wide yawning, laughing, etc., and may be recognized by an inability to close the mouth, and by an unusual projection of the chin. *Treatment:* Protect the thumbs with a napkin or heavy gloves; place them within the mouth, in a line with and on the back teeth of the lower jaw, and press forcibly downwards and backwards, at the same time raising the chin with the other fingers, and the jaw will slip into place with a snap.—4. (*The Shoulder.*) May usually be detected by the deformity produced. The patient being seated in a chair, the surgeon places one of his knees in the axilla, resting the foot on the chair. He then puts his hand on the shoulder to fix the scapula, and with the other depresses the elbow over his knee. The arm should then be carried for some days in a sling, and if there is much inflammation, cold water dressings, or a lotion of lead water and tincture of arnica (sugar of lead, 1 dr., and tincture of arnica, 2 oz., to water; 1 pt.) may be applied. This joint may also sometimes be successfully reduced by the following maneuver: Have the patient lie down, and sit directly behind him; place one hand upon the shoulder to fix it;

Dislocation of the Jaw.

Dislocated Thumb.

Dislocation of the Thumb.

Reducing Dislocation of the Finger.



Dislocation of the Right Shoulder into Armpit.

Self-Reduction of Shoulder.

The common form is into the armpit. The shoulder is flattened, the head of the bone may be felt with the fingers, and the arm cannot easily be raised even with the shoulder. *Treatment:* Lay the person on a bed, on the side of the injured joint; seat yourself on the edge of the bed, and, having placed your heel in the patient's armpit, grasp the wrist or arm in some way with both hands and pull steadily downwards. After pulling a few moments, divert the patient's attention, by asking him to slightly change position, and while he is trying to do so pull suddenly with increased force, and the bone will probably be felt to slip into its place. Another method is by the knee in the axilla, then raise the arm from the side, and draw it straight up by the patient's head, till the bone is thus elevated into its socket. Another method is shown by the engraving of the man and gate.—5. (*The Wrist, Knee, or Ankle.*) These are most always accompanied with a fracture of one or both bones of the involved joint, and the services of a good surgeon are very indispensable.

DROPSY OF TESTICLES.—A collection of serum in the tunica vaginalis. It forms a pear-shaped swelling, smooth on its surface, fluctuating if pressed, free from pain and tenderness, and causing merely a little uneasiness by its weight. *Treatment:* The remedies are three-

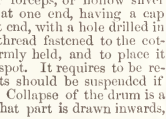
fold: 1. Strong discutient lotions, which sometimes assist the cure in children, but cannot be depended on for adults.—2. Evacuation of the serum, or the *palliative cure*, by a puncture with a lancet, or by making a number of punctures with a grooved needle, so that the fluid may escape into the cellular tissue of the scrotum, whence it is readily absorbed. This is sufficient for children, but rarely so for adults. —3. By injecting stimulating fluids, or introducing setons into the tunica vaginalis, to excite inflammation sufficient to destroy its secreting faculty. The surgeon grasps the tumor behind, and plunges a trocar and canula into the sac, pointing the instrument upwards, so that it may not wound the testicle. He next withdraws the trocar, at the same time pushing the canula well into the sac. About ½ oz. of tinct. iodine is then injected.

DROPSY, Operation of Paracentesis in.—For the general treatment of dropsy, see the same in MEDICINE. When medicines fail to afford relief, an operation must be resorted to. In dropsy of the abdomen, let the patient be placed on the side of a bed and the part affected surrounded with a broad bandage, having in it a slit corresponding with the place of puncture on a line with the umbilicus or navel, and a couple of inches below it. After seeing that the patient's bladder has been emptied, let the skin at that point be divided with a lancet or sharp knife, and a trocar and canula be thrust through, when the trocar is withdrawn and the water flows through the canula. While the water is flowing, an assistant draws steadily upon the two ends of the bandage, thus making gentle compression, without which a sensation of faintness is generally experienced, and afterwards, when the operation is completed, the bandage should be securely pinned.

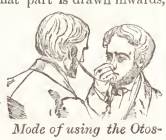
EAR-ACHE.—An affection that depends more on sympathy with the neighboring gums than any other cause. The irritation caused by cutting the permanent teeth in youth, and the wisdom teeth in adults, is the most frequent cause. *Treatment*: When caused from the irritation of teething, it can be relieved by scarifying the gum above the tooth, or by inserting a little wool in the ear, wetted with laudanum, and covering the ear with a large hot bran poultice. If from decayed or rotten teeth, these should be removed. When the ear-ache proceeds from cold, or some nervous affection of the head, the wool, with laudanum in the ear, and fomentation of chamomiles, will in general subdue the pain; but a better remedy is to drop into the ear a few drops of a solution of 2 gr. of atropia (the active principle of belladonna or deadly nightshade) in ½ *oz.* of water.

EAR, Diseases of.—Perforation of the "drum" of the ear very often accompanies fracture of the petrous bone; but may be caused by blows on the head, boxes on the ear, violent blowing of the nose, forcibly syringing, by disease, as after scarlet fever, by descent in the diving bell, by the introduction of foreign substances, and by loud noises. The symptoms which indicate an aperture in the membrane are, that the patient is conscious of air passing from the ear during swallowing; or that he can taste or perceive in his throat substances applied by syringing the ear. Diseased conditions are examined with a speculum and the otoscope. Purulent discharges from the ear can often be cured by patient daily syringing with pure warm soft water. After a few weeks, the addition of a little salt exerts a tonic effect. Obstinate cases require an aurist's treatment with nitrate of silver, etc. The closing of a perforation depends on the youth and strength of the patient and the healing of any diseased condition. A little bit of cotton wool, moistened with water, if passed down the meatus, and applied against the orifice, will act as a support to an injured membrane, and to the relaxed chain of small bones in the ear, and often produces a remarkable increase of hearing. Borated, or other medicated cotton, such as is sold at the druggists, should be used. On no account should any of the quack appliances now advertised take the place of this soft cotton, or the irritation will set up or increase a purulent discharge, ultimately destroying the ear. Not even the cotton should be used until a persevering effort has been made, for many months, to heal any ulcer in the ear, as even so innocent a foreign body as this soft cotton, antiseptically medicated, will militate against healing. The patient can usually be taught to introduce and withdraw this cotton with great nicety, by means of a slender forceps, or hollow silver tube, slightly bent at one end, having a cup soldered on the bent end, with a hole drilled in it, through which a thread fastened to the cotton is pulled and firmly held, and to place it exactly in the right spot. It requires to be renewed daily. Efforts should be suspended if irritation is caused. Collapse of the drum is a condition in which that part is drawn inwards, so as to be concave externally and leave the handle of the malleus unnaturally prominent. This requires the attention of an aurist. There are many diseases of the internal ear, only recognized by the skillful aural surgeon, who, with the otoscope, speculum and catheter, as shown in our engravings, and sometimes with the tuning fork and other scientific appliances, is able to diagnose the case, as no patient can for himself. Astringent gargles

Ear Speculum.



Mode of using the Otoscope.



Mode of using the Eustachian Catheter and the Explorer.

for the mouth are useful in improving the condition of the entrance of the Eustachian tube, on whose healthful state good hearing largely depends. It is often closed by bad colds. Prolonged bathing in cold water is a prolific source of deafness. A plug of cotton in each ear before swimming, is a sensible precaution.

EAR, Foreign Bodies in the. — Most foreign bodies, especially of small size, may be readily removed by syringing with warm water. Should instruments be used, great care should be observed, and very little force exerted. When foreign bodies cannot be removed by syringing the ear, introduce a very small brush or swab of frayed linen or muslin cloth, or a bit of sponge, moistened with a solution of glue, and keep it in contact with the foreign body until the glue adheres, when the body may be easily removed. Insects in the ear may be readily killed by pouring oil into the ear, after which they may be removed by syringing. Hardened ear wax may be softened by dropping into the ear some oil or glycerine, and then washed out with a syringe and warm water.

EYE, Cataract of the.—The blindness caused by obscuration of the crystalline lens. *Treatment*: This is by a well-known surgical operation, which none but a surgeon would undertake. There are two kinds of operation, extraction of the lens, and depressing it; the former secures the best result.

EYE, Closure of Tear-Passage of.—In health there is a tear-passage between the eye and nostril; this is sometimes closed up, causing a constant overflow of tears. *Treatment*: By a surgical operation this passage must be opened again, and a silver style introduced to keep it open for a period.

EYE, Inflammation of Tear-Gland of. — This gland sometimes inflames, and frequently suppurates, forming a small abscess. *Treatment*: Poultice the swelling while there is pain, and open it when it becomes mature.

EYELID, Eversion of.—After long-continued inflammation, the mucous lining of the eyelid becomes thickened, and the lid is turned out; the same effect is sometimes produced by the puckering of the scar of a healed burn or abscess in the vicinity of the under eyelid. *Treatment*: When caused by inflammation, try a wash of nitrate of silver, 2 gr. to 1 oz. of water; if this does not succeed, a portion of the thickened lining must be cut out, so that the lid may be braced up by the contraction of the scar that follows the healing of the cut. But when the eversion is caused by a scar after a burn or abscess, this scar itself must sometimes be excised, and a new under eyelid formed from the neighboring skin of the cheek.

EYELID, Falling of.—In the aged and feeble, owing to the paralysis of the muscle that raises it, the upper lid falls down. The patient is unable to see unless he lifts the lid. No efficient treatment is known. The lid may recover its power by using stimulating lotions or electricity.

EYELID, Inflammation of the.—The glands of the lids secrete a sticky mucus, which, during sleep, glues the lids together, so that, on awaking in the morning, the patient cannot get his eyes open. The complaint is generally chronic and obstinate, lasting a long time. Weakly persons, with disordered digestion, are most subject to it. In bad cases the lids ulcerate, and the lashes fall out. *Treatment*: The lids should be bathed with a solution of 10 gr. of sulphate of zinc, or 20 gr. of sugar of lead, and 1½ dr. of laudanum in ½ pt. of water, and the bowels opened daily with a small dose of Epsom or Rochelle salts, or the citrate of magnesia, and the edges of the lids, as soon as the active inflammation is subdued, touched once or twice daily with a solution of 5 gr. of tannin, or 2 of sulphate of zinc, in 1 oz. of water; a small amount of citrine ointment should be rubbed along the borders of the lids, with a small brush, at night.

EYELIDS, Insects on the. — In rare instances lice infest the eyelashes; they lodge about the roots of the hairs, and cause an obstinate itching. *Treatment*: Anoint the eyelashes with a small quantity of mercurial ointment.

EYELID, Inversion of the.—When the eyelid is turned in, there exists, either on account of previous inflammation, or some cause not clearly understood, a redundancy of the skin of the eyelid, and a contraction of its cartilage. *Treatment*: By operation a portion of the skin of the eyelid is removed, and the edges of the wound brought together by suture.

EYES, Dryness of the.—Sometimes a morbid dryness affects the eyes. *Treatment*: Keep the eyes constantly moist with glycerine.

EYES, Excessive Moisture of the.—In this case there is an over-secretion of tears, such that the cheeks are kept constantly wet. *Treatment*: As this complaint is owing to general irritability and weakness, the treatment is directed to regulating the bowels by occasional dram doses of Epsom salts, and promoting the strength by a dessertspoonful of comp. tinct. of gentian twice a day, before breakfast and supper.

EYES, Foreign Bodies in the. — They should be removed as soon as possible. Do not rub the parts, as this only increases the inflammation. If the injury is caused by caustic, strong acids, or salt, drop sweet-oil into the eye. When lime, ashes, dye-stuffs, or tobacco is the offending object, cream or sour milk is the best application. When sharp minerals, paint, sand, dirt and the like get into the eye, apply white of egg. When small particles cannot be removed by the above means, the upper lid should be turned inside out by taking the eyelashes between the finger and thumb and turning the lid upwards over a probe or knitting needle; the foreign substance may then be wiped off with the corner of a linen handkerchief. To remove cinders, take a small camel's hair brush dipped in water and pass it over the ball of the eye after raising the lid.

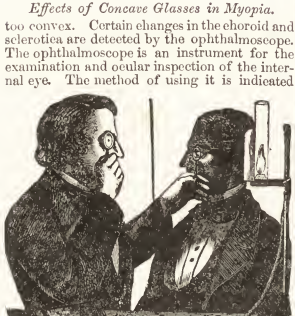
EYES, Gonorrhœal Ophthalmia of the.—Confined mostly to adults, though it may occur in children. Great precaution is always necessary to prevent the spread of the disease through a family. Any one with this kind of sore eyes should always have his own basin and towel, and nobody else should use them. *Treatment*: If possible, an oculist should be

consulted immediately. The eye should be kept clean with warm water and a soft rag; hard rubbing should be avoided; the best remedy is then a solution of alum, 10 gr. to 1 oz. of water, dropped into the eye every hour.

EYES, Myopia of, or Short Sight.—This affection may depend either on an increase in the refractive power of the eye, or else on an elongation of its axis, so that in either case the rays of light are brought to a focus before they reach the retina. The cornea is often exceedingly convex, and the secretion of aqueous humor abundant; and the crystalline lens is also

Effects of Concave Glasses in Myopia.

too convex. Certain changes in the choroid and sclerotica are detected by the ophthalmoscope. The ophthalmoscope is an instrument for the examination and ocular inspection of the internal eye. The method of using it is indicated



An Opthalmoscopic Examination.

by the illustration. By it the condition of the eye is readily seen. *Treatment:* The eyes should be accustomed to look at distant objects. When children display any tendency to short sight, their studies should be abridged, and they should have plenty of exercise in the open air. Shooting, archery, ball, and field sports in general, are highly beneficial. If the myopia is very decided, or if the eyes feel fatigued after any ordinary use of them, it will be better to wear glasses continually. Spectacles should always be used in preference to a single glass. The patient should choose a pair that enables him to see objects within 40 feet as distinctly as other people, but not so concave as to make objects appear dazzling, or smaller than usual.

EYES, Presbyopia, or Long-sight.—This depends apparently on a diminished quantity and density of the humors of the eyeball, through which it becomes flatter, and its refractive powers are diminished. *Treatment:* Use convex glasses immediately on discovering that it is impossible to read at the usual distance without fatigue to the eye; taking care that the lenses

Effects of Convex Glasses in Presbyopia.

chosen are of the lowest power, that will assist vision and restore the faculty of reading at the distance of from 12 to 16 inches. The sight should be spared by artificial light as much as possible. The glasses should cause minute objects near the eye to appear bright and distinct, but not larger than natural.

EYES, Strabismus, or Squinting of the.—The ordinary form of squint in young persons is the *convergent*, in which the eye is turned inwards; the *divergent*, that in which the eye is turned outwards, is chiefly met with in elderly persons. *Treatment:* If the affection be of not more than a few weeks' duration, it may perhaps be removed or mitigated by judicious medical treatment, especially by purgatives; as, 3 improved comp. cath. pills, taken at bedtime and followed by ½ oz. castor oil the next morning, if they do not operate previously; by antacids, as a teaspoonful of Husband's magnesia, followed by 2 teaspoonfuls of vinegar; by tonics, as iodide of potassium, 1 dr.; syrup of sarsaparilla, 4 fl. oz.; mix; take 1 teaspoonful before each meal. In settled cases, an operation by a skillful oculist will often cure.

EYES, Styes of the.—Stye is a small painful boil at the edge of the eyelid, having its seat probably in the hair follicle of an eyelash. *Treatment:* Poultices or fomentations; afterwards the citrine ointment to remove remaining hardness. Give one 3 gr. blue mass pill twice a week at bedtime, and follow it with a Seidlitz powder the next morning; and take every morning before breakfast a dessertspoonful of wine in which the tartrate of iron and potash has been dissolved in the proportion of 1 dr. to 1 pint.

EYES, Ulceration of the Cornea.—A common disease and always painful, sometimes excessively so. There is usually great dread of the light and hot water runs constantly from the eye. A white spot will be visible somewhere in the clear part of the eye, which is the seat of the ulcer. *Treatment:* A solution of atropine, 4 gr. to 1 oz. of water for adults, should be dropped into the eye 4 times a day, according to the amount of pain.

FELON (Whitlow, or Run-Around).—An abscess in the extremities of the fingers, or between the joints, and sometimes on the toes. It usually commences with a pricking pain in the finger. Soon the part begins to swell, becomes hard, hot, and exceedingly painful. The patient gets no rest night or day, and the matter burrows around the bone, causing caries of the joint. *Treatment:* 1. On the first approach, let it be painted with pure deliquescent, undiluted carbolic acid, and apply a coating of collodion over this.—2. Take equal parts of lard, soap, salt, and spirits of turpentine. Shave the soap and mix with the other ingredients, and apply as a

plaster; use kerosene where turpentine is not at hand. If the skin is thick, soak it in hot lye before applying the plaster.

FREEZING.—A person apparently dead from being frozen should never be taken into a warm house; on the contrary, always place the body in a cold room, and cover it with snow; or bathe and rub with ice-cold water, until the limbs become soft and flexible; then place it in a dry bed and rub briskly with flannel. So with any individual part that is frozen, caution being used not to raise the temperature too suddenly, or mortification may follow. Teaspoonfuls of weak brandy and cold water can be given occasionally.

GANGLION.—A movable, elastic swelling, with little or no pain, or change of color of the skin, situated under or between the tendons or sinews, and generally near a joint. *Treatment:*—1. By sudden pressure or a smart blow, the sack may be ruptured; where this cannot be done, puncture and let out the contents. Pressure may then, sometimes, cause the sides of the sack to adhere, and a cure be effected. — 2. Puncture it with a hypodermic syringe, draw out any fluid that will come through the hypodermic needle, and then inject into it carbolic acid or tincture of iodine

Ganglion in a Finger.

GLANDERS.—This disease is chiefly manifested by an unhealthy suppuration from the nasal cavities, pustular eruptions on the skin, and unhealthy abscesses. When seated in the lymphatic system, it is called *farcy*—when in the nasal cavities, *glanders*. It may be either acute or chronic. Acute glanders begins with the symptoms of a putrid poison. There are feelings of indisposition, followed by fever; then abscesses appear in red swellings about the joints; the fever is of a low, malignant character; in about a fortnight a dusky, shining swelling appears on the face, extending over the scalp and closing the eyes; then an offensive, yellowish discharge issues from the nostrils. *Treatment:* The chief points are to open all abscesses as soon as possible, to syringe the nasal cavities with solutions of creosote, and to support the strength and abate the thirst with wine or brandy, soda water, beef tea, etc. The effluvia must be counteracted by fumigations of chlorine and aromatics. Creosote injections, the administration of iodide of potassium with iodine, and mercurial salivation, in different cases respectively, have effected cures.

MOLES.—Croton oil, under the form of pomade or ointment, and potassio-tartrate of antimony, under the form of paste or plaster, have each recently been successfully employed, on the Continent for the removal of ordinary moles and nævi. The following is the mode of using the latter adopted by an eminent French surgeon: Tartar emetic, in impalpable powder, 15 gr.; soap plaster, emplastrum saponis, 1 dr.; beat them to a paste. Apply this paste to nearly a line in thickness (not more), and cover the whole with strips of gummed paper. In four or five days eruption or suppuration will set in, and, in a few days after, leave in the place of the nævus only a very slight scar. Croton oil ointment effects the same, but less completely unless repeated, by producing a pustular eruption, which, however, does not permanently mark the skin.

WARTS.—A wart belongs to the skin proper, the *vera cutis*, and consists of an abnormal growth of one or more papillæ, in which the nerves or blood vessels terminate. *Treatment:* Touch them repeatedly with nitrate of silver, or apply nitric acid to their extremities. Do not touch the adjacent skin. A safer remedy is to get a piece of sal ammoniac, about the size of a walnut; moisten the warts, and rub the sal ammoniac well on them every night and morning. If these prove ineffectual, try any one of the following:—1. Dissolve 1 oz. of white vitriol in 5 tablespoonfuls of water; put into a vial, and rub the warts as often as convenient.—2. Dissolve as much common washing soda as the water will take up; wash the warts with this for a minute or two, and allow them to dry without being wiped.—3. Pass a pin through the wart; apply one end of the pin to the flame of a lamp; hold it there until the wart frics under the action of the heat.—4. In cases of multiple warts of the face, apply the following paste: sublimed sulphur, 5 dr.; pure concentrated acetic acid, 2½ dr.; glycerine, 2 oz.; mix; for external use. The paste is applied to the warts either with a brush or spread over small pieces of linen. This is done at night, the paste being washed off the next morning. The application is repeated for several days in succession. Under the influence of this treatment the warts shrivel up, become blue, and ultimately drop off spontaneously.—5. Another very simple method employed with success in the treatment of facial warts, consists in covering the affected parts with pieces of flannel, smeared with soft soap. These are left in position for 24 to 48 hours, according to the degree of sensitiveness displayed by the patient, until the skin becomes red and shrivels up. After removing the flannel the warts should not be washed, nor even wiped; they become spontaneously detached in about a week.—6. Electrolysis is the most efficacious means of treating nevi molluscifórmes. A needle connected with the negative pole of a battery is introduced into the tumor, while the patient holds the positive electrode in his hand. A current of from one to two milliampercs should be used, and the application should last about thirty seconds. It is repeated at the end of a week or a fortnight. Large nevi require application of the galvano-cautery or some other caustic.—7. The common wart, which is so unsightly on the hands and face, can be easily removed by small doses of sulphate of magnesia, taken internally. — 8. Several children, treated with 3 gr. of Epsom salts, morning and evening, were promptly cured.

GOITRE. — A tumor on the forepart of the neck. It is an endemic disease: that is, one extremely prevalent in certain localities; among which may be mentioned Derbyshire, Nottingham, and the chalky parts of England generally; and various Alpine and mountainous districts, especially the Tyrol and valley of the Rhone. The use of melted snow, or of water impregnated with calcareous or earthy particles, to which the inhabitants of those places are more or less habituated, although not perhaps the invariable cause, is the most probable that can be assigned. *Treatment:* Take 20 drops of the comp. tinct. of iodine in a tablespoonful of wine, 3 times a day before meals, and paint the tumor twice a day with the tincture of iodine. It may be necessary, under the threatening of suffocation, to perform an operation; but this is extremely dangerous on account of hemorrhage, and does not always produce a cure.

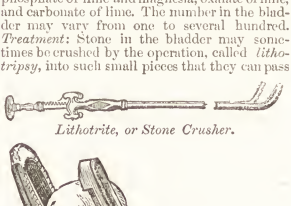
GONORRHŒA (Clap).—A tingling or itching sensation at the end of the penis, which becomes inflamed and swollen, a discharge of matter, at first thin and whitish, and, later, thick greenish-yellow, attended with intense scalding in passing water; pain and soreness along the entire under-surface of the organ, and involuntary, painful erections. The glands of the groin may become enlarged and inflamed, forming "buboes," which, if neglected, may suppurate. After the inflammatory symptoms have abated, a muco-purulent discharge is left, which, when obstinate and thin, is called a *gleet*. *Treatment:* First give ½ oz. of Epsom salts to operate as a cooling aperient; then take 3 times a day 1 dr. of a mixture of balsam copaiba, mucilage of gum Arabic, and sweet spirits of nitre, of each 1 fl. oz.; when the disease is obstinate, inject the urethra every four hours with a solution of 2 gr. of nitrate of silver in 8 fl. oz. of water. The patient should be kept very quiet and if there is much pain and fever should continue the Epsom salts in dram doses every morning, and take 8 gr. of Dover's powder at bedtime.

GRAFTING. Skin.— When a large surface of the body needs a covering of skin, and it is impossible for nature to supply the want, the operation of skin-grafting is resorted to to aid nature. Frightfully contracted cicatrices which follow burns, etc., are excised and their places filled with skin removed from another body or part of the same body, and engrafted on the required place. The skin adheres, and with surprising rapidity sends out prolongations of delicate skin in all directions, covering the surface with a new skin, comparatively free from contraction.

GRAVEL.— Small stony deposits, or *calculi*, are generally formed in the kidneys by a precipitation of earthy substances, and when they pass freely and frequently the disease is termed *gravel*. The passage of these gritty particles through the waterpipe frequently causes excruciating pain. *Treatment:* The pain being one of the most prominent, as well as serious symptoms, the treatment should be first directed to its relief; and this can be accomplished in no quicker or better way than by a hypodermic injection of from ½ to ¾ gr. of sulphate of morphia, dissolved in ½ dr. of warm water. This may be repeated every ½ hour till the pain subsides. We may be obliged to resort to bleeding, warm bath, soothing injections, diluent and diuretic drinks, spirits of turpentine; also mucilaginous drinks, like flaxseed tea, slippery elm, or gum Arabic water, are useful throughout the disease. The ordinary result is the passage of the calculus; but sometimes it is retained in the kidney, increasing in size, and branching into the pelvis or renal cavity. Then it is called *stone*. The symptoms are then pain in the loins, irritation and retraction of the testicle, bloody urine, and inflammation of the kidney. The passage of the stone through the ureter causes most acute and severe pain, faintness and sickness, which may last for several days, and is only relieved by the stone entering the bladder. The symptoms of stone in the bladder are frequent, sudden, irresistible desire to make water; pain in the glans penis, and elongation of the prepuce; sudden stoppage of the stream in urination, and its re-establishment by change of position—the urine being mixed with mucus and sometimes with blood. Stones vary in their form, size, color, consistence, and chemical composition; the size may be that of a pea, or a goose-egg. Some are soft and friable; others are flinty, and require great force to fracture them. They are most generally composed of lithic or uric acid, lithate of ammonia, phosphate of lime and magnesia, oxalate of lime, and carbonate of lime. The number in the bladder may vary from one to several hundred. *Treatment:* Stone in the bladder may sometimes be crushed by the operation, called *lithotripsy*, into such small pieces that they can pass away through the waterpipe. The instrument

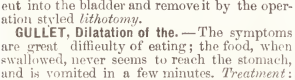
Urinary Deposits.

Lithotrite, or Stone Crusher.



Its Crushing End, Magnified.

used consists of two blades, which slide one upon the other, the extremities being slightly bent. It is introduced into the bladder as a sound or catheter, and afterwards the blades are separated, to grasp the stone. The crushing power is a screw, variously adapted. The extremities of the instrument have teeth, so as to retain the stone when grasped, and also apertures to allow of the escape of sand or powdered stone. The patient must be previously prepared for the operation, by regulation of the general health, dilatation of the urethra, and distension of the bladder by introduction through a catheter of warm water. The patient lies on a convenient table or bed. After encountering the stone and fairly grasping it, the stone is crushed by slowly and gradually turning the screw. Then the instrument should be slowly



Male Catheter, in two Parts.

withdrawn, and when the irritation has subsided, subsequently introduced to crush the fragments. When the stone cannot be crushed and removed in this way, the surgeon is obliged to cut into the bladder and remove it by the operation styled *lithotomy*.

GULLET, Dilatation of the.—The symptoms are great difficulty of eating; the food, when swallowed, never seems to reach the stomach, and is vomited in a few minutes. *Treatment*: The patient should be fed as in palsy. Sometimes a blind pouch is connected with the gullet, and occasions great distress by intercepting the food. The only remedy is to feed the patient constantly with the stomach-pump, so that the pouch may close.

GULLET, or FOOD-PIPE, Cancer of the.—Causes burning pain between the shoulder blades, and difficulty of swallowing. *Treatment*: Support with ice-cream, eggs, meat beat to a pulp, etc.; and give nourishing injections; for pain apply belladonna plasters to the back, and give opium, if necessary.

GULLET, Palsy of the.—This occasions inability of swallowing, but without pain, and a bougie, when passed, meets with no obstruction. *Treatment*: It generally depends on organic disease of the brain or spinal cord, which must be examined into and cured, if possible. The patient should be fed by the stomach pump, by nutrient enemata, and by pushing soft food occasionally down the gullet with a probang.

GULLET, Polypus of the.—Cases are recorded of polypous tumors projecting into the pharynx or gullet. *Treatment*: They must be removed by a surgical operation, in the same way they are removed from the nostrils and other localities.

GULLET, Spasm of the.—This disease is known by its generally occurring in sudden fits—the patient at a meal finding himself altogether incapable of swallowing, and the attempt to do so producing spasmodic pain and a sense of choking. *Treatment*: This affection always depends on a weakened or hysterical state of the system. Tonics, antispasmodics, and alteratives, especially iron with aloes and galbanum at bed-time; as, reduced iron, ½ dr.; aloes, galbanum, of each, 1½ dr.; sufficient syrup to make 60 pills; take 2 pills at bedtime and 2 at 11 A. M.; exercise in the open air and warm and cold bathing; great attention to the diet, care not to swallow anything imperfectly mastieated or too hot, and the occasional passage of a bougie, are the remedies.

GULLET, Stricture of the.—This causes difficulty of swallowing, gradually increasing, never absent, and occasionally aggravated by fits of spasm. Swallowing frequently produces pain in the chest, which shoots between the shoulders, and up to the head. *Treatment*: A mild course of mercury, so as just to affect the gums; occasional leeching, to relieve paroxysms of pain; hyoscyamus or conium, if there be much irritability; a seton between the shoulder blades; and the occasional passage of a bougie, or of a *ball probang*, or of a piece of sponge moistened with a weak solution of nitrate of silver.

GULLET, Tumors of the.—Tumors sometimes press on the gullet, producing ulceration and all the symptoms of stricture. *Treatment*: This disease demands the same management as that recommended for polypus, stricture, etc.

GULLET, Ulceration of the.—A disease almost uniformly fatal, producing exhaustion, irritation and inability to swallow. *Treatment*: The same as for tumors, stricture, etc.

GUM-BOIL.—A small abscess commencing in the socket of a tooth, and bursting through the gum, or sometimes through the cheek. It is usually caused by the irritation of a dead or carious tooth. *Treatment*: Fomentations; removal of the tooth, if much decayed; and an incision as soon as matter can be detected. If the tooth is extracted soon, the sac of the abscess very often comes away with it.

GUMS, Epulis of the.—A fibrous tumor of the gum. It generally commences between two teeth, which it gradually separates, then loosens, and finally displaces, and may spread so as to involve several of them. Or it may begin on the free surface of the gum. It is indolent, painless, and of slow growth. *Treatment*: It must be extirpated without delay. If possible, it must be cleanly shaven from the periosteum; but, if necessary, the tooth on either side must be extracted, and the tumor entirely cut out.

GUMS, Inflammatory Softening of the.—This generally affects elderly people, and may be a consequence of tartar, but more frequently depends on a congested state of the liver and bowels. The gums are swollen, spongy, exceedingly tender, and subject to constant pain, and bleed on the slightest touch. If the disease proceeds, they separate from the teeth; the teeth loosen and fall out. *Treatment*: Deep and free scarifications and repeated leechings; the bowels cleared by purgatives; and gargles should be employed. Whilst there is much pain and soreness, the soothing gargle, as, creosote, 20 drops; gum Arabic mucilage, ½ fl. oz.,

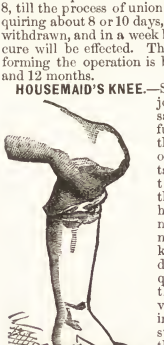
rub together and add water, 8 fl. oz.; afterwards the following: Alum, 1 dr.; dilute sulphuric acid, 40 drops; tinct. myrrh, 2 fl. dr.; decoction of cinchona, 6 fl. oz.; mix. Or, tannin, 20 gr.; brandy, ½ fl. oz.; camphor mixture, 6 fl. oz.; mix.

HARE-LIP.—A malformation that is born with a child. Hare-lip is more frequently found in the upper than in the under lip; in the latter case, the child is unable to articulate, or retain the saliva in the mouth, creating a source of ceaseless discomfort and pain. The disease is a fissure of one or both lips, having a space between, wider at the bottom and narrower to an apex at the gum, resembling the letter V reversed, Λ. This condition is called simple hare lip; but sometimes the fissure is double, having a pendant piece of the lip in the centre of both fissures. Compound harelip is that where the cleft extends along the bones of the palate, over the whole arch of the mouth, while in some cases the bones are entirely wanting. *Treatment:* This is very simple. The operation consists in making the two edges of the fissure even, bringing them together by two short silver needles, and keeping them in that position by silk thread passed over their ends like the figure 8, till the process of union has taken place, requiring about 8 or 10 days, when the needles are withdrawn, and in a week longer the permanent cure will be effected. The best period for performing the operation is between the age of 6 and 12 months.

Operation for Hare-Lip.

Button Suture.

HOUSEMAID'S KNEE.—Situated near the large joints are certain little sacs, or bags, whose function is to lubricate the tendons with the oily fluid they contain. Inflammation of the one between the knee-pan and skin has received the above name, because housemaids, from often kneeling on hard, damp stones, have frequently been subject to this affliction. It causes very great pain, swelling and fever. The swelling is in front of the knee-pan, and entirely unconnected with the joint. *Treatment:* Rest, leeches, fomentations and purgatives. If not speedily relieved by these means, it should be freely opened. When inflammation has abated, the absorption and consequent disappearance of the tumor, have sometimes been hastened by injecting into its substance the tincture of iodine with a hypodermic syringe.



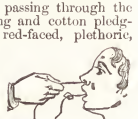
Housemaid's Knee.

HYDROPHOBIA.—It is best, when it can be safely done, to cut immediately around the entire track of the animal's teeth. If a finger be bitten, it would be best to chop the finger off, or amputate at the next joint. If the cutting cannot be safely done, warm water should be applied freely to wash away the virus, and promote free bleeding. A large cupping glass should then be applied; or, the bitten part should be strongly sucked for some minutes, by the person himself, or by any one else having no sores on the lips or in the mouth. A red-hot iron, or caustic potash, or pure deliquescent carbolic acid should then be thoroughly applied to every part of the wound, after which dress with lint, moistened with warm spirits and water with a little carbolic acid added, or with a warm poultice.

LIP, Epithelial Cancer of the.—A disease of middle life, and affects the lower rather than the higher classes, men much more than women, and the left more often than the right side. The disease begins as a crack or excoriation, thick epidermis, or as a wart, or as a superficial hardness of the skin. *Treatment:* Extirpation, free, entire, and early. The wound must be brought together vertically by pins and the twisted suture. In cases not fit for the knife, the palliative treatment of eaneer must be adopted. (See *Cancer.*)

MALIGNANT PUSTULE.—A contagious and very fatal disease, commencing as a little dark red spot, with a stinging pain, on which there soon appears a pustule on a hard inflamed base. When this is opened, it is found to contain a slough, black as charcoal, which rapidly spreads. *Treatment:* Same as for ulcers.

NOSE, Bleeding from the.—Let the arms be raised above the head; bathe the face, neck, and head with cold or ice-water, and lay a towel wet with it on the forehead; when this is not sufficient, let some salt water or alum water, or a pinch of powdered alum, be snuffed up the nose, or thrown up with a syringe, or blown through a quill, or better, if it can be had, some of the powder or solution of the persulphate of iron. If these means fail, the nostrils must be plugged, by a surgeon's passing through the nostril and mouth a string and cotton pledget. If the patient be red-faced, plethoric, and subject to headache and giddiness, a moderate hemorrhage may be regarded as a salutary effort of nature; a good purgative can be administered, as calomel, 5 gr.; podophyllin, aloes, rhubarb, of each, 2 gr.; mix, and make a powder, to be taken in a syrup or sauce; if the bleeding continues, give the following: Dilute sulphuric acid, 1 oz.; syrup of orange peel water, of each, 4 oz.; mix; take 1 tablespoonful 3 times a day.



Plugging the Nostrils.

NOSE, Enlargement of, or Hypertrophy.—This happens principally to those addicted to high eating. *Treatment*: The tumor may be removed with the knife; but the surgeon must first examine the patient's general health, and put him on a regular diet.

NOSE, Foreign Bodies in.—These may be removed from the nose by a small, bent probe. If they cannot be brought through the nostrils, they may be pushed back into the throat. The removal should be effected as early as possible.

NOSE, Polypus of.—A tumor of the consistence of jelly, pear-shaped, yellowish, slightly streaked with blood-vessels, attached by a narrow neck to the mucous membrane, causing a constant feeling of stuffing and cold in the head. *Treatment*: A probe should be introduced to feel for the neck of the polypus, which should then be seized with forceps, and gently twisted off. If it projects backwards into the pharynx, it must be extracted through the mouth.

NOSE, Rhinoplastic Operations on.—When a portion or the whole of the nose has been destroyed by disease or accident, the deficiency may be restored by a transplantation of skin from an adjoining part; the operation being varied according to the extent of the deformity. When the whole or greater part of the nose has perished, a triangular piece of leather should be cut into the shape which the nose formerly presented, and spread out flat on the forehead, with its base uppermost, and its boundaries marked out on the skin. Then the remains of the old nose (if any) are to be pared, and the margins of the nasal aperture cut into deep, narrow grooves. When the bleeding from these wounds has ceased, the flap of skin marked out on the forehead is to be dissected up, and all the cellular tissue down to the periosteum with it, so that it may hang attached merely by a narrow strip of skin between the eyebrows. When all bleeding has ceased, the flap is to be twisted on itself, its edges fitted into the grooves made for their reception, and fastened with sutures.

PALATE, Fissure of.—In some cases the uvula merely is fissured; in others the cleft extends forward, and may be combined with a hare-lip. *Treatment*: When the fissure is combined with hare-lip, and the gap extends from back to front entirely through the hard and soft palate and lip, the lip should be operated upon soon after birth in the manner described for hare-lip; and the observations then made should be attended to, as to the saving and pushing together any projecting bone. During childhood trusses should be worn to bring the edges of the bony fissure nearer together. If the fissure at birth should be discovered to be in the soft parts only, cauterize the angle of the fissure and allow it to cicatrize.

Fissure of the Palate.

PILES are external or internal. The predisposing causes are whatever tends to determine the blood to the rectum, such as constipation, pregnancy, sedentary habits; and the exciting causes may be purging, diarrhea, etc. *Treatment*: The palliative treatment of external piles consists in the application of astringent and anodyne ointments, made of galls, opium, etc., and the regulation of the bowels with laxatives, such as sulphur, rye mush with molasses, etc. The radical treatment is removal by scissors or bistoury; arresting the hemorrhage, and producing a healthy ulcer. A recent tense, single pile, may be successfully cured sometimes by letting out its contents by a lancet. With internal piles, in the first place, the stomach and bowels must be regulated by laxatives; disorder of the liver must be corrected, since any obstruction of the portal circulation in that organ predisposes to bleedings, or congestion of all the bile-making viscera. Great benefit will result from the use of astringent injections, such as solutions of zinc, oak bark, etc.; 6 or 8 drops of Fowler's solution of arsenic, three times daily, in ½ glass of water, has sometimes a wonderful effect in any case of piles; but the radical cure consists in their removal by a surgeon.

Suture for Fissure of the Palate.

PROUD FLESH.—Large granulations which sometimes give to healing ulcers, etc., an uneven, flabby and florid appearance. They are generally indicative of a weakened system, but frequently result from wounds and sores being kept too warm. Some mild astringent, as 1 gr. sulphate of zinc, or sulphate of copper, in 1 oz. of water; or 1 gr. of tannin, rubbed up with twice the quantity of powdered gum Arabic; or a few gr. of burnt alum, will usually be sufficient to arrest them. In addition, when the system is weak, or the diseased surface large, wine, tonics and good diet should be used. Dry calomel, dusted over exuberant granulations, will usually check them.

RUPTURE, or HERNIA.—A protrusion of the abdominal viscera. The exciting causes are over-exertion of some kind. Hernia is divided into *reducible*, *irreducible* and *strangulated*; and if the contents of the sac be intestine, it is called *enterocele*; if it contains omentum, it is called *epiplocele*. The sac is formed of peritoneum, and the different parts are called mouth, neck, and fundus. 1. *Reducible Hernia*. A painful swelling suddenly forms at some part of the abdominal walls, which is compressible and soft; can be made to disappear by pressure in the proper direction, and which often disappears spontaneously. An *enterocele* is smooth, elastic, and globular, retires suddenly, and with a gurgling noise. An *epiplocele* is more irregular in its form, has a doughy feel, and retires slowly without noise. *Treatment*: The treatment consists of reduction and retention. Reduction is effected by a manipulation termed *taxis*, the patient being placed in a recumbent position, and the muscles of the abdomen relaxed; gentle and steady pressure is made by the

hand in the direction of the descent. Retention is effected by continued and suitable pressure over the site of the protrusion, by means of a truss. The points of a good truss are, a well made elastic spring and a pad, that can be accurately fitted. The spring is to be applied 2 inches below the crest of the hip bone, and not above it, as is frequently done, Care must be taken to prevent excoriation, and also that every portion of intestine or omentum is removed from the sac previous to its application. By constant and careful use of a truss, a radical cure may be effected in a child, but rarely, if ever, in an adult.—2. *Irreducible Hernia.* When the contents of the sac cannot be restored to the abdomen, the hernia is called irreducible. It may arise from adhesions between the sac and the intestine contained, or from membranous bands stretching across the sac; from great enlargement of the omentum or intestine, or contraction of the cavity of the abdomen. The patient usually suffers from flatulence, indigestion and constipation, owing to the movements of the bowels being partially interrupted. *Treatment:* Consists in carefully regulating the bowels, avoiding any great exertions, and the wearing of a bag truss for support and to prevent further protrusion.—3. *Strangulated Hernia.* This is an incarceration of the contents of the sac with inflammation, and an interruption to the passage of feces, and of the circulation in the part. The inflammation is caused by the constriction, which may be the result of spasm, or sudden enlargement of the intestine by feces or gas. The symptoms are flatulence, constipation, pain in the part and abdomen, nausea and vomiting; and unless reduction can soon be effected there is danger that the imprisoned intestine will mortify. *Treatment:* First apply a quart of pounded ice to the hernial tumor to drive out the blood, and thus make it smaller; then let one or two assistants hold the patient in an inverted position for a few seconds at a time while the taxis is faithfully tried. If this does not succeed, the bowel will have to be cut down upon and its constriction relieved by operation.

SCROFULA, or WHITE SWELLING. — White swelling generally appears in the knee-joint, but sometimes attacks other joints. The disease commences with slight pains, perhaps affecting several joints, but at length settling decidedly in one. The pain increases in severity, and is felt as a small spot deep in the joint. The parts become swollen and hard, but do not turn red; the skin retains its natural color or assumes a shining whiteness. If not checked, matter forms in the joint, and may escape from several openings. *Treatment:* Dietetic and hygienic measures, abundance of exercise and nourishing diet, tonics of infusions of quassia, gentian or chamomile, with the bicarbonate of potash in the proportion of 3 dr. to every 6 oz. of bitter infusion, should be taken 3 times a day, and, if necessary, a grain or two of quinine, in the form of a pill, night and morning, or the citrate of iron and quinine, given in mint water or infusion of calumba, may be substituted in delicate constitutions. For the glandular form of the disease the iodide of potash and of iron; a mixture of 1 or 2 dr. of the iodide of potash and 4 to 6 dr. of the syrup of the iodide of iron in 3 oz. each of cinnamon or peppermint water, and as much compound syrup of sarsaparilla, may be given in tablespoonful doses 3 or 4 times daily. Excision of the affected bone has also been practiced, with the beneficial result of *shortening* the disease probably by months, and perhaps by years.

SPRAINS. — Warm applications are in most cases the best for 3 or 4 days, and may be applied in the following manner: Dip a good-sized piece of flannel into a pail or basinful of hot water or hot poppy fomentation, 6 poppyheads boiled in 1 qt. of water for about ½ hour; wring it almost dry and apply over the sprained part. Then place another piece of flannel (quite dry) over it, that the steam and warmth may not escape. This process should be repeated as often as the patient feels that the flannel next to his skin is getting cold, the oftener the better. If, however, the patient finds cold or tepid water more comfortable, it should be used. If the swelling be great, cold water should be applied. The diet should be nourishing, and not tend to constipate the bowels. When the knee is the joint affected, the greatest pain is felt at the inside, and therefore the fomentation should be applied to that part. When the shoulder is sprained, the arm should be kept close to the body by means of a linen roller, which is to be wrapped 4 or 5 times around the whole of the chest. It should also be brought 2 or 3 times underneath the elbow, in order to raise the shoulder. Gentle friction with the hands, after the swelling and pain have subsided, will help towards recovery.

TEETH, Caries of. — A successive softening and decay, gradually spreading till it reaches the central cavity of the tooth, which from that time is subject to fits of toothache. It may be promoted by any circumstances which lower the general health. It is very frequently a consequence of pregnancy and of nursing; it may follow any serious illness, or loss of strength, or the abuse of mercury. *Treatment:* If the caries be slight and recent, the whole of the decayed portion should be removed, and the cavity filled with gold, or an amalgam. But if the decay has advanced far towards the pulp cavity, or has laid that open, it may be necessary first to employ aperients and tonics, and use some applications to deaden the sensibility of the tooth, so as to enable it to bear the filling, and to protect it by a temporary filling of cotton or gutta percha. Avoid exposure to cold, errors in diet, and drinking very hot, cold, sweet, or acid fluids.

TEETH, Fracture of. — If a portion of a tooth is broken off, without exposing the pulp cavity, the exposed surface should be filed smooth, and no inconvenience will probably follow. If it is snapped off at the neck, and the pulp cavity is exposed and very painful, it should be touched with lunar caustic, and the mouth frequently bathed with strong poppy decoction; when pain and tenderness have ceased, an artificial tooth may be fastened to the stump. If a tooth is loosened by a blow, it should be fastened by silk to its neighbors. If a tooth is entirely driven

out, it should be replaced as soon as bleeding has ceased, and be fastened in by silk; no food should be allowed that requires mastication, and inflammation should be combated by bleeding over the gums.

TEETH, Irregularity of.—Usually a consequence of contracted and ill-formed jaw-bones. If either of the canine teeth or of the incisors of either jaw project much, persistently endeavor to push it back into its proper position with the fingers. But if at the age of fourteen or fifteen this method has not succeeded, and the teeth are crowded, the projecting tooth may be removed, although in many cases it is better to sacrifice one of the bicuspides to make room for it. If a growing child is underhung, so that the under incisors come in front of the upper ones when the mouth is shut, or so that the teeth meet at the cutting edges, instead of the lower teeth being received within the upper, the child should be encouraged daily to push the upper teeth forwards with its tongue and fingers; and should frequently put the end of a spoon-handle behind the upper incisors, and then close the mouth, using the spoon as a lever to press the upper teeth forwards and the lower ones backwards. But if these simple means do not succeed, recourse should be had to the appliances used by dentists. The wisdom teeth, especially in the lower jaw, are extremely liable to be misplaced, growing directly outwards or inwards, and producing ulceration of the cheek or tongue; or projecting forwards against the neighboring molar, or backwards into the coronoid process, or even being contained within a tumor in the substance of that process. In such cases a dentist's services will be necessary.

TESTICLE, Inflammation of.—Bleeding, purgatives, tartar emetic, opium, cold or warm lotions, should be resorted to, according to the patient's feelings. Low diet, and the recumbent position are essential. The weight must be sustained by a handkerchief. After the acute symptoms have subsided, friction with mercurial ointment, astringent lotions, and compression, will be useful. In the hardness and swelling which generally remain, iodide of potash has the best effect.

TOE, Great, Exostosis of. — The great toe is subject to a disease caused by a fibrous tumor at first; but it soon ossifies, pressing against the front half of the nail. *Treatment*: The only useful treatment is excision of it, and of that part of the nail adjacent.

Exostosis of Great Toe.

TOE-NAIL, Ingrowing. — Soak well in warm water until the soreness is relieved; then introduce under the edge of the nail pledgets of lint, to force it up out of the flesh. At the same time, with a sharp-pointed knife, scrape a groove lengthwise through the center of the nail, from the root to the point. Repeat the scraping daily until it nearly penetrates the quick, and keep in this condition. When proud flesh springs up in the ulcer, and it is very tender, take a little perchloride of iron in powder and insinuate it as deeply as possible between the free edges of the nail and the ulcer. This may be repeated in 24 hours or 36 hours, if necessary. Another good remedy is to put a small piece of tallow in a spoon, heat it quite hot, and pour it on the granulations.

Ingrowing Toe-Nail.

TONGUE, Inflammation of. — Great swelling, tenderness, and difficulty of speaking and swallowing; generally accompanies severe salivation; but it may occur in an acute form independently of this cause. *Treatment*: Purgatives and gargles; by bleeding, incisions, and antiphlogistic regimen generally. If abscess form, the fluctuating part should be opened.

TONGUE, Swelling Under, or Frog. — A soft, elastic, fluctuating and transparent tumor which forms under the tongue, and contains a pale-yellowish fluid. *Treatment*: A good plan is to empty the cyst by means of a trocar, wash it out thoroughly, and then throw in a solution of iodine.

TONGUE-TIE. — A prolongation of the frænum linguæ, confining the apex of the organ to the lower jaw. It is usually detected by the difficulty which the infant has in sucking. *Treatment*: Divide the frænum with a blunt-pointed pair of scissors, taking care to direct their points downwards, and keep as close to the lower jaw as possible, so as to avoid the lingual artery.

TONGUE, Ulceration of. — Endeavor to remove the cause and use aperients and an astringent gargle, as of alum. When this fails, free and early extirpation should be performed.

TONSIL, Chronic Enlargement of. — A frequent sequel of inflammation, especially of catarrh in scrofulous children. The parts are liable to attacks of acute inflammation, swallowing is impeded, the voice is hoarse, and breathing laborious, especially during sleep. *Treatment*: The system must be strengthened, and the secretions kept up by tonics and alteratives. Iron, especially the iodide, bark, and cod-liver oil, may be administered in either of the following forms: 1. Iodine, 2 gr.; iodide of potassium, 4 gr.; water, 1½ pt.; mix; take ½ wineglassful 3 times a day.—2. Corrosive sublimate, 1 gr.; tinct. of cinchona, 2 fl. oz.; mix; take 1 teaspoonful 3 times a day. Contraction must be promoted by astringent gargles, by swabbing the throat once a day with a lotion of nitrate of silver, 20 gr. to the oz. of water; use a piece of sponge the size of a walnut, over the end of a stick, firmly fastened on. Another remedy is to inhale boiling water, to which 20

drops of creosote or the same of tincture of iodine has been added. If these measures fail, part of the gland should be removed with the knife.

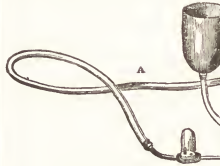
TONSIL, Inflammation of, or Tonsilitis. — Known by rapid swelling of the part, throbbing pain, swallowing difficult, perhaps impossible; headache, foul tongue and fever. *Treatment*: It must be treated by poultices, a dose of calomel followed by purgatives, inhalation of the steam of boiling water, and, to promote the secretion of saliva; use the following as a gargle: Solution of chlorinated lime, 4 fl. dr.; honey, 1 oz.; water, 3 fl. oz.; mix and add 1 tablespoonful to a glass of warm brandy. If the gland continues to swell, or if it occasion any embarrassment to the breathing, an incision should be made into it to unload the vessels, and give exit to matter.

TOOTHACHE.—Let the patient have a dose of calomel and colocynth; confine him to liquid diet; wash out the mouth with a solution of carbonate of soda in water; let the gum around the tooth, and between it and its neighbors, if tumid or tender, be scarified with a fine lancet; then let the cavity be filled loosely with a little bit of cotton dipped into a solution of tannin and mastic, 1 dr. of each to 1½ oz. of cologne water. If the pain is very violent, ½ gr. of powdered acetate of morphia may be taken up with the cotton imbued with the tannin; warmed before it is put into the cavity. In some cases, a whiff of chloroform will lull the pain. The following are also occasionally of service: Warm poultices to the cheek; a little piece of pellitory chewed; warm poppy decoction held in the mouth; or a full opiate at bedtime, if the bowels have been well cleared; stimulant, escharotic and astringent substances introduced into the cavity of the tooth, such as a drop of strong solution of nitrate of silver, or solution of alum or of tannin, or creosote, and of such aperients as Epsom salts, ½ oz.; syrup of ginger, comp. tinct. of cardamoms, of each, 1 fl. oz.; comp. infusion of rose, 10 fl. dr.; mix and take at one draught.

TOOTHACHE, Neuralgic. — Take quinine in large doses, together with aperients and alteratives.

TOOTH, Hemorrhage of, After Extraction. — The cavity must first be cleared of all coagulum; then a piece of matico leaf, or a little strip of lint loaded with powdered matico, or a bit of nitrate of silver, may be put into the socket; but if neither of these succeeds, the cavity must be plugged; one end of a long thin strip of lint is to be firmly pressed into it, so as to come into contact with its very bottom, and the remainder in successive portions forced in till the socket is filled up to the level of the gum. A compress should then be placed on the part, thick enough to be pressed upon by the opposite teeth, and the mouth kept firmly closed by a bandage.

TRANSFUSION OF BLOOD.—This consists in conveying blood from a healthy person to a weaker one. The basilic vein in the right arm of the patient is opened. From the median cephalic vein of the right arm of the healthy person blood is allowed to flow into the cup of a very ingenious apparatus here depicted. It consists of a cup of glass or of plated metal, a flexible tube and a metal tube, which



Apparatus for Transfusion.

last is to be inserted into the vein. This last has an air-trap, so constructed that any bubbles of air would be detained in it, and be rendered visible to the operator. The blood is received into the cup, and allowed to fill the flexible tube and air-trap (which is emptied of air by being turned upside down), then the nozzle can be inserted into the vein. By raising the cup the force of the stream may be increased, and it can be stopped in a moment by the finger and thumb of the operator.

TREPHINING. — An important operation performed by surgeons when a part of the skull has been forced down upon the brain by some accident, causing unconsciousness and endangering the brain and life of the person. The skull is pierced by the instrument near the injury, a small section is removed, and an *elevator* introduced to relieve the pressure. The aperture will then heal up.

Application of the Trephine.

ULCERS.—For simple ulcers, lint soaked in water, or water and laudanum, is all that is required. For indolent ulcers, the application may be made more stimulating by the addition of 2 gr. sulphate of zinc, or a few drops of nitric acid; or the surface of the ulcer may be touched with lunar caustic, followed by a warm poultice until free suppuration is established, after which the water dressing will be sufficient. For irritable ulcers, soothing applications, as warm anodyne fomentations or poultices are required, and dressings of extract of opium in glycerine and water, with rest of the part in an elevated position, are required. For both these forms and indolent ulcers, tonics, as quinine and iron, open air exercise, and good nutritious diet are useful; and in all forms of ulcers, especially when there is much formation of matter, cleanliness and frequent changes of dressings. Specific ulcers require constitutional treatment,

Bandaging an Ulcer.

in accordance with the nature of the case giving rise to them. A small amount of carbolic acid, 2 to 10 gr. to the oz., is at times a valuable addition to dressings. For weak ulcers, the application of strips of adhesive plaster as a bandage is sometimes of great advantage by supporting the edges, drawing them together, and thus assisting nature in her efforts to repair.

UVULA, Relaxed.—The uvula is the projection seen at the back part of the mouth, at the entrance to the throat. From the middle of the soft palate, the uvula hangs down into the throat, acting as a valve. It is liable to be inflamed and relaxed, occasionally a troublesome cough, by its length, irritating the upper part of the windpipe. *Treatment:* The usual mode is by astringents.—1. Take of powdered kino, 6 dr.; powdered alum and powdered cinnamon, of each, 2 dr.; syrup, a sufficient quantity to form an electuary; mix, and take a dessert-spoonful occasionally.—2. Bruised oak bark, 1 oz.; water, 1½ pt.; boil down to 1 pt.; strain, and add powdered alum, ½ dr.; brandy, 2 oz.; mix, and use as a gargle.

VEINS, Tumors in, or Phlebolites.—These little tumors, which sometimes so greatly disfigure the face and neck, are calcareous concretions, or limy growths, formed by the degeneration of blood-clots in dilated veins. The knife is the only remedy, in the hands of a surgeon.

Elastic Stocking for Varicose Veins.

VEINS, Varicose. — Varicose or dilated veins are generally found on the lower extremities. They are more common in women than in men, and are often the origin of troublesome ulcerations that frequently occur in later life. *Treatment:* Excision, and even a ligature around the trunk veins supporting the varix, have been adopted; but the best treatment is a steady and equal pressure by means of a laced stocking, as much rest in the horizontal posture as possible, and care taken to keep the bowels always open.

VENEREAL DISEASE.—The treatment must be a combination of alterative and tonic measures; a mild course of mercury should be resorted to, by rubbing 1 dr. of mercurial ointment on the inner portion of the thighs every second night; or by a blue pill, 2½ gr. blue mass and 1 gr. of extract of henbane, hyoscyamus, or of hemlock; or, should it cause pain in the bowels or purging, ½ to ½ gr. of opium may be given night and morning, until a slight constitutional effect is produced; then iodide of potash may be given in doses of from 10 to 30 gr. 3 times daily. Iodide of potash, in doses of 4 gr., 3 times daily, in 1 oz. of comp. syrup of sarsaparilla, is an effective remedy. A mixture of 2 gr. of quinine, dissolved in 4 drops of dilute nitric acid, in infusion of gentian, 3 times daily before meals; or 15 drops of the tinct. of iron, 3 times daily, will often prove highly efficacious.

WINDPIPE, Inflammation of.—Great constitutional disturbance shows itself, with difficulty of breathing and swallowing; a dry, harsh cough, with wheezing at every inspiration; the voice sinks to a whisper, the countenance becomes livid, and respiration is carried on with extreme difficulty, death by suffocation terminating the sufferings unless relieved. *Treatment:* Hot fomentations, blisters, cupping, hot bath, and an active employment of calomel and opium, 1 gr. of each, every 3 hours. Inhalation is valuable in this disease; for this purpose the following combination has been found useful: Comp. tinct. of benzoin, 3 fl. oz.; chloroform, 40 drops; mix; a teaspoonful in a pint of water at 140° F. for each inhalation.

WOUNDS, Applications for.—1. Wash twice a day with 1 dr. of carbolic acid in 8 oz. of water; then take 5 parts of glycerine and 4 parts of the yelk of egg; mix well; the mixture forms a varnish, with which wash the wound.—2. balsam fir, true Venice turpentine, oil of sweet almonds, of each, 2 oz.; add carbolic acid, ½ dr., previously dissolved in 2 dr. warm glycerine; mix; apply with a flat camel's hair brush, and inject into the interstices of the wound with a glass syringe, having previously cleansed the wound with very warm water and a bulb syringe.

WRYNECK.—A peculiar distortion, in which the head is bent down toward one shoulder (generally the right), and the face is turned to the opposite. *Treatment:* This will vary with the causes producing it. If it result from spasm, purgatives, leeches, and fomentations should be used; if from paralysis of the opposite side, general tonic treatment and stimulating friction will be useful. If the contraction be permanent, the muscle must be divided. In the latter extremity, the services of a surgeon are necessary.

Women and Children.

REMARKS.—A baby should not sleep in the same bed with another person more than absolutely necessary, and should have a plenty of fresh air, day and night. Give an ailing child a warm bath, and the effect will be soothing and grateful. It should not remain in the water more than a few minutes, and when taken out be wrapped in a blanket and quickly dried with warm towels. Bathing the hands and face frequently is very refreshing, and will sometimes induce sleep. Every mother should make some general preparations for accidents. For a cut there is nothing better than isinglass plaster and powdered rosin. Get a few cents worth of rosin, pound it until it is fine and put it into an empty, clean pepper or spice box, with perforated

top; it can then be easily sifted out on the cut; put a soft cloth around the injured member, and wet it with cold water once in a while. It will prevent inflammation and soreness. In doing up a burn, the main point is to keep the air from it. If sweet oil and cotton are not at hand, take a cloth and spread dry flour over it and wrap the burned part in it. Some simple remedies should always be on hand. Among them a little bottle of peppermint, in case of colic; chlorate of potash, for a sore throat; pepsin, for indigestion; a bottle of brandy, of alcohol and of tinct. of camphor. Have them where they are handy, but never touch them without being sure of what is taken.

ANÆSTHETIC, For Children.—Chloral, in sufficiently large doses, always produces in children a profound sleep approaching to anæsthesia. In incomplete anæsthesia from chloroform, the patient feels the pain, and manifests his sensations by cries, as in anæsthesia from chloral; but, while in the first case memory is preserved, in the latter all recollection of what was done is lost. The necessary doses for anæsthesia are: From 2 to 4 years, 2 graines; from 4 to 8, 3 graines; from 8 to 12, 4 graines. It should be given in one dose, while fasting. Sleep comes on very quickly. The operation should be performed about 1 hour or 1½ hours after the child has fallen to sleep. 5 hours is the usual duration of the sleep, during which the respiration and the circulation preserve very nearly the normal type.

BOWELS, Bands for Weak.—If the bowel complaint should become troublesome, keep a flannel band bound snugly around through all the hot weather. It supports the bowels, keeps them warm, and will often cure the trouble when medicine and diet have been of no avail.

BOW-LEGS.—If the child is healthy, and has good, nourishing food and pure air, it will probably outgrow its bow-legs as its strength increases. Rubbing the legs with the hand in the morning may help to strengthen and straighten them, holding them straight at the same time. If the case is pretty bad, the two legs may be bound together with comfortable bandages during sleep, rubbing them well before and after binding them. If the child is still quite young, it may be kept from standing on its feet for a few months, giving time for the crookedness to straighten while the limbs are growing stronger. A healthy child, with wholesome food, and pure air to breathe, if kept from standing and walking while too young and weak, will not have bow-legs. Scrofulous children are more likely to suffer in this way, and those that are very fleshy.

BRANDY, For Children.—When brandy is used, or ordered by a physician, a few drops, according to the age, should be given in water or some sweet milk. Generally keep it in reserve for the time of the day when the sufferer appears to exhibit signs of being weaker than usual, and then give only enough to restore it to its average condition in health. Usually it is most frequently needed in the latter part of the day, or quite early in the morning.

BREAST, Acute Inflammation of.—Known by great swelling, tenderness and pain, and fever. These symptoms are generally soon succeeded by formation of matter. *Treatment:* At first purgatives, leeches, and fomentations, or poultices after them; the milk should be drawn off, if it can be done without very much pain, and Dover's powder given to allay restlessness. The arm should be kept quiet in a sling. So soon as suppuration is evident, a puncture should be made. Efficient support should be given by bandages, to take up the weight of the organ, compress the distended vessels, and prevent bagging of matter. If, after leeches and purgatives, the tenderness and pain diminish, so that there seems a chance of resolution without suppuration, similar support is most useful.

Support for Inflamed Breast.

BREAST, Sore Nipples of.—Excoriations and cracks of the nipples not only cause great pain and inconvenience in suckling, but are a frequent cause of acute inflammation of the breast. The tannin lotion, made of ½ dr. of tannin, 1 fl. dr. of alcohol, and 4 fl. oz. of water, mixed together, should be used. The nipple may be defended from the clothes and the child's mouth by a metallic shield, or rubber band. Women who are subject to this affection should frequently wash the parts with salt and water, or solution of alum, during pregnancy; or should apply every night a liniment composed of equal parts of rectified spirit and olive oil.

BREAST, Swelling of.—The swelling of the breasts to an enormous size is very common during the earlier months of pregnancy in plethoric women. Boys and girls about the age of puberty are subject to slight swelling and tenderness, which soon disappears of itself if not interfered with. The breasts of new-born infants also are sometimes found to be swollen and hard. *Treatment:* When the breasts are found to be hard and swollen, they should be gently bathed with warm hog's lard, and a piece of folded linen saturated with it laid over them. If this means does not cause the swelling to subside, apply a warm poultice, changing it every 3 hours, till the abscess breaks and discharges its matter, when it will speedily heal.

CANKER.—A serious disease, consisting of ulceration, commencing in the gums, and thence extending to the lips and cheek. Apthæ affects children during the first weeks and months of life; but canker rarely attacks a child under 1½ years of age or over 7 years, choosing for its advent by preference the periods of the first and second dentition; and, at the latter period seem-

ing often to be aggravated, if not caused by decayed teeth. *Treatment*: Tonics and generous nourishment are of prime importance, as canker generally indicates a low state of the system. Give 1 gr. doses of quinia in a little milk twice a day to a child 2 years old; also 2 or 3 teaspoonfuls of whisky in the 24 hours. Use chlorate of potash, 1 dr. to the pt. of water, as a mouth-wash, in mild cases; but if the ulceration becomes very severe and destructive, resort at once to the muriatic acid, 1 part acid to 2 or 3 parts honey; this preparation should be applied by means of a sponge pressed over the foul ulcers; one or two applications will probably be sufficient to thoroughly cleanse the diseased surface, and change it to a more healthy action. *Homeopathic*: Carbo veg., mercurius and nux vomici, will be found the best remedies with which to correct this condition; when the ulcers are consequent upon a derangement of the stomach or liver, the remedies must be chosen with a view to correct these functional derangements.

CHAFING.—(See *Erythema* in MEDICINE.)

CHILD-BED FEVER (Puerperal Peritonitis).—When this occurs, it is on the third or fourth day, usually after confinement; the woman is seized with rigors, pains in the head, acute and constant pain over the abdomen, increased by pressure or any motion. All the secretions are suddenly stopped, the milk and womb discharges especially, the abdomen is tense and distended, the skin hot, the pulse quick, small and wiry, yet sometimes full and bounding, with a white-coated tongue; the face is flushed and anxious, there is occasionally sickness at the stomach, and the respiration is brief and quick; the pulse becomes more rapid, the skin clammy, the tongue, gums and teeth covered by a dark brown fur, and a low, muttering delirium indicates the approaching end, when the fever progresses thus far. *Treatment*: Give 1 gr. opium every hour, combined with 2 gr. of calomel, and cover the entire abdomen with hot poultices of hops and bran, or of scalded corn-meal, or with hot fomentations, or cloths wrung out of hot turpentine. Later, give quinine in 2 or 3 gr. doses, 4 or 3 times daily, with beef tea. Warm vaginal injections of a solution of carbolic acid, 1 dr. to 6 oz. of water, and ½ oz. alcohol, are of great value.

CHILD-BED FITS (Puerperal Convulsions).—During labor, women are frequently attacked by convulsions, especially if of a nervous or epileptic condition. The patient is suddenly deprived of consciousness; the face and all parts of the body are distorted by spasms; the eyes are agitated and roll frightfully; the tongue projects and is bitten, causing it to bleed; bloody froth issues from the mouth; the paroxysms last from 5 to 20 minutes, when the convulsive movements gradually subside, and consciousness returns. In unfavorable cases, the patient remains in a state of total insensibility. *Treatment*: Keep up action of the bowels by mild saline cathartics, as the Rochelle salts; free action of the kidneys should be promoted by the tartrate or the citrate of potash, or use small repeated doses of cream of tartar, a teaspoonful in a tumbler of water, as often as required, to act both on the kidneys and bowels. Use chloroform inhalation to control the convulsions until labor is completed with the forceps, or by turning, when the passages are sufficiently dilated. Stimulating injections, ice to the head, mustard plasters to the extremities and over the abdomen, and cups to the back of the neck and along the spine, with full doses, 20 gr. each, of chloral and bromide of potash in a wineglassful of sweetened camphor water, and repeated when necessary, usually give relief; use until all convulsions subside.

CHLOROSIS, or GREEN SICKNESS.— A disease or condition almost peculiar to young women at the age of puberty, consequent upon, or accompanied with, suppressed or vitiated menstruation. It is characterized by derangement of the stomach and bowels, manifest by a pale, bloated appearance of the tongue, foul breath, loss of appetite, or morbid craving for certain indigestible articles, as chalk, coal, clay, paper, etc. The bowels are torpid, the stools imperfectly digested, and of an unnatural color. The skin is extremely pale, sometimes clear, sometimes yellowish, greenish, or waxy. *Treatment*: Good diet, iron in some form, with bitter tonics, salt water bathing, change of air, cheerful companionship, and regular, moderate exercise. A pill of iron, quinine and strychnine, in the following form, is recommended: Sulphate of quinia, reduced iron, of each, 1 dr.; acetate of strychnia, 1 gr.; enough ext. of gentian to make 60 pills; take 1 pill before each meal. The elixir of iron, calisaya bark and strychnia is an excellent preparation, as sulph. strychnia, 1 gr.; sulph. cinchona, 1 dr.; tinct. of chloride of iron 2 fl. dr.; enough syrup of tolu to make of the whole 4 fl. oz.; mix; take 1 teaspoonful before each meal.

CHOLERA INFANTUM. — The symptoms are diarrhea, vomiting, refusal of food, and weakness; at first the head may be hot and the stomach swollen; and later coldness and wasting; death may result in a few days, with head symptoms; in other cases the child seems merely to waste away from the combined effect of diarrhea and want of food. *Treatment*: Stop the vomiting and purging as soon as possible by opiates and astringents, as spearmint tea, cinnamon water, of each, 1 oz.; tinct. catechu, 2 dr.; aromatic ammonia, 1 dr.; laudanum, 12 drops; syrup of orange-peel, 2 dr.; mix, and give 1 teaspoonful every hour, till the diarrhea and vomiting are checked, or sleep is induced. 2 or 3 teaspoonfuls of brandy during the 24 hours, diluted by 3 or 4 times as much hot water, with a little sugar, may be useful in preventing exhaustion. Warm applications, ginger or cayenne plaster, externally over the abdomen, with gentle friction, are frequently beneficial.

CLEFT-SPINE TUMOR. — A congenital affection in which the spinous processes and lamine of some of the vertebræ are cleft or deficient. The spinal membranes, deprived of their ordinary support, yield to the pressure of the fluid which they contain (which also is secreted in unusual quantity), and bulge out, forming a tumor in the middle line of the back. *Treatment*:

Apply moderate support by means of a hollow truss, or some such contrivance, so as to counteract that tendency to effusion which there always is when a natural support is taken away.

COLIC OF INFANTS. — 1. Hot catnip tea, or spearmint tea, or aniseed tea, or any of the hot carminatives by the mouth are useful in this complaint; but a simple injection of hot water, or hot saleratus water, will often prove to be the most complete remedy. Either of the following are valuable: — 2. Powd. rhubarb, fennel seed, of each, 2 dr.; water, 1 pt.; boil until $\frac{1}{2}$ is dissipated; dose, $\frac{1}{2}$ teaspoonful to $\frac{1}{2}$ tablespoonful, 2 or 3 times a day. It is useful in those cases attended by constipation. — 3. Laudanum, 80 drops; anise oil, 18 drops; alcohol, 1 oz.; mix; put in $\frac{1}{2}$ pt. of boiling water, after sweetening to taste give $\frac{1}{2}$ teaspoon or more, according to age.

COUGH, Whooping. — This has 3 stages, the catarrhal, convulsive, and declining. The first stage has the symptoms of catarrh, as sneezing, dry cough, languor, restless nights and fever; the cough is intermittent and is more frequent by night than day; this stage lasts from 1 to 3 weeks. The 2nd stage exhibits the paroxysmal cough; it is a peculiar *whoop*, from the spasmodic closure of the glottis; the paroxysms last from 1 to 3 minutes and frequently terminate by vomiting of mucus and the contents of the stomach; the face becomes swollen and livid, and blood often exudes from the mouth, nose and ears; this lasts from 3 to 6 weeks. In the 3rd stage the symptoms become milder and less urgent; when after 3 or 4 weeks the child may get well. *Treatment:* No complete remedy for this disorder has been discovered; but belladonna, either alone or in combination with quinia, has given relief. 1. Sulphate of atropia, 1 gr.; distilled water, 1 fl. oz.; mix; 2 to 4 drops every 2 hours, unless the peculiar effect of belladonna in dilating the pupils is observed; when this appears, stop the medicine for a few hours, and afterwards let the intervals be 3 or 4 hours. — 2. Ext. belladonna, 1 gr.; powdered alum, $\frac{1}{2}$ dr.; syrup of ginger, syrup of gum Arabic, water, of each, 1 oz.; mix; a teaspoonful 3 times daily, also once at night, if cough occurs. *Homeopathic:* If the patient is feverish, and the cough dry and whistling with some soreness of the throat, give aconite; if the cough is suffocative, with scanty urine and great exhaustion, give arsenic; if the paroxysms are frequent, worse in the night, and the child gets very red in the face, give belladonna. Administration: During the first stage, the remedy may be repeated 3 or 4 times a day; in the second stage, every 2 or 3 hours in bad cases; during the stage of decline, a dose 2 or 3 times a day will be sufficient; dissolve 12 globules or 3 drops of the liquid in a tumbler $\frac{1}{2}$ full of water, and give teaspoonful doses.

CROUP.—An inflammatory disease affecting the larynx and trachea. The symptoms are a laborious and suffocative breathing, with wheezing, a cough, a peculiar shrillness of voice, and more or less expectoration of purulent matter as the disease progresses. It attacks suddenly, often in the night. A false membrane forms in the most dangerous cases, and croup is considered to be divided into 2 kinds: the spasmodic, and the membraneous or malignant. In the former, the symptoms are very violent, but are often relieved completely by a prompt emetic. The latter, or malignant kind, comes on more insidiously, and seems like a peculiarly hoarse cold. *Treatment:* The treatment of malignant croup may also be commenced by an emetic; tartar emetic, $\frac{1}{2}$ gr., for a child 4 years old, and 5 gr. of ipecac, mixed with a little warm water. If this does not relieve by bringing away the false membrane, the child should then be treated in the same manner as for diphtheria; the strength should be supported by nourishment and stimulants, if necessary, frequent inhalations of the steam of warm water, and his bowels kept in proper order. It is well to have a couple of grains of calomel in this first cathartic, as the influence of that is to diminish inflammation and regulate the secretions of the liver and glandular system. After that, the bowels should simply be regulated by rhubarb, salts, or oil, as may be convenient. The following are also quite efficient methods of treatment: 1. Give 2 teaspoonfuls of Epsom salts, and put the child to bed; apply mustard to its feet; wring out a flannel cloth in hot water, and wrap it around the neck as warm as it can be borne, protecting the bed with dry cloths; if the breathing is not easier, and the skin not getting moist in 3 or 4 hours, mix $\frac{1}{2}$ teaspoonful each of powdered alum and ipecac in $\frac{1}{4}$ glass of tepid water, and give it; if it does not vomit in 10 minutes, repeat the dose with a teacupful of warm water every 5 minutes until there is free vomiting. If this should fail to afford relief in 12 hours, give 10 gr. of calomel, mixed with 1 dr. of saltpeter, called nitrate of potash; divide into 12 powders, and give 1 every 2 hours. — 2. Bind a napkin wet with cold water, and a dry one over it, around the throat, and give a teaspoonful of syrup of ipecac; the cloths must be changed every few minutes till the choking is over; if necessary, give the ipecac or hive-syrup till the child begins to vomit. *Homeopathic:* Give spongia as soon as the hard cough is heard, and repeat every hour, $\frac{1}{2}$ hour, or 15 minutes, a drop for a dose; aconite, when the pulse rises and there are feverish symptoms; this medicine can be alternated with spongia when the symptoms are very acute, and then given every 10 minutes with spongia; give hepar sulphuris, when the cough is looser and the feverishness has disappeared; a drop every 2 hours.

DIARRHEA. Of Infants. — To check infantile diarrhea: 1. Cinnamon water, 1 fl. oz.; spearmint tea, $\frac{1}{2}$ fl. oz.; bi-carbonate of soda, 10 gr.; syrup of orange-peel, 2 fl. dr.; laudanum, 6 drops; mix; take 1 teaspoonful every hour. — 2. Infusion of simaruba, $1\frac{1}{2}$ oz.; dilute nitric acid, 4 drops; syrup of clove, $\frac{1}{2}$ oz.; laudanum, 6 drops; mix; take 1 teaspoonful every 3 hours. (See *Diarrhea* in MEDICINE.)

DRINKS, For Children.—Fresh rice water, barley water, oatmeal water, with lemons and sugar, are valuable in every house where children are. These are surely better than cold tea, which is often given, or even milk when not fresh. Give the baby all the water it wants.

DROPSY, Of the Brain.—This disease appears most frequently during the periods of infancy and childhood. Among its precursory head symptoms, none is more marked or impressive than the sudden scream, or piercing shriek, with which the little patient sometimes wakens from its sleep; and the ominous import of which the experienced parent learns to dread. The other symptoms are too familiar to need particular notice. *Treatment*: Purgatives are the main dependence; commence with a full dose of calomel, from 2 to 4 gr., mixed with a little wet sugar, for a child a year old; and follow it up with small doses of Epsom salts every 4 hours; as Epsom salts, 1 dr.; nitre, 10 gr.; syrup of lemon, 3 fl. dr.; water, 9 fl. dr.; mix; a dessertspoonful every 4 hours. Then, apply externally, glycerine, 1 oz.; tinct. of iodine, ½ oz.; mix, and apply to the head twice a day, either on a cloth or by painting with a little brush. As an internal tonic, use iodide of potassium, 20 gr.; syrup of tolu, ½ fl. oz.; water, 2 fl. oz.; mix; a teaspoonful morning and evening after food. In extreme cases, blisters, and even issues on the occiput or nape of the neck have been advised. One of the new remedies, pilocarpine, or extract of Jaborandi, on account of its great power to drain the head by profuse salivation of the mouth, bids fair to be eminently useful in this disease; but future experience must decide this matter. *Homeopathic*: When there is a flushed, purplish, swollen face, with red eyes and dilated pupils, give belladonna; much intolerance of light, irritation, or feverishness, give aconite; great stupor, drowsiness, and stertorous breathing, give opium; manifest signs of effusion, dark flushed face, and dry lips, give bryonia. Administration: Of either of the above remedies, dissolve 10 globules in a tumbler ½ full of water, and give 2 teaspoonfuls every 3 hours.

EVOLUTION AND INVOLUTION.—These terms are now employed, the former to describe the gradual dilatation of the womb during the months of pregnancy, and the latter its more rapid, but still gradual contraction to very nearly its virgin dimensions. These are great and wonderful changes; and it is not strange that it takes much time, and much of the undiverted energies of nature for their accomplishment. The virgin womb weighs 1 oz.; and the just emptied womb, immediately after childbirth, 24 oz. There are diseases and dangers, incident to evolution, which are well-known, and which the intelligent mother will endeavor to avoid. The work of making a human being is a great one, and it is easy to comprehend that she, to whom such an important trust is committed, should not allow her energies to be too much absorbed by other labors. But it seems more difficult for the woman to understand why, when she feels so well, she need be kept quiet so long after the birth of the child. Involution furnishes the reason; this also is a great work; 24 oz. are to be contracted to nearly 1 oz., and if the woman would retain her handsome form, free from that abdominal protuberance frequent among child-bearing women, and if she would also recover her youthful vigor, she will be careful of her strength during six weeks after labor.

FEVER, Scarlet, or Canker Rash.—Somewhere between the second and tenth day after exposure it begins with languor, pains in the head, back and limbs, with drowsiness, nausea and chills; these are followed by heat, thirst, etc. When the redness appears the pulse is quick, and the patient is anxious, restless, and sometimes delirious; the eyes are red, the face swollen, the tongue is covered in the middle with white mucus, and is studded with elevated points of extreme redness; the tonsils are swollen and the throat red. The greatest degree of redness is reached on the evening of the third or fourth day from its beginning, when a gentle moisture appears, the disease begins to decline, with itching, and the scarf-skin falls off in branny scales; as the disease advances the tongue often becomes suddenly clean, and presents a glossy, fiery-red surface, which is sometimes, with the whole lining of the mouth, raw and tender. On pressing down the tongue, the throat is swollen and of a deep, florid red; on the tonsils may be seen white or gray ulcers; the great amount of mucus in these parts causes also a continual rattling in the throat; the glands under the ear and jaw inflame and occasionally break; the inflammation of the throat almost always runs into ulceration, and abscesses sometimes form in the ear and cause deafness that may be difficult or impossible to cure. *Treatment*: In ordinary cases, the treatment should be very simple. The apartment should be kept cool, and the bed-covering light; the whole body should be sponged with cool water as often as it is hot and dry, and the patient be permitted to take cooling drinks; when the fever is very high, the wet sheet pack should be thoroughly tried. (See *Bathing* in HYGIENE.) Give 10 drops of the tincture of belladonna, night and morning; the feet and hands should be soaked 2 or 3 times a day in hot water, with a little ground mustard or cayenne pepper stirred in; if the bowels are costive, they should be kept open by gentle laxatives, 1 dr., each, of rhubarb and magnesia or Rochelle salts, or by injections; the diet should, as a rule, be liquid, but need not necessarily be low; milk, milk-porridge, chicken or mutton-broth, or beef-tea, will be suitable; in many cases tonics, as quinine in 2 gr. doses, 5 drops of mineral acids in sweetened water, or 10 drops of muriated tincture of iron, may be required. A useful external application is fat salt bacon, which should be rubbed over the whole surface from neck to heels, 2 or 3 times a day; internally nothing is better than equal parts of muriatic acid and honey, applied with a small brush or swab, or diluted with water and used as a gargle. During convalescence great care must be used to prevent catching cold; warm clothing should be worn; quinine in 2 gr. doses 3 times daily may be used as a tonic, and lemonade or cream of tartar water drank freely to excite the free action of the kidneys. *Homeopathic*: Febrile symptoms before the eruption, dry, hot skin, frequent pulse, great thirst, anxiety, restlessness, and nervous excitement, give aconite; eruption smooth, and scarlet red, burning sensation of skin, tongue coated with prominent red papillæ,

throat inflamed and dark-red with stinging pain, give belladonna; eruption delays or grows suddenly pale, rapid prostration, putrid throat, internal heat and external coldness, fetid diarrhea, give arsenicum; profuse discharge from nostrils, bad smelling breath, foul ulcers in mouth, swelled glands in neck, give nitric acid; extreme drowsiness, stertorous breathing, delirious, give opium. When scarlet fever is prevalent, a dose of belladonna taken occasionally will usually ward off an attack, or at least so modify the disease as to render it comparatively harmless; dissolve 12 globules or 3 drops in a tumbler half full of water, and give a teaspoonful twice a day for a week, after which it will be sufficient to repeat the dose once in 2 days; for the troublesome itching that often disturbs the patient so much, anoint the skin with cocoa-butter, or rub with rusty bacon; the tenacious phlegm that accumulates in the throat will be loosened and removed by taking teaspoonful doses of glycerine in a little water; the patient should be sponged off 2 or 3 times a day with tepid water, and his linen and the bed-clothing frequently changed. The temperature of the room should be maintained at about 70° Fahr., and amply supplied with pure, fresh air. Administration: In severe cases the remedy may be repeated every 2 or 3 hours; but when the symptoms are less urgent, a dose every 3 or 4 hours will be sufficient; dissolve 12 globules or 3 drops in a tumbler ½ full of water, and give a teaspoonful at a dose; a little milk or thin gruel is all the patient should be allowed during the violence of the attack; even after the fever abates, and there is a craving for food, great care must be exercised in the giving of nourishment; milk is one of the very best articles of diet, and may be used in any stage of the disease; as soon as digestion is being performed regularly, a little mutton or chicken-broth, cream toast, light puddings, etc., may be taken; fresh water or bits of ice will be found very grateful to the patient, and may be taken at pleasure.

FITS, or SPASMS. — During the period of childhood the nervous system is so easily excited or irritated that these are of frequent occurrence. During the first four years of its life the child is especially liable. *Treatment*: When a child is attacked, place the lower extremities up to the knees in water, hot as can be borne, for 10 or 15 minutes; when taken out, rub them thoroughly dry and wrap in a warm flannel, at the same time enveloping the whole head in a cold cloth and changing it often. If the spasm is caused by indigestion, or constipation, give an injection of warm slippery-elm or flaxseed tea. An enetic, a teaspoonful of mustard in a tumbler of warm water, may be given. Mustard poultices or chloroform liniment to the spine may also be used, if necessary. If the gums are swollen and tender, lance them.

HYMEN, Imperforate.—Sometimes this membrane completely obstructs the vagina, and causes the menstrual fluid to accumulate and distend the uterus. The impediment is easily got rid of by an incision. Then the fluid that has accumulated should be syringed out with warm water; otherwise it might putrefy, and cause typhoid fever and death. The abdomen should be bandaged, and the patient confined to bed until the uterus has resumed its healthy size.

HYSTERICS. — An attack is generally preceded by depression of spirits, restlessness and a frequent desire to pass water. It is sometimes marked by convulsions, or fits. At times the attacks are local, manifested by spasms in the throat, the patient feels a ball rise there, her heart beats violently, and she laughs and cries by turns. In the worst cases, the limbs are thrown into spasms; the patient struggles violently, rising up in a sitting posture, and throwing herself back, twisting the body from side to side, clenching the hands, and throwing the arms about, so that she is with difficulty held. After the paroxysms, the patient generally passes a large quantity of very pale urine. *Treatment*: Cutting the stays and lacing, laying the patient on her back and dashing cold water suddenly in the face, and holding some hartshorn to the nose, will generally effect a recovery. If not, give ½ teaspoonful each of Hoffman's anodyne and aromatic spirits of hartshorn, or the ammoniated tincture of valerian in a wineglass of camphor water, and again dash water over the face and neck. If these fail, give an enctic, as a teaspoonful of mustard, 15 gr. sulphate of zinc, or 20 gr. of ipecac, in a tumbler of water. After the subsidence of the attack, 3 or 4 comp. cath. pills should be given. Quinine will be found the best tonic, 1 gr. 3 times a day, in the form of pill, or in a little sweetened milk.

JAUNDICE, Of Infants.—New-born infants are subject to a form of jaundice which usually makes its appearance 3 or 4 days after birth. The skin assumes a yellow color, which may last only a few days and then pass away. But sometimes, in addition to the yellowness of the skin, the whites of the eyes, the secretions of tears and urine become yellow, and the evacuations from the bowels have a clay-colored appearance; the abdomen swells; the child becomes fretful, and all the ordinary symptoms of jaundice are developed. *Treatment*: Give 1 gr. of calomel with a little wet sugar at bedtime, and 5 gr. of Husband's magnesia in a little milk the next morning; repeat this medicine once a week, until the jaundice disappears.

LABIA, Inflammation of. — The labia may be the seat of acute inflammation and of encysted tumors, which perhaps may be connected with the round ligament; of hernia and of fibrous or fatty tumors. *Treatment*: The treatment of these cases requires no distinct comments. The clitoris and nymphæ, if they grow to an inconvenient size, should be partly excised.

LABOR.—When labor is about to commence the woman usually experiences some general agitation of the nervous system, the womb settles down lower, the genital organs become relaxed and moist, a temporary diarrhea comes on, and there are frequent calls to make water; thus providentially emptying those viscera adjoining the child's pathway, and making more room for his head. Labor has 3 stages; the first commences with the beginning of labor, and ends when the child's head has cleared the mouth of the womb; the second stage, commencing with

the termination of the first, continues till the child is born; the third stage comprises the period between the delivery of the child and that of the afterbirth; thus, at the end of the first stage, the inside door is wide open, and the largest part of the child, his head, has passed through; at the end of the second stage, the outside door has been fully opened, and the child has passed through; the third stage delivers what has been left behind, and thus completes the process. There are two kinds of labor pains—the wringing and twisting pains, and the bearing-down pains. The first seem peculiarly trying to the nervous system; they exist during the first stage, and seem to be in the neck of the womb while it is being dilated. The bearing down pains occupy the second stage, and, though very severe, are better borne than the wringing pains of the first stage. These pains may be relieved by anæsthetics; and although there has been much prejudice against them on the part of the ignorant, intelligent physicians have recommended them highly. They seem to be even more appropriate at this time than during surgical operations; for they not only save the sufferer from much of her pain, but they also promote muscular relaxation, and thus help the labor to a more rapid termination. And they seem less dangerous at this time also; for even chloroform, which has not always been found safe for the dentist and the surgeon, has never been known to do injury to a woman in childbirth. Chloroform then may be recommended for these terrible pains, and with a 2 oz. bottle and napkin may be left very much to the management of the patient herself; she may pour about ½ teaspoonful on the napkin, and begin to snuff it earnestly when she feels a pain coming on, and come back to consciousness between the pains. Two other symptoms are often present during the first stage; nausea, and a sudden shivering without feeling cold; these are both favorable indications, being occasioned by the rapid dilatation of the neck and mouth of the womb. The bed should first be prepared. If there is a feather bed, it should be removed or turned back; the mattress should be protected by a rubber or oil cloth, if convenient, or by folded sheets, or any cloths that will be sufficient to guard the bed against the discharges. The woman should have on the clothes she expects to wear after labor; and when she lies down these should be tucked up under her arms, ready to be brought down after she gets through, thus saving her the trouble of changing her clothes at a time when she may be exhausted after so much pain and flowing. The lower part of her body may be covered by a sheet pinned around, and such other wraps as may be necessary for her comfort; these, after they have been soiled by the discharges, can easily be removed and the clean clothes brought down at the same time. But, although it is well to have the bed in readiness, and prepare the woman's clothing, she need not lie down at the beginning of labor, unless she chooses, but may sit, walk, or stand, as she feels most inclined. When a person takes charge of a case of labor, he (or she) should first inquire about the state of the bowels and bladder; unless the bowels are more open than usual, he should have an injection of a solution of 1 tablespoonful of salt in a pint of tepid water administered; or, if there is time, he may give by mouth ½ oz. of castor oil, or of Epsom salts. He should next inquire as to the frequency of the pains, and whether the waters have been discharged; his first examination should be made as early, at least, as the first discharge of the waters, so that, if it should be necessary to alter the position of the child, he may be able to do it before the womb has contracted tightly around the child's body. The membranes furnish a soft cushion wedge to press against and at length press open the mouth of the womb. Should they remain unbroken after this has been accomplished; that is, after the first stage is completed, they are not only useless, but, by presenting too much bulk for the successful action of the womb and abdominal muscles, they really retard the progress of the labor, and should be ruptured by the attendant; he can easily do this by sharpening the nail of his index finger to a point, and, during a pain, when they are tense, by scratching a small opening. In an ordinary labor, besides cheering and encouraging the patient, there will be nothing further for him to do until the head presses against the perineum, or space between the openings of the vagina and of the bowel. This becomes very thin during the last severe pains; and, to prevent a rupture, the attendant's hand, guarded by a napkin, should be kept pressing firmly and evenly against it during the passage of the child's head and shoulders. The child usually announces its advent by a loud cry, which gives a favorable impression as to life and lungs. But sometimes he makes no noise, and does not even appear to breathe. In such cases dash cold water on his face, and on the pit of the stomach; and slap his back briskly; if this does not succeed, resort at once to artificial respiration. (See *Asphyxia*, in MEDICINE.) After breathing has been established, the cord should be tied about two inches from the child's body, and, for the sake of neatness, it is well to tie a second cord two inches from the first, and then cut the cord between. This two inches of navel-string, attached to the child, soon becomes dead flesh and drops off in a few days; lest this dead flesh should come in contact with and irritate the living flesh, it is well, when the child is dressed, to cover the cord so that it may not touch and lie against the child's skin. For this purpose nothing is better than a piece of cotton batting two inches square, twisted around the navel-string, and confined by winding around it several turns of thread or small twine. During the third stage, by gentle friction of the attendant's hand over the mother's abdomen, contraction of the womb is excited, and the afterbirth is expelled, generally with the very first pain or pains that succeed the birth of the child; this is grasped by the attendant and rotated several times so as to unite its membranes into a strong cord, and thus secure their being withdrawn entire. After the womb has thus been emptied of its contents a swathe should be immediately applied to the mother; it should reach from the ribs to 6 or 8 inches below the hips, and should be so snugly

pinned around her as to afford a firm and even support to the abdomen and its contents. The soiled clothing should now be removed, a soft napkin applied to the external parts, the clean clothing brought down and the woman comfortably fixed in bed; she may now be permitted to rest 2 or 3 hours, after which the child should be promptly put to the breast; this should be repeated for a brief period every 3 or 4 hours for the benefit of both mother and child; in the case of the mother, nursing the breast has an influence to promote a thorough and desirable contraction of the womb, and to excite the gradual secretion of milk; and as to the child, it not only procures a little nourishment, but also puts into practice that innate knowledge of imbibing, so necessary for its future support. The *first* milk that comes also has a necessary aperient effect in starting the child's digestion. There are very rarely any after-pains after the birth of the first child, but in subsequent labors the woman is quite often troubled by them. She can first try a drink of camphor mixture, tinct. of camphor, 1 dr.; sugar, 2 dr.; water, ½ pint; mix the tinct. of camphor with sugar first, then add the water, and use freely as a drink. If this should fail, then try ½ gr. of sulphate of morphia, or 30 drops of laudanum. The diet of the mother should be bland and cooling, until after the milk has come; as there is apt to be some fever, while the breasts are filling; she should take no meat or heating food till after 4 or 5 days have passed; but should be kept to gruel or simple toast and tea. After this period she may be guided somewhat by her appetite, avoiding diversity and preferring simple, plain and nourishing articles of food.

MARKS, Mother's. — Blotches or stains, often quite superficial, and affecting only the skin. Some, however, though not rising above the surface, involve the adjacent cellular tissue; while others show the form of warts or moles, or form tumors. Another form is *nævi*, produced by the enlargement or excessive intermingling of the smaller blood-vessels. They may be of every shape and color. *Treatment:* Usually, they must be let alone. Warts and moles can be destroyed. (See *Warts* in SURGERY.) If a *nævus* is attached by a slender portion of skin, and hangs like a cluster of berries, by tying a thread tightly around the pedicle, it will fall off in a few days, when touching the base of it with caustic will usually cure. Pressure and cold lotions have been the most general and successful modes of treatment for nævi; in cases where the pressure by bandage and compress, inclosing a piece of coin, can be early adopted and steadily persevered in, it is the best means to eradicate projecting marks, the discolored skin being afterwards destroyed by caustic; care must be taken to increase the pressure by degrees. When these measures fail, their removal can usually be effected only by surgical operation.

MEASLES. — This is one of the principal eruptions, affecting individuals but once, and produced by contagion. The rash usually appears on the 4th, but sometimes on the 3d, 5th, or 6th day, of a febrile disorder; and, after a continuance of 4 days, gradually declines with the fever. The disease generally commences from 10 to 14 days after the contagion has been received. The eruption first shows itself in distinct, red, and nearly circular spots. As these increase in number, they coalesce; forming small patches of an irregular figure, but approaching nearest to that of semicircles or crescents. These patches are intermixed with single, circular dots, and with interstices of the natural color of the skin. On the face they are slightly raised, so as to give the sensation of inequality of surface to the finger passing over the skin. The disappearance of the eruption is followed by scaling off of the skin. *Treatment:* In ordinary cases no treatment is needed except keeping the bowels in order. If the eruption should be unusually delayed, or if, after having once appeared, it should recede again, put the feet in warm water, and give warm drinks; and if this should not succeed, give syrup of ipecac in teaspoonful doses, until there is free vomiting. Lemonade and the the juices of fruit are useful; and 10 drops of the dilute sulphuric acid, in ½ oz. of water 3 times a day, is a good cooling remedy. After recovery, the greatest care is necessary for weeks against catching cold. *Homeopathic:* Aconite should always be given first, for the primary fever, and then followed by pulsatilla, when the rash comes out; a dose every 3 hours; belladonna must be chosen for severe headache, sore throat, and great intolerance of light; a dose every 3 hours; for chest or bowel complications, consult the articles on bronchitis, pneumonia, and diarrhea; should the rash suddenly disappear from a chill, then put the patient into a hot bath, and give bryonia, a dose every hour.

MECONIUM.—The first evacuation from the child's bowels; of a dark-green or deep-black color, and very tenacious. It seems to be formed of the mucous secretions of the intestines, mixed with bile. The discharge usually takes place soon after birth, but sometimes it is delayed for many hours, and causes restlessness, colic, etc. *Treatment:* The first milk of the mother will generally have the effect to relieve this difficulty; therefore, the child should be put to the breast as soon as possible, and no artificial feeding allowed if it can be avoided. If this does not succeed, give 1 teaspoonful of sweet oil, or ½ dr. of flake manna, or, if these fail, 1 fl. dr. of warm castor oil.

MENSTRUATION.—About the age of 14, the young girl's form expands, her breasts enlarge, and there comes from the womb a bloody discharge, which, unless interrupted by pregnancy or other cause, afterwards occurs once in 28 days, usually until she is about 49 years old, and hence called the "menses," "monthly flow", the "catamenia," the "monthlies," the "courses," the "flowers," the "changes," etc. The flow lasts, ordinarily, from 4 days to a week, and amounts, on an average, in healthy conditions, to about 5 oz.; it varies considerably in different persons, and may even do so at different times in the same individual without any serious impairment of health. So necessary is this menstrual secretion to health, that if from any cause its first appearance is prevented, or if it is suppressed or retained, the system suffers seriously.

MENSTRUATION, Absence, or Retention of.— This may depend upon congenital malformation, as absence of the ovaries, uterus, or vagina, closure of the cervix, imperforate hymen, etc.; or it may be dependent upon the health or habits of the patient. *Treatment*: If malformation be suspected, recourse must be had to an examination, and the defect, if possible, relieved by operation. If the retention be dependent on constitutional causes, remove them. If the patient is of a full habit, venesection, mild diet, hip-baths, etc. When the reverse obtains, an opposite plan of treatment must be followed; tonics, as tartrate of iron and potash, 1 dr.; wine, 1 pt.; dissolve the iron in the wine, and take 1 dessertspoonful 3 times a day, before meals; a generous diet, exercise, warm clothing, hip and foot baths, always bearing in mind that the woman is not sick because she does not menstruate, but that she does not menstruate because she is sick, or in other words that the *amenorrhœa* may be merely a symptom of deranged health. *Homeopathic*: Pulsatilla should be given if there are premonitory symptoms, and the period is slow in making its appearance. A drop dose twice daily.

MENSTRUATION, Cessation of. — Called by women the "change of life," the "critical period," etc. It usually occurs at or about the age of 49, though in some instances earlier; on the other hand it may be much later. As the change of life approaches, the menses become more or less irregular. They may be very scant or very profuse, amounting to a real hemorrhage. In many cases the change takes place so gradually, that the woman passes through it before she is aware. Others less fortunate are afflicted with dizziness, headache, flushes of heat, nervousness, debility, piles, itching and other unpleasant symptoms for years. *Treatment*: Symptoms must be treated as they arise; in general, a tonic course should be pursued, as nature will accomplish this change of life perfectly well, if her forces are not diminished by prostration or debility. Give citrate of iron and quinia, 1 dr.; sherry wine, 2 fl. oz.; mix; 1 teaspoonful 3 times a day; and support with generous diet.

MENSTRUATION, Painful. — The cause may be a neuralgic, inflammatory, or other painful condition of the womb; or displacement of the womb, or some obstruction, as bending or stricture of the neck of the same organ. The pains are sometimes so violent as to resemble labor pains. The discharge is usually scanty, and sometimes accompanied with shreds and clots. *Treatment*: Stricture, or narrowing of the neck, except when from an inflamed condition of the lining membrane, can only be cured by the passage of instruments to enlarge the canal. During the pains, rest in bed, cloths wrung out in hot water and applied over the lower part of the belly and between the thighs, hot stimulating teas, cups over the loins, and anodyne suppositories, as morphia, 1 gr., extract belladonna, 2 gr., with 1 dr. cocoa-butter or suet, made into 4 suppositories, are good. In the congestive form, the spirits of mindererus in tablespoonful doses, with ½ to ¾ gr. of acetate of morphia, 3 or 4 times a day while the pain lasts, are the best remedies. *Homeopathic*: Give chamomilla, pulsatilla, and cocculus, together with the application of hot fomentations to the abdomen.

MENSTRUATION, Profuse. — An increase of the menstrual flow in frequency or in quantity, and may be either active or passive, the former occurring in robust plethoric habits, the latter in the reverse. The most common causes are excitements, fevers, internal congestions, displacements of the uterus, and approach of the critical period, etc. It may be confounded with the hemorrhage arising from abortion, foreign growths, etc., within the uterus. *Treatment*: In persons of a full habit, venesection may be necessary; rest, saline laxatives, astringents, etc. In the interval, moderate diet, cold baths, etc. In debilitated cases, rest, tonics and astringents, and opium, good diet, etc. The following tonics and astringents are excellent remedies in this complaint: Sulphate of quinine, 1 dr.; tinct. of chloride of iron, 2 fl. dr.; enough water to make of the whole 4 fl. oz.; mix, and take 1 teaspoonful 3 times a day; bromide of soda, 1 oz.; fl. ext. of ergot, 4 fl. oz.; mix, and take 1 teaspoonful 3 times a day. *Homeopathic*: China if there is great weakness or faintness, and if the attack lasts long, and the blood is dark red: a drop dose every 3 or 4 hours. Ipecacuanha if there is sickness, the blood very bright, and occasional pains occurring; a drop dose every 3 or 4 hours. Calcarea carb., in the intervals, especially if the flow comes before the month's time, and the patient is of a strumous habit; 2 grains twice daily, dry on the tongue.

MENSTRUATION, Suppression of.—This most frequently arises from wet feet, and catching cold. It occurs also in two forms: *Acute*, when the discharge is arrested during the flow; as, by cold, emotions, etc.; and *chronic*, where it occurs in consequence of the acute, or from gradual falling of the health, disease of ovaries, and critical period, etc. *Treatment*: The most important point in the early treatment is not to confound the disease with pregnancy and cause miscarriage by the course adopted. In the acute form, if there is much constitutional disturbance, venesection, or cups to the loins, laxatives, baths and opium to relieve pains. In the chronic form, if possible, remove the cause; use tonics, aloetics, and the means above mentioned; there being but few direct emmenagogues. Among the earliest measures, the hot foot-bath, drinking hot teas, hot fomentations to the abdomen and putting the patient into a warm bed, will often succeed without much resort to drugs. 5 gr. of powdered capsicum taken in capsules or sauce, will often relieve the pain and excite the flow. Whatever may be the measures resorted to they will generally be more efficient if used about the time when the regular flow should occur. *Homeopathic*: Aconite is suitable to cases of sudden suppression resulting from a chill or mental emotion, and should be given early in drop doses every 3 hours, followed by pulsatilla, which will give more general relief than any other medicine, and especially to the nervous and delicate fair-haired women who suffer from uterine colic, and affections of the mucous mem-

branes. A drop dose 2 or 3 times daily, with an occasional dose of sulphur at bedtime.

MILK, Deficiency, or Superabundance of. — These may arise from mental anxiety, grief, sorrow, defective nutrition, etc. *Treatment*: Promote a vigorous state of health; wet a cloth with a warm infusion of Palma Christi, or castor oil plant, or fennel seed; keep it applied to the breast externally, and at the same time use the infusion of any of them freely as a drink. In case of superabundance, give internally, in their regular doses, iodide of potassium, belladonna, colchicum, or iron, and apply externally either belladonna or colchicum.

MILK FEVER.—This occurs generally about the third day, if the milk does not appear before. It begins usually with a chill; the pulse is quick, full and hard; the breasts are sometimes hard, full and distended; but sometimes the secretion is suppressed and the breasts are empty and soft. *Treatment*: The bowels should be moved gently with mild saline laxatives, as teaspoonful doses of Epsom salts, or rhubarb and magnesia; with 10 to 30 drops of spirits of nitre, to cool the fever, or 2 to 5 gr. of Dover's powder, with 10 to 20 of the citrate or nitrate of potash, and the breasts should also be drawn. It usually subsides in 24 to 36 hours.

MILK-LEG.—This occurs usually in the second or third week after delivery; is limited to the lower extremity, and chiefly to one side, exhibiting to the touch a feeling of numerous irregular prominences under the skin. It is hot, white and unyielding; and is accompanied sooner or later with fever. After a few days the heat, hardness, and sensibility diminish; and the limb remains swollen for a period. The disease frequently consists in obstruction of the iliac or other veins. Owing to the pressure of the heavy uterus the serous part of the blood is forced out into the cellular membrane of the limb. *Treatment*: The application of leeches or cupping-glasses near the groin; fomentations to the limb, etc., and, when the active state has subsided, the use of a bandage applied gently at first, but afterwards gradually tightened. In this painful disease much attention should be given to placing the patient in bed as comfortably as possible, laying the leg on pillows, and so supporting it that the foot shall be raised a little higher than the hip. The limb should be assiduously fomented by means of flannels wrung out of hot saleratus water, the bowels kept in order by cooling aperients, such as drachm doses of Epsom salts, or 1 or 2 Seidlitz powders every day, and pain should be allayed by 6 gr. doses of Dover's powder, as often as necessary.

MILK-SCAB.—A disease of nursing infants, and usually occurs during the first period of dentition. It is an eruption of numerous, small, white pustules in clusters upon a red surface. It generally breaks out on the face first, mostly on the cheeks or forehead, attended by violent itching. The vesicles, which are filled with an acrid fluid, become broken by friction, and the humor dries into thin, yellowish scabs. As the irritation increases, the scabs grow thicker from the constant secretion beneath them. The isolated patches run together, and the eruption gradually spreads over the whole face, and sometimes the entire body. There is considerable heat and redness in the surrounding skin, and the child, who is exceedingly restless and fretful, is constantly rubbing the affected parts. *Treatment*: Anoint thoroughly with oxide of zinc ointment every evening, and very gently wash off the ointment and those scabs that are loose the next morning with warm borax water, a saturated solution. Use simple water dressing during the day.

MISCARRIAGE.—This term is applied to the expulsion of the fœtus before the seventh month, or before there is a probability of its living; its expulsion after the seventh month, and before the full time is termed premature labor. A great variety of causes may provoke miscarriage; such as over-exertion, shocks, blows, falls, mental emotions, fright, anger, joy or sorrow, when excessive, and disease, especially the eruptive diseases, and syphilis. When miscarriage is threatened, the patient generally experiences a sense of uneasiness, languor, pain in the back, and periodical pains of an expulsive character in the lower part of the abdomen, often with more or less flowing. *Treatment*: Perfect quiet, and rest in bed in a horizontal posture, on a hard bed, lightly covered with clothes, in a cool room, cold, wet napkins to the vulva, and a decided opiate, either 30 drops of laudanum by the mouth, or 40 by injection. If these means fail, and the flowing continues, the tampon, or plug, must be resorted to, and drachm doses of the fl. ext. of ergot administered every hour. For a plug, a sponge wet with vinegar, or a handkerchief, or any small pieces of linen may be pressed into the vagina, till it is full; and then a T bandage is applied. If further measures should be needed, and the dangerous flowing still continues, an experienced physician is required.

MOUTH, Infants' Sore, or Aphthæ.—This very common affection of infants generally makes its appearance about the second or third week after birth. A few days before, the inner surface of the mouth will be found reddened, and small, red, elevations grouped in clusters on the lips, cheeks, gums, and other parts of the mouth. These patches soon become covered with a white, cheesy-like substance, resembling curdled milk. If this coating be removed, it leaves the surface beneath unbroken, smooth and red. Sometimes these patches run together and cover the whole mouth, and in severe cases extend down the throat. The affection is not dangerous, but is often painful, and prevents the child from nursing. It may be communicated to the mother, and cause excoriation and soreness of the nipples. *Treatment*: Keep the child's bowels in order, and apply locally equal parts of powdered borax and white sugar; put a pinch of this powder upon the child's tongue 5 or 6 times a day.

MOUTH, Nursing Sore.—This occurs to nursing women and even to those advanced in pregnancy. There is a scalding sensation upon the tongue and hot watery discharge from the mouth, the roof of which especially shows evidence of inflammation, and small, hard, painful swellings form on the tongue and cheek, which ulcerate

and are very sore. There is feverishness, and the bowels are costive; but if the ulceration extends to the bowels there is diarrhea. After weaning it disappears. *Treatment*: Mild laxatives, if the bowels are constipated; if diarrhea, spiced rhubarb and chalk mixture, with 20 gr. of chlorate of potash 3 or 4 times daily, with small doses of iron and quinine. This complaint implies an asthenic or debilitated state of the system; therefore support in every way with generous diet and wine.

MUMPS. — It begins with soreness and stiffness in the side of the neck; soon followed by swelling of the parotid gland, which is painful, and increases for 4 or 5 days; after the 4th or 5th day the swelling subsides, and disappears in from 7 to 10 days; generally both glands swell at the same time, but sometimes one only is attacked; after the swelling has subsided, the other is attacked; there is generally fever, with hot, dry skin, quick pulse, furred tongue, constipated bowels and scanty high-colored urine; from effects of cold and imprudence, the disease sometimes suddenly leaves the glands of the neck and affects the breast of the female, and the testicles of the male; sometimes causing irreparable injury. *Treatment*: The swelled gland should be fomented with a flannel wrung out of an opiate lotion, ½ oz. of laudanum to 1 qt. of hot water, and, when very painful, should be poulticed 3 or 4 hours with a hot linseed meal poultice; costiveness should be relieved by a tablespoonful of castor oil, or ½ oz. of Epsom salts; the bowels should be kept open by 1 teaspoonful of the salts every morning; should the disease change to the brain or the testicles, the feet should be immersed in hot mustard water, and still more attention given to keeping the bowels free. *Homeopathic*: Redness of the face and eyes, also of the swelled gland, with headache, give belladonna; tendency to the brain, delirium, wild, staring look, and nervous excitement, give hyoscyamus; fever, heat and chills, jaws stiff, and difficult swallowing, give mercurius. In ordinary cases, the chosen remedy may be repented, 3 times a day; should the disease be transferred to the brain, testicles or ovaries, it may be necessary to repeat it every 3 hours; dissolve 10 or 12 globules in ½ tumbler of water, and give 1 teaspoonful to a child, or 2 teaspoonfuls to an adult as a dose; the patient should be kept in a proper temperature, but not too warm, and care should be taken to prevent his taking cold by exposure in any way.

NIPPLES, Sore.—(See *Breast.*)

OVARIES, Inflammation of. — Catching cold from getting the feet wet, etc., while menstruating, excessive fatigue, excessive sexual indulgence, etc., may be causes. *Treatment*: Perfect quiet, with hot fomentations, hops and mush poultices, and anodyne and counter-irritating embrocations to relieve pain, and general treatment for any fever, are necessary in the acute stage, and later, repeated blisters. For ovarian dropsy, when the accumulation is large, a surgical operation is necessary.

PERINEUM. Laceration of.—This, during labor, if up to, but not through the anus, and if the patient when passing water turn upon her hands and knees and uses extreme cleanliness, will generally heal, so as to give little or no subsequent inconvenience. Yet it would be better, immediately after labor, to close it by quill suture. Complete laceration of the perineum into the anus is attended with distressing incontinence of feces, and is prevented from healing by the action of the sphincter muscle.

PREGNANCY. — One of the most significant signs of pregnancy is the sudden stopping of the menses; if in addition to this, about the 5th or 6th week after the last catamenial period, there should be morning sickness, swelling of the breasts, and the circles around the nipples should be conspicuously dark and wide, the woman's condition is evident. Soon after the 4th month, quickening, or the first motion of the child perceived by the mother, takes place; but the only unmistakable sign of pregnancy is pulsation of the fœtal heart discovered by auscultation, and this is not usually manifest before the 5th or 6th month. It must be remembered that the woman is not sick, but only in a peculiar condition, and in order to pass through it successfully little is needed but ordinary sanitary rules and good common sense. She should take a reasonable amount of out-door air and exercise; but she should remember that while making a human being, she is engaged in a great and sacredly important work, and should not allow herself to be over-fatigued by exertions either of body or mind; her best physical energies and nervous vigor should be reserved for the benefit of the immortal being within her. If nausea is excessive, 10 gr. of oxalate of cerium, or of pepsin, occasionally administered, has oftimes removed it; the same amount of the new remedy, *ingluvin*, prepared from the gizzard of the fowl, has suited other cases; champagne has been of excellent service also for the same purpose; and, recently, it has been discovered that the gentle dilatation of the mouth of the womb by the finger has completely relieved the nausea when all other efforts have failed. The average duration of pregnancy is 280 days, counting from the last catamenial period; a variation of a few days, or even weeks, may take place in exceptional cases; but this is the rule by which it is generally wise to reckon.

PRICKLY HEAT.—(See *Lichen* in MEDICINE.)

RICKETS.— A disease generally confined to childhood, characterized by a large head, prominent forehead, protruded breast bone, flattened ribs, tumid belly, emaciated limbs, and great general debility. The bones, more particularly those of the spine and legs, become distorted; the stools are frequent and loose, a slow fever succeeds, and, unless the child rallies, it wastes away and death ensues. When recovery takes place there is always more or less deformity left. *Treatment*: The treatment of rickets depends more on proper domestic management than on direct medication. Careful nursing, warm dry clothing, thorough ventilation, moderate exercise, and, above all, a light nutritious mixed diet abounding in nitrogenous matter and the phosphates (see *Food, Nutritive Power of*, in HYGIENE) will do much to effect a cure. To these may be added the administration of 1 gr.

doses of quinine twice a day; and occasionally 1 dr. phosphate of soda or rhubarb.

RUPTURE, or HERNIA, Of Infants. — This defect is quite common among infants, and particularly those with delicate constitutions. When it takes place at the navel it is called *umbilical hernia*; if in the groin, *inguinal hernia*. The defect may be known by the protrusion of a portion of the intestine or abdominal viscera, forming a tumor beneath the skin. Umbilical hernia may be reduced by placing the child on its back and making gentle pressure upon the protruding part; it should then be retained in place by a suitable bandage. For this purpose, take a hemisphere made of wood, cork or ivory, of suitable size, place the convex surface on the opening, and retain it there with cross strips of adhesive plaster and a bandage round the body. If this be worn a sufficient length of time, a radical cure will generally be effected. Inguinal hernia is more difficult to treat. No one but a qualified physician or surgeon should attempt its management.

SCALD HEAD.—Children are often troubled with a dirty, yellowish incrustation which forms on the scalp; it usually appears on top of the head, and keeps spreading. It is caused by an excessive secretion thrown out on the surface, which thickens into a dry, scaly crust, partially covering the scalp. If any part of this crust be removed, the skin underneath exhibits a red, angry appearance. Uncleanliness and keeping the head too warm are generally the cause. *Treatment*: In addition to the most particular attention to the preservation of the health and cleanliness, the scales should be removed by thorough washing with soap and water, and, if necessary, by poultices; the hair should also be shaved, or cut off as closely as possible; the head should be kept covered with a cloth wet with equal parts of linseed oil and lime water.

SLEEP-WALKING, or SOMNAMBULISM. — Children are most subject to sleep-walking. When adults are affected with it, the cause may generally be traced to mental exhaustion, over-excitement, or emotional feeling. The most preferable method of awakening a somnambulist is by dashing cold water on the face. It is well to occasionally administer an aperient, and also to rectify any errors of diet, if necessary, and to remove, by the exercise of judicious and kindly advice and change of scene, undue excitement or morbid feeling. The other precautions, such as securing the feet, etc., during sleep, guarding the exits of the bed-chamber, are obvious.

SNUFFLES (Coryza).—Infants are often troubled with a kind of catarrh, or obstruction of the nose, which prevents them from breathing whilst they are sucking. It also annoys the child during sleep, and gives rise to a peculiar snuffling sound, similar to snoring in adults. In some cases there is a considerable flow of mucus from the nose. *Treatment*: (See *Colds* in MEDICINE).

TEETHING.—The first sign of teething is heat in the mouth of the child, felt by the mother during sucking, flow of saliva, biting and grinding the gums. The temporary set usually appear in the following order: 2 front in each jaw, *incisors*, about the 7th month; 1 tooth next to each of the preceding, *lateral incisors*, from the 7th to 10th month; first grinding teeth, *anterior molars*, about the close of 12th month; stomach and eye teeth, *canines*, from the 14th to the 20th month; back teeth, *posterior molars*, from the 18th to the 37th month. If the gums are examined, it will be found that the ridge, previously perceived along the edge of the jaw, has disappeared, and the gum is full and rounded. (For child's jaw, see cut in ANATOMY—*Alimentation, Organs of.*) *Treatment*: When the bowels are confined, give a gentle purgative. The warm bath at 96 degrees soothes the child. If there are more than two good movements of the bowels, and very loose and offensive, check them. If the tooth is nearly through, the gums

Lancing the Gums.

A Gum Lancet.

inflamed and feverish, and distress is shown, use the lancet. If there is much bleeding, it can be stopped by taking a clean, soft linen towel and pressing it with the finger firmly against the gum. If this fails, a little powdered alum may be put on the finger and pressed against it. Give the child fine splinters of ice to melt in its mouth, and let it enjoy the fresh air.

URETHRA. Tumor of.—An excrescence, varying in size from a large pin's head to that of a horse-bean, is liable to grow from the female urethra, causing great distress through its exquisite sensibility. *Treatment*: It should be cut off, and a caustic applied to the surface. Immediately after, a sponge dipped in diluted vinegar should be applied, to prevent injury to surrounding sound parts; and if necessary to introduce the caustic within the urethra, it must be by means of a tube with an aperture in it corresponding to the diseased surface.

URINE. Retention of, After Delivery.—This is more particularly the case where the labor has been prolonged or very difficult, and the bladder injured by the passage of the child. *Treatment*: It will be necessary in some cases to draw off the urine with a catheter; this must be done by a physician, or skilled nurse. The application of warm fomentations to the region of the bladder, or sitting over a chamber which contains hot water, is sometimes very useful.

URINE. Retention of, in Children.—The bladder may be very much distended and painful when pressure is made in that region. Sometimes there is fever, sleeplessness, piteous moaning and crying, drawing up of the limbs and twisting of the child's body. *Treatment*: A folded napkin wrung out of warm water, and laid over the region of the bladder, will have a salutary effect. (See in MEDICINE, *Urine, Retention of.*)

VAGINA, Anterior Fistula of.—A communica-

tion between the bladder and the vagina. It generally results from sloughing of the parts after a tedious labor. *Treatment*: As soon as it is discovered, the patient should be made to lie on her face; the utmost cleanliness should be enforced by means of astringent injections and fomentations; by which means the cicatrization and contraction of the aperture will be promoted. When the spontaneous processes of cure are carried so far as can be, art must step in; and most wonderful have been the triumphs of modern surgical art in this operation. Until Dr. Marion Sims, of New York, and other eminent surgeons, demonstrated to the world the feasibility of closing up by a surgical operation this opening between the vagina and bladder, the unfortunate sufferer from this fistula had no other prospect before her for years, except to live with the constant stench of urine dribbling upon her garments, or upon a mass of cloths kept about her person, as the best result in her power. The first surgeons in all our large cities now perform this operation.

VAGINA. Posterior Fistula of.—This must be treated at first by cleanliness and mild laxatives. If after a time the aperture does not close, it must be treated as in the above last case. This fistula is an opening through the posterior wall of the vagina, and anterior wall of the rectum, making a communication between the two; causing a calamity but little inferior to that of the anterior fistula; and, fortunately, equally amenable to the resources of surgical art, by means of a similar operation.

VAGINA. Prolapse of.—When the posterior wall falls down, bringing with it the rectum, there is great distress and difficulty in getting rid of the discharges; when the anterior wall, with the bladder, falls down, there is great irritability of the bladder, difficulty of emptying it, decomposition of urine, and other ill consequences. *Treatment*: Cold astringent injections, tonics, baths of alum water, and firm perineal bandage are the first set of remedies. Should these fail, it may be necessary to resort to a pessary, a thing which no one, however, should use if he can help it. If these do not succeed, there is an ingenious surgical operation, which consists of two parts: 1st, in contracting the circumference of the vagina; 2nd, in uniting the posterior portions of the labia, so as to bring forward the perineum, as it were, to act as a natural cushion and support to the prolapsed parts.

WASHING THE CHILD.—Immediately after the the birth of the child, it should be carefully anointed and rubbed well over the entire body with a little hog's lard or some sweet oil, and especially in the arm pits, in the groins, and wherever the limbs are folded upon each other; then take a piece of dry flannel and wipe the child until it is clean and dry. After this a little warm water and fine soap may be used to remove the grease. Particular pains should be taken to have the child perfectly clean at this first bathing; by observing care in this respect, scaly eruptions and excoriations of the skin will in many instances be avoided. The temperature of the room should be warm, and the child bathed at least once a day; at first the water should be about new-milk warm, but the temperature should be gradually lowered, and after a few weeks may be used cold. Never bathe the child in a cold room.

WASTING AWAY (Marasmus).—Consists of a scrofulous affection of the mesenteric glands, attended with a gradual wasting of the body or flesh, distended, hard abdomen, pale, sickly appearance of the skin, sunken eyes, variable appetite, which is sometimes voracious; irregular action of the bowels, the evacuations resembling soap-suds and very offensive. If the disease continues long, fever sets in. The disease frequently becomes developed in a child during the irritation of teething, or is called into activity by the use of unwholesome food, want of pure air and cleanliness. *Treatment*: Fomentations, friction and the warm bath should be faithfully employed externally; the abdomen, especially, should be daily rubbed with the warm flat hand very gently, but long and perseveringly; and let the hand during the process, be so often wet with tepid brandy that 5 or 6 teaspoonfuls be rubbed in every day. For a tonic, internally: Iodide of potassium, 1 dr.; syrup of sarsaparilla, 4 oz.; mix; ½ teaspoonful before each meal for a child of 2 years. Let there be as much as possible of out-door air and generous diet; and when practicable, let the little patient be changed for awhile to a new dwelling-place, and new scenes.

WET-NURSING.—There are times when reasons may prevent the mother from suckling her offspring. Ill-health, a delicate constitution, failure of the milk, or other physical causes may render it entirely impracticable. In all such cases it is better to employ a wet nurse, if a suitable one can be obtained, than attempt to bring up the child by hand. In large cities the risk is much greater than in the country, where fresh milk can be obtained without difficulty. In selecting a nurse, it is of the greatest importance that she be perfectly healthy. Her age should be about the same as that of the mother, and her confinement have occurred about the same time. She should be free from all eruptions, as tetters, ulcers, glandular swellings, and all scrofulous taint. She ought to have a supply of good milk, be possessed of a kindly disposition, cleanly in her habits, and have a fondness for children. Having engaged such a nurse, enforce upon her mind the necessity of regular habits and strict attention to diet. She should avoid all heating or stimulating beverages, spices, flatulent food, or quack nostrums; bathe frequently, take proper exercise, and breathe pure, fresh air.

WHITES (Leucorrhœa.)—This signifies a discharge from the vagina, generally white, or nearly colorless and transparent, sometimes yellow, or green, or slightly sanguineous, and of varying degrees of consistency. When severe, it is accompanied by a sense of weight, heat and soreness in the vagina, irritation of the bladder, pain in the lower belly and thighs, etc. There is almost always headache, languor, debility and pain in the back. *Treatment*: The bowels should receive the first attention. An oz. of Epsom salts, dissolved in 1 gill of water, and first one-half taken, and in 4 hours the other half, if the

first does not operate, will frequently cool the inflamed vagina. Besides the regulation of the bowels, little can be accomplished beyond removal of the causes of the complaint, when they can be discovered, and promoting the general health and strength in every way possible. *Homeopathic:* Calcarea carb. is of the greatest value in the treatment of this affection of young women—2 gr. twice daily dry on the tongue, followed by occasional doses of sulphur. Sepia is most suitable to those cases of leucorrhœa occurring in married women, where there is a tendency to falling of the womb. A drop dose twice daily. The general health should be attended to, and local injections of calculated water—a teaspoonful of the pure tincture to a teacupful of water, cold—is often of great value, if there is much irritation. A lotion of a teaspoonful of hydrastis to ½ tumblerful of water, should there be much relaxation. China will relieve the weakness consequent on the leucorrhœal flow; a drop dose twice or thrice daily.

WOMB. Bleeding from.—Whatever the cause, rest and quiet are imperative. The patient should be placed in bed in a moderately cool room, with the hips elevated, and cloths wet with fresh or ice-water applied over the belly, thighs and genitals, and in severe cases ice may be introduced into the vagina, and pressed against the neck of the womb; if following labor, gentle pressure should be made over the womb to cause it to contract. If these means fail, a soft handkerchief, a piece of soft sponge, or pieces of soft linen or cotton, wet with cold water, or iced water, or with some astringent solution, as alum water, or a weak solution of the persulphate, or perchloride of iron, must be carefully introduced into the vagina and pressed against the neck of the womb until the vagina is full.

WOMB. Falling of, or Prolapsus.—A sinking of the uterus nearly or quite down to the os externum. It often occurs in early pregnancy. The causes may be congestion of the uterus, tumors, tympanitis, distention of the colon, relaxation of the ligaments, too early "getting up" after labor, tight lacing, dancing, running, or any severe muscular exercise, leucorrhœa and other exhausting discharges, straining, coughing, etc. There is pain in the back and groin, extending down the thighs to the knees or toes. The patient suffers great distress in standing or walking, and in voiding the urine and fæces. *Treatment:* In slight cases, rest in a horizontal position, with cold or astringent injections, are often sufficient. In prolapsus after confinement it is particularly necessary. Bandages, when they relieve, act by supporting the abdominal muscles, and those of the back; hence they may be useful in women who have borne many children, and in whom these muscles are much relaxed. They can never be regarded as uterine supporters. In decided prolapsus, mechanical support by means of pessaries becomes necessary. These differ in shape according to the end to be obtained, and the peculiar views of the practitioner using them. The cheapest and a good support will be found to be a piece of fine firm sponge, cut to a proper size, to admit when damp of being pressed up to the vagina to hold the womb in its place. The sponge should have a stout piece of small cord sewed two or three times through its centre, up and down, and left sufficiently long to allow its being taken hold of to remove the sponge, once a day, or every other day at the farthest, for the purpose of washing, cleaning, and using the necessary injections; and this must be done while the patient is lying down, to prevent the womb from again falling or prolapsing. After having injected some astringent solution, wet the sponge in the same, and introduce it sufficiently high to hold the womb in its place. A liberal use of iron tonics is needed. Mix fine iron filings with as much ground ginger. Dose, ½ teaspoonful 3 times daily in a little honey or molasses, increasing or lessening the dose to produce a blackness of the stools. Continue this course until well.

WOMB. Inflammation of.—The signs of this trouble are pain, fever, vomiting, swelling of the belly, and tenderness at the neck of the womb, extending to the loins and thighs, and great prostration, and perhaps delirium. *Treatment:* The bowels should be opened by a mild saline laxative. The belly, and especially the lower portion, should be completely covered with a large hot meal, or hops and bran poultice; leeches should be applied to the inside of the thighs; opiates may be administered by suppositories. Soothing injections may also be made into the vagina. If the inflammation becomes chronic, repeated blistering may be required in the groins, and over the womb.

The Sick Room.

REMARKS. — In the sick room, as well as in most other departments of life, cleanliness should be observed in every respect; have a ventilation which provides pure air without a draft; a uniform temperature suited to the necessities and wishes of the patient; such light as shall carry health to the body without blinding the eyes; quiet and rest that shall the most soothe and pacify should be secured, and food of the right kind and proper quality. When the brain is affected the room must be darkened and kept perfectly quiet. A sick child should never be suddenly aroused, but spoken to gently and soothingly. If it makes a great resistance to taking medicine the doctor should be informed, as the excitement produced may do more harm than the medicine would do good. A sick child never should be left alone for more than a few minutes at a time, yet it should be carefully guarded from excitement and noise, and other children should be kept away from it. In diseases of the chest a child should be raised by pillows into a half sitting position, as this makes it more easy for it to breathe. In administra-

tion of medicine, if the dose is not given in the department of MEDICINE, do not neglect to consult the doses so frequently stated through MATERIA MEDICA and PHARMACEUTICAL CHEMISTRY.

AIR. To Cool.—It is often necessary, besides the ordinary ventilation, to devise some means to cool the sultry summer air of a sick room. For this purpose the following methods are recommended: 1. Hang thick towels, dipped in cold water with a little vinegar added, to the open window-sash.—2. Put 4 large cakes of ice in the different corners of the room; place each cake on a stout netting suspended on a frame; thus provide a clear drainage to the water; avoid noise and jar in placing the cake in position, and permit nearly all the surface of the ice to be acted on by the air of the room; to the bottom of each net attach pieces of bunting reaching entirely across the net and down to a receptacle on the floor; these pieces conduct the ice-water and so completely expose it to the action of the air as to abstract a very large portion of the heat; have nets suspended as high as consistent with convenience in placing the ice, because the cold air would descend.

BED-PANS. — These should be used in all cases where there is debility, or where the patient should remain quiet, as in fractures. The best for common use is a shovel-shaped pan. After the pan has been used, the nurse should immediately remove it from the room and empty it, and it should be well cleaned before being brought back; in case of infectious diseases a strong solution of copperas and carbolic acid should be thrown into it before removal from the room.

BED-ROOM. Of the Sick.—A sofa or reclining chair, upon which the patient can be placed while his bed is being changed and made up, should, if the size of the apartment will admit of it, form a part of the furniture. Two tables, a small one for the bedside, to contain the medicines in use, etc., and a larger one for the reception of other things, are desirable. Two or three bed-room chairs will be required; the wash-stand may well be supplied with an extra bowl and an additional water pitcher and goblet; add then spoons and glasses for administering medicines, and a liberal supply of soap, towels, etc. The room of a convalescent should be made to look as bright and cheery as possible. Trifling changes may be made in the arrangement of the furniture; a new picture, or one from another part of the house, hung where it can easily be seen by the invalid; illustrated newspapers or new books placed on the table, a few cut flowers, and one or two plants in bloom, do much to brighten a room. Wood-stoves are far preferable to coal-stoves in a sick room; in any case, all the flues should be closed and no gas be allowed to escape into the room. A tin of water should be placed on the stove, so that the air may not become too dry. Should the room be heated by hot air, it is well to place a basin of water near the registers, or a basin of boiling water occasionally beneath.

BEDS and BED-CLOTHES. — Narrow beds, (iron bedsteads) with fresh hair or moss mattresses, are the best. These beds are easily moved, and thus the patient will not be compelled to look constantly at the same cracks in the wall, or count the same three spots in the corner. He can be moved now into a shaded corner, now to the western windows, to see the sun go down, again in front of the fire, that he may look at its cheerful blaze, and anon into the most secluded corner, that he may rest and sleep. All this is an immense gain, and is sure not only to comfort the prisoner, but to shorten his illness. A very excellent mattress for sick persons is the woven wire, which is a strong fabric of wire interwoven in all directions, with plenty of spring to it, and which yields to pressure in every direction. If this mattress is used, it is usually sufficient to place 3 or 4 folds of a blanket over it. Water or air mattresses are also very comfortable, and especially useful in chronic cases, as they prevent the constant pressure from inducing bed-sores. There are also many ingenious beds in use for the sick, which can be lifted or lowered at pleasure. The bed-clothing must be light; counterpanes and coverlets must be discarded from the sick-room, and only good, light blankets be employed. The pillow-cases and sheets are better of cotton than of linen. They should be placed smoothly over the bed, and be changed frequently—daily in the case of infectious fevers. The bed the patient lies on should be absolutely flat and perfectly smooth. If a blanket be placed between the mattress and the bottom sheet, it is necessary to take great care that no wrinkles or inequalities are left in it. The bottom sheet must always be protected as far as possible from everything likely to soil it. Since it is very desirable not to disturb the patient oftener than is absolutely necessary, this may be done by the means of draw-sheets, which are placed under the middle of the patient, or under any part of the body where a discharge is issuing, or likely to issue. Draw-sheets are made of old sheeting doubled and sewed together, their size depending upon the requirements of the case. These should be removed as soon as they become soiled. The sheets and blankets should be tucked well in around the bed in cold or chilly weather. Nothing is more easy to an experienced nurse, or more difficult to an inexperienced one, than to change the bed linen with the person in bed. Everything that will be required must be at hand, properly aired, before beginning. Move the patient as far as possible to one side of the bed, and remove all but one pillow. Untuck the lower sheet and cross sheet and push them towards the middle of the bed. Have a sheet ready folded or rolled the long way, and lay it on the mattress, unfolding it enough to tuck it in on the side. Have the cross sheet prepared, and roll it, also, laying it over the under one and tucking it in, keeping the unused portion of both still rolled. Move the patient over to the side thus prepared for him; the soiled sheets can then be drawn away, the clean ones completely unrolled and tucked in on the other side. The coverings need not be removed while this is being done; they can be pulled out from the foot of the bedstead and kept wrapped around the

patient. To change the upper sheet take off the spread and lay the clean sheet over the blankets, securing the upper edge to the bed with a couple of pins; standing at the foot draw out the blankets and soiled sheet, replace the former and put on the spread. Lastly change the pillow cases. (See *Beds and Bed-clothes* in HYGIENE.)

BED-SORES. — To guard against bed-sores, the position of the patient should be frequently changed, to relieve the constant pressure on any one part, and he should be bathed often with tepid salt water, or weak spirits and water, to stimulate a more active circulation of the skin, being careful, of course, to avoid wetting his clothing or the bed-clothing, lest he catch cold. Abrasions of the skin, after being well bathed, should be covered with collodion, and its application repeated as often as may be required. If sores or sloughs have formed, these should be bathed with a mixture of spirits and water, of sufficient strength to cause slight smarting, with a few drops of carbolic acid, and then dressed with covering of lint wet with the same, and all pressure removed by suitable pads, or, better, by air or water pillows. These are made of rubber cloth, and of various sizes and shapes. Sometimes one or more thicknesses of soft buckskin, spread with soap-plaster, with suitable holes cut out, will be found useful to relieve the pressure. Ordinarily no application of lotion, ointment, or plaster can be of any service unless the pressure upon the sore can be relieved.

BEDS, To Warm.—One of the best articles for this purpose is an India rubber bag, holding 2 qts., to be filled with hot water. It closes with a tight metal stopper. Another convenient article used in a sick room, is a sand-bag. Get some clean, fine sand, dry it thoroughly in a kettle on the stove, make a bag about 8 in. square of flannel, fill it with the dry sand, sew the opening carefully together, and cover the bag with cotton or linen cloth. This will prevent the sand from sifting out. Heat the bag quickly by placing it in the oven, or even on the top of the stove. The sand holds the heat a long time; and the bag can be tucked close to the form without hurting the invalid. It is a good plan to make 2 or 3 of the bags, and keep them ready for use.

CASTOR OIL, To Disguise. — The following formula affords a method of completely disguising castor oil: Glycerine, castor oil, of each, 2 fl. oz.; oil of cinnamon, 4 min. The essential oil should be rubbed up with the glycerine, the castor oil added, and the mixture well shaken before using; ½ of the mixture will be an adult dose.

CLEANING THE SICK ROOM.—It is important that the sick room should be well cleaned, and the best time to do it is in the morning. If, however, the patient has not had a good night's rest, or if he has been restless and unable to sleep during the night and inclined to sleep during the morning, it would be well to put it off until he has had some rest. As little dust as possible should be raised; if the floor be covered with carpet, sprinkle moist tea leaves over it, and it should then be lightly swept with a hand-brush or broom. All soiled articles should be removed, and only those necessary be returned after washing.

COD-LIVER OIL, To Disguise.—Mix a tablespoonful of it intimately with the yolk of an egg, add a few drops of essence of peppermint, and ½ tumbler of sugared water. Another method is to add ether to the oil, or Hoffman's anodyne instead of the ether, in the proportion of 15 minims of the ether or anodyne to each ½ oz. of oil.

CONTAGION.—(See same in HYGIENE.)

CONVALESCENCE. — With convalescence come manifold dangers that must be guarded against with jealous care. A single act of imprudence then may render unavailing all the watchful anxiety of the previous weeks. An invalid is peculiarly liable to take cold when first allowed to sit up. The room should be slightly warmer than usual, the chair or couch on which he is to sit covered with a blanket, and he himself well wrapped in blankets and shawls. If possible, close-fitting flannels should be worn, and the feet must be covered with stockings. He should not be allowed to remain too long out of bed the first time, and it is well to have it warmed before he returns to it. No visitors should be admitted, and all excitement should be avoided until he has had time to rest after the exertion. Except those actually engaged in the care of the sufferer not more than one friend at once should ever be allowed to enter the sick room. In some cases quiet is absolutely essential to recovery, and it is always desirable. The visitor should sit where the invalid can see without being obliged to turn his head; he should enter and leave the house and move about the room quietly; carry a cheerful face and speak cheerful words, but tell no lies to be cheerful; do not fall into gay and careless talk in the attempt to cheer the patient; don't ask questions, and thus oblige the patient to talk; talk about something outside, and not about the disease and circumstances of the patient; tell the news, but not the list of the sick and dying; never whisper in the sick room; if possible carry with you something to please the eye and to relieve the monotony of the sick room—a flower, or even a picture; if desirable, some little wholesome delicacy to tempt the appetite will be well bestowed; but it is most unkind kindness to tempt the sick to eat too much of rich cakes, preserves, sweetmeats, etc. The weakness and languor inseparable from long illness render convalescence sometimes a very tedious and trying time. The small stock of strength is unequal to the demands made upon it, and it should be husbanded in every possible way. At night the invalid should have something to take the last thing before going to sleep; any light nourishment will answer —a cup of cocoa, beef-tea, or thin custard; a delicate sandwich, and if stimulant is ordered, a glass of wine taken then will prevent exhaustion during sleep. At the early morning hours, from 3 to 5, the powers of life should be re-inforced by food, as they are considered then to be at their lowest ebb. If it is impossible to heat anything, a cold drink is better than nothing. Half a pint of milk, with the white of one egg beaten up in it, may be given. There is usually little appetite at this early hour, and something must be

chosen that can be easily taken. During convalescence, properly regulated exertion is highly serviceable; but it should never be carried so far as to produce exhaustion, and should be pursued for some time indoors, before it be attempted in the open air; the latter, at first, should always take place in a carriage, that can be opened or closed at will; the patient may then attempt short walks in the open air; but, in all cases, it is of importance that he is not unduly fatigued, as, otherwise, injury instead of benefit will be the result. A patient should never be allowed to sit up longer than is agreeable to his feelings, and never so long as to produce a sense of fatigue.

DEATH. Pains of.—Those most conversant with death scenes unite in their testimony to contradict the popular impression about its sufferings. As far as they can judge from appearances, the period of dissolution is not, in the great majority of instances, distinguished by great pain. The light of science and experience upon a subject which has heretofore been considered peculiarly dark and gloomy, consigns to a merited oblivion those false and dismal expressions, "last struggle," "pangs of death," "death-agony," etc.

DEATH, Resuscitation from Apparent.—The most powerful means for this purpose is unquestionably the use of artificial respiration according to the Sylvester method. (See *Asphyxia*, in MEDICINE.) But there may occasionally be some incidental helps; in one instance a person was brought to by pouring water from a height upon the pit of the stomach; switching that most sensitive part of the organism, the skin, may have a powerful effect; sound has great power to rouse the unconscious; the beating of a drum, a sudden scream, and especially music, when it is touchingly and skillfully performed.

DEATH, Signs of.—The importance of being able to decide between death and a state of suspended animation, is obvious. There may be an apparent cessation of breathing and of the beatings of the heart, the eyes may be partly open and glassy, the jaws and fingers somewhat rigid, and there may be increasing paleness, coldness and rigidity. But none of these signs are decisive; there are a few others that leave no room for mistake: 1. Hold a mirror before the mouth and nostrils, and, if there is any breathing at all, it will be made manifest by the moisture that will dim its surface.—2. Place a lighted lump under the arm or leg of the person, so near that its flame will gradually burn the skin; if he be alive, there will first be a blister; but, if dead, the skin will not be raised at all, and there will only be the scar of a burn.—3. Tie a piece of twine tightly around the person's finger; if he be living, the finger will become red and swollen; if dead, no change will be produced.—4. Let fall into the person's eye a few drops of a solution of sulphate of atropia, 4 gr. to the fl. oz. of water; if he is living, the pupil will soon become dilated; if dead, no change will occur.—5. The reverse of this experiment may be tried by means of a few drops of tincture of calabar bean, if accessible; applied in the same manner they will cause the pupil to contract.

DIFFICULT BREATHING. To Relieve.—In all such cases the chest should be raised, allowing the head to fall back. The completest extension backward of the head and neck will give the surest relief.

DISINFECTANTS.—(See same in HYGIENE.)

DRINKS, For the Sick.—In fevers, small pieces of ice held in the mouth and allowed to dissolve sometimes answer the purpose, but not in the majority of cases. Up to a certain point, the action of water taken internally, in fevers, is excellent. Aside from allaying irritation by quenching thirst, it flushes the kidneys, carrying off much of the effete material produced by the high temperature. This is especially the case with acids. One drachm of hydrochloric acid added to 1 qt. of water will give it sufficient acidity to accomplish the desired purpose, while at the same time it adds to the pleasantness, and sometimes relieves nausea. The use of acids in fevers is highly commended by some authors. The same amount of sulphurous acid may be added to 1 qt. of water when the bowels are loose or there is a tendency that way. In these cases acidulated barley-water is pleasant and nourishing. The same may be said of toast water. In constipation, oatmeal water may be used in the same manner. A few tamarinds added to a glass of water will often assuage thirst and open the bowels gently. A weak infusion of cascarilla or orange-peel, acidulated slightly with hydrochloric acid, was with an eminent authority a favorite thirst-allaying drink for fever patients. Raspberry vinegar is a useful drink. Sweet fruits, although at first agreeable and refreshing, must be taken with care and moderation, for they often give rise to a disagreeable taste, and at cept to produce flatulence and diarrhea. (For *Milk*, see that topic in HYGIENE.)

FOOD, For the Sick.—As a rule, diet for the sick should be simple and nutritious, and so prepared as to be most easily and readily digested. During the acute stage of disease, the liquid forms, as broth, gruels, etc., are generally preferable. Meats should be cooked lightly, and the best methods are by boiling and broiling. Boiled food is usually the most easily digested, but not always the most nutritious. Fried meats of all kinds are indigestible, and should find no place in the dietetics of the sick. Variety is not less important than quality. Both sick and well soon tire of sameness of food. It should be borne in mind that the body requires a variety of substances to supply its constantly recurring wants and preserve or restore its health, and that the food must furnish them. All kinds of ripe fruits not of an acid quality, such as apples, pears, peaches, plums, grapes, raspberries, strawberries, blackberries, sweet cherries, sweet oranges, melons, cantaloupes, and such others, will not disagree with the patient at the proper stage for tempting the appetite. Have always a clean napkin; change it every time food is partaken of. If the patient is too weak to use a spoon or fork himself, be careful not to cram. If, with a languid movement of the hand, the poor sufferer

should bid you "begone" with all the nicely-prepared food, take it kindly, but try it again at some other time. Patience must be exercised. Bullying will do no good. Do not let the patient know before what he is to eat or when it is coming. But it is well to ascertain if he has any longing for a particular article. (See COOKING FOR THE SICK, in CULINARY.)

FRICTION. — In medicine, friction, whether simple or conjoined with liniments, is a therapeutical agent of considerable power. By it the circulation is promoted in debilitated parts, and medical substances (iodine, mercurials, opium, etc.) are made to penetrate the pores of the skin. The benefit of friction, which consists of motion and heat, whether or not the same be raised by rubbing the body with a coarse cloth or the flesh-brush, has advantages by which the obstructions of the pores and cutaneous glandules are opened, their stagnating juices broken into small particles, dissolved, and rendered fit to be carried off in perspiration, in the room of which new juice will succeed with new vigor to the body; and longevity is this way most certainly promoted. Simple friction is performed by the hand alone, or with a piece of flannel, a hair glove, or a flesh brush. If it be performed by short, brisk strokes with the tips of the fingers, and with great celerity, when the naked hand is the agent, and if it be continued for an hour or upwards, and repeated several times a day, its influence in reducing swelled glands and swellings of the joints, in starting into action partly paralyzed muscles, as well as in alleviating rheumatic pains, is very great; besides being well performed, the friction should be continued for (at least) half an hour, in order to render it useful. Gentle, slow and equable friction, by producing a continued repetition of an agreeable impression on the nervous system, acts both as an anodyne and hypnotic. The operator should sit by the side of the bed, and introducing the hand under the bed-clothes, rub the legs or the arms (or other parts) gently with equally lengthened but slow movements. When the invalid is a child, its influence is more powerful when aided by a monotonous, but a soft, tune, which, although it operates upon a distinct sense, yet, by combination, renders the friction more soporific. When friction is accompanied with the use of any acrid or irritating substance, or is intended to introduce any active remedy into the system, the rubbing should be brisk, and of sufficient force to slightly abrade and inflame the cuticle; and should be continued until the substance, which is usually in the form of ointment, either wholly or partially disappears, owing to its absorption by the skin. The hand of the operator should, in most cases, be guarded by a glove; otherwise he is likely to share with the patient the effects of the medicine, a result not always agreeable or even safe.

LIGHT.—The sick chamber should be the room in the house most exposed to the sunlight. If it is possible to place the bed where the patient can see the sky, so much the better. If the sun becomes too bright it is easy to exclude it, but light is an absolutely essential element in recovery. The fewest patients die in the southerly exposed wards of hospitals. The inhabitants of dark villages in the mountains, even with the pure air which surrounds them, show a greater proportion of idiocy than those in other parts of the land. It is only in a few affections of the eyes or brain that an exclusion of light is required, and those are so rare as to be only the exceptions which prove the general rule. Smoking kerosene lamps, gas, etc., contaminate the air, but light is necessary in the sick room. The lamp may be placed in the hall, or a lantern hung outside of the window, admitting light into the room.

MEDICINES, Administration of. — Medicines should be given at regular intervals, and strictly in accordance with their directions. Should the patient be asleep when the hour arrives for its administration, he should not be disturbed, except in particular cases. Liquid medicines should never be measured out with a spoon; a graduated medicine glass should be in every sick room. Should the medicine be an acid and the spoon used be silver, the medicine is altered and often rendered poisonous, and, instead of being beneficial, is injurious. Medicine should be taken well diluted. Powders, if in small bulk, may be mixed with a little jelly or sugar, and taken from a spoon. Should the powder be in a large quantity, it may be mixed with water or mucilage. Pills may be easily swallowed by placing them on the tongue and taking a mouthful of water; in swallowing the water the pills will be washed downwards.

NIGHT-SWEATS.—The cure for night-sweats depends entirely on the cause. Malaria gives rise to them, and then the cure is quinine and arsenic. Debility may cause them. In that case tonics and good nutritious food should be used. Consumption causes it, and the cure is sulphuric acid, 10 to 20 drops in water each hour. After the acute stage of intercostal rheumatism is passed and the patient is prostrated, and convalescence retarded by profuse sweating during sleep, administer in the evening 2 full doses of chloral hydrate.

NURSING. — The first requisite for a good nurse is obedience to the directions of her superior officer, the physician. Too many, who have undertaken the business of nursing, have done so with the idea that they are to prescribe for the patient, and decide upon the proper medical treatment. This is a false and erroneous idea; for, while it is well that the nurse should have a good education, should understand much of medical science and methods, and should be so intelligent as not to give a blind and slavish compliance even to the physician; yet, generally speaking, she should be in a mood of mind to cordially carry out his directions, and to submit the medical care of the patient to him, who alone has the responsibility. Next to obedience comes neatness; the nurse should be naturally neat; then come cheerfulness, energy, a sunshiny disposition, a happy countenance, etc.; to insure which she must of course possess good health and great endurance; for the life of a nurse is a laborious life.

CULINARY.

CONFECTIONERY.

CANDIES.

REMARKS. — The different stages through which sugar passes in the process of candy making are as follows: The sugar is boiled until it becomes a perfectly transparent syrup; if further boiled until a portion "touched" between the forefinger and thumb, on opening them, is drawn into a small thread, which crystallizes and breaks, this stage is called the *thread*. If boiled again, it will draw into a larger string, and if bladders may be blown through the drippings from the ladle with the mouth, it is now called *bloom* sugar, or "boiled to the blow." If, when reboiled, the skimmer is dipped in, and shook over the pan, and then given a sudden flirt behind, the sugar will fly off like feathers; this is called the *feathered* stage. The next stage is called the *crackled* stage, or "boiled to the crack." In this stage the sugar hangs to a stick dipped into it, and if put directly into a pan of cold water turns hard and snaps. The next stage is the *caramel*, and is tested by dipping a stick first into the sugar, and then into cold water, when, on the moment it touches the latter, it will, if matured, snap like glass. It has now reached a full candy height. Throughout, the fire must not be too fierce, less it burn the sugar. If it is desired to work old candy over, dissolve it in water and run through a jelly-bag until clear.

ACID. To Remove. — If the candy is too acid, dissolve it in water, then put in a sufficient quantity of lime or chalk in powder to cause strong effervescence; after it has subsided, pass through a flannel bag; let the pan it is dissolved in be capable of containing twice as much as is put in.

ALMOND CHOCOLATES. — Prepare the almonds as if for burnt almonds (see *Burnt Almonds*) and then roll into chocolate, previously warmed.

ANISEED SUGAR PLUMS.—Dry 2 lbs. green anised in a stove; rub it in the hands to break off the stems; winnow to rid of dust; then put in a swinging basin, and coat with sugar boiled to thread; when coated sufficiently, whiten and polish.

BARBERRY DROPS. — Mix the juice of ripe barberries with powdered and sifted loaf sugar till they become a soft paste; heat over the fire, stirring all the time, but not letting it boil; remove from the fire; add a little more sugar; stir well, and deposit it in drops on a tin, or a sheet of paper; dry the drops in a nearly cold oven.

BARLEY SUGAR.—Boil clarified loaf sugar to the thread; then pour in for every pint of liquid sugar 2 teaspoonfuls of lemon juice and 6 or 7 drops of essence of lemon. Stir well and boil again, till as before, it is brittle; while this is boiling, slightly oil a marble slab; on this pour the sugar; when cool, cut it up into strips with a pair of scissors, and twist the sticks a little with the hand.

BISCUIT PASTE.—Prepare some paste as for Savoy cakes. (See *Savoy Cakes*, in CAKES.) Take $\frac{1}{6}$ of the mixture, and add dissolved chocolate; stir the whole well and divide into 2 equal portions; to 1 part add some more of the mixture; mix together prepared cochineal or carmine and infusion of saffron; stir this into another portion of paste; divide it, and add to 1 part some more of the paste; butter or paper a square tin, and spread on a spoonful of each colored paste in rotation; bake it in a moderate oven, and when cold cut it into pieces as required.

BRANDY BALLS.—Boil brown sugar to the crack; work in good peppermint and 1 oz. ivory black to 7 lbs. sugar; roll them to the proper size and cut them off; then roll round with the hand.

BURNT ALMONDS.—For each lb. of sifted almonds use 2½ lbs. loaf sugar, made into a syrup. A round bottomed copper pan is the best for making these in. Boil the almonds in the sugar until they crack; take from the fire, stir and sep-

arate for the second coat. Put 2 lbs. more of syrup into the pan; add the drainings from the first operation, and do the same thing over again; repeat this until finished; finally, drain; dry, and color with cochineal.

ALMOND CANDY or HARDBAKE.—Boil 1 lb. of sugar and ½ pt. of water until it becomes brittle when dropped in cold water; then add ½ lb. of almonds blanched and split, the juice of ½ a lemon, and 1 oz. of butter. Boil until the candy hardens at once in the water. Pour it out on a well-oiled dish. When cold it may be taken off the plate and kept for use in a tin box. Time, half an hour.

ALMOND CREAMS.—Blanch and pound 5 oz. of sweet and 1 oz. of bitter almonds to a paste; put to this loaf sugar to taste, rubbed with lemon-rind, and pounded. Rub smoothly a dessert spoonful of corn-flour into 1 qt. of milk, or if it is to be had use 1½ pt. of cream; add the yolks of 3 eggs well beaten. Put the whole, when well mixed, into a saucepan, set it on the fire, and stir constantly until it thickens; but on no account allow it to boil. The whites of the eggs may be whisked, and a little placed on the top of each glass. Time, about ten minutes to boil the cream. Sufficient for a dozen custard-glasses.

CANDIED BONBONS.—Heat 1 lb. of sugar until it registers 40 deg., then cool it down to 38 deg., by the addition of some essence to flavor, either aniseed cordial, cheery water, maraschino, or almond may be used. Let it cool, and beat it with a wooden spoon until it forms a paste, when put it in a basin until wanted. Next, get a wooden tray about 1 ft. square, and 2 in. deep, fill it with dry starch finely powdered, and stamp the starch all over with an ornamental cutter, leaving about ½ in. between each interstice. Melt part of the paste in a sugar boiler, rub the spout with whiting, and fill the patterns in the starch with the sugar; let it dry for two hours; take them out, brush them to clear away the loose starch, place them in a candy pan, cover them with some syrup at about 36 deg. of heat, and cover with a sheet of paper. Allow the bonbons to stay fifteen hours in a drying closet, then break the top only of the sugar, throw off the syrup, put the bonbons on a wire strainer, and give them their finishing touch by letting them again dry in the hot closet.

CINNAMON DROPS.—Mix ½ oz. of powdered cinnamon, or ½ tea-spoonful of oil of cinnamon, with 1 lb. of pounded sugar and ½ pt. of water; boil the syrup to a candy height or until it snaps when put into cold water; then spread it on a large flat dish, well oiled, and score it, before it hardens, into small squares, or drop it evenly on paper. Time to boil, about a quarter of an hour.

COFFEE CREAM CARAMELS.—Melt 2 lbs. of sugar with as little water as possible in a vessel on the fire; when the sugar begins to bubble, pour in slowly 1 teacupful of rich cream and stir carefully; add 2 oz. of fresh butter and extract from 2 oz. of coffee, stirring gently and continuously while adding. As soon as cooked sufficiently to be brittle when dropped in cold water, pour into buttered tin dish, and when nearly cooled, mark off with a buttered knife into squares.

DATE CREAMS.—One cupful of molasses, 1 egg, ½ cupful of butter, and 1 cupful of hot water in which a teaspoonful of soda has been dissolved; 1 spoonful of mixed spices, and 1 large cupful of dates, chopped fine. Cut in squares, like frosted creams, bake in a moderate oven, and spread boiled frosting over the top.

EVERTON TAFFY.—Put into 1 teacupful of water 1 lb. of powdered white sugar, and when the sugar is dissolved, add ½ lb. of butter beaten to a cream and keep constantly stirring the mixture until a little of it put on a buttered dish firmly sets; add lemon or other flavoring to taste just before taking from the fire. Pour out on a dish that has been buttered. Never undertake to make candy of any kind in a tin saucepan.

FRENCH VANILLA CREAM.—Break into a bowl the white of 1 or more eggs, as is required by the quantity you wish to make, and add to it an equal quantity of cold water; then stir in the finest powdered or confectioners' sugar until it is stiff enough to mold into shape with the fingers. Flavor with vanilla to taste. After it is formed into balls, cubes or lozenges, place upon plates to dry. Candies made without cooking are not as good the first day. This cream is the foundation of all the French creams.

HICKORY-NUT CANDY.—Crack the nuts and chop them fine. Then measure as many cups of the nuts as of white granulated sugar. Put the sugar by itself in a saucepan, and shake the pan slightly until the sugar is dissolved. Then pour in the nuts and stir around. Pour this into buttered tins, and before it is quite cold cut into small squares. Any other kind of nut can be used if preferred; peanuts make a delicious candy made in this way.

MAPLE SUGAR CREAMS.— Grate maple sugar, mix it in quantities to suit the taste with French cream, adding enough confectioners' sugar to mold into any shape desired. Walnut creams are sometimes made with maple sugar, and are delicious.

NUT CREAMS.—Chop almonds, hickory nuts, butter nuts, or English walnuts, quite fine. Make the French cream, and before adding all the sugar, while the cream is still quite soft, stir into it the nuts, and then form into balls, bars or squares. Three or four kinds of nuts may be mixed together.

ORANGE DROPS.—Grate the rind of 1 orange and squeeze the juice, taking care to reject the seeds. Add to this a pinch of tartaric acid; stir in confectioners' sugar until it is stiff enough to form into small balls the size of a small marble. These are delicious.

ORANGE-FLOWERS' CANDY.—Put 1 lb. of doubly-refined loaf sugar into a saucepan with ½ pt. of water, and boil gently for ten minutes. Throw in 2 oz. of freshly-gathered orange-flowers, and leave them in the boiling syrup for five minutes, then turn them into a bowl, and let them remain for two days. Boil the syrup

once more until it rises high in the pan; strain upon sheets of paper which have been placed upon large flat dishes, and loosen it from the paper before it is quite cold. Store the candy in canisters.

BUTTER-SCOTCH.—Dissolve 2 lbs. of sugar in 2 pts. of water; boil and add 2 tablespoonfuls of butter, and sufficient flavoring extract to suit.

CANDIED FRUITS.—Take the fruit out of the syrup, and let it drain on a sieve; dip the sieve with the fruit into luke-warm water; take it out; let it drain, and dry in the stove; boil some fresh syrup to the blow; put in the fruit, and boil in it; with a spoon rub the sugar against the side of the pan, to grain it; when it begins to whiten put the fruit in the white part separately; with two forks take it out and lay it on sieves or wire frames, for the sugar to drain from it.

CARAMELS.—These are made by boiling clarified sugar till it is very brittle; then pour it on an oiled slab or sheet of tin, and, as soon as it is cool enough to receive an impression with the finger, stamp it in small squares with a caramel mold; then turn over the mass; wipe the bottom and put it in a dry place to harden. When caramels are to be flavored, put the flavoring in when the sugar has come to the crack; then reboil, and finish as before. If flavored with chocolate, it must first be dissolved in water; if coffee caramels are wanted, an infusion of the coffee must first be made, strained through a cloth and stirred into the syrup gradually; if the caramel is to be flavored with lemon, grate the rind with a lump of sugar, add a few drops of lemon juice with water enough to dissolve the sugar completely, and stir the whole into the boiled syrup.

CHANTILLY BASKETS.—Prepare some ratafias; boil some sugar to the caramel degree; rub the inside of a mold with oil, dip the edge of the ratafias in sugar and stick them together; place the face of the ratafias towards the mold, except the last two rows on the top, placing their faces to meet the eye when the sugar is cold; take it out; join the bottom and top together with the same sugar; make a handle of spun sugar, and place over it; line the inside with pieces of Savoy or sponge cakes; fill with custard or whipped cream, and stick in here and there, in the cream, small pieces of the cake. The ratafias can be replaced by cherries, grapes, or oranges; the last are peeled and divided into small pieces; the cherries and grapes can be used either fresh, preserved, wet, or dried.

Chantilly Basket.

CHEWING GUM. — 1. 1 lb. refined parafine; ½ lb. white sugar; color to suit; melt and pour into a candy pan, and divide when cool into squares —2. 1 lb. spruce gum, or Venice turpentine; ½ lb. parafine; melt together; and divide when cool into desired shape.

CHOCOLATE.—Warm a mortar and pestle until hot; wipe the mortar out clean, and put prepared nuts in it; pound the nuts until reduced to an oily paste; if it is required sweet, add ½ or ⅔ of its weight in powdered loaf sugar; pound it again so as to mix it well together; place it in a pan and put it in the stove to keep warm; take a portion, roll well on a slab with a roller, until reduced to a smooth paste; put in another pan, and keep warm until the whole is similarly disposed of; then place it again on the stone; work it over and divide into pieces; put these into molds; shake them and let them cool.

CHOCOLATE CANDY. — 1 cup of molasses, 2 of sugar, 1 of milk, ½ of chocolate, a piece of butter ½ the size of an egg; boil the milk and molasses together, separate the chocolate fine, and mix with just enough of the boiling milk and molasses to moisten; rub perfectly smooth; then with the sugar stir into the boiling liquid; add the butter and boil 20 minutes.

CHOCOLATE CREAMS. — 2 cupfuls of powdered sugar to ½ cupful of boiling water or milk; put on the stove and boil ten minutes; grate ½ square of Baker's chocolate; place this on top of a steaming kettle; leave it there until soft; take off the cream and beat it until perfectly white; roll into little round balls, and dip them in the melted chocolate; flavor with vanilla.

CHOCOLATE KISSES.—1 lb. sugar; 2 oz. of chocolate, pounded together and finely sifted; mix with the whites of eggs well beaten to a froth; drop on buttered paper and bake slowly.

CHOCOLATE PISTACHIOS. — Warm sweet chocolate by pounding it in a hot mortar; when reduced to a malleable paste, take a little and wrap round a blanched pistachio nut; throw it in nonpareils of various colors, covering it all over; fold in colored or fancy papers with mottoes.

COCOANUT CANDY.—2 cups of white sugar; ½ cup of water; boil; put the pan in a larger pan of water and stir until cool; when it begins to get stiff, stir in the grated cocoanut, and when cold cut into cakes.

COLORS, For Candies. — The following are healthy and desirable; nearly all others should be avoided: *Bistre.* Light brown, prepared from wood soot; sugar may be substituted for this or any other shade of brown, by continuing the boiling after it has passed the degree of caramel, until it is burnt; but mix water with it so as to lessen the shades; dissolved chocolate may also be substituted. — *Black.* Ivory or bone charcoal, ground fine and mixed with a little gum Arabic. — *Blue.* Rub indigo in warm water until the required color is obtained; or, dissolve ½ lb. in 1 lb. oil of vitriol. — *Carmine.* Reduce 1 oz. of cochineal to a fine powder; add to it 6 qts. of clear rain or filtered water; put this into a large tin saucepan, and boil for 3 minutes; then add 25 gr. of alum, and let it boil 2 minutes longer; take it off to cool; when it is blood warm pour off the clear liquor into shallow vessels, and put them by to settle for 2 days, covering them with paper when it is settled, decant off the pure liquid; then dry the carmine for use — *Green.* Boil the leaves

of spinach about 1 minute in a little water, and when strained bottle for use. — *Lemon.* Use a solution of saffron. — *Orange.* Yellow, with a portion of red. — *Purple.* Madder or logwood, intensified with a little indigo. — *Red.* Cochineal, 4 oz.; boil 5 minutes in ½ pt. of water; then add 1 oz. cream tartar and ½ oz. pounded alum; boil 10 minutes longer; add 2 oz. sugar, and bottle for use. — *Yellow.* Rub with some water a little yellow gamboge on a plate.

COMFITS.—These are small seeds preserved in sugar. Sift the seeds in a hair sieve; put them in the comfit pan, and rub well about the bottom until warm; boil clarified loaf sugar; pour over the seeds about 2 tablespoonfuls; rub and shake about the pan, until dry; give another charge and repeat the above process; give 4 or 5 charges, increasing the amount of syrup each time, dusting flour over them before the last charge; sift them in a hair sieve; put them again in the pan and proceed as before until of the required size.

COUGH CANDY.—7 lbs. gran. sugar; ¼ oz. cream of tartar; 3 pts. water; color with a spoonful of saffron water; boil to the crack; pour out on the slab; when stiff add ½ oz. tartaric acid, 1 teaspoonful of aniseed, and 2 drops of peppermint; mix thoroughly, and pull; when done form into strips, rolls or drops.

COUGH LOZENGES.—(See same in CHEMIST AND DRUGGIST.)

CREAM CANDY.—Take sugar and add an equal quantity of cold water; wet a little starch —about 2 tablespoonfuls of starch to every cup of sugar; rub it smooth and set aside for use; set the sugar and water over the fire to boil, but do not stir after it begins to boil; let it boil till it hardens readily when dropped into cold water; as soon as it has reached that state pour in the starch, stirring rapidly; and let it boil, while being constantly stirred, for a minute or two; then pour into a well buttered dish and set aside until cool enough to work with the hands; add to it while working such flavoring as is preferred; work till very light; draw it out into a flat piece and cut into sticks.

DROPS.—These are made by taking the desired amount of sugar and dissolving it in the required flavor; then boil it to the consistency of thick syrup; drop it on to plates or sheets of paper, and put it away to cool. The almond flavor is obtained by blanching the almonds, crushing them, adding a little lemon juice and 1 pt. of water to every lb. of almonds, putting the compound into a cloth and wringing out the milk. Cocoanut drops require the sugar to be added to the whites of 3 eggs, beaten to a stiff froth; then the cocoanut is added. Chocolate drops require no sugar; the chocolate is warmed, a little butter added, and rolled into shape; then nonpareils are sprinkled over the top. Coffee drops are made the same as cocoanut drops. When the flavor of fruit is desired, the pulp of the fruit is stirred with the sugar.

FRENCH CANDY.—Take 2 lbs. best loaf sugar; put into an enameled saucepan with just enough water to wet it; set it on a clear fire; boil 10 minutes and remove any scum that may arise; this done, remove it from the fire. Dip a little candy in a basin of cold water. If it does not form a ball between thumb and finger, when cool, return it to the fire and boil a few minutes longer. If it has a brittle feeling, add a tablespoonful of water and boil again; when it is boiled to the right point, set it aside to cool. Divide it then into as many parts as different flavors are desired; drop the desired flavor, after being mixed with the desired color, on each piece; roll the piece like a piece of dough until thoroughly mixed.

FRUITS, To Candy.—(See CANDIED FRUITS.)

GINGER CANDY.—1 lb. loaf sugar; a few drops of acetic acid or the juice of ½ lemon; a dessertspoonful of essence of Jamaica ginger; boil the sugar with just water enough to dissolve it to the ball; add the acid and the essence; rub the sugar with a silver spoon against the sides of the sugar boiler to whiten; pour it into small moulds or into a tin pan; mark it off into the desired shapes and put away to dry.

GUM DROPS.—Cheap gum drops, better than those of gelatine, can be made as follows: Mix 1 lb. of starch with sufficient cold water to make a stiff paste; then pour over boiling water to make it clear; add ½ lb. glucose and 1 to 1½ lbs. sugar; stir briskly over a moderate fire; flavor with any essence desired, and pour into starch molds.

HOARHOUND CANDY.—7 lbs. sugar, white or brown; ¼ oz. cream of tartar; 1 qt. water; ½ pt. strong hoarhound tea; boil to the feather; grain against the sides of the pan with spoon, 2 or 3 minutes, then pour out on the slab; form into flat sticks, rolls or drops, with a hoarhound cutter, which are made in two styles, with movable knives or with fixed divisions.

Hoarhound Cutter, with Knives.

HOARHOUND LOZENGES. — (See CHEMIST AND DRUGGIST.)

JUJUBE GUM.—1 lb. jujubes; very white and picked gum Arabic, 2 lbs.; powdered sugar, 2 oz.; pound the jujubes in a marble mortar with 5 pts. of water; put the whole into a pan, and boil until reduced to 3; strain the decoction through a cloth; beat up the white of an egg with a glass of water, and mix part with the decoction as it boils; throw in a little at a time of the remaining part, to check the ebullition; when all used, take off the scum; put again on the fire; add gum and sugar powdered and passed through a horse-hair sieve; stir until dissolved; when of the consistence of honey, place it in the bain-marie, and neither stir nor touch it; when it has acquired body enough, pour it into molds, previously oiled with good olive oil; place in the stove to finish drying; when dry, take it out and cut in small pieces.

LEMON CANDY.—6 lbs of sugar; add to it 3 pts. of water; put the mixture over a slow fire for ½ hour; clarify with a little dissolved gum Arabic; skim off the impurities as they rise to the surface of the boiling sugar; when it becomes perfectly clear take a spoonful and drop it into cold water; flavor with oil of lemon; pour off thinly; cut into sticks.

LICORICE PIPES.—8 lbs. of sugar, 12 oz. of licorice; warm the licorice and cut in thin slices; dissolve in 1 qt. of boiling water; stir well; let it settle; pour off free from sediment; dissolve the gum in the clear part, and mix into a paste; roll out a piece in a round form, until it is about the size of the largest end of the stem of a tobacco pipe; dry them in the stove.

LOZENGES.—Dissolve in ¼ pt. of hot water ½ oz. of gum Arabic; when cold stir it up with 1½ lbs. of loaf sugar and a spoonful of any powdered spice, or 12 drops essence; roll and beat the whole up into paste; make into cakes and punch out the lozenges with a round stamp; dry them near the fire. In place of the spice any flavoring may be used that is desired.

MODELLING.—In modelling candy figures, correct proportions are very important. The form of the body is first made with the fingers, the more minute parts with the tools and a pair of scissors. In making a doll, make the whole length 6 times the length of its foot, 8 times that of its head; the thumb as long as the nose or the biggest joint of the middle finger; the fore finger shorter than the third, and the little finger shorter than the third by one joint; the width of the wrist as long as the thumb; the ear the length of the nose, its breadth half its length; the arm 3 times the length of the head, or 4 faces; the leg, from the knee-joint to the bottom of the foot, two heads and a half; the foot, which is ⅙ of the human stature; divide the body into 3 parts—first the toes from the top of the large one to the lowest joint of the little one, next the middle of the foot, and lastly the heel and instep. After the proportions have been determined upon, it is important that the form be true to nature; not only in making dolls, but in making flowers, baskets, etc., graceful and natural positions must be aimed at, avoiding the stiff and awkward.

Gouge. *Rose Stick.* *Foot Tool.* *Cutting Tool.*

MODELLING TOOLS.—Four tools are required—a rose stick, the thin, flat end being used for forming the leaves of roses out of the paste by flattening a piece on a table until it is of the required form and size; the other end for fluting and making borders, etc. A foot tool, used for forming the edges and borders, the circular end being used to work underneath any part, or circular mouldings, and also for the paws of animals. A cutting tool, for which purpose the curved thin end is used, also for the formation of leaves, and the opposite end for fluting; a gouge, used in the formation of leaves for flowers. The curves of each tool are also used for different purposes in modelling, and for forming the raised and depressed parts. There are many others, but these will be sufficient, with the dotting or pointing tool; a piece of round pointed stick will do for this last.

MOLASSES CANDY.—Take 2 qts. of molasses; boil over a slack fire from 25 to 35 minutes; test it after it has boiled 20 minutes by taking some out on the end of a clean spoon, and dipping into cold water; if it hardens quickly it is boiled enough; when boiled put in a teaspoonful of baking soda, and stir well; pour out into oiled or buttered tins; when cooled, with your hands well buttered or oiled, pull until the candy is white.

NUT CANDY.—To 1 lb. brown sugar add 3 tablespoonfuls of water; when it boils add ¼ lb. butter; when thick and ropy, drop in the nuts; take from the fire and stir till it grains; then pour into buttered tins.

OILED PAPER, To Make.—Melt some lard, or use sweet oil, and with a varnish brush go over one side of the paper lightly; then lay it between unoiled sheets of paper; put it away for 5 or 6 hours, and it will then be ready to wrap around the candy.

PASTES.—Take 1 oz. of picked gum tragacanth; wash it in water; put in a clean pot and pour on it ½ pt. of water; stir it frequently; let it dissolve 24 hours; squeeze it out through a coarse cloth; put it into a mortar, adding gradually 6 or 8 oz. of sugar; work until it is a smooth white paste. When it is wanted for use, take the required quantity, work more sugar into it and add the flavoring desired. When fruit flavor is wanted, take ¾ lb. reduced pulp to 1 lb. sugar, cut the paste into the desired shape, form it into rings or mold it it into figures.

POP CORN BALLS.—The corn being popped, salted, and kept as warm as possible, sprinkle over it a mixture of gum Arabic and ½ lb. sugar, dissolved in 2 qts. water, and boiled a few minutes; stir the corn thoroughly; mold into balls with the hands. If desired, sprinkle with a solution of carmine to the mixture, after it has been balled, to give a red tint.

PURITY, Of Candy, To Test.—If the candy be dissolved in water, its purity may be tested as follows: If the water remains transparent the candy is pure; but if milky or depositing a sediment, terra alba or some harmful adulteration has been used.

ROCK CANDY.—Take a brass kettle; make 8

or 10 holes at equal distances from each other around the sides of the kettle; pass threads through these; stop the holes upon the outside; boil the sugar to the feather; pour it into the kettle; put it into a warm place 5 or 6 days; pour off the syrup; pour it over again; set it away; repeat this process 2 or 3 times; then again set it away until cool, when the threads may be removed with the candy clinging to them.

STARCH MOLDS.—Take 2 or 3 flat boxes an inch deep; fill them with powdered starch; into this press any patterns desired; into these the compound is to be dropped, the dropper in one hand and a piece of wire in the other to cut off the fluid as it falls.

SUGAR CANDY.—1. 2 cupfuls of white sugar; ½ teaspoonful of cream of tartar; 1 cupful of cold water, and 1 teaspoonful of butter; boil without stirring.—2. 3 cupfuls sugar; ½ cupful of vinegar; ½ cupful of water; juice of 1 lemon; boil without stirring, till brittle; pour on a buttered dish, and pull until quite white and light.

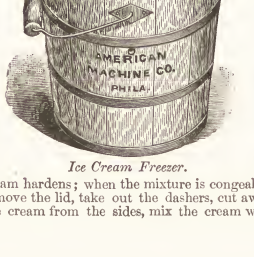
SUGAR PLUMS.—Take a quantity of sugar syrup, in the proportion to their size; add a drop or two of any esteemed flavoring essence; if the bon-bons are preferred white, when the sugar has cooled stir it round the pan till it grains and shines on the surface; when ready, pour through a funnel into leaden molds, of various shapes, and slightly moistened with oil of sweet almonds; as soon as the plums are cold, take them from the molds; dry them for 2 or 3 days in the air, and put them upon paper. If required to be colored, add the color just as the sugar is ready to be taken off the fire.

TAFFY.—(See *Molasses*, or *Sugar Candy.*)

WALNUT CREAM DROPS.—The cream is made in the same way as that for chocolate creams; it is then made into a disc and ½ a walnut kernel stuck on each side; the cream may be colored or flavored with chocolate, coffee, vanilla, lemon, etc. as desired.

ICES AND CREAMS.

REMARKS ON MAKING.—When not possessed of a machine, having procured the necessary ingredients, secure a small, deep tub, not less than 8 inches greater in diameter than the inside can or freezer; see that the tub has a hole in the side near the bottom, with a plug, which can be drawn at pleasure, to let off surplus water which would retard freezing. Have near at hand a spatula of hard wood, with which the cream can be scraped from the sides of the freezer. Have also a smaller one with which mix coarse salt and ice together, and deposit the same between the can and the ice tub. Pound the ice fine. When the cream is flavored, place it in the freezer, which put in the tub; pile the salted ice around it; if there is a crank, turn it slowly at first, increasing the speed as the cream hardens; when the mixture is congealed, remove the lid, take out the dashers, cut away the cream from the sides, mix the cream with the spatula until it is smooth and soft; reinsert the dashers; cover the can again, and work until the cream is hard and well set. If there is no crank, use the spatula repeatedly instead. For ease and rapidity, there is, of course, nothing so good as a well-constructed, quick and reliable freezing machine, such as the "American," shown in the cut. For the best freezing mixtures and colorings, see those topics in this department.



Ice Cream Freezer.

ALMOND CREAM.—Take 6 oz. bitter almonds, blanch and pound them in a mortar; add by degrees a little rose water; boil very gently in 1 pt. of cream until highly flavored with them; pour the cream into a bowl; stir in 1 lb. powdered loaf sugar; cover it; set it away to cool gradually; when cold, strain it and stir gradually, but very hard, into 3 pts. of cream; freeze, and let stand about 2 hours, when freeze the second time, and serve at once.

APRICOT ICE.—Skin, divide and stone 6 large ripe apricots; blanch, pound and add the kernels to the fruit; juice of 2 lemons; ½ pt. of water, and 2 oz. of clarified sugar; put in an earthen crock for 1½ hours; strain and mix the whites of 3 eggs beaten to a firm froth with 4 oz. of powdered sugar; add this to the prepared water; mix thoroughly and freeze; 12 oz. of jam can be used instead of the fresh fruit.

APPLE ICE.—Pare and core some apples; cut them in pieces into a preserving pan; cover with water; boil until reduced to a marmalade; strain; to 1 pt. of apple water add ½ pt. syrup, the juice of a lemon, and a little water; when cold, freeze.

BARBERRY ICE.—First soften the berries by either boiling in the syrup or putting in a stew-pan, and stirring over the fire until tender; pass them through a sieve, mix, and freeze.

BISCUIT ICE CREAM.—Dry and pound 2 oz. of sponge cake; mix with 1 pt. of custard; flavor slightly with lemon; sweeten and freeze. Savoy cakes may be used and a few ratafias.

BROWN BREAD ICE.—Make a custard of eggs and milk, flavored with vanilla; cut up some brown bread into dice, dry it in the oven; put it hot into the cold custard; freeze; pour iced custard around it in the dish in which it is to be served.

CHERRY CREAM.—Made in the same way as cherry ice, only using 1 qt. of cream in place of the water.

CHERRY ICE.—2 lb. cherries; 4 oz. ripe gooseberries; ½ pt. syrup; ½ pt. water; the juice of 2 lemons; pound the cherries with the stones in a mortar; pass the juice of the fruit through a sieve; mix the syrup and water with it; freeze.

CHOCOLATE CREAM.—1 qt. of cream; 1 pt. of new milk; 1 lb. sugar; 2 well-beaten eggs; 5 tablespoonfuls grated chocolate rubbed smooth in a little milk; flavor to taste; heat the milk almost to boiling; pour it by degrees in with the beaten egg and sugar, and freeze.

CHOCOLATE ICE.—Set 4 oz. of grated chocolate over a slow fire with 2 tablespoonfuls of water; when dissolved remove from the fire; add a cupful of warm water; mix with cold syrup; freeze and serve.

COFFEE CREAM.—1 qt. cream; 5 oz. fine coffee; 12 oz. sugar; roast the coffee; stir until it is a good brown color; throw into the custard cream while quite hot; cover closely; let it infuse for an hour or two; then strain and freeze.

COLORS, For Ices. — *Green.* Pound spinach leaves, or beet leaves; express the juice; boil in a teacup in a saucepan of water to take off the rawness. — *Red.* Use beet root sliced, and some liquor poured over. — *White.* Use almonds finely pounded, with a drop of water; or use cream. — *Yellow.* Use yolks of egg or a bit of saffron steeped in the liquor and squeezed; the flower of the crocus is also used; it has no taste.

CURRANT ICE.—1½ pts. ripe currants; ½ pt. raspberries; 1 qt. cream; the juice of 2 lemons; 12 oz. sugar; mix as raspberry.

FILBERT CREAM.—1 qt. cream; 1 lb. nuts; 12 oz. sugar or 1 pt. syrup; crack the nuts; roast the kernels in the oven; when done, pound them with a little cream; make a custard, and finish as almond ice.

FREEZING MIXTURES.—Coarsely pulverize the salts when about to use them, and do not mix until just before throwing them in the liquid ingredients. 1. Snow or pounded ice, 2 parts; salt, 1 part.—2. Snow or pounded ice, 5 parts; salt, 2 parts; sal ammoniac, 1 part.—3. Snow, 8 parts; concentrated hydrochloric acid, 5 parts.

GINGER CREAM.—6 oz. of preserved ginger, 1 qt. of cream, ½ pt. of the syrup from the ginger; sugar sufficient to sweeten it with; the juice of 2 lemons; pound the ginger in a mortar; add the cream, etc., and freeze.

GOOSEBERRY ICE.—Same as cherry ice, using 2 lbs. of gooseberries to 1 lb. cherries.

LEMON CREAM.—Same as lemon ice, using 1 qt. cream instead of the water.

LEMON ICE.—6 lemons, juice of all and grated rind of 3; 1 large sweet orange, juice and rind; 1 pt. water; 1 pt. sugar; squeeze out every drop of juice and steep in it the rind of orange and lemons 1 hour; strain, squeezing the bag dry; mix in the sugar and then the water; stir until dissolved, and freeze by turning in a freezer, opening three times to beat all up together.

MARASCHINO ICE.—Make a lemon ice, using less water, and making up the deficiency with Maraschino; be careful the taste of the lemon does not prevail too much.

ORANGE CREAM.—Mix 1 qt. milk or cream, 1 lb. sugar, the juice of 8 oranges, the rinds of 4 oranges rubbed on the sugar, and 4 yolks of eggs; when the compound begins to thicken, stir briskly, and strain, freezing when cool.

ORANGE ICE.— 6 oranges, juice of all, and grated rind of 3; 2 lemons, the juice only; 1 pt. sugar dissolved in 1 pt. water; prepare and freeze as you would lemon ice.

PEACH CREAM.—Same ingredients, with the exception of 1½ pts. cream instead of ½ pt. of water, and the same process of making as peach ice.

PEACH ICE.—1 lb. of the pulp of ripe peaches; ½ pt. of syrup; ½ pt. of water; the juice of 2 lemons; mix as apricot; if the fruit is not ripe enough to pulp, open and take out the stones; put them in a stewpan with the syrup and water; boil until tender; pass through a sieve; mix in the pounded kernels; when cold freeze.

PINE APPLE CREAM.—Put on the fire in a copper or tin vessel 1 lb. of strained pine apple pulp; 12 oz. sugar; 1½ pts. milk or cream; yolks of 3 eggs; beat till thick; do not boil the cream; strain the mixture into a vessel and set aside to cool; freeze.

PINE APPLE ICE.—1 lb. pine apple; 1 pt. syrup; ½ pt. water, and the juice of 2 lemons; cut the pine in pieces, and put it into a stewpan with the syrup and water, and boil until tender; pass it through a sieve; add the lemon juice, with 2 or 3 slices of the pine cut in small dice; mix, and when cold freeze.

PISTACHIO CREAM.—1 qt. cream; 8 oz. of pistachios; 12 oz. sugar; blanch and pound the pistachios with a little of the cream; mix; flavor with a little essence of cedrat, or the rind of a fresh citron rubbed on sugar; color it with spinach; make it into a custard with eggs, and when cold strain and freeze.

PUNCH ICE.—Make a lemon ice; rub off the yellow rind of the lemons on sugar; when the ice is beginning to set, work in the whites of 3 eggs to each qt., beaten to a strong froth; mix with sugar; when nearly frozen, take out the pot from the ice, and mix well with it a glass of rum and of brandy; after the spirit is well mixed, replace the pot and finish freezing.

RASPBERRY ICE.—1 qt. ripe raspberries; 4 oz. ripe cherries; ½ pt. syrup; ½ pt. water, and juice of 2 lemons; mash the fruit and pass it through a sieve; mix with it the other articles; add a little prepared cochineal to heighten color; freeze.

RATAFIA CREAM.—For 1 qt. cream, crumble 6 or 8 oz. ratafia cakes quite fine, and mix with the cream when it is frozen.

STRAWBERRY CREAM.—3 pts. thin cream; 2 lbs. powdered sugar; 3 pts. of ripe strawberries; mash the fruit; strain through a fine wire strainer; add the cream and sugar and freeze as rapidly as possible.

STRAWBERRY ICE.—8 pts. of the best scarlet pines; 1 pt. syrup; ½ pt. water, and the juice of 2 lemons; mix as raspberry.

TEA CREAM.—Put ½ oz. fine orange-flavored tea into an earthern pot and pour on it 1 pt. boiling milk; let it stand until nearly cold; pour it off fine; strain to free it from any particles of leaf; put the liquor into a large stew pan, with enough lump sugar to make it sweet; when it is hot add to it ¼ pt. rich cream and the yolks of 5 eggs; stir over a slow fire until it becomes a thick custard, and then take from the fire; stir occasionally until it is cool, to prevent a skin forming; freeze in the usual manner.

TEA ICE.—1 qt. cream; 2 oz. best green tea; 12 oz. sugar; put the tea into a cup, and pour on it a little cold river water containing a small portion of carbonate of soda; let it remain for an hour or two, then add a little boiling water; strain it, and add to the cream and eggs; finish as the others.

TUTTI FRUTTI CREAM.—1 pt. of milk, 1 qt. cream, yolks of 5 eggs, beaten light with the sugar; 3 cups of sugar, 1 lemon, juice and grated peel; 1 glass of pale sherry, and ½ lb. crystallized fruits, chopped; heat the milk almost to boiling; pour by degrees over the eggs and sugar, beating all together well; return to the fire, and boil 10 minutes, or until set into a good custard; when cold, beat in the cream, and half freeze before you stir in ½ lb. of crystallized fruit—peaches, apricots, cherries, limes, etc.—chopped very fine; beat in with these the lemon and wine; cover again, and freeze hard. In all fruit ice creams the beating of the custard should be very hard and thorough, if you would have them smooth.

VANILLA CREAM.—Take 1 qt. rich new milk, put in it a vanilla bean broken in two, and set it over the fire in a water-bath to heat; separate the whites and yolks of 3 eggs and beat them very light; when the milk almost boils, stir up the beaten yolks with 4 cups of crushed white sugar, and add to them the hot milk little by little, beating steadily the while; then beat in the frothed whites; place again over the fire, stirring it briskly for 15 minutes; pour it out into a deep dish and set aside to cool; when quite cold beat into it 3 pts. sweet rich cream, and freeze.

VANILLA ICE.—1 qt. cream; ½ oz. vanilla; 12 oz. sugar; cut the vanilla into small pieces, and pound it with the sugar until quite fine; add the cream and eggs; make it into a custard; strain, and when cold freeze.

WENTWORTH'S CREAM.—5 qts. pure cream; 2 lbs. best pulverized sugar; sufficient extract of vanilla to flavor to taste; stir together; turn into the can; beat until it fills the can; freeze.

COOKING.

REMARKS. — In cooking, to make the art a success, it is best to remember a few general rules. The following are the most important: When anything is made too salt, counteract it by adding a spoonful of vinegar and a spoonful of sugar. When about to cook, get together everything that you expect to use; see that the fire is right to begin with and remember that as much depends on the baking as on the molding. Look at the object in process of baking from time to time, and especially at the beginning; turn it round, if necessary, in case it be heated more on one side than on the other, to prevent burning. In baking meat and fish, keep the bottom of the pan covered with broth or water, and place a piece of buttered paper over the object in the pan. It not only prevents it from burning, but acts as a self-basting operation, and keeps the top moist and juicy. If the top of a cake bakes faster than the rest, place a piece of paper on it. Regularity and attention to time are the main secrets of boiling. Less heat is requisite to keep liquids boiling in copper and iron saucepans than in those made of tin. Great waste of fuel arises from making liquids boil fast, when they only require to be kept slowly boiling. The average time for boiling fresh meat is from 18 to 20 minutes for every pound. Dried or salted fish or meats require soaking in cold water before boiling. Meat and poultry will lose their flavor and firmness if left in the water after they are done. When the meat is desired blanched, put it into cold water; gradually raise it to the boiling point; take the meat out at once; plunge it into cold water; leave it there until quite cold; then remove it and wipe dry; it is now ready to be dressed, or for further cooking. In broiling, the gridiron should always be greased first. It is better to broil before the fire than over it. To fry well, rub the meat in a small quantity of fat, butter, or oil, which has attained a proper degree of heat, instead of placing it in cold fat and letting it soak in while melting. In roasting, all dark meats, such as beef and mutton, put down to a sharp fire for at least 15 minutes, until the outside has acquired a coating of condensed gravy, and then remove back, and allow to cook gently. Lamb, veal, and pork, if young and tender, should be done at a moderate fire. Veal should even be covered with paper. Very rich meat, if covered with paper, does not require basting. Fowls, place close to the fire, to set the skin, and in about 10 minutes rub over with a small piece of butter. Meats, while roasting, dredge with flour, just at the time when the gravy begins to appear. There are a few tables that are very valuable to housekeepers, as follows: Flour, 1 lb. is 1 qt.; meal, 1 lb. and 2 oz. are 1 qt.; butter, 1 lb. is 1 qt.; powdered white sugar, 1 lb. and 1 oz. are 1 qt.; 10 eggs are 1 lb.; a common tumbler holds ½ pt.; a teacup is a gill; best brown sugar, 1 lb. 2 oz. are 1 qt.; a tablespoonful is ½ oz.; 4 teaspoonfuls equal 1 tablespoonful; 16 large tablespoonfuls of a liquid are ½ pt.; 8 large tablespoonfuls are 1 gill; 4 large tablespoonfuls are ½ gill or 1 wineglass; 1 common wineglass is ½ gill; 1 common tumbler is ½ pt.

The following is a list of the chief French and other phrases used in bills of fare and cooking, with an explanation of each :

Allemande.—The white sauce known as *veloute*, thickened with cream and whites of eggs, and seasoned with nutmeg and lemon juice.

Angelica.—A plant preserved in syrup ; used to ornament pastry, tarts, etc.

Aspic Jelly.—A transparent jelly made from meat, and used to garnish fancy dishes.

Au bleu.—Fish dressed so as to give a bluish tint.

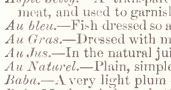
Au Gras.—Dressed with meat gravy.

Au Jus.—In the natural juice, or gravy.

Au Naturel.—Plain, simple cookery.

Baba.—A very light plum cake.

Bain-Marie.—A loose-bottomed vessel or cistern to be put on a hot hearth, or stove, and partly filled with hot water, to keep sauces, soups, etc., up to scalding heat without burning or reducing the quantity.



Bain-Marie.

Bard.—Thin slice of fat bacon to cover any meat or game where "larding" is not preferred.

Bechamel.—A French white sauce made from ham, veal, onions, and a variety of seasoning.

Beignet.—A fritter of any kind, fruit, vegetables, meats, etc., that is dripped in batter or egg and fried.

Bisque.—Is a shell-fish soup.

Blanc.—A white broth in which to boil poultry, lamb, etc., to make them look white.

Blanch.—Anything put into cold water, boiled, strained and then plunged into cold water.

Blanquettes.—Thin slices of any white meat warmed up in white sauce, and thickened with yolks of eggs.

Boudin.—An entree or side dish prepared with any kind of *quenelle* or force meat.

Bouilli.—Beef stewed and served with sauce.

Bouillon.—The common soup or broth.

Braise.—A mode of stewing in a close-covered vessel.

Brioche.—A spongy cake somewhat like Bath buns.

Calipash.—The glutinous meat of the upper shell of the turtle.

Calipee.—The glutinous meat of the lower shell of the turtle.

Caramel.—Sugar boiled until the water all evaporates, and then used for ornamental purposes.

Casserole.—A stew-pan, also a rice crust molded in form of a pie, baked and filled with *puree* or mince of game, or a *blanquette* of white meat.

Compote.—Fruit stewed and served with syrup, or stewed pigeons and small birds.

Consomme.—A strong, rich gravy used for enriching soups and gravies.

Coulis or *Cullis.*—Rich, brown gravy, made from stewing ham and veal a long time. Used to color, thicken and flavor soups and sauces.

Croquantes.—A bright colored mixture of fruit and boiled sugar.

Croquettes.—Finely flavored minces of meat, fish, foul, etc., made into plain or fanciful shapes and fried.

Croustades or Dresden Patties.—Rich paste in fancy molds and filled with mince.

Crouton.—A sippet of bread fried and used to garnish hashes, etc.

Daubes.—Meat or fowl stewed in sauce.

Dessossey.—To bone.

Papapillote.—A cutlet wrapped in oiled or buttered paper.

Entree.—Side dish for first course.

Entremet.—A corner dish for second course.

Escalopes.—Collops or round slices of meat.

Espagnol.—A brown sauce used as the foundation of many other sauces.

Faggot.—A tiny bunch of parsley, thyme, and bay leaf tied together.

Farce.—Stuffing or force meat.

Flance.—Side dishes for grand dinners.

Foncer.—Ham, veal or bacon laid at the bottom of a bake or saucepan, under meat.

Fondue.—A light and pleasant preparation of cheese.

Fricandeau.—A fancy dish of boned turkey or larded veal as an *entree.*

Fricassee.—Chickens, etc., cut in pieces in a white sauce, with truffles, mushrooms, etc., as accessories.

Fritter.—Anything incased in a covering of batter or eggs, and fried.

Galette.—A peculiar kind of French cake.

Gateau.—A cake.

Glaze or Glace.—Stock boiled down to a paste, and when needed warm in the *bain-marie*, and put on with a brush to improve the looks of braised dishes.

Godiveaux.—Various kinds of force meats.

Gratin.—*Au Gratin.*—A term applied to certain dishes prepared with sauce and baked.

Haricot.—So called from the French word for beans with which the dish was originally made. Now understood as any thick stew, or *ragout* of mutton, beef, or veal, cut in pieces, and dressed with vegetables and roots.

Jardiniere.—A mode of stewing vegetables in their own sauce.

Lardon.—The piece of bacon used for larding.

Leasen.—A mixture of egg and cream.

Lit.—A layer of anything.

Luting.—A paste to fasten the lids on pie pans ; for preserving game.

Maigre.—Dishes for fast days, made without meat.

Marinade.—A liquor to boil or stew fish or meat in.

Matelote.—A rich stew made of fish and wine.

Mayonnaise.—Cold salad dressing.

Menu.—The bill of fare.

Meringue.—Pastry made of sugar and whites of eggs beaten to a snow.

Mignonnette.—Peppercorns ground very coarse.

Miroten.—Pieces not larger than a crown piece made into a *ragout.*

Nougat.—A mixture of almonds and sugar.

Nouilles.—A kind of vermicelli.

Panada.—Soaked bread used in the preparation of French force meat.

Paner.—To use bread crumbs.

Poele.—A kind of broth in which to boil fowls. Much used in nice French cooking.

Pot-au-feu.—The stock-pot.
Profeterolles.—A kind of pastry creamed inside.
Puree.—A thick soup.
Quenelles and *Godiveaux.*—Different kinds of force meat balls.
Ragout.—A very rich sauce, or made dish.
Relevees.—The remove dishes.
Remoulade.—Salad dressing.
Rifacimento.—Meat dressed a second time.
Rissoles.—Balls of fine mince put in paste, or rolled in egg or bread crumbs, and fried, as an *entree* or garnish.
Roux.—A thickening made of butter and flour.
Salmis.—Game, hashed when half roasted. Hash differs from *salmes* by being made of well done meat.
Sauce Piquante.—An acid sauce.
Saute.—Fried; sometimes the frying-pan is called *saute.*
Seasoning.—Three bay leaves, six cloves, a blade of mace, pepper and salt.
Souffle.—The very lightest of puddings.
Stock.—Essence extracted from meat.
Tamis or *Tammy.*—A fine strainer of woolen canvas for straining soups, sauces, etc.
Timbale.—A sort of pie made in a mold.
Trifle.—A second-course dish, made of sponge cake, macaroons, jams, etc., brandy or wine, and liqueurs.
Tourte.—A kind of tart baked in shallow tins.
Turbans and *Mazarines.*—Ornamental *entrees* of forced meats and fillets of poultry, game or fish.
Veloute.—White sauce.
Vol-au-Vent.—Very light puff paste cut in fanciful shapes, the interior scooped out after baking, and filled with *ragouts* of minced sweetbreads, chicken, game or fish.

BISCUITS, CRACKERS, ETC.

ABERNETHY BISCUIT.—Take 8 lbs. flour; 1½ lb. butter; 1 qt. sweet milk; 12 oz. sugar; 1 oz. caraway seeds; 6 eggs; mix dough of the above, break in pieces of about 2 oz., mold, roll out, prick, and bake in a moderate oven.

APPLE BISCUIT. — Boil 12 fine apples until they become pulpy; take them out and rub through a hair sieve; add 2 lbs. of powdered loaf sugar, and 2 or 3 drops of oil of lemon or cloves; mix together; roll the mixture into separate masses of the size and thickness of a bun; cut them into any shape desired; then dry in a very slow oven.

BAKING POWDERS.—The very best and freshest qualities of materials only should be used, and the powder preserved in perfectly air-tight receptacles, or the strength will soon disappear. —1. Take 16 oz. corn flour and dry it well; mix with it 8 oz. of bicarbonate of soda and 5 of tartaric acid.—2. Tartaric acid, ½ lb.; bicarbonate of soda and potato farina or British arrowroot, of each ¾ lb.; dry perfectly by a very gentle heat; mix in a dry room; pass the mixture through a sieve, and at once put them into packets.

BATH BUNS.—½ oz. German yeast made into a sponge as for plain buns; ½ lb. flour; ¼ lb. butter; mix the whole lightly together with 6 yolks of eggs and a little milk; when ready, work in ¼ lb. rough broken loaf sugar; lay them out on a buttered baking sheet in the shape of a rock; put a few comfits on the top of each and bake in a sharp oven.

BREAKFAST BISCUIT.—To each qt. of flour, take 3 teaspoonfuls of yeast powder; 1 heaping tablespoonful of lard, and enough sweet milk to make the dough as soft as can be handled; salt to taste; put the yeast powder in the flour; sift it all together through a sieve; put in the lard, rubbing it in well; add the salt, then the milk or water; sprinkle the bread-board and dough with flour; work until it is smooth enough: then roll out about an inch thick, and cut with a round cake-cutter; stick with a fork; grease the dripping-pans and put them in.

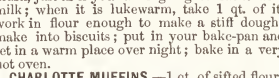
BUNS.—1 cup of milk; 1 cup of sugar; 1 cup of yeast; flour to make a batter; let it rise over night, then add ½ cup melted butter, 1 cup of sugar, flour to knead it, and let it rise again; roll and cut into cakes, and let it rise again.

BUTTER CRACKERS. — Rub 3 tablespoonfuls of butter into 1 qt. of flour; add 1 saltspoonful of salt; 2 cups of sweet milk; and ½ teaspoonful of soda dissolved in hot water; knead well for ½ hour; roll into an even sheet; cut with a wineglass; prick with a fork, and bake hard in a moderate oven; hang them up in a muslin bag in the kitchen 2 or 3 days to dry.

BUTTERMILK BISCUIT.—2 cups of good buttermilk; 1 of sour cream; 1 heaping teaspoon of soda; a pinch of salt; mix soft and roll as you like.

CENTENNIAL BISCUIT. — Make good corn mush, just as if you were going to eat it with milk; when it is lukewarm, take 1 qt. of it, work in flour enough to make a stiff dough; make into biscuits; put in your bake-pan and set in a warm place over night; bake in a very hot oven.

CHARLOTTE MUFFINS.—1 qt. of sifted flour; 3 eggs, the whites and yolks beaten separately



Muffin Pans.

until stiff; 3 cups of milk, and a little salt; mix quickly, beat well, and fill the hot irons half full.

CHEESE BISCUIT.—2 oz. of butter; 2 of flour; 2 of grated cheese; a little cayenne pepper, and salt; make into paste, and roll out very thin; cut into shape desired; bake a very light brown, and serve as hot as possible.

CHOCOLATE BISCUIT.— Mix some chocolate powder with white of eggs and powdered loaf sugar, into a paste; mold into biscuits, and bake at a gentle heat on a sheet of white paper.

CINNAMON MUFFINS.— 1 cup of sour milk; ½ cup of sugar; 1 egg; 1 tablespoonful of cinnamon; 1 tablespoonful of soda dissolved in a little hot water.

COCOANUT BISCUIT. — Break the shell of a cocoanut; remove the dark inner husk; grate the white kernel, and simmer slowly for ½ hour in 1 qt. milk; strain the milk through a towel; squeeze the grated nut to obtain all the milk; add to the milk a teaspoonful of salt, a gill of liquid yeast, or ½ oz. of compressed dough in an earthen or wooden vessel; cover with a thick towel; set in a moderately warm place to rise; when light and spongy knead for 20 minutes with flour enough to prevent sticking; make it into little biscuits; put them into a baking-pan; cover them with a towel; let them prove to rise again for 10 minutes, and then bake in moderate oven.

CORN MUFFINS.—1½ cups of corn-meal; the same of flour; 2 teaspoons of baking powder; ½ cup of sugar; ½ teaspoon of salt; small tablespoon of melted butter; 2 eggs; milk enough to make a stiff batter.

CRACKERS. — Take 1 large cupful of bread dough; roll out on the molding-board; spread on it a piece of butter and lard together, as large as a goose egg; sprinkle a little flour over it; fold it up, and pound with something heavy a long time; take a small piece at a time; roll out very thin; stamp with a clock key, and bake very quickly.

CRACKNELS.—Flour, 1 pt.; add a little grated nutmeg, the yolks of 2 eggs, 2 or 3 spoonfuls of rose-water, and cold water q. s. to make a paste; roll in ½ lb. butter, and make into desired shapes; in 1 hour put them into a kettle of boiling water, and boil until they swim; then throw them into cold water; take them out; and when dry, bake them on tins.

CREAM CRACKERS. — Rub together 14 lbs. flour and 1 lb. butter; add 1 lb. pounded sugar, 48 eggs, and flavor; mix thoroughly, and work it quite stiff and smooth; roll out quite thin; cut them with a cutter into any form; put them into boiling water and boil them till they float; remove with a skimmer and dry them on cloths; bake on clean pans without being buttered, in a warm oven.

CREAM MUFFINS.—1 qt. of sweet milk; 1 qt. of flour; 6 eggs; 1 tablespoonful butter; the same of lard; melt together; beat the eggs light, the whites and yolks separately; add the milk, with a little salt; then the shortening; lastly the flour, stirring in lightly; bake immediately in well-greased rings, half filled with batter; oven hot; send to the table at once.

CREAM OF TARTAR BISCUIT.—1 qt. of flour; 1 pt. milk; 1 teaspoonful of soda; 2 of cream of tartar; and 1 of salt; butter the size of an egg; mix the cream of tartar with the flour; rub in the butter and salt; dissolve the soda in a teaspoonful of boiling water; mix all together lightly.

CROSS BUNS.—2½ lbs. flour; ½ lb. sifted sugar; coriander seeds, cassia, and mace, of each, powdered, a sufficiency; make a paste with ½ lb. butter; dissolve in ½ pt. hot milk; work with 3 tablespoonfuls of yeast; set it before the fire for an hour to rise; make it into buns; set these before the fire on a tin for ½ hour; brush over with warm milk and bake to a nice brown in a moderate oven.

DROP BISCUIT. — 1 qt. of flour; 3 teaspoonfuls of baking powder; 1 small teaspoonful of salt; piece of butter the size of an egg, rubbed thoroughly in the flour; 1 pt. of milk; drop from a spoon in buttered pans; bake in quick oven.

EGG MUFFINS. — 2 eggs well beaten; 1 pt. of milk; 1 teaspoonful of salt; 2 tablespoonfuls of yeast and flour to make a batter; mix together; stand in a warm place over night; in the morning, stir in a tablespoonful of melted butter and ½ teaspoonful of soda dissolved in a little hot water.

ENGLISH BUNS.—½ lb. of flour; ½ lb. of butter; 4 eggs; 1 wineglass of yeast; 1 pt. of milk; 1 wineglass of brandy and rose-water mixed; a little cinnamon and nutmeg; after it is well raised, add ½ lb. of sugar, and 6 oz. of flour; bake in a moderately hot oven.

FRENCH BUNS.—1 cup of currants; 1 lb. of flour; 1 teaspoonful of baking powder and 2 tablespoonfuls of ground cinnamon; put these in a sieve; rub ½ lb. of butter to a cream; mix it with the sifted flour and add the currants; beat 3 eggs with ¾ lb. of sugar until very light; mix all together, stirring as rapidly and as little as possible; drop the mixture on buttered tins, in rough spoonfuls, an inch apart.

GINGER CRACKERS. — 1 pt. of molasses; 1 cup of sugar; 6 oz. butter; a small piece of soda dissolved in a tablespoonful of sour cream; cloves and ginger to taste; flour enough to roll out thin and cut.

GRAHAM BISCUIT. — Take 1 qt. of water or milk; butter the size of 1 egg; 3 tablespoonfuls sugar; 2 of baker's yeast; a pinch of salt; enough white flour to use up the water, making it the consistency of batter cakes; add the rest of the ingredients, and as much Graham flour as can be stirred in with a spoon; set it away till morning; in the morning grease pan and flour hands; take a lump of dough the size of a large egg; roll lightly; let them rise 20 minutes, and bake in a tolerably hot oven.

GRAHAM CRACKERS. — ½ cup butter; ½ cup sugar; 4 eggs; 1 cup of fine white flour; ½ teaspoonful soda; enough Graham flour to roll out.

GRAHAM GEMS.—To 1 qt. Graham flour add ½ pt. fine white flour; enough milk or water, a little warm, to make a thick batter; no salt or baking powder; have the oven hotter than for biscuit; let gem-pans stand in the oven till you get ready; beat batter thoroughly; grease your pans; drop in while the irons are smoking hot; bake quickly a nice brown.

GRAHAM MUFFINS. — 1 egg; a little sugar; 1 pt. sour milk; 1 teaspoonful of soda; flour enough to thicken; bake in a quick oven; 2 or 3 spoonfuls of sour cream with the milk improves them.

GRAHAM PUFFS. — 1 egg; 1 pt. sweet milk; 1 pt. Graham flour; a pinch of salt; beat the egg thoroughly; add the milk; then the flour gradually; beat the whole mixture briskly with an egg-beater; pour into cast-iron gem-pans, well greased and piping hot; bake in a very hot oven.

HOMINY MUFFINS. — Take 2 cups of fine hominy, boiled and cold; beat it smooth; stir

in 3 cups of sour milk; ½ cup of melted butter; 2 teaspoonfuls of salt, and 2 tablespoonfuls of white sugar; add 3 eggs well beaten; 1 teaspoonful of soda dissolved in hot water; 1 large cup of flour; bake quickly.

LUNCHEON BUNS.—1 lb. of flour; 6 oz. butter; ¼ lb. of sugar; 1 egg; ¼ pt. of milk; 1 dessertspoonful of baking powder; 5 drops of essence of lemon; warm the butter without oiling it; beat with a wooden spoon; stir the flour in gradually with the sugar; mix the ingredients well together; make the milk lukewarm, beat it up with the yolk of the egg and the essence of lemon, and stir these into the mixture; add the baking powder; beat the dough well for about 10 minutes; divide it into 24 pieces; put them into buttered tins or cups; bake in a brisk oven from 20 to 30 minutes.

MADEIRA BUNS.—Butter, 8 oz.; 2 eggs; flour, 1 lb.; powdered sugar, 6 oz.; ½ nutmeg; powdered ginger and caraway seeds, of each, ½ teaspoonful; work well together; add as much milk as required; ferment; lastly, bake on tins in a quick oven.

MARYLAND BEAT BISCUIT. — Rub 1 tablespoonful each of butter and lard into 1 qt. of sifted flour; with 1 teaspoonful of salt; gradually add milk enough to make a stiff dough, mixing it with the hand.

MILK BISCUIT.—Mix 1 pt. of milk with 6 oz. of butter; ½ teacupful of pulverized sugar; 1 teaspoonful of salt; 1½ teacupfuls of yeast; flour enough to make a sponge; let it stand till perfectly light; knead it into a loaf; return to the tray till it rises again; then roll out the dough; cut it into small cakes, and let stand ½ hour; bake in quick oven ¼ hour; leave them in the pans till wanted for tea, to prevent the under crust hardening.

MOTHER'S MUFFINS.—1 pt. milk; ½ cup of yeast; flour for stiff batter; small quantity of salt; 1 egg; spoonful of lard; set to rise over night.

MUSH BISCUIT. — 1 qt. of milk or water; a piece of lard the size of an egg; 1 tablespoonful of salt; put on the fire; when boiling, add sufficient corn meal to make a rather stiff mush; when milk warm, add 1 cup of yeast and sufficient flour to make into dough; work well; in the morning make up into cakes; let rise about 15 or 20 minutes; then bake.

OATMEAL CRACKERS.—1 teacupful oatmeal and enough tepid water to wet and make into dough; mix well and quick; the harder the dough the better; if it can be rolled out with the rolling-pin, begin to roll, stopping to press the ragged edges with your fingers; keep at it in the same way till it is ⅛ or ¼ inch thick; be quick or it will get too dry under your hands; make only dough enough at one time for 1 cracker; do not brown it any in baking.

OATMEAL GEMS.—Take 1 cup of oatmeal and soak it over night in 1 cup of water; in the morning add 1 cup of sour milk, 1 teaspoonful of saleratus, 1 cup of flour, a little salt; bake in irons as other gems and muffins. If on first trial you find them moist and sticky, add a little more flour, as some flour thickens more than others.

PICNIC BUNS.—8 oz. butter; 14 oz. flour; 6 oz. sifted sugar; 2 eggs; ½ a nutmeg; teaspoonful sifted ginger; large spoonful of caraway seeds; beat the butter to a cream; add the eggs, well beaten; mix the other ingredients together and work them well into the butter; add a tablespoonful of flavoring essence; bake in tin patty pans, in a moderately hot oven.

POTATO CAKES.—Equal amounts of potatoes and flour and a small piece of butter or lard; rub thoroughly together; roll out and cut as for biscuits, not too thick; bake in a rather quick oven; when done to a light brown, cut open and butter; eat warm.

QUEEN MUFFINS.—1 qt. milk; ¾ of a cup of yeast; 2 tablespoonfuls white sugar; 1 tablespoonful of lard or butter; 1 of salt; flour to make a good batter; 2 eggs; set the batter without eggs; in the morning beat the eggs very light; stir to a batter; bake in muffin rings 20 minutes in a quick oven.

RAISED MUFFINS.—1 qt. of milk; a little salt; 2 spoonfuls yeast; 2 eggs; a piece of butter, the size of an egg, melted in the milk, warmed; make in the morning and raise until night, or vice versa; eggs to be put in just before cooking; flour; bake in rings in a spider over a slow fire; split and butter before sending to table.

RICE BISCUIT.—Mix together 3 lbs. of wheat flour and 1 lb. rice flour; put this in a pan; make a hole in the middle; rub in by degrees 1 lb. 10 oz. of loaf sugar; ½ lb. butter; make the whole into a dough; ¾ pt. milk with an egg or two, dissolving first in the milk 1 oz. of volatile salt; roll out the dough into a thin sheet; cut out the biscuits with a plain round cutter; rub milk over the tops; throw them into rice flour; put them on buttered tins, so as not to touch; bake in a moderately brisk oven.

RICE MUFFINS.—Boil rice soft and dry; take ½ cup rice; stir in 3 spoonfuls sugar, piece of butter size of an egg, and a little salt; 1 pt. sweet milk; 1 cup yeast; 2 qts. flour; let it rise all night; if sour in the morning, add a little soda dissolved in milk; bake in muffin rings.

ROCK BISCUIT.—6 eggs; 1 lb. of sifted sugar; ½ lb. of flour; a few currants; break the eggs into a basin; beat them well until very light; add the pounded sugar; when this is well mixed with the eggs gradually dredge in the flour, and add the currants; mix all well together; put the dough with a fork on the tins, making it look as rough as possible; bake the cakes in a moderate oven, from 20 minutes to ½ hour; when done allow them to get cool; store them away in a tin canister, in a dry place.

SAFFRON BUNS.—Make a sponge of best white flour, sweet baker's or brewer's yeast and warm sweetened milk, over night; simmer, according to quantity, saffron threads in new milk, sweetened to taste, till all the color is extracted; let it cool to blood heat; add ¼ lb. or ½ lb. of oiled butter; work up to a light spongy consistency with the yeast and flour; let it rise again; work on a warm board into small round buns; set them either in a tin with hollows for each or on a common baking tin; cover with warm cloths; let them rise again; bake in a moderately quick oven for 20 or 30 minutes; when half

baked wash over with warm milk and sprinkle with crystal sugar on top, if desired; enough saffron should be used to make the buns a deep yellow color when broken.

SALLIE'S BISCUIT.—3 good-sized potatoes boiled and mashed fine; 1 tablespoonful sugar; ½ pt. boiling water; when cool add 1 cup yeast, let it rise till light; then add 1 qt. water and flour to knead; knead ½ an hour; set it to rise light again before baking.

SALLY LUNN.—1 scant qt. flour; 4 eggs; 1 teacupful milk; 1 teacupful lard and butter mixed; 1 teaspoonful cream tartar; ½ teaspoonful soda, dissolved in hot water; 1 of salt; beat the eggs very light, yolks and whites separately; melt the shortening; sift the cream tartar into the flour; add the whites.

SCOTCH BISCUITS.—1 pt. soft yeast; 1 qt. lukewarm water; 1 teacupful of shortening, lard and butter; 2 teacupfuls of brown sugar; 1 lb. dry currants; 1 lb. raisins—cut in two; ¼ lb. citron; take 6 eggs, beat them and put in allspice, cloves and nutmeg, according to taste; mix sugar and butter first; add eggs and fruit; then add yeast, water and flour; mold out into 3 long loaves; set to rise about 4 hours; bake in an ordinary heated oven about 1 hour.

SEED BUNS.—2 lbs. of flour; 8 oz. of dripping; 6 oz. sugar; 1 oz. caraway seeds; 1½ teaspoonfuls of yeast; as these should rise quickly, mix as for other yeast cakes; when risen, roll out very lightly on a well floured board; cut with a tumbler; bake quickly in a hot oven.

SNOWFLAKE BISCUIT.—Rub butter the size of an egg into a quart of flour; sift a teaspoonful of salt and 2 teaspoonfuls of sea-foam through the flour; whip 2 cups of milk for a minute with a cupful of new-fallen snow; stir it into the flour; let the dough be as soft as you can handle; roll out thin; cut out with a small cake cutter; bake in a quick oven.

SODA BISCUIT.—½ cup of shortening rubbed in the flour; 1 pt. of sour milk; 1 even teaspoonful of soda and half as much salt; mix very soft and bake in a quick oven.

SODA CRACKERS.—5 small cups of flour; 2 small cups of corn-starch; two teaspoonfuls of salt; 5 teaspoonfuls of cream tartar; pass through the sieve 3 times; chop 2 tablespoonfuls of firm lard in the flour; dissolve 2 scant teaspoonfuls of soda in 2 tablespoonfuls of warm water; add about a pint of milk; stir into the flour and mix to a smooth dough; roll out thin; cut into squares; rub the surface with sweet milk; bake in a very moderate oven; do not brown.

SPANISH BUNS.—1 pt. of flour; 1 pt. sugar; 1 cup sweet milk; 1 cup butter; 4 eggs, beat separately; 1 tablespoon cinnamon; 1 teaspoon cloves; 1 teaspoon soda; 2 teaspoons cream tartar, or 3 spoons baking powder; bake on tins when taken from the oven; sprinkle with white sugar while hot.

SPONGE BISCUIT.—Stir into a pint of lukewarm milk ½ teacup of melted butter, 1 teaspoonful of salt, ½ teacup of family, or 1 tablespoonful of brewer's yeast; add flour till it is a very stiff batter; when light, drop this mixture by the large spoonful on to flat buttered tins, several inches apart; let them remain a few minutes before baking; bake them in quick oven till they are a light brown.

SWEET BISCUIT.—Rub 4 oz. of butter into 8 oz. of flour; add 6 oz. of ground loaf sugar; the yolks of 2 eggs, the white of 1; roll the paste thin; cut it with a wineglass or cutter; egg over the top of each with the remaining white; sift on sugar; bake in a moderate oven.

TEA BISCUIT.—Soften ½ cupful of lard or butter in a bowl; add 1 qt. of flour with 2 full teaspoonfuls of baking powder sifted in it; mix into a middling light dough, with about ½ of a pint of milk with 1 teaspoonful of salt dissolved in it; when mixed turn out on the board; knead a little; roll in a sheet ½ in. thick; cut them out with a plain round cutter; place them close together in a quick oven and bake.

WASHINGTON BISCUIT.—1 lb. flour, the yolk of 1 egg, some milk; make into a stiff paste; knead till smooth; roll thin; cut into biscuits; bake in a slow oven till dry and crisp.

WHITE BISCUIT.—Put as much sweet milk into your stirring dish as you wish to use; scatter in white flour; stir at the same time as for mush, until as stiff as can be stirred with a spoon; knead until smooth; roll ½ in. in thickness; cut into small cakes; prick with a fork; bake in a quick oven.

WINE BISCUIT.—Rub into 1 lb. of dry flour 4 oz. butter, 4 oz. white powdered sugar, 1 egg, and 1 spoonful or 2 of cream to make it into a paste; when mixed, put currants into ½ and caraway into the rest; cut and bake in tins.

BREAD.

REMARKS.—The most nutritious bread is made from wheat flour; but there are many things necessary to the production of a really good loaf of bread, besides good flour. We must have good yeast, which has been kept at a proper temperature. We must arrest the first stage of fermentation at the right time, and remember to knead the loaf well. All of these precautions will be of no avail if the oven is not properly heated when the bread is first put in; and this heat must be maintained throughout the whole process of baking. Care should be taken to adapt the loaves to the size of the oven. The flour must be sifted before using. When taken out of the oven hot, never set flat on a table. Take it out of the tins and wrap in clean linen, and set on end till cool. If it has a thick hard crust, first wrap in a wet cloth, then a dry one over it, and let it sweat until it becomes soft. Hot bread is not very healthy, yet it is sometimes eaten. It should then be cut with a hot knife and laid on a napkin. It is well to remember that 14 lbs of American flour will make 21½ lbs. of bread, and thus save some waste of flour by a wrong calculation.

ÆRATED.—Divide 3 lbs. flour into two por-

tions; mix up the first with water holding in solution 2 oz. bicarbonate of soda; then mix the second portion of flour with water, to which 1 oz. of muriatic acid has been added; knead each mass of the dough thoroughly; when done, mix both portions together as rapidly and perfectly as possible; form the mass into loaves and bake immediately.

APPLE.—Prepare a dough exactly as if for rusks; when very light, roll out a cake about ½ in. thick; spread stewed apples over it, and over that place another cake of dough; put it into a pan to lighten for a short time; bake; have some thin slices of apples stewed very tender, and when the bread is baked lay these slices of apples all over the top; sprinkle well with sugar, some small bits of butter, and either nutmeg or cinnamon; put it back in the oven long enough for the sugar to form a coating on the top; take it out, and, when cold, slice it nicely for tea.

BOSTON BROWN. — Sift together ½ pt. of flour, 1 pt. corn meal, ½ pt. rye flour, 1 teaspoonful salt, 1 tablespoonful brown sugar, 2 teaspoonfuls baking powder; peel, wash, and boil 2 mealy potatoes; rub them through the sieve, diluting with ½ pt. of water; when quite cold, use it to make a batter and pour it into a well-greased mold, having a cover; place it in a saucepan of boiling water; simmer 1 hour without the water getting into it; take it out of the water; remove the cover, and bake about 30 minutes.

BREAD. TO MAKE.—To 1 qt. of milk or water, put ⅛ of a teacupful of yeast; add flour to the thickness of batter, and let it rise over night; then add flour enough to knead softly until it will not cling to the board; let it rise in the pan; make into small loaves; let it rise again; bake in a moderate oven; be sure not to let it stand in the oven after it is done.

BROWN.—1. 1 qt. of rye; 2 qts. of Indian meal, scalded; ½ teacup of molasses; 2 teaspoonfuls of salt; 1 teaspoonful of saleratus; 1 teacup of home-brewed yeast, or half as much distillery yeast; make it as stiff as can be stirred with a spoon with warm water; let it raise from night till morning; put it in a large, deep pan, and smooth the top with the hand dipped in cold water; let it stand awhile; bake 5 or 6 hours. —2. Set a sponge with wheat flour; after the sponge has raised well, mix the dough with rye flour; work well; after the dough has raised well mold it into loaves, and raise again; bake on an oven bottom; when almost done take the loaves out of the oven; wash them on top with a little brown sugar and water; then set them back to finish baking.

BUCKWHEAT MEAL.—To 2 qts. of sifted buckwheat meal, add hot water enough to wet the same; when cool, add 1 teaspoonful or more of salt, ½ pt. of yeast, and ½ teaspoonful of molasses; then add wheat flour enough to make into loaves; knead well; when risen light, bake or steam 3 or more hours. If this should get sour while rising, add 1 teaspoonful of sugar and a little saleratus, dissolved in water.

BUTTERMILK.—2 qts. of buttermilk, come to a boil; pour over 2 qts. of flour; stir rapidly; add cold water until it is as thin as it can be stirred; if not cool enough for the yeast by this time, set in a water pail, stirring it all the while; stir in the yeast which is already soaked; empty all in the bread-pan, where the flour is already warmed, with a hole in the middle; cover it tight; set it where it will keep warm all night.

COCOANUT. — To 1½ pts. of Graham flour and 3 tablespoonfuls of cocoanut, add ½ pt. of cold water; mix well; knead on a board until little flour is left on it; make into rolls; bake from 30 to 40 minutes in a moderate oven; when quite cold cut and serve in thin slices.

CORN.—1. Take 1 pt. corn meal; ½ pt. wheat flour; 1 tablespoonful butter; 1 teaspoon of sugar; ½ teaspoonful of cream of tartar; 1 pt. of milk; 2 eggs; stir well together; bake ½ hour. —2. Mix 2 qts. of new corn meal with 3 pts. of warm water; add 1 tablespoonful of salt, 2 tablespoonfuls of sugar, and 1 large tablespoonful of hop yeast; let it stand in a warm place 5 hours to rise; add 1½ teacupfuls of wheat flour and ½ pt. of warm water; let it rise again 1½ hours; pour into a pan well greased with sweet lard, and let it rise a few minutes; bake in a moderately hot oven 1½ hours.

CORN ROLLS.—1 qt. of milk; 1 pt. of wheat flour; ½ pt. of corn meal; 1 oz. of butter; 1 teaspoonful of salt; 1 teaspoonful of soda dissolved in 2 teaspoonfuls of the milk; 2 teaspoonfuls of cream of tartar sifted with the flour; 2 eggs, the whites beaten stiff; scald 1 pt. of milk over boiling water; add the butter, salt, and the meal; mix smooth in a little of the cold milk; stir and let it cook until like thick mush; stir in the cold milk and the yolks of the eggs well beaten; then the flour, soda, and the whites of the eggs gently; bake in gem-pans in a quick oven.

CORN STARCH.—Set a sponge in the usual manner with flour; let it rise; add sufficient water to make the amount of dough required; add a pinch of salt; make the dough the required stiffness by adding equal quantities of flour and corn starch; proceed in all respects as for ordinary bread.

CRUSHED WHEAT ROLLS. — Work Graham flour into cold crushed wheat mush, so soft that you can barely roll it out 1 in. thick; do not knead it much; cut it into small shapes with a knife; bake quickly in a hot oven.

FRENCH.—Put 1 pt. of milk into 3 qts. of water; in winter, let it be scalding hot, but in summer little more than milk warm; put in sufficient salt; take 1½ pts. of good ale yeast, free from bitterness; lay it in 1 gal. of water the night before; pour off the yeast into the milk and water; then break in rather more than ¼ lb. of butter; work it well till dissolved; beat up 2 eggs in a basin; stir them in; mix about 1½ pecks of flour with the liquor; in winter make the dough pretty stiff, but more slack in summer; mix well, and the less it is worked the better; stir the liquor into flour as for pie crust, and after the dough is made over cover it with a cloth; let it rise while the oven is heating; when the rolls or loaves have lain in a quick oven about ¼ hour, turn them on the

other side for ¼ hour longer; take them out and chip them with a knife, which will make them look spongy and of a fine yellow.

FRENCH ROLLS.—1 lb. of flour, 2 ozs. of butter; the whites of 3 eggs well beaten; rub these together; add a tablespoonful of good yeast; a little salt; milk enough to make a stiff dough; cover; set in a warm place till light, which will be an hour or more, according to the strength of the yeast; cut into rolls; dip the edges into melted butter to keep them from sticking together; bake in a quick oven.

GERMAN YEAST.—Time, 1½ to 2 hours. 1 lb. flour; 1 tablespoonful of salt; 2 oz. of dried German yeast; 1 cupful of water; 1½ pts. of warm water; dissolve the yeast in a small cupful of cold water; add to it 1½ pts. of warm water; put the flour, mixed with the salt, into a broad, deep pan; make a hole in the middle of the flour, and pour in the water and yeast; knead it up quickly; let it stand near the fire; cover over with a thick cloth for 1 hour; then divide into loaves; bake accordi g to their size.

GRAHAM.—Make a sponge as for white bread with wheat flour, 1 square of compressed yeast to 2 qts. of water; when light, make up the dough with Graham flour and ½ teacupful of molasses; let stand to rise again; make up the loaves with the hands; when light, bake.

HOE CAKE.—Scald 1 qt. of corn meal with just hot water enough to make a thick batter; stir in 2 large spoonfuls of good butter; beat this a little; add ½ teaspoonful of salt; bake in buttered pans ¾ hour; serve hot.

HOMINY.—A large cup of cold boiled rice or hominy; as much Indian corn meal; the same of flour and milk, to make thick batter; beat in 3 eggs; 1 teaspoonful of salt and 1 dessertspoonful of sugar; stir in 1 tablespoonful of butter melted; bake in a shallow tin pan in a hot oven; cut it out in squares, and serve hot on a napkin.

HOUSEHOLD.—Remove the flake-bran from flour, 14 lbs.; boil the bran in 1 gal. of water until reduced to 7 pts.; strain, cool, and knead in the flour; add salt and yeast as for other bread.

LEAVENED.—Use leaven instead of yeast, and proceed in the same way; 1 lb. to each 32 lbs. of flour,

MILK YEAST.—Take 1 cupful of milk; add hot water to warm the milk; mix sifted flour to make a thin sponge; let stand over night in a warm place; in the morning add ½ cupful of butter, and flour to sufficiently stiffen for bread; knead thoroughly; fill pans ½ full; in a warm place allow the loaves to rise to the top of the pans; bake in a steady oven, not too hot, 1 hour.

NAPLES.—1 lb. of flour; rub into it 1 oz. of fresh butter, 1 egg, 2 spoonfuls of good yeast, a little salt, ½ pt. of milk; mix all well; let it rise 1 hour; do not work it down, but cut it in pieces the size of your thumb; bake on tins in a quick oven.

POCKET BOOKS.—A lump of dough about as large as a quart bowl; 2 eggs beaten light; 1 tablespoonful of lard, and flour enough to make it as stiff as the dough; work it well; about an hour before baking spread it out thin on the bread-board and sprinkle on a very little soda and a dessertspoonful of white sugar; work well again; roll out thin, and grease the surface with butter; cut them out a little larger than biscuits and double over; put in pans and let them rise again; bake quickly.

POTATO.—Boil 8 large potatoes in salted water; when soft, peel off their skins and mash them thoroughly, either on the molding or the bread-board, with a rolling-pin, or put in the pot over the fire, in which they were boiled, and mash fine with a potato-masher; put the potatoes into the pan; add enough Graham or wheat flour to make it into a thick dough; turn in a cupful of hot water or milk; when cool enough, stir in a cupful of home-made yeast, or 3 tablespoonfuls of baker's yeast; add a teaspoonful of salt and set in a warm place to rise; when risen, knead the whole mass thoroughly; when it has risen again very lightly, knead only enough to put into well-greased pans; let it rise 20 minutes; bake in a moderately hot oven.

POTATO ROLLS.—Boil 4 good sized potatoes with their skins on; squeeze them in a towel to have them dry and mealy; then remove the skin and mash them perfectly smooth with a spoonful of butter and a little salt; beat the yolks of 3 eggs; stir into the potatoes; then add 1½ pts. milk, and a large spoonful of yeast; beat in the flour until it is a stiff dough; set to rise, and when risen, bake in a quick oven.

PULLED.—Take from the oven an ordinary loaf of bread when it is about half baked; with the fingers, while it is yet hot, pull it apart in egg-sized pieces of irregular shape; throw them upon tins; bake them in a slow oven to a rich brown color.

RICE.—Boil ½ lb. of rice in 3 pts. of water till the whole becomes thick and pulpy; with this and yeast, and 6 lbs. of flour, make your dough.

RUSKS.—In cold weather, to make up 2½ qts. of flour, mix into a paste with 1 pt. of boiling water; 2 tablespoonfuls of sugar; 3 of flour; and 2 large Irish potatoes boiled and mashed smooth; in the evening make up dough with this sponge; add 3 well-beaten eggs; ¾ lb. sugar; ½ pt. fresh milk; set it away in a covered vessel, leaving plenty of room to swell; next morning work into the risen dough, which should not be stiff, ½ lb. of butter and lard mixed; make into rolls or biscuits; let the dough rise for the second time; flavor with 2 grated nutmegs or ½ oz. of pounded stick cinnamon; when very light, bake in a quick, steady oven till of a pretty brown color; glaze with the yolk of an egg, and sprinkle with powdered white sugar.

SALT RISING.—Take 2 or 3 pts. of new milk; stir in flour until it is of sufficient thickness; set in a dish containing water nearly as hot as you can bear your hand in; keep it as near the same temperature as possible; in 6 or 7 hours it will be up, unless the flour is too fine; if it is, add a little Graham or corn meal; have your flour and some warm milk ready; put in the sponge and as much of the milk as is necessary to make the dough sufficiently thin; make in loaves and set

in a warm place to rise; when sufficiently light, bake, and you will have as good and light bread as you ever tasted.

SWEET POTATO PONE.—Take 12 or 15 nice sweet potatoes; boil until well done; peel, mash and rub through a sieve to get out all strings or tough fibres; add sugar to taste; ½ doz. eggs; butter to make it very rich; ground cloves, nutmeg and sweet milk enough to make it the consistency of custard; pour the mixture in a buttered pan, and bake.

TEA ROLLS.—To 1 qt. of flour take 1 tablespoonful of lard; 1 cup of milk; 1 teaspoonful of salt; 4 even teaspoonfuls of good baking powder; rub the lard into the flour in which the baking powder has been sifted, together with the salt; add the milk; mix lightly; roll out and cut with a large round mold; turn 1 half over to the other; glaze with milk and bake in a mediumly hot oven for 20 minutes.

UNFERMENTED.—To each lb. of flour add, separately, 1½ dr. of bicarbonate of soda, and 1 dr. of tartaric acid (both perfectly dry, and in very fine powder); rub them well together with the hands until thoroughly incorporated; form the whole into a dough with water, as quickly as possible, and at once bake in a quick oven. About 8 or 9 oz. of water are required for every lb. of flour.

VIENNA.—2 lbs. sifted flour banked around pan; ½ pt. milk; ½ pt. water; mix a thin batter; quickly add ½ pt. milk, in which has been dissolved ½ oz. salt and ½ oz. compressed yeast; leave remainder of flour against side of pan; cover and keep free from air 45 minutes; mix in rest of the flour until dough leaves side and bottom of pan; let stand for 2½ hours; divide into 1 lb. pieces; subdivide into 12 pieces; fold corner of each piece to centre; turn over to rise for 30 min.; put in hot oven; bake in 20 min.

VIENNA ROLLS.—Have ready in a bowl 1 tablespoonful of butter or lard; make it soft by warming a little and stirring around with a spoon; take 1 qt. unsifted flour; add to it 2 heaping tablespoonfuls baking powder; mix and sift them thoroughly together; place in the bowl with the butter; take more or less sweet milk, to form a dough of usual stiffness, according to the flour; put into the milk ½ teaspoonful salt; stir it into the flour, etc., with a spoon; turn out on a board and knead sufficiently to make smooth; roll out ½ in. thick and cut with a large round cutter; fold each one over to form a half-round, wetting a little between the folds to make them stick together; place them on buttered pans so as not to touch; wash them on top with milk to give them a gloss; then bake immediately in a hot oven about 20 min.

WATER RISING.—Take 1 qt. pitcher and a spoon; scald them; fill the pitcher ½ full of boiling water; cool to the temperature of good hot dish water; stir in flour to make a batter as thick as flour pancakes; ½ teaspoonful of salt and as much soda; cover closely; set where it will keep quite warm; stir occasionally; it will raise in 5 or 6 hours.

YEAST.—1. Pare and boil 1 doz. mealy potatoes; boil 30 minutes; when boiling, put in another kettle 1 handful of loose hops or 2 tablespoonfuls of pressed hops, and 3 qts. cold water; cover and let boil; when the potatoes are cooked, drain off all the water and mash very fine; strain the boiling hop water into the mashed potatoes; stir well and add ½ cup of sugar, ½ cup of salt, and 1 pt. of flour; when the salt, sugar and flour are mixed, stir well and strain through a colander; let it stand until blood warm; stir in 1 cup or cake of yeast; set to rise in a temperature of 75°; keep in a stone jar or pot with a tight cover, which should be firmly fastened.—2. Take 12 common sized potatoes; boil soft and mash hot; pour over 1 pt. boiling water; add 1 pt. cold water; strain through a colander; add 1 teacup sugar, 1 tablespoon salt; when cool add 1 teacup baker's yeast; set in a warm place; allow it to rise light several times and beat down; place in a glass jar, cover tightly, and set in a cool place. ½ a teacupful of this is sufficient for 2 ordinary sized loaves of bread.—3. Take 3 handfuls of peach leaves and 3 medium-sized potatoes; boil them in 2 qts. of water until the potatoes are done; take out the leaves and throw them away; peel the potatoes; rub them up with 1 pint of flour, adding cool water sufficient to make a paste; pour on the hot peach leaf tea and scald for about 5 minutes. If you add to this a little old yeast, it will be ready for use in 3 hours; if you add none, it will require to stand a day and a night before use.—4. To a pint of new milk put 1 teaspoonful of salt on a large spoonful of flour; stir well and keep it lukewarm by the fire; in an hour it will be fit for use. Twice as much must be used as of common yeast. If sour, put in saleratus—a teaspoonful to 1 pt. of yeast, when ready for use. If it foams up lively, it will raise the bread; if not, throw it away.—5 (*Vienna.*) Powder and mix Indian corn, barley and rye; then macerate in hot water; rack off the liquor and allow it to clear, when saccharification takes place; add a minute quantity of ordinary yeast; remove the scum which rises and compress in a hydraulic press, when drained.

CAKES.

ADJUNCTS TO CAKE MAKING.—Get every article ready previously to its being wanted, and place before the fire, that it may become gently heated. Have a good sized bowl, a strong wooden spoon, a good egg beater, fine sifted flour, fresh eggs, the sweetest of butter, powdered sugar, and flavoring. A wooden spoon is useless without an untiring arm to wield it; and the finest of flour, the best of butter, the freshest of eggs will avail nothing unless properly mixed. Thoroughly dry and warm the flour; wash currants in a hair sieve; wipe dry in a cloth; then set before the fire; before using them, dust them over with a little flour. Rub the sugar to a fine powder and pass through the sieve. Beat the eggs well in a basin. The butter should be perfectly sweet and free from buttermilk. Beat the butter and sugar thoroughly

together. To melt the butter, place it in a basin set in hot water. If sour milk or buttermilk is used in making cake, place it in the oven as soon as put together, unless, like hard ginger-bread or cookies, it needs to be rolled out or molded. In that case it is not injured if it stands for some hours. If soda and cream of tartar are used, sift the latter with the flour. The soda should be dissolved in cool water or milk. After buttering the cake tins scatter a little flour over them, and the cake will not stick to the tin. If the oven is likely to bake hard at the bottom, put a paper in the bottom of the tin. Butter it well first.

Egg Beater.

ABERFRAW.—$\frac{3}{4}$ lb. of butter; $\frac{1}{4}$ lb. of loaf sugar; 1 lb. flour; add the butter by degrees and work with the hand; roll out and cut with a glass.

ALMOND.—1 lb. of butter; 1 lb. of sugar; 1 lb. flour; 2 lbs. of sweet almonds blanched and pounded; $\frac{1}{2}$ lb. desiccated cocoanut; the juice and grated rind of 1 large lemon; 10 well beaten eggs; 1 gill of wine or brandy.—2. 1 lb. of ground almonds; add 2 lbs. of powdered sugar; the whites of 9 eggs; beat the mixture well with a wooden spoon for 10 minutes; lay it out upon wafer-paper, in oven shapes, with a tablespoon; bake them in a slow oven; when done, break off all the paper but what sticks to the bottom of the cakes.

ALMOND COOKIES.—2 lbs. of butter; 3 lbs. of sugar; 1 lb. of almonds blanched and chopped, cut in halves or pounded; 2 teaspoonfuls of cinnamon; 1 teaspoonful saleratus; 1 cup of boiling water; 1 lemon; 1 doz. eggs; knead the flour enough to make the dough as stiff as cooky dough should be; roll and cut in fancy shapes, and after they are in the tins sprinkle the almonds thickly over them.

ALMOND DROPS.—Take 9 oz. flour; 6 oz. sugar; $\frac{1}{2}$ lb. butter; 4 eggs; 2 teaspoonfuls of baking powder; stir butter and sugar first; rub the powder into the flour; add the rest; pour into square tin pans, filling them about $\frac{1}{2}$ in.; strew cinnamon, sugar and sliced almonds over it; scald the almonds first; bake a light brown, and when done, cut into squares.

ALMOND SPONGE.—10 eggs; 1 lb. of sugar; $\frac{1}{2}$ lb. of flour; a few drops of lemon; when ingredients are well beaten, add $\frac{1}{2}$ lb. sweet almonds, blanched and pounded in a white mortar or stout bowl. (To blanch pour boiling water upon them.) Add a little peach extract, and bake in a brisk oven.

AMMONIA.—1 cupful butter; 2 of sugar; 3 of flour; $\frac{1}{2}$ pt. of cream, a piece of ammonia the size of a small hickory nut; 1 lb. of fruit; 3 eggs, reserving the white of 1. This cake should not be cut for 2 weeks.

ANGEL FOOD.—Beat the whites of 11 eggs to a stiff froth; sift into these, a little at a time, 10 oz. powdered sugar; mix carefully and lightly; sift 5 oz. of flour 4 times; add a level teaspoonful of cream of tartar to the flour; sift again; then sift it into the eggs and sugar, a little at a time; mix carefully and lightly; when all the flour is used, add a teaspoonful of vanilla essence to the cake; put it into a new cake pan without buttering or lining the latter; bake in a moderate oven about $\frac{3}{4}$ of an hour, testing the cake with a broom straw; let the cake cool gradually at the mouth of the oven with the door open; when cold, loosen around the edges and turn out.

ANISEED.—1 lb. 2 oz. of powdered sugar; 1 lb. of flour; 5 eggs; 2 oz. aniseed; beat up the sugar and 3 eggs in a bowl; add the other 2 eggs; after being well beaten, mix in half the flour and aniseed; take it out of the bowl and mix it on the table with the rest of the flour; have a wooden mold with figures on it, cut in to the depth of an inch; press the mixture in it and cut off all that rises over the mold; cut each figure separate and place them on a waxed cake-pan; let them dry in a warm room for 4 or 5 hours; cook in a slow oven.

APPLE FRUIT.—Soak 2 cups dried apples over night; in the morning drain and chop fine in a chopping-bowl; add 1 cup of molasses; let it boil slowly on back of stove 3 or 4 hours, until the molasses has thickened; let it cool; add 1½ cups of brown sugar, 1 cup of sour milk, 1 teaspoonful each of cloves, allspice and cinnamon, 1 teaspoonful soda, 3 eggs, 3½ cups of flour; add raisins and currants, if desired; stir the flour well in the last thing; bake in 2 square tins or 1 large 5 qt. basin; if in the latter, bake slowly 2½ hours.

APPLE SHORT-CAKE.—1. Fill a square breadtin $\frac{3}{4}$ full of sliced sour apples; make a thick batter of $\frac{1}{2}$ cupful of sour cream, $\frac{1}{2}$ cupful of buttermilk, 1 teaspoonful of saleratus, a little salt and flour to make quite stiff—a little stiffer than cake; turn this over the apples; bake 40 minutes; serve with sauce, or cream and sugar flavored with nutmeg.—2. Season apple sauce with butter, sugar, and nutmeg; make a nice shortcake; open, butter and spread with applesauce; serve with sweetened cream.

AUSTIN.—3 cups sugar; 1 cup butter; 5 cups flour; 1½ cups milk or water; 1½ cups chopped raisins; 2 eggs; 2 tablespoonfuls molasses; 1 teaspoonful soda dissolved in water; salt and spice.

BACHELOR'S BUTTON.—Rub 2 oz. of butter into 5 oz. of flour; add 5 oz. of white sugar; beat 1 egg with ½ the sugar; put into the other ingredients; add almond flavoring according to taste; roll them in the hand about the size of a large nut; sprinkle them with lump sugar; place them on tins, with buttered paper; bake lightly.

BANBURY.—Mix well together 1 lb. of currants; ¼ lb. finely minced kidney suet; 2 oz. each of candied orange and citron shred small; a few grains of salt; a full ½ oz. of powdered cinnamon and nutmeg; 4 oz. of macaroons, or sponge-cake, reduced to powder and moistened with a tablespoonful of milk; make a paste of $\frac{3}{4}$ lb. of butter to 1 lb. of flour; mold very smooth; roll out into thin squares; spread the mixture upon one; cover with a second; mark with the back of a knife in regular divisions;

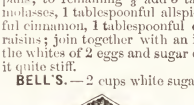
bake very light brown; sift sugar over them.

BANNOCK. — Into 1 pt. of Indian meal stir 1 pt. of buttermilk; ½ teaspoonful of salt; 1 teaspoonful of molasses; 1 of butter; and add 2 well-beaten eggs; 1 pt. of wheat flour; thin with milk to a thin batter; last, stir in 2 large teaspoonfuls of soda dissolved in hot water; pour into buttered shallow pans; bake 1 hour in a quick oven which bakes top and bottom brown.

BATH.—Mix well together 1 lb. of flour; ½ lb. of butter; 5 eggs and a cupful of yeast; set the whole before the fire to rise; after it rises, add ½ lb. white sugar; 1 oz. caraway seeds well mixed in; roll the paste into little cakes; bake on tins.

BEEFSTEAK.—2 cupfuls sugar; ½ cupful butter; 1 cupful milk; 3½ cupfuls sifted flour; 3 eggs; 1 teaspoonful soda; 2 teaspoonfuls cream of tartar; divide into 3 equal parts; put ⅔ in 2 pans; to remaining ⅓ add 3 tablespoonfuls of molasses, 1 tablespoonful allspice, 1 tablespoonful cinnamon, 1 tablespoonful cloves, 1 cupful raisins; join together with an icing made with the whites of 2 eggs and sugar enough to make it quite stiff.

BELL'S.—2 cups white sugar; ½ lb. butter; 5 eggs; 3 cups flour; 1 teacup sweet milk; 2 teaspoons baking powder; 2 teaspoons vanilla; 1 lb. currants; ½ lb. citron; bake 2 hrs. in a slow oven; beat the butter and sugar together; then add the other ingredients; bake in small cake-pans of different shapes.



Diamond Cake Cutter.

BLACK.— 3 cupfuls of butter; 1 qt. of sugar; 3 pts. of flour; ½ pt. of molasses; ½ pt. of brandy; ½ pt. of wine; 1 teaspoonful of saleratus; 1 oz. each of all kinds of spices; 12 eggs, 3 lbs. of raisins; 2 of currants; ½ lb. of citron; bake in deep pans, in a moderate oven, between 3 and 4 hours; this is one of the best rich cakes.

BLACK CHOCOLATE.—1 cup butter; 2 cups sugar; 2½ cups flour; 5 eggs; 1 cup sour milk; 1 teaspoon soda, dissolved in a little boiling water; ½ cake Baker's chocolate, grated and put in the cake before stirring in the flour; bake in jelly tins in 4 layers. *Filling*: 1 lb. white sugar wet with a little cold water; add the whites of 3 eggs slightly beaten; ½ cake grated chocolate; cook in boiling water until it thickens; flavor with vanilla; spread between the layers and out-side the cake; sprinkle grated cocoanut over the top.

BOSTON.—1 cup of sugar; 1 cup of milk; 1 teaspoonful of butter; 1 egg; 2½ cups of flour; 2 teaspoonfuls of cream tartar; 1 teaspoonful of soda; flavor with nutmeg or lemon.

BOSTON COOKIES. — 2 cups sugar; 1 cup butter; 1 cup milk; 1 egg, and the yolk of another; ⅓ teaspoonful of saleratus, and 1 teaspoonful of cream tartar; mix stiff; roll thin; rub the white of 1 egg on the top; sprinkle on a little sugar.

BREAKFAST.—1½ cups of light bread dough; 2 ditto of white sugar; ½ teacup butter; 3 eggs; ½ teaspoon soda; 1 teacup stoned raisins; cloves, cinnamon or nutmeg to taste; rub the raisins in flour; stir the butter with the hand; if not thick enough, add a small bit of flour; put a layer of the batter in deep scalloped or plain cake pan; then a layer of raisins; and so on, until all the batter is in the dish; place in a warm place for 2 hours; then bake.

Scalloped Cake Pan.

BRIDAL SPONGE.—12 eggs; their weight in granulated sugar and the same of flour; beat the yolks of the eggs, and the sugar well together; beat the whites to a stiff froth; sift the flour very lightly; add a teaspoonful of the beaten white of egg and 1 of flour alternately till all is used; add the grated rind and juice of a lemon; put a well greased paper in a tin baking pan; bake the cake in a very hot oven; if it is getting too brown on top, cover with a piece of letter paper.

BRIDE'S.—1. Wash 2½ lbs. of fresh butter in plain water first, then in rose water; beat the butter to a cream; beat 20 eggs, yolks and whites separately, for 30 minutes; have ready 2½ lbs. of the finest flour, well dried and kept hot; 1½ lbs. of pounded sugar, sifted; 1 oz. of spice in fine powder; 3 lbs. of currants nicely cleaned and dry; ½ lb. of almonds, blanched; ¾ lbs. of sweetmeats, cut, not too thin; keep all by the fire; mix all the dry ingredients; pour the eggs strained into the butter; beat the whites of the eggs to a strong froth; mix ½ pt. sweet wine with the same quantity of brandy; pour it into the butter and eggs; mix well; put all the dry things in by degrees; beat very thoroughly; have ½ lb. of stone jar raisins chopped

Bride Cake.

as fine as possible; mix them carefully so that there shall be no lumps; add 1 teacupful of orange-flower water; beat the ingredients together a full hour at least; butter a hoop well; take a white paper, doubled and buttered; put in the pan round the edge; do not fill it more than 3 parts with batter, as space should be allowed for rising; bake in a quick oven 5 hours; cover it with icing, ornamenting it according to fancy. — 2 eggs; 1 lb. dark sugar; ¾ lb. butter; 1 lb. flour; 4 lbs. currants; 3 lbs. raisins; 2 tablespoonfuls mace; 2 nutmegs; 2 tablespoonfuls cinnamon; a little less of cloves; 1 lb. citron, cut in slices (pour ½ the brandy over it, and let it stand while making the cake); 1 gill of brandy; stir the butter and sugar well together; add the spices; then the yolks of the eggs well beaten; then a few of the currants (some floured, and some without flour); then a little flour, and a little of the whites of the eggs, and more fruit, more flour, more whites, fruit, and so on, until all are in; add ½ teaspoonful soda and ½ teaspoonful cream tartar, dissolved in 1 tablespoonful milk; let it foam; mix well together with the hand; add a teacupful of darkest molasses and a little vanilla, or a castor bean, which is better; put it in the pan in layers and pack it hard; bake 3 or 4 hours; it is to be covered with icing and ornamented with appropriate devices.

BRIOCHE. — Beat ½ lb. butter until it is in a cream; take 3 eggs and beat until light; mix thoroughly with the butter; add to this ½ lb. sifted flour; mix 1 small cake compressed yeast; then a gill of water; set to rise over night in a warm place; put in a turban form, and bake in a quick oven.

BUN LOAF.—Take 5 lbs. of flour, and 5 teaspoonfuls of soda; mix well; add 1 lb. of raisins; 1 lb. currants; 2 oz. candied peel; 2 oz. citron; ½ lb. brown sugar; ½ lb. treacle; ½ lb. lard or butter; 2 teaspoonfuls allspice; when well mixed add as much fresh buttermilk as will make it the right consistency; bake slowly in deep tins.

BUTTERMILK COOKIES. — 1½ cupfuls of butter; ⅞ cupful buttermilk; 2 cupfuls of sugar; 1 teaspoonful each of saleratus and lemon extract.

CALIFORNIA.—2 cups sugar; 1 cup water; 1 cup butter; 3 cups flour; 2 eggs; 1 teaspoon cream of tartar; ½ teaspoon soda; spice to taste.

CARAMEL.—3 cups of sugar; 1½ cups of butter; 1 cup of milk; 4½ cups of flour; 5 eggs; 2 teaspoonfuls of baking powder; bake in layers. Then take and mix 1½ cups brown sugar; ½ cup of milk; 1 cup molasses; 1 teaspoonful of butter; 1 tablespoonful of flour; 2 tablespoonfuls of cold water; boil this 5 minutes; add a cake of Baker's chocolate (grated); boil until it is the consistency of custard; add a pinch of soda; stir well; remove from the fire; when cold flavor with vanilla; spread between the layers and on top of the cake; set it in a sunny window to dry.

CARAWAY. — Break 3 eggs into a bowl, which place in another containing boiling water; whisk with them ½ lb. of castor sugar for 15 minutes; while beating, gradually add boiling water to that in the outer bowl; when the batter is thick, mix in 6 oz. of fine flour; sift with a teaspoonful of baking powder and 2 oz. of butter dissolved, but not oiled; add ½ teaspoonful of caraway seeds, carefully picked and cleansed; put the cake in a buttered tin; bake from 30 to 40 minutes.

CARAWAY COOKIES. — 1 cup butter; 2 of white sugar; 3 eggs; ½ cup seeds; flour enough to make a stiff paste; roll it very thin with sugar instead of on the board; cut it in round shapes; bake about 15 minutes.

CENTENNIAL. — Rub 2 lbs. of dry fine flour with 1 of butter; mix it with 3 spoonfuls of yeast in a little warm milk and water; set it to rise 1½ hours before the fire; beat into it 2 lbs. of currants, 1 lb. of sugar sifted, 4 oz. of almonds, 6 oz. of stoned raisins, chopped fine, ½ nutmeg, cinnamon, allspice, and a few cloves, the peel of a lemon chopped as fine as possible, 12 yolks and whites of eggs; beat separately and long; beat well; butter the pan; bake in a quick oven.

CHILDREN'S.—1 pt. cup of white coffee sugar; 1 teacup of butter; 3 eggs; 1½ cups of sweet milk; ½ teaspoonful of soda dissolved in hot water; 1½ pts. of flour; season with ground mace and nutmeg.

CHOCOLATE. — Stir ½ lb. of pounded sugar and the yolks of 12 eggs well together; add a little lemon peel; stir in also ½ lb. of flour; beat the whites of the 12 eggs to snow and stir them in; fill a large squirt with this mass and make large dots on paper; bake slowly; then scoop out the lower part with a spoon, and fill with whipped cream mixed with sugar and vanilla: put 2 together to make a round ball; ice them with chocolate prepared thus: boil to every ¼ lb. of chocolate 3 oz. of fine white sugar, with a little water till it is a sufficient thickness; take it off the fire; stir it well till a skin rests at the top; when the cakes have been spread with this, put them into the oven for a few minutes to dry.

CHOCOLATE ECLAIRS.—Take the weight of 4 fresh eggs in sugar; half the weight in flour; mix with the latter ½ teaspoonful of cream of tartar and ¼ teaspoonful of soda very thoroughly; beat the yolks of the eggs until light;

Small Cake Pans.

add slowly the sugar, keeping it very light; alternate the beaten whites of the eggs with the flour; bake in pans having compartments, or in small cake pans; drop a spoonful of batter in each, or in a paper-lined and well-buttered pan, making the cakes as nearly of a size as possible; the oven should be quick; when done, take out; place 2 together, allow them to cool; cover with the chocolate.

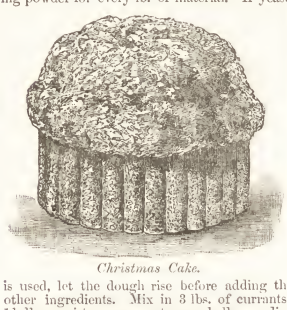
CHOCOLATE KISSES.—3 heaping tablespoonfuls of grated chocolate; 1 lb. of granulated sugar; the whites of 4 eggs; beat the eggs to a froth, not too stiff; add the sugar and chocolate; stir well together; flavor with 30 drops of vanilla; drop on buttered paper with a tea-

spoon; bake in a moderate oven for 10 minutes.

CHOCOLATE MACAROONS.—Put 3 oz. plain chocolate in a pan; melt on a slow fire; work it to a thick paste with 1 lb. of powdered sugar and the whites of 3 eggs; roll the mixture down to the thickness of about ¼ inch; cut in small round pieces with a paste cutter, either plain or scalloped; butter a pan slightly; dust it with flour and sugar in equal quantities; place in it the pieces of paste or mixture; bake in a hot but not quick oven.

CHOCOLATE MARBLE.—2 cups sugar; ½ cup butter; 1 cup sweet milk; 2½ cups flour; 2 eggs; 3 teaspoons baking powder; 1 teaspoon lemon extract; dissolve 2 blocks chocolate in a little boiling water; add ½ cup sugar and 1 teaspoon vanilla; to this add 2 tablespoons of cake and stir well; marble it through the cake; first a little of the white cake, then the chocolate, until the pan is full; bake slow and even.

CHRISTMAS.—Take 5 lbs. of flour; mix with it a dessertspoonful of salt; rub in ⅜ lb. of butter, and 1 lb. lard; put in 1½ oz. German yeast, or ½ pt. of good fresh brewer's yeast, and knead as for common bread; if there is any difficulty about the yeast, baking-powder may be used, allowing a heaped teaspoonful of ordinary baking powder for every lb. of material. If yeast



Christmas Cake.

is used, let the dough rise before adding the other ingredients. Mix in 3 lbs. of currants; 1½ lbs. moist sugar; nutmeg; ¼ lb. candied lemon peel finely minced; 1 tablespoonful of brandy, and 4 eggs well beaten; butter the tins, and line them well with buttered paper; bake in a moderate oven about 2 hours.

CHRISTMAS COOKIES.—4½ cups sugar; 1½ of butter; 1 of thick cream; 1 teaspoon of soda; 2 eggs; flavor with orange or lemon extract; powder with sugar, and put a few raisins in the centre.

CIDER FRUT.—8 cups of flour; 10 eggs; 6 cups of sugar; 3 cups butter; 2 cups milk, clabber preferred; 4 teaspoonfuls of cream of tartar; 2 teaspoonfuls soda; 2 lbs. seeded raisins; 2 lbs. French currants; ½ lb. thinly sliced citron; raisins scalded in ½ pt. of sweet cider; when cold sprinkle flour over them to prevent them from settling; cloves, allspice, cinnamon, and mace to taste; bake 4 hours.

CIDER SPICED.—½ cup butter; 1½ cups sugar; 1 cup cider; 1 egg; 2 teaspoonfuls of cinnamon; 2 of cloves; ½ nutmeg; 1 teaspoon soda; flour enough to make a stiff batter.

CINNAMON.—1 cup sour cream; 1 cup sugar; ½ cup melted butter; 1 egg; ½ teaspoon soda; mix as for cookies; roll out; spread ground cinnamon over the top; roll up as a roll jelly cake; slice off with a sharp knife and bake.

CITRON.—1 cup of butter; 2 of sugar; 3 of flour; 4 eggs; 1 cup of milk; 1 teaspoonful of soda; 2 of cream of tartar; a pinch of salt; make the cake; put in the pan; cut the citron thin, and put into the cake endways; push down until the batter covers the citron; this will prevent the citron from falling to the bottom of the pan.

COCOANUT.—2½ cups powdered sugar; 1 cup butter; 4 full cups prepared flour; whites of 7 eggs, whisked stiff; 1 small cup of milk, with a mere pinch of soda; 1 grated cocoanut; ½ teaspoonful nutmeg; the juice and ½ the grated peel of 1 lemon; cream, butter, and sugar; stir in the lemon and nutmeg; mix well; add the milk and whites and flour alternately; stir in the grated cocoanut swiftly and lightly; bake in 4 jelly-cake tins. *Filling*: 1 lb. sweet almonds; whites of 4 eggs, whisked stiff; 1 heaping cup powdered sugar; 2 teaspoonfuls rosewater; blanch the almonds; let them get cold and dry; pound in a Wedgewood mortar, adding rose-water as you go on; save about 2 doz. to shred for the top; stir the paste into the icing after it is made; spread between the cooled cakes; make that for the top a trifle thicker and lay it on heavily; when it has stiffened somewhat, stick the shred almonds closely over it; set in the oven to harden, but do not let it scorch.

COCOANUT COOKIES.—2 cups of sugar; 1 cup of butter; 2 eggs; ½ grated cocoanut; make just stiff enough to roll out; roll thin.

COCOANUT JUMBLES.—½ lb. cocoanut; ½ lb. sugar; whites of 2 eggs; 2 tablespoonfuls of flour; 2 tablespoonfuls of milk of cocoanut; grate the cocoanut; beat the eggs very light and mix all together; form into small cakes or pyramids; bake in a moderate oven.

COCOANUT POUND.—Beat ½ lb. of butter to a cream; add gradually 1 lb. of sifted flour; 1 lb. of powdered sugar; 2 teaspoonfuls of baking powder; a pinch of salt; 1 teaspoonful of grated lemon-peel; ¼ lb. of prepared cocoanut; 4 well-beaten eggs; 1 cupful of milk; mix thoroughly; butter the tins, and line them with buttered paper; pour the mixture in to the depth of 1½ in.; bake in a good oven. When baked take out, spread icing over them, and return the cake to the oven a moment to dry the icing.

COCOANUT PUFFS.—The whites of 3 eggs beaten very light; 1 small teacupful of fine white sugar; 1 tablespoonful of corn starch; when these ingredients are mixed, put the mixture into a custard saucepan or jug set in a pan of boiling water; stir constantly for 20 minutes; take it off the stove; add ½ lb. of desiccated or grated cocoanut; when well mixed drop in teaspoonfuls on buttered paper; bake in a

very slow oven, as they must not brown at all.

COFFEE.—Coffee, 1½ cups; 1½ cups sugar; ½ cup molasses; 1 cup of chopped raisins; 1 of currants; nearly 1 cup of butter; 1 teaspoon of soda; 1 nutmeg; a little citron, cinnamon, cloves, spices of any kind you have; stir together sugar, molasses, spices, fruit and butter, and pour on the coffee hot; add flour to make as stiff as fruit cake.

COFFEE LAYER.—Bake 2 sponge cakes and let them cool; take 2½ cups of milk; 1 egg; 4 tablespoonfuls of sugar; 2 cups of flour; boil until it thickens; flavor with very strong coffee; place between the cakes, and frost the top.

COLD WATER.—1 teacupful of sugar; piece of butter the size of an egg; ½ teaspoonful of cream of tartar in a coffeecupful of sifted flour; ½ teaspoonful of soda in ½ teacupful of water; whites of 2 eggs beaten to a stiff froth and put in last; flavor to taste.

COMPOSITION.—1¾ lbs. flour; 1½ of sugar; ¾ lb. of butter; 4 eggs; 1 pt. of good milk, or ½ pt. of cream; 1 lb. of fruit; ½ nutmeg; ½ teaspoonful of cinnamon; sift thoroughly with the flour 1 teaspoonful of soda and double that quantity of cream of tartar; rub the butter and sugar together; break in the eggs; work them in well; add the flour, a little at a time, till it is well stirred in; then the spices; then the fruit, having floured and dried it; stir 15 minutes; pour in pans; bake immediately.

COOKIES.—Mix ½ cup of butter and 1½ cups of sugar to a cream; flavor with lemon or vanilla; add the beaten yolks of 3 eggs; when well mixed, put in the 3 whites of the eggs, beaten to a standing froth; stir until very light; work in flour enough to make a very soft dough; flour the hands well; shape little pieces into cakes, patting them out thin; brush the tops with sugar dissolved in milk; place far enough apart to prevent their touching, and bake in a quick oven.

CORN STARCH.—1 cup butter worked to a cream, with 2 cups sugar, 1 cup milk, 2 cups flour, in which is sifted 1 large teaspoonful yeast powder; the whites only of 6 eggs beaten to a froth; mix all these well; then add 1 cup corn starch; beat well; bake in a moderate oven.

COTTAGE.—¾ of a cup of butter; 1 cup of white sugar; 1½ cups flour; 4 eggs—yolks and whites beaten separately; 1 tablespoonful of sweet milk; 1½ teaspoonfuls of baking powder; a lemon and a little salt; rub the baking powder into the flour.

CRANBERRY SHORT-CAKE.—½ cup butter; 1 cup sour milk; 1 teaspoonful soda; ½ teaspoonful salt; flour to make the consistency of biscuit; bake in a tin; split in half while warm and spread both pieces with butter; stew 1 qt. cranberries; sweeten; put between and on top of layers; eat with sugar and cream.

CREAM.—Sift ½ lb. flour into 3 oz. creamed butter; add an even teaspoonful baking powder, 2 tablespoonfuls powdered sugar, a pinch of salt, ½ teaspoonful of grated lemon peel, 1 cupful of cream that has turned a little, and a beaten egg; mix the batter; pour it into a buttered and papered tin; bake in a moderate oven.

CREAM COOKIES.—Stir together thoroughly 1 cup of sour cream and 1½ cups of white sugar; add a small teaspoonful of soda, dissolved in a little warm water; stir in immediately about a cup of flour; then add the white of 1 egg well beaten; mix in enough flour to roll easily; roll thin, as they will raise more than half; bake in a moderately hot oven, being careful to not brown them.

CREAM LAYER.—1 cup sugar; ⅔ cup sweet milk; 1 egg; 1 tablespoon butter; 2 scant cups flour; 2 teaspoons baking powder. *Filling:* ½ pt. sweet milk; 1 egg; 1 tablespoon corn starch; 2 tablespoons sugar; beat the egg, corn starch, and sugar together; stir into the milk while hot.

CREAM PUFFS.—Put 1 oz. of butter in 1 pt. water over the fire; when the water boils beat into it 4 oz. flour; let it cook 5 minutes; stir to prevent burning; remove from fire and beat into it 6 eggs, 1 at a time; when well beaten put upon a tin, well buttered and dusted with flour; use 1 tablespoonful of flour for each puff; brush the tops with a beaten egg; bake them brown; cool them; open one side and fill with cream. *Filling:* Mix together (cold) 2 oz. corn starch; 2 oz. powdered sugar, and the yolks of 2 eggs; stir in about 1 pt. of new milk; put over the fire; stir until it has boiled 5 minutes; flavor with vanilla; fill puffs when cold.

CREAM ROSE.—Whites of 10 eggs, beaten to standing froth; 1 cup of butter creamed with sugar; 3 cups powdered sugar; 1 small cup sweet cream; nearly 5 cups prepared flour; stir the cream (into which it is safe to put a pinch of soda) into the butter and sugar; beat until the mixture is like whipped cream; flavor with vanilla, and put in by turns the whites and the flour; color a fine pink with cochineal; bake in 4 jelly cake tins; when cold spread with *Filling:* 1½ cocoanuts pared and grated; whites of 4 eggs whisked stiff; 1½ cups powdered sugar; 2 teaspoonfuls best rose water. Instead of cochineal, use strawberry or currant juice in their season, making allowance for the thinning of your batter, by adding a little more flour. Strain the cochineal, if it is used, and stir in drop by drop.

CUP.—Mix 3 teacups of sugar with 1½ of butter; when white, beat 3 eggs; stir them into the butter and sugar, together with 3 teacups of sifted flour, and rosewater or essence of lemon to the taste; dissolve 1 teaspoonful of saleratus in 1 teacup of milk; strain it into the cake; add 3 more teacups of sifted flour; bake the cake immediately, either in cups or pans.

CURRANT.—2 lbs. of flour; 1 lb. butter; 1 lb. sugar; 2 oz. candied peel; ¾ lb. each of currants and sultanas; 3 eggs; 2 teaspoonfuls each of carbonate of soda and cream of tartar; sufficient milk to mix to a proper consistency; rub the butter and flour well together; add the currants, sultanas and sugar, and the peel finely cut; beat the eggs well; add the milk; beat into the mixture; mix the carbonate of soda and cream of tartar with a little milk; while effervescing pour into the cake; beat the whole for about 5 minutes; have ready a cake pan lined with greased paper; pour in the mixture; bake in a quick oven about 3 hours.

DANDY.—2 cups sugar; 3 cups flour; 1 cup milk; 3 eggs; 3 teaspoonfuls baking powder;

put this in 2 pans; save enough for another, in which put 3 tablespoonfuls of molasses, 1 teaspoonful cinnamon, 1 of cloves, 1 of allspice, and 1 handful of raisins; put this, when baked, between the other two with jelly or icing.

DATE.—2 cupfuls brown sugar; 1 cupful of molasses; 1 cupful of butter; 1 cupful of cider; 3 eggs; 1 teaspoonful each of cinnamon and cloves; a little nutmeg; 1 teaspoonful of soda; 1 lb. of dates stoned and chopped, and flour to mix pretty stiff.

DELICATE.—Stir to a cream 1 lb. of powdered white sugar and 7 oz. of butter; add the whites of 16 eggs beaten to a stiff froth, ½ nutmeg, or 1 teaspoonful of rosewater, or lemon; stir in gradually 1 lb. of sifted flour; bake the cake immediately; the yolks can be used for custards.

DRIPPING.—Mix well together 2 lbs. of flour, 1 pt. of warm milk and 1 tablespoonful of yeast; let it rise ½ hour; then add ½ lb. brown sugar, ¼ lb. currants and ¼ lb. of good, fresh beef dripping; beat the whole well for nearly ¼ hour; bake in a moderately hot oven.

DROP COOKIES.—Whites of 2 eggs; 1 large cup of milk; 1 cup of sugar; ½ cup of butter; 2 teaspoonfuls of baking powder; flavor with vanilla, rose, or nutmeg; flour enough for thick batter; beat thoroughly; drop in buttered pans; dust granulated sugar on top; bake with dispatch.

DROP GINGER.—1. 1 cupful of butter or lard; 1 cupful of white sugar; 1 pt. of molasses; 3 eggs; 1 cupful of hot water with 2 teaspoonfuls of soda dissolved in it; 1 tablespoonful of ginger; flour enough to make a tolerably stiff batter; drop with a spoon into a long pan.—2. 1 cup of molasses; ½ cup of butter; 1 cup of milk; 3 cups of flour; 2 teaspoonfuls of ginger; 1 of soda; drop with a spoon on a buttered pan.

DUTCH.—6 oz. butter and lard mixed; 4 eggs; ½ lb. of flour; ½ lb. of sugar; beat the butter and lard to a cream; mix it with the eggs; add the flour and sugar, both warmed, and a little nutmeg and cinnamon; when well beaten, add a spoonful of brandy; bake 1 full hour in a buttered mold in a quick oven.

DUTCH COOKIES.—½ lb. pulverized sugar; ½ lb. butter, worked until a cream; add 6 eggs; the yolks first, and the whites beaten to a froth; then enough flour, into which put 3 teaspoonfuls of baking powder, to make a dough; roll thin; cut with a biscuit cutter; beat 1 egg; spread on each cooky; strew sugar, cinnamon and sliced almonds over them; almonds must be previously scalded.

EGG.—2 cups of sugar; 1 egg; a piece of butter the size of a large egg; 1 cup of sour milk; 1 teaspoonful of soda; a little salt and nutmeg; 1 teaspoonful of lemon; 3 cups of flour; beat the white of an egg separately, the sugar and yolk and butter together; bake in a thoroughly heated oven.

EGGLESS.—1. 1 cup sugar; ½ cup butter; 1 cup buttermilk; 1 teaspoonful of soda; 1 teaspoonful of cream tartar; 3 cups of flour; bake in a moderate oven.—2. 1½ cups sour milk; ½ cup butter; 2 cups chopped raisins; 1 teaspoonful soda; spice to taste; flour enough to make a thick batter.

FIG LAYER.—2 cups of sugar; ½ cup of butter; 3 cups of flour; 1 cup of cold water; whites of 6 eggs; 3 teaspoonfuls of baking powder; bake in layers. *Filling:* One cup of raisins; 1 cup of figs; ½ cup of sugar; white of 1 egg; beat all together and put between the layers.

FROST.—Beat 2 lbs. butter and 3 lbs. sugar together until quite light; add 30 eggs, 10 at a time, beating after each addition; then a little extract lemon; add 3 lbs. flour; stir just enough to mix; put in flat, square pans, greased, and bake in a slow oven; when done, frost on the under side and mark in squares.

FRUIT.—4 cups of flour; 2 cups of sugar; 1 cup of butter; 6 eggs (whites and yolks separated); 1 cup of cold water; 1 coffeecupful of hickory-nut kernels; ½ lb. of raisins, seeded, chopped and dredged with flour; 1 teaspoonful of soda, dissolved in hot water; 2 tablespoonfuls of cream of tartar, sifted in the flour; 1 teaspoonful of mixed nutmeg and cinnamon; rub butter and sugar together to a smooth cream; put in the yolks; then the water, spice and soda; next the whites and flour; then the fruits and nuts, stirred together and dredged; mix thoroughly and bake in 2 loaves.

GALETTE.—A great favorite in France. Sift 1 lb. of the best flour; put it in a heap on the pastry board; make a hole in the middle; put into it a pinch of salt and one of sifted sugar, ¾ lb. butter, and 1 gill of water; knead the ingredients together; when they begin to mix sprinkle over by degrees ½ gill of water, continuing to knead with the palm of the hand; when the paste is smooth make it into a ball and let it lie for 1 hour; at the end of this time roll out the paste to thickness of ¼ in.; pinch the edges; put the cake on a baking sheet; brush over the top with yolk of egg; score it in the form of diamonds; bake in quick oven for ½ hour, or until the galette is elastic to pressure of the finger.

GERMAN COFFEE.—2 heaping coffeecups of bread dough; 4 heaping tablespoonfuls of sugar; ½ cup of butter and drippings (equal parts of each); mix all well together; add 1 large handful of flour; mix well again; set it aside to rise; when sufficiently raised, roll out about ¾ in. thick; place in buttered tins; raise again until quite light; beat the yolk of an egg with a teaspoonful of milk, and rub it over the top with a brush; bake; when done, brush again with milk, and sprinkle with sugar and cinnamon on the top; or, before baking, brush over it melted butter, and sprinkle with sugar and cinnamon.

GINGERBREAD.—1. Rub ½ lb. butter into 1 lb. of flour; rub in ½ lb. sugar, 2 tablespoonfuls of ginger, and 1 spoonful of rose water; work it well; roll out; bake in flat pans in a moderate oven about ½ hour.—2. 2 cups of butter; 4 cups of sugar; 1 cup of milk; 2 eggs; 2 teaspoonfuls of soda; 2 teaspoonfuls of ginger; flour enough to roll out well.

GINGER COOKIES.—1 teacupful of brown sugar; 1 of New Orleans molasses; 1 of thick sour cream; 1 tablespoonful of ginger; 1 teaspoonful of salt; 1 tablespoonful of saleratus (dissolved in a little cold water); 1 egg; mix soft; roll ½ in. thick; bake in a moderate oven.

GINGER SNAPS. — Mix together in a deep pan 1 pt. West India molasses, ½ lb. butter or lard, ¼ lb. brown sugar, 2 large tablespoonfuls ginger, 1 teaspoonful cinnamon, a little cayenne pepper, also a little salt if lard is used, 1 teaspoonful soda dissolved in warm water, sufficient flour to roll out conveniently; let the whole be well incorporated into a large lump; knead it till it leaves the hands clean; beat hard with a rolling-pin, which will make it crisp when baked; roll out into thin cakes.

GOLD.—1. One lb. each of flour and sugar; ⅜ lb. butter; the yolks of 14 eggs; the juice and grated rind of 2 lemons. Stir the sugar and butter to a cream; add the yolks well beaten and strained; put in the lemon peel; then the flour (dried), and a teaspoonful of saleratus dissolved in a spoonful of hot water; beat 15 minutes; just before it goes into the oven, stir in the lemon juice very thoroughly. — 2. Yolks of 4 eggs; 1 cup of sugar; ½ cup of butter; ½ cup of milk; 2 cups of flour; ½ teaspoon of soda; 1 teaspoon of cream of tartar; citron and currants.

GRAHAM COOKIES.—2 cups sugar; 1 cup sour cream; ½ teaspoonful soda; mix quickly; roll and bake.

GROUND RICE.—Rub together 2 lbs. butter and 4 lbs. sugar; add 16 eggs; beat up thoroughly; add 2 pts. milk, 4 oz. ammonia, and flavor with lemon; stir all up; add 4 lbs. rice flour; mix thoroughly; drop on buttered pans the size of an egg, and bake.

HAMLET.—2 eggs; 1½ cups sugar; 1 cup of raisins chopped fine; ⅔ cup of butter; 1 teaspoon, each, of cloves, cinnamon and nutmeg; 1 teaspoon of soda dissolved in 2 tablespoonfuls of sour milk; mix stiff; cut out like cookies.

HICKORY NUT.—Take 1½ gills of maple syrup; 1 gill of medium thick, slightly soured cream; 1 pt. hickory nut meat; 1 teaspoon soda; a pinch of salt; a few drops of lemon essence or other seasoning; flour enough for medium thickness; bake in a moderately heated oven.

HONEY.—1 qt. strained honey; ½ pt. soda; ½ pt. melted butter; 1 teaspoonful of sugar dissolved in ½ cup warm water; ½ nutmeg and 1 teaspoonful ginger; mix these ingredients; then work in flour to roll; cut in thin cakes; bake on buttered tins in a quick oven

HONEY COOKIES. — 1 pt. honey; ½ cup butter; 1 cup sweet milk; 2 eggs; ½ grated nutmeg; beat the eggs and honey together until they froth; add the butter and milk; use yeast powder with the flour.

HUCKLEBERRY.—¾ lb. of flour; 6 oz. sugar; ¼ lb. butter; cream the sugar and butter; 3 eggs, beaten very light; 1 teacupful of sour milk; 1 teaspoonful of vinegar; ½ teaspoonful of saleratus dissolved in vinegar; 1 qt. of huckleberries; beat well together and bake.

ICE CREAM.—1 cup fine white powdered sugar; ½ cupful butter; cream them together; add ½ cupful of milk; whites of 4 eggs; 2 cupfuls flour; ½ teaspoonful soda in milk; 1 teaspoonful cream of tartar in flour. For the cream: 3 cupfuls powdered sugar; 1 cupful water; boil together until it becomes a clear syrup; beat the whites of 3 eggs to a froth; pour the syrup on to it; stir together; flavor with a teaspoonful vanilla; put between the three rounds of cake, and on top.

ICING.—1. ½ lb. of powdered sugar; 4 spoonfuls rose-water; the juice of 1 lemon; the whites of 2 eggs; beat all well together; cover the cake when half cold with a paste brush; set in a cool oven to dry the icing.—2. 1 lb. pulverized sugar; pour over 1 tablespoonful cold water; beat whites of 3 eggs a little, not to a stiff froth; add to the sugar and water; put in a deep bowl; place in a vessel of boiling water, and heat; when quite thick remove from the fire, and stir while it becomes cool till thick enough to spread with a knife. — 3. 1 lb. sweet almonds and 1 lb. loaf sugar; beat them in a mortar until they are well mixed and very fine; put them in a pan with the whites of 10 eggs that have been previously well beaten with the whisk; beat them well together with a wooden spoon; lay smoothly on the cake, about an inch thick, ½ hour before it is baked. For pink icing, add cochineal syrup; for blue, indigo; for yellow, saffron; for green, spinach syrup; and for brown, add chocolate.

IMPERIAL.—Cream together 1 lb. of the best butter and 1 lb. of white sugar; add 8 eggs, yolks and whites beaten separately; 1 lb. of raisins, stoned and chopped; ½ lb. of blanched almonds; ¼ lb. of citron, both thinly sliced; a little mace; 2 wineglasses wine; 1 lb. of sifted flour; bake in a steady oven.

INDIAN MEAL POUND.—Sift 1 pt. of yellow corn meal and ½ pt. wheat flour; into which first put 1 teaspoonful baking powder and a small spoonful salt; 1 grated nutmeg; 1 tablespoonful ground cinnamon; put ⅔ lb. granulated sugar and ½ lb. butter together; beat 8 eggs very light; add to the butter and sugar, alternately, with the meal, a little at a time; ½ cup milk; have dish or pan well buttered; bake long in a moderate oven.

JELLY.—Beat together thoroughly 1 cup of butter and 2 cups of sugar; add the beaten yolks of 4 eggs; stir in 1 cup of milk; 2 even cupfuls and ½ scant cup of sifted flour; beat the whites of the eggs; stir them into the batter; add 1 teaspoonful of lemon extract, 2½ teaspoonfuls of baking powder; stir 10 minutes; pour into the jelly cake pans; bake in rather a quick oven. When done, remove them from the pans, lay them on a cloth, and spread with tart jelly.

JELLY ROLL.—1 teacup of white sugar; 1 cup of flour; 4 eggs; 1 teaspoonful of cream tartar; ½ teaspoonful of soda; turn bottom side up; spread with jelly; roll up while warm.

JENNY LIND.—1½ teacups of sugar; ½ teacup of milk; the same quantity of butter; 3 eggs; 2 cups of flour; ½ teaspoonful of soda; 1 of cream tartar; bake in a long, shallow tin, for the top and bottom layer. For the middle layer the same, leaving out 1 egg; add 1 cup of raisins and 1 cup of currants; spice to the taste; roll the fruits in ½ cup of flour; put together with jelly and frost the top.

JUMBLES.— 1½ cups sugar; ½ cup butter; 2 eggs; ½ teaspoon soda; 1 of cream of tartar (dissolved in a little sweet milk); flour enough to make like pie crust; bake in waffle irons. Fill

the little holes with light and dark jelly, alternately.

KING.—¾ lb. of butter; 1½ lbs. of sugar; 1 nutmeg; 6 eggs; 1 cup of milk; flour to make an ordinary batter.

KIPFEL.—Beat up 1 lb. pounded white sugar with the whites of 8 eggs and a little vanilla flavoring; when mixed, make it up into the shape of small horseshoes; having minced 1 lb. sweet almonds, turn these kipfel round in them; bake the kipfel on wafers, in a very moderate oven.

KISSES.—1. Beat to a stiff froth the whites of 2 eggs; and beat into them, very gradually, 2 teacupfuls of powdered sugar and 2 tablespoonfuls of corn starch; flavor with lemon; butter tin sheets with mashed butter, and then cover with letter paper; drop on this the mixture in teaspoonfuls about 2 in. apart; bake 15 minutes in a warm oven; be sure that it is not warm enough to brown them; after they are taken out, let them stand until cold before removing them from the paper.

KNICKERBOCKER.—Beat ½ lb. fresh butter to a cream; ½ lb. of powdered sugar; ¾ lb. of sifted flour; 1 tablespoonful of orange-flower water, and 1 of brandy; 4 oz. of washed currants; 5 well-beaten eggs; beat the mixture until very light; line some shallow cake-tins with buttered paper; pour in the mixture until half full; bake in a quick oven.

LADY.—Break up 2 lbs. butter; mix in 3 lbs. sugar; rub well together for 5 or 10 minutes; add 2 pts. whites of eggs; beat up all light; add 4 lbs. flour and 1 oz. soda dissolved in 2 pts. milk with 2 oz. cream of tartar; mix all well together; bake in pans about 1½ in. deep, in loaves that will weigh from 2 to 3 lbs., when baked, take out of the pans and frost on the under side.

LADY FINGERS. — Beat the whites and yolks of 4 eggs separately; mix with the yolks 3 oz. of flour and 3 of powdered sugar; add the beaten whites, and afterwards a gill of rose-water; beat all together for a few minutes; put the mixture in a paper funnel; squeeze it out into the shape of fingers on paper which has had a little powdered sugar dusted over it; dust a little sugar over the fingers; let them stand 5 minutes; bake to a fawn-color in a moderate oven; fasten together after they have been baked with a little white of egg; keep them in a close-covered tin till wanted.

LAPLAND.—5 eggs; beat the whites and yolks separately till both are as light as may be; mix them together and add 1 pt. of rich cream and 1 pt. of sifted flour; half fill small tin shapes with the batter; set it to bake 10 minutes in a well heated oven, and send to table hot.

LEMON. — Beat 6 eggs, the yolks and whites separately till in a solid froth; add to the yolks the grated rind of 1 fine lemon, and 6 oz. of sugar dried and sifted; beat this ½ hour; shake in with the left hand 6 oz. of dried flour; add the whites of the eggs and the juice of the lemon; when well-beaten in, put immediately into tins; bake about an hour in a moderately hot oven.

LEMON COOKIES.—1 lb. of flour; ½ lb. of butter; 1 lb. powdered sugar; juice of 2 lemons, grated peel of 1; 3 eggs, whipped very light. Stir butter, sugar, lemon juice and peel to a light cream; beat at least 5 minutes before adding the yolks of the eggs; whip them in thoroughly; put in the whites; lastly the flour; roll out about ¼ in. thick; cut into round cakes; bake quickly.

LEMON GINGER. —½ lb. of butter; ½ lb. of sugar; 3 eggs; 1 small cup of milk; the same quantity of molasses; 3½ lbs. of flour; 1 teaspoonful of ginger; 1 of cinnamon; 1 tablespoonful of saleratus dissolved in the milk; the rind of 2 lemons and the juice of one; bake in a quick oven.

LEMON JELLY.—2 cups of sugar; ½ cup of butter; 1 cup of milk; 3 eggs; 2 teaspoonfuls of cream tartar; 1 teaspoonful of soda; 3 cups of flour; mix, and bake in fine thin layers. For the jelly, grate the rind of 3 small or 2 large lemons; add the juice of the same with 1 cup of sugar, 1 egg, 1 cup of water, 1 teaspoonful of butter, 1 tablespoonful of flour; mix with a little water; boil till it thickens; place between the layers of the cake.

LEMON PUFFS. — Beat and sift 1½ lbs. of loaf sugar; mix with it the peel of 2 lemons grated; whisk the whites of 2 eggs to a firm froth; add it gradually to the sugar and lemon; beat all together for 1 hour; make up into any shape you please; place the puffs on oiled paper on a tin; put them in a moderate oven; bake 6 or 8 minutes.

LEMON SNAPS. — 1 large cup of sugar; 2 cups of flour; a little more than ½ cup of butter; 2 eggs; 2 tablespoonfuls of hot water; ½ teaspoonful of soda; flavor with lemon; roll very thin.

LEMON SPONGE.—8 eggs; 10 oz. sugar; ½ lb. of flour; the juice and grating of 1 lemon; separate the eggs; beat the yolks, sugar and lemon until thick and light; whisk the whites until dry, which add with the flour, half of each at a time; mix all together, but avoid beating; butter your pan well, and bake in a moderate oven.

LIGHTNING.—Yolks of 4 eggs; 3 tablespoonfuls of sugar; the same of flour; about 2 tablespoonfuls of milk; the juice of half a small lemon; the whites of 3 eggs, beaten to a stiff froth; mix with the yolks, flour, etc.; put in a buttered pan and quick oven.

LINCOLN.—1½ lbs. sugar; 1 lb. butter; 1¾ lbs. flour; 2 lbs. suet; 1 pt. sweet milk; 1 tablespoonful soda; 6 eggs; 1 teaspoonful cloves; 2 of cinnamon; 1 gill of brandy.

LITTLE SHORT-CAKE.—Rub into 1 lb. of dry flour 4 oz. of butter; 4 oz. of white powdered sugar; 1 egg; 1 spoonful or 2 of thin cream to make into a paste; mix; put currants in ½ and caraways into the rest; cut, and bake on tins.

MACAROONS.—1. The whites of 3 eggs beaten to a froth; ½ lb. of powdered sugar; ½ lb. of desiccated cocoanut; ½ pt. rolled and sifted crackers; 1 teaspoonful extract of almonds; drop the mixture on buttered paper in a dripping pan; bake a light brown. —2. Mix ½ lb. of sweet and 2 oz. of bitter almonds; mix them with ½ lb. fine sifted sugar; put them in a cool oven until they take a pale brown color; add ¾ lb. of fine

sifted sugar; the whites of 2 large eggs beaten to a strong froth, or sufficient to make paste stiff enough to form into cakes.

MACHINE JUMBLES.—Rub together 3 lbs. sugar, and 2 lbs. 4 oz. butter; add 12 eggs, a few at a time; beat all up well; ¾ oz. of ammonia; 1½ pts. milk; a little ext. lemon; 5 lbs. 4 oz. of flour; stir sufficiently to mix.

MADEIRA.—Beat up with a whisk until quite light 6 eggs, ½ lb. of sugar, and a little lemon zest; when well beaten add ½ lb. fresh butter, slightly melted, and ½ lb. of flour; put into a round cake hoop, papered; place on top of the cake 3 slices of citron cut thin; dust a little sugar over the top; bake in a moderate oven.

MADELINE.—4 eggs; ½ lb. butter; ½ lb. sugar; ½ lb. flour; mix the butter, sugar, and the yolks of the eggs thoroughly; add the flour and mix again; then the whites of the eggs beaten to a stiff froth; grate in a little lemon rind; put in little dishes, each about ⅔ full; bake till done.

MALAGA.—2 cups of sugar; ½ cup of butter; beat to a cream; add ½ cup of sweet milk; mix 3 cups of flour with 3 teaspoonfuls of baking powder; beat the whites of 7 eggs to a froth; stir all together and flavor with lemon; bake in sheets. *Filling*: Whites of 3 eggs, beaten with sugar as for frosting; save out enough for the top of the cake; add 1 coffeecup of seeded and chopped raisins, 2 teaspoonfuls of lemon ext.; spread between the sheets.

MAPLE SUGAR.—3 cups of flour; 1 of butter; ½ of sour milk; 1½ of maple sugar, broken into small lumps; 3 eggs; 1 teaspoon soda.

MARBLE.—*1st Part*: White sugar, 1½ cups; butter, ½ cup; sweet milk, ½ cup; soda, ½ teaspoon; 1 teaspoon cream of tartar; whites of 4 eggs; flour, 2½ cups; beat the eggs and sugar together; mix the cream of tartar with the flour; dissolve the soda in the milk. *2nd Part*: Brown sugar, 1 cup; molasses, ½ cup; ½ cup sour milk; soda, ½ teaspoon; browned flour, 2½ cups; yolks of 4 eggs; cloves and cinnamon ground, each ½ teaspoon; mix the ingredients same as above. When both are prepared, put in the cake pan in alternate layers of each; or put them in spots on each other, making what is called leopard cake, until all is used: then bake as usual.

MERINGUE STRAWBERRY SHORT-CAKE.—Make a very light biscuit crust; and bake it in a jelly-cake pan; after it is baked, split it open and cover each half with berries; sugar slightly; on top of the berries pile the whites of eggs beaten to a very stiff froth; sweeten; set back in a quick oven to brown slightly; allow the whites of 2 eggs to each cake; 1 tablespoonful of sugar to each egg; if you like, make a soft custard with the yolks of the eggs.

MINISTER'S.—1 teacup sugar; 1 tablespoon butter; 1 egg well beaten; 2 cups flour; 1 of sweet milk; 1 teaspoon cream tartar; ½ teaspoon soda; 2 teaspoons extract of bitter almonds.

MOCK LADY.—2 cups sugar; ⅔ cup of butter; the whites of 4 eggs; 1 cup of sweet milk; ½ teaspoon soda in the milk; 3 cups of flour with 1 teaspoon cream of tartar; flavor with rose, lemon or vanilla; bake in sheets.

MONT BLANC.—2 even cups of powdered sugar; ¾ cup butter, creamed with sugar; whites of 5 eggs, very stiff; 1 cup of milk; 3 cups of flour, or enough for good batter; 1 teaspoonful soda, dissolved in hot water; 2 teaspoonfuls of cream of tartar, sifted in flour; vanilla flavoring; bake in jelly-cake tins. *Filling*: Whites of 3 eggs, whisked stiff; 1 heaping cup powdered sugar; 1 cocoanut, pared and grated; mix lightly together, taking care not to bruise the cocoanut; when perfectly cold, spread between and upon them.

MOSS.—Rub 6 lbs. of flour and 3 lbs. of butter well together; add 2 lbs. sugar and 8 eggs; flavor with ess. of lemon; mix well together until smooth and stiff; take a piece the size of an egg; push it through a sieve; form it in bunches to resemble moss; put on buttered pans; bake very carefully in a moderate oven to a delicate brown.

MOUNTAIN.—1 lb. of flour; 1 lb. of sugar; ½ lb. of butter; 1 teacupful sour milk; 6 eggs; 1 teaspoonful soda; 2 of cream of tartar; bake as jelly cake and spread frosting between and on top.

NEAPOLITAN.—1 lb. of flour; ½ lb. powdered sugar; ½ lb. of butter; 6 eggs; 6 yellows; ½ oz. of rose water or orange blossom water; mix the flour, sugar, butter and eggs together with the perfume; if too stiff, add a little milk; leave the dough ½ hour in a cool place; roll it out ½ in. thick; cut it with a small tin cutter of any shape; put the cakes on a pan slightly greased; color the tops with beaten egg and milk; chop some almonds up over them; cook in a very hot oven.

NEW YEAR'S.—1 lb. of flour; 1½ lbs. of almonds; 1 lb. of sugar; ¾ lb. butter; 6 eggs; 2 teaspoonfuls of cream tartar; 1 teaspoonful soda and ½ teacupful of milk; beat butter and sugar to a cream; add the eggs well beaten, then the milk, in which dissolve the soda; put the cream tartar in the flour; mix well; beat this all well; then stir in the blanched almonds; line a cake pan with well buttered paper; bake in a steady oven.

NEW YORK LUNCH.—Beat 16 eggs and 2 lbs. sugar together about 5 minutes; add 2 oz. ammonia, 1 pt. milk, and flavor; mix all; add the flour, stirring carefully, but sufficiently to mix; bake in little round pans, in a warm oven.

OATMEAL.—Take 3 heaping teaspoonfuls of grated cocoanut; add to it ½ pt. of the finest oatmeal; and 2 heaping teaspoonfuls of sugar; stir into it 1 gill of boiling water and mix it thoroughly together; turn it out on the rolling board, well floured; roll thin; cut it out as for common crackneels; put a bit of citron and ½ doz. currants into each cake; stick them into the dough; bake it in a slow oven; watch carefully, lest they brown a shade too deep.

OLD COLONY.—3 eggs; 1 scant cup butter; 2½ cups sugar; 1 cup sour milk; 3¾ cups flour; 1 teaspoon soda; spice to taste. Sift powdered sugar over the top of the cake.

ORANGE.—2 cups of flour; 2 cups of sugar; ½ cup of water; the yolks of 5 eggs and whites of 4; 2 teaspoonfuls of yeast powder; grated rind and juice of 1 orange.

ORANGE LAYER.—¾ cup of butter; 2 cups

sugar; ½ cup sweet milk; 3 cups flour; whites 10 eggs; 3 tablespoonfuls baking powder; grate the rind of 2 ordinary sized oranges into the cake; press out the juice into the icing; bake in layers like jelly cake; put the icing between.

ORLEANS.—1 liberal lb. best flour, dried and sifted; 1 lb. powdered sugar; ¾ lb. butter, rubbed to a cream with the sugar; 6 eggs, beaten light, and the yolks strained; 1 cup cream; 1 glass best brandy; 1 teaspoonful mixed mace and cinnamon; 1 teaspoonful soda, dissolved in hot water; 2 teaspoonfuls cream tartar, sifted with flour; add the strained yolks to the creamed butter and sugar; to this the cream and soda; in alternate supplies, the whites and flour; finally, spice and brandy; beat up hard for 3 minutes; bake in 2 square loaves in a not too quick but steady oven; cover with paper if the cakes hows signs of crustiness on the top before it has risen to the proper height; bake 1 hour; cover with lemon frosting when cool.

PARADISE.—3 eggs; 1 cup of butter; 2½ cups of sugar; 1½ cups of sweet milk; 1 small teaspoonful of soda; 4 large cups of flour; 1 lb. of raisins; cloves, cinnamon and nutmeg.

PARISIAN.—Make a mixture as for pound cakes, leaving out the fruit, peel, spices, etc.; bake in a round or oval hoop; when baked and cold, cut into slices, ½ in. thick; spread each slice over with jam or marmalade; cut the outside of the cake round, or flute to form a star; cut the centre out to about 1½ in. from the edge, leaving the bottom slice whole; fill this with preserved wet or dry fruits, creams, or a trifle. Ornament the top with piping, wet or dry fruits, and peels, or pipe with jam and icing.

PARLIAMENT.—Boil for 10 minutes 2 oz. of whole ginger, which has been well crushed in 1½ gills of water; strain, and let get cold; if it has wasted, add water to make up the original quantity; mix ½ lb. of raw sugar, sifted fine, with 1 lb. of flour; 1 small teaspoonful of caraway seeds, and ½ teaspoonful of carbonate of soda; put into this 2 oz. of butter or lard; well mix 1 teaspoonful of molasses with the ginger water; make all into a paste; roll it out on a board to the thickness of rather less than ½ in.; cut into any shape; put the cakes on a flour baking sheet; brush them over with water in which you have mixed a very small quantity of molasses; bake in a moderate oven for ½ hour.

PEACH SHORT-CAKE.—Make a dough as for soda biscuits, only shorter; roll to ½ in. thick; place on a baking tin; spread this with butter; place another layer of dough on top; bake in a quick oven; while hot, separate the two layers; spread mashed fresh peaches with plenty of sugar between, also over the top; serve with cream.

PINEAPPLE SHORT-CAKE.—A couple of hours before bringing cake on the table, take a very ripe, finely-flavored pine apple; peel it, cut as thin as wafers and sprinkle sugar over it liberally; then cover it close. For cake, take sufficient flour for one pie dish; butter the size of a small egg; 1 or 2 tablespoonfuls of sugar; the yolk of an egg; 2 teaspoonfuls of baking powder; a very little salt; milk enough to make a very soft dough; do not knead the dough, but just barely mix it; press it into the pie plate; rub the baking powder and butter, sugar and salt well throughout the flour; add the other ingredients then quickly; when time to serve, split the cake; spread the prepared pineapple between the layers; serve with nothing but sugar and sweet cream.

PLUM.—1. 1 lb. of flour; 1½ teaspoonfuls of baking powder; a little salt; ½ lb. each of butter, sugar, and currants; 2 eggs and ½ pt. of milk. — 2. 2 lbs. of large fresh raisins; 1 lb. of citron; 8 fresh eggs; 2 cups of powdered sugar; 1 of butter; 4 of flour; 1 of sweet milk; ½ teaspoonful of soda; 1 nutmeg, grated; ½ teaspoonful of ground cloves; sift the flour and put in the oven to brown, as you would coffee; cut the raisins in half and seed them; cut the citron in strips ½ in. wide; slice as thin as possible; bake in a 6 qt. basin 2 hours. For the icing, take the whites of 4 eggs; 2 cups of powdered sugar; 2 tablespoonfuls of corn starch; the juice of 1 lemon; 1 oz. of rose-water.

PORK.—1 lb. of pork; 1 cup molasses; 2 cups sugar; 1 pt. boiling water; 2 eggs; cinnamon, cloves, and allspice, 1 tablespoonful each; 2 teaspoonfuls cream of tartar; 1 teaspoonful soda; 1 lb. of raisins, chopped; flour to make it the consistency of any stirred cake; chop the pork fine and turn on the boiling water; let stand until no longer hot; bake very slowly.

POUND.—1½ lbs. of flour; 1 lb. of butter; 1 lb. fine white sugar; 10 eggs; 1 gill of brandy; ½ nutmeg, grated; 1 teaspoonful of vanilla or lemon extract, or orange-flower water; beat the butter and sugar to a cream; beat the eggs to a high froth; put all together; beat it until it is light and creamy; put in basins lined with buttered paper; let the mixture be 1½ in. deep; bake in a moderate oven for 1 hour; when done turn it gently out; reverse the pan; set the cake on the bottom until cold; let the paper remain until the cake is to be cut.

PUMPKIN.—For 2 loaves: 2 cups buttermilk; 3 cups each of wheat flour and corn meal; 1 cup stewed pumpkin; 1 cup molasses; ½ cup butter; 2 eggs; 1 tablespoonful soda; steam 1½ hours; bake ½ hour.

QUEEN.—Rub together 2 lbs. sugar and 2 lbs. butter; add 16 eggs, 1 pt. milk, 1 oz. of ammonia; stir all well together; add the flour; bake in square pans with a few currants on top.

RAISED.—6 lbs. flour; 3⅓ of sugar; 3 of shortening; ½ of lard; ½ lb. butter or nice beef drippings; 1 qt. sweet milk; 1 pt. fresh yeast; 2 eggs; 6 nutmegs; 2 lbs. raisins, or 1 lb. raisins and 1 of currants; take all of the flour, ½ the sugar, and ½ the shortening and mix well; heat the milk boiling hot; stir it in thoroughly; add the yeast and work all together; place in a warm place to rise. Better make it in the morning, and by evening it will be light. When light, add the rest of the required ingredients; work all in with the hands; cover and keep in as warm a place as convenient, as for bread. In the morning it will be light; dip out into pans which have greased paper linings; let them stand ½ hour, or long enough to become light in the pans; bake in the heat required for bread, 40 minutes. If sweet milk cannot be ob

tained, boiling water can be substituted, but milk is better.

RIBBON.— 1 cup of sugar; ½ cup butter; ½ cup sweet milk; 1 large teaspoonful of baking-powder; 2 cups of flour; 3 eggs, taking out 2 of the whites for frosting; bake in 3 layers; put spices and fruit in middle layer, between each light one, jelly; then frosting between each.

RICE.—8 beaten eggs; 1 lb. of white sugar; ½ lb. of butter; 1 lb. of rice ground very fine; a little salt; 3 tablespoonfuls of milk; and any flavoring liked. Cream the butter and sugar, add the eggs, then the milk and salt, stirring in the rice last. Bake in small pans.

RICE SPONGE.—Beat up 3 eggs for 2 minutes; add the peel of a lemon finely rasped. Boil 6 oz. of loaf sugar in ½ gill of water, and pour it boiling on to the eggs. Whisk the mixture for 20 minutes, or until it is very thick. The success of the cake depends on this being properly done. Have ready mixed 2 oz. of flour and 3 of rice flour and stir lightly into the batter. Bake in small tins, greased and sifted with a mixture of sugar and rice flour.

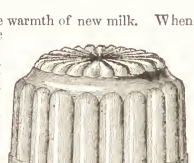
ROCHESTER.—1 lb. of butter; 1¾ lbs. sugar; 2 lbs. of flour; 8 eggs; 1 pt. of sour milk (½ pt. cream, to make it richer, can be substituted for ½ the last); 1 teaspoonful soda; 2 teaspoonfuls cream of tartar (put soda in the milk, cream of tartar in the flour); nutmeg to taste; and ½ wineglass of brandy improves it.

ROCK.—8 oz. of flour; 3 oz. of currants; 3 oz. of pounded sugar; 1 oz. of lemon peel, sliced fine; 1 teaspoonful of baking powder or ½ that quantity of soda. Rub all together and mix to a moderately stiff dough with buttermilk. Drop the mixture with a fork in little heaps on greased paper, so that the surface of each has a rough and uneven appearance; bake quickly of a light brown.

RYE TEA.—1 pt. sweet milk; 2 eggs well beaten; 1 tablespoonful of brown sugar; ½ teaspoonful of salt; stir into this sufficient rye flour to make it as stiff as common griddle-cake batter; bake in gem-pans ½ hour; serve hot.

SARATOGA.—White part: ½ cupful of butter; 1½ cupfuls of white coffee sugar; ½ cupful of sweet milk; 2 cupfuls of flour; the whites of 3 eggs beaten to a froth; 1 heaping teaspoonful of baking powder; flavor with lemons; bake in 2 round tins. Fruit part: ½ cupful of butter; 1 cup brown sugar; ½ cup sweet milk; 1 cupful of flour; ½ cupful each of raisins and currants chopped fine; 2 even teaspoonfuls of baking powder; the yolks of 3 eggs; bake in 1 round tin. Place first a layer of white; cover with icing; then a layer of fruit cake; cover also with icing; then another layer of white, and cover with the rest of the icing.

SAVOY.—1 lb. of loaf sugar, powdered; 1 pt. of good eggs; 14 oz. of flour; warm a pan free from grease, with the sugar in it, in the oven until you can scarcely bear your hand against it; take it out; pour in the eggs; whisk the whole together with a birch or wire whisk until it is quite light and cold, when it will be white and thick. If it should not whisk up well, warm again; beat it as before; or beat over the stove fire until it is the warmth of new milk. When finished, sift the flour and stir in lightly with a spoon; add a few drops of essence of lemon to flavor; butter some tin or copper molds regularly, with rather less on the top of the molds than the sides; dust with loaf sugar sifted through a lawn sieve; knock out all that does not adhere; again dust it with fine flour; turn it out; knock the mold on the board as before; tie or pin a piece of buttered paper round the mold, so as to come 2 or 3 in. above the bottom; fix the mold in a stand; nearly fill it; bake in a moderate oven. When done, the top should be firm and dry.



Cake Mold.

SCHOOL.—1 egg; 1 cup white sugar; 1 cup sweet milk; a piece of butter the size of an egg; 1 pt. flour; into which sift 2 teaspoons baking powder; work together with butter, sugar, and the yolk of the egg till it is light and foamy; add the milk and flour; then the beaten white of an egg; butter a piece of white paper, and lay in the bottom of the baking tin; pour in the cake; bake in a pretty hot oven.

SCOTCH COOKIES.—Beat 2 cups of sugar with 1 cup of butter and 5 tablespoonfuls of milk in which has been dissolved 1 teaspoonful of soda; beat 2 eggs quite white and add them; mix 2 teaspoonfuls cream tartar with ½ lb. flour and 1 teaspoonful of powdered cinnamon; mix the whole together; add more flour from time to time to make a dough; roll thin and bake quickly.

SCOTCH FRUIT.—1 cup of butter; 2 of white sugar; 4 of sifted flour; ¾ cup sour milk; 1 teaspoon soda; 9 eggs, beaten separately; 1 lb. raisins; ½ lb. currants; ¼ lb. citron; cream the butter and sugar; then put in the beaten yolks of eggs; while stirring in the flour add the whites well whipped; flavor with 1 teaspoon lemon, and 1 of vanilla extract; have raisins chopped a little, or, better still, seeded, and citron sliced thin; wash and dry currants before using; flour all fruit slightly; in putting cake in pan place first a thin layer of cake; then sprinkle in some of the three kinds of fruit, then a layer of cake, and so on; always finish off with a thin layer of cake; bake in a moderate oven for two hours.

SCOTCH SHORT-CAKE.—Rub together into a stiff, short paste 2 lbs. flour, 1 lb. butter and 6 oz. loaf sugar; make it into square cakes, about ½ in. thick; pinch them all along the edge at the top; over the whole sprinkle some white comfits; put the cakes on tins so as to touch each other by their edges; bake in a slow oven.

SEED.—1 lb. of flour; ½ lb. butter; ¾ lb. of powdered sugar; ½ cup of good yeast; 4 tablespoonfuls cream; nutmeg; a pinch of soda, dissolved in hot water; 2 tablespoonfuls caraway seeds; ¼ lb. citron shred very small; mix the

flour, cream, half the butter (melted) and the yeast together; work up well; set to rise for 6 hours; when very light, work in the rest of the butter rubbed to a cream with the sugar and the soda water; and when these ingredients are thoroughly incorporated, the seed and the citron; let it rise $\frac{3}{4}$ hour longer, until it almost fills the pans; bake steadily $\frac{1}{2}$ hour if you have put it in small pans; 1 hour if it is in large loaves.

SHREWSBURY COOKIES.—1 lb. flour; 1 lb. sugar; $\frac{1}{2}$ lb. butter; 3 eggs; 1 tablespoonful ground cinnamon; mix together the butter and flour; stir in the sugar and cinnamon; work the eggs into the paste; roll out thin; cut and bake in a quick oven at once.

SNOW.—1 tumblerful of flour; $1\frac{1}{2}$ tumblerfuls of sugar; 1 small teaspoonful of cream of tartar; no soda; the whites of 10 eggs; beat the eggs very light; sift the flour, sugar and cream of tartar together; stir gradually to the eggs; bake in a round, papered pan. After baking, frost with the white of 1 egg, 3 teaspoonfuls of powdered sugar, and cover with a grated cocoanut.

SNOWFLAKE.—3 eggs; $1\frac{1}{2}$ cups sugar; $\frac{1}{2}$ cup butter; $\frac{1}{2}$ cup milk; $\frac{1}{2}$ teaspoonful soda; 1 teaspoonful cream tartar; 2 cups flour; whites of 2 eggs; $\frac{1}{2}$ cup sugar; beat together; bake in jelly-cake tins; frost each layer; sprinkle with grated cocoanut.

SODA.—1 lb. of flour; 6 oz. butter or dripping; 6 oz. sugar; $\frac{1}{2}$ pt. milk; 1 teaspoonful of carbonate of soda; add 1 or 2 eggs, with $\frac{1}{2}$ lb. currants or caraway seeds; mix the soda thoroughly with the flour; rub in the butter; beat the whole with a wooden spoon for 20 minutes before putting into a well greased cake tin; bake for fully $1\frac{1}{2}$ hours.

SPANISH PUFFS.—Mix $\frac{1}{2}$ pt. of milk with 2 well beaten eggs; add by degrees 1 teaspoonful of flour, 2 oz. butter; the same of sugar, and the grated rind of 1 lemon; mix well; butter some saucers; pour in, and bake in a quick oven 20 minutes.

SPONGE.—4 eggs; 1 cup sugar; 1 cup flour; $\frac{1}{2}$ teaspoonful baking powder; 1 teaspoonful extract of orange; beat the yolks and sugar together 10 minutes; add the flour with powder sifted in, then the extract; add the eggs (whites) beaten to a froth; bake in a well buttered tin in a steady oven 30 minutes.

STARCH.—2 cups of sugar; 1 cup of butter; 1 cup of sweet milk; 1 cup of common starch; 1 pt. of flour; whites of 8 eggs; 2 teaspoonfuls of cream of tartar; 1 teaspoonful of soda.

SUGAR.—Blend well with the fingers 6 oz. of good butter with 1 lb. of fine flour; work it quite into crumbs; add a few grains of salt, 1 lb. of dry sifted sugar, a tablespoonful of the best cinnamon in very fine powder, and 1 large teaspoonful of mixed spices; to these the grated rinds of 3 sound fresh lemons; make these ingredients into a paste, with the yolks of 5 eggs, and about 4 tablespoonfuls of white wine, or with 1 or 2 more in addition, if required, as this must be regulated by the size of the eggs; half of very thick cream and half wine are sometimes used for them. Roll the mixture into balls; flatten them to something less than $\frac{3}{4}$ in. thick; bake them in a moderate oven from 15 to 20 minutes; loosen them from the baking sheets—which should be lightly floured before they are laid on—by passing a knife under them; turn them over; when quite cold, stow them in a dry, close-shutting canister.

SULTANA.—4 cups flour; 1 cup butter; 3 cups powdered sugar; 8 eggs, beaten light; strain the yolks; 1 cup cream or rich milk; 1 lb. sultana (seedless) raisins dredged thickly; 1 teaspoonful soda, dissolved in hot water; 2 smaller teaspoonfuls of cream tartar; $\frac{1}{2}$ grated nutmeg and $\frac{1}{2}$ teaspoonful cinnamon; cream the butter and sugar; sift the cream tartar with the flour; dredge the raisins with flour when you have picked them over with great care; wash and dry them; mix the beaten yolks with the creamed butter and sugar; then the spice and brandy; beat 3 minutes and stir in the cream or milk lightly with the soda water; put in first a handful of one and then a spoonful of the other; then the flour and whipped whites; at last beat in the fruit; bake in 2 large loaves or 4 small ones; bake slowly and carefully; ice thickly.

SUNSHINE.—The whites of 11 eggs and yolks of 6; $1\frac{1}{2}$ cups granulated sugar, measured after sifting; 1 cup of flour measured after sifting; 1 teaspoonful of cream of tartar and 1 of extract of orange; beat the whites to a stiff froth; gradually beat in the sugar; beat the yolks in a similar manner; add the beaten whites and the orange; stir in the flour; mix quickly and well, and place in pans; bake 50 minutes in slow oven.

SUPERB.—The whites of 12 eggs, the yolks only of 6; 1 lb. of sugar; 1 lb. of butter; $\frac{1}{2}$ lb. flour; $\frac{1}{2}$ lb. meal; the juice of 2 large lemons and 1 wineglassful of French brandy; cream the sugar and butter together; then mix with the yolks, well beaten; add alternately a portion of the whites, whipped stiff, and the sifted flour, until it is all in; the meal goes in with the flour; let it be baked carefully in a well regulated oven.

SWEET POTATO LIGHT.—1 qt. of flour; 1 qt. of sweet potatoes, boiled and grated; $\frac{1}{2}$ cup of lard; 1 cup of yeast; mix with either milk or water; knead well; let them rise twice; bake like tea biscuits.

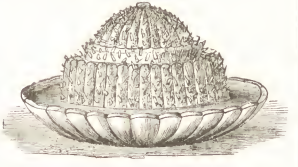
TEA.—1 pt. of dough taken from your bread; 1 teacupful of sugar; 1 of butter; 3 eggs; 1 cupful of raisins or currants; 1 teaspoonful, each, of cloves, cassia and allspice; $\frac{1}{2}$ teaspoonful of soda; stir till well mixed; bake in a slow oven.

TEMPERANCE.—2 lbs. of flour; $\frac{3}{4}$ lb. of butter; 1 lb. of sugar; 6 eggs; 1 teaspoonful of soda; mix flour and butter well together; put in the sugar; dissolve the soda in a little water and work that in; add the eggs well beaten; work well together; roll thin; cut in rounds or any shape you fancy; bake only a few minutes in a quick oven; flavor to taste.

TROWBRIDGE.—6 oz. of butter; the same of sugar; $\frac{3}{4}$ lb. of flour; 2 eggs; 1 teaspoonful of rose water; stir to a cream the butter and sugar; add the eggs, flour and spice; roll it out thin; cut into small cakes.

TIPSY.—Small sponge cakes steeped in bran-

dy; cover with grated almonds and candied peel; or stick almonds, cut into spikes, in them. They are usually piled on a dish, surrounded by a custard, and covered with preserves drained as dry as possible.



Tipsy Cake.

UNION.—2 cups of sugar; ½ cup of butter; ¾ cup of sweet milk; 3 cups of flour; whites of 6 eggs; ½ teaspoonful of soda and 1 teaspoonful of cream tartar. Custard: 1 pt. of milk; ½ cup of sugar; 2 eggs; 2 tablespoonfuls of corn starch; boil until like thick cream; spread between the layers when cool; flavor to taste.

VANITY PUFFS.—Beat the whites of six eggs to a stiff froth; sift in 1 lb. of powdered sugar; flavor with lemons; drop by small spoonfuls upon buttered paper; dry in a cool oven 2 hours.

VARIEGATED. — 1 cup powdered sugar; ½ cup of butter creamed with the sugar; ½ cup of milk; 4 eggs, the whites only, whipped light; 2½ cups of prepared flour; bitter almond flavoring; spinach juice and cochineal; cream butter and sugar; add the milk, flavoring the whites and flour; divide the batter into 3 parts; bruise and pound a few leaves of spinach in a thin muslin bag until you can express the juice; put a few drops of this into one portion of the batter; color another with cochineal, leaving the third white; put a little of each into small, round pans or cups, giving a light stir to each color as you add the next.

VERMICELLI.—Parboil 12 oz. of vermicelli; drain it on a sieve; put it into a stewpan, with 1 pt. of cream, 4 oz. of butter, 8 oz. of sugar, the essence of the rinds of 2 oranges, extracted by rubbing on a piece of sugar, and a little salt; cover with the lid; set the stewpan to simmer very gently on a slow fire, until the vermicelli has entirely absorbed the cream; add the yolks of 6 eggs and the whipped whites of 3; mix the whole together; put this preparation into a mold previously spread with butter and strewn with bread crumbs; bake the cake in the oven for about 1½ hours; when done turn it out on its dish; pour some damson sauce round the base; serve.

WAFERS.— 1 lb. sifted flour; 2 tablespoonfuls of butter; a little salt; enough milk to make stiff dough; rub the butter into the salted flour; wet with milk; roll thin; cut into small round cakes, and roll these again into cakes as large as a tea plate and as thin as stout writing paper; lift carefully to a floured pan and bake quickly.

WALNUT.—1. 1 lb. of flour; 1 lb. of sugar; ¾ lb. of butter; 1½ lbs. raisins; 1 nutmeg; 6 eggs; 1 wineglassful of wine; the kernels of 2 qts. walnuts; bake in a quick oven.—2. 1 coffeecup of sugar; 2 of raisins (stoned and chopped); 1½ cups of flour; ½ cup of butter; ½ cup of sweet milk; 3 eggs; 2 teaspoonfuls of baking powder; ½ nutmeg, grated; 1 teaspoonful of lemon or vanilla; 1 cup heaping full of nuts; crack the nuts and pick the meats out before you do anything else to the cake; bake slowly with a buttered paper in the bottom of the tin.

WASHINGTON.— 2 cupfuls of white sugar; 1 cupful of sweet milk; 4 eggs; beat the whites and yolks separately; add 3 cupfuls of flour; ½ teaspoonful of soda; 1 teaspoonful of cream of tartar; bake in round, flat tin pans; peel and grate 2 large apples and the rind of a lemon; add the strained juice of the latter; 1 heaping cupful of white sugar; 1 egg; let it boil up in a stewpan; pour it out; when quite cool spread over the cakes, which must be placed one over the other in layers.

WATERMELON.—White part: 2 cups of white sugar; 1 cup butter; 1 cup milk or water; 3 cups flour; whites of 8 eggs, well beaten; 2 teaspoonfuls quick yeast. Red part: ½ cup butter; ½ cup water; 2 cups flour; whites of 4 eggs, well beaten; 1 teaspoon quick yeast; 1 cup raisins; put the red part around the tube of the pan, and the white around the edges. Use as much coloring in the red part as you fancy.

WEDDING.—(See *Bride's Cake.*)

WHIGS.—1 lb. of flour; 4 oz. of butter; 4 oz. of sugar; ½ pt. of milk; 3 eggs; 1 teacupful of yeast; mix this well together; put in a cake pan; when light, bake in a moderately hot oven.

WHITE FRUIT. — 1 cup of butter; 2 cups of white sugar; 3 cups flour; ½ cup sweet milk; 1 teaspoonful cream of tartar; ½ teaspoonful of soda; whites of 8 eggs; 1 lb. of raisins; ½ lb. of citron chopped.

WHITE MOUNTAIN.—2 cups sugar; ½ cup of butter; whites of 7 eggs, well beaten; ½ cup of sweet milk; 2 cups flour; 1 cup corn-starch; 2 teaspoonfuls baking powder; bake in jelly-cake tins. Frosting: Whites of 3 eggs and some sugar beaten together; spread over the cake; add some grated cocoanut; then put the cakes together; put cocoanut or frosting on the top.

WHITE POUND.—1 cupful of fine white sugar and ½ cupful of butter; beat 10 minutes; add the whites of 4 eggs, well beaten; beat 10 minutes longer; sift 1½ cupfuls of flour, in which sift 1 scant teaspoonful of baking powder and 6 tablespoonfuls of milk; flavor with rose or bitter almond.

WHITE SPONGE. — Place a clean sieve over an earthen bowl, and measure into the sieve 1 cup of powdered sugar, ½ cup of flour, ½ cup of corn starch, 1 teaspoonful of best baking powder; run them through together; have ready the whites of 8 eggs, beaten to a stiff froth; add 1 teaspoonful of rose extract; mix thoroughly and bake in square tins about 2 in. deep, in a quick oven.

WINDSOR.—Beat the yolks and whites of 6 eggs separately; have ready the crumbs of 3 Vienna rolls soaked in milk; squeeze dry; mix the crumbs with 4 oz. of melted butter; add the beaten yolks and 2 oz. crushed sugar, with 1 teaspoonful of grated lemon peel; work the mix-

ture; add gradually 2 oz. each of raisins, almond paste, and candied orange peel; add the frothed whites of eggs; butter and paper a shallow tin; bake in moderate oven; when done sprinkle powdered sugar over it; sprinkle chopped almonds over the bottom of the cake tin before adding the cake.

YULE TIDE.—Place 1 lb. of fresh butter in a pan; keep it near the fire till melted; stir into it 1 lb. of powdered loaf sugar, a good tablespoonful each of allspice and cinnamon; by degrees put in the yolks of 10 eggs and their whites, separately, whisked to a froth; add 1 lb. candied citron peel sliced thin, 2 lbs. of currants cleaned and dried, 2 oz. of blanched sweet almonds, 1½ lbs. of flour, and 1 gill of brandy; mix all well together; bake for 3 hours.

ZEPHYR.—Wash the salt out of nearly ¾ lb. of butter; add to it ¾ lb. of powdered sugar and 3 well beaten eggs, a teaspoonful of rose water, and sifted flour enough to make a thin batter; stir it with a wooden spoon till the batter is perfectly smooth and so light that it will break when it falls against the sides of the mixing bowl; fill well buttered muffin molds (small) nearly half full with the mixture; bake in a quick oven; serve hot with newly-made butter.

Coffee, Tea, Etc.

CHOCOLATE.—Chocolate is composed of cocoa and sugar. (See same in Candies.) Its nutritive power is great, and its use is recommended to men of letters, consumptive people, and ladies, whose charms a cup of chocolate every morning for breakfast, is said to preserve surprisingly. However heartily one may have lunched, a cup of chocolate immediately afterward will produce digestion 3 hours after, and prepare the way for a good dinner. When required for use it should not be melted in a pan, which is liable to absorb the essential oil. Chocolate should not be prepared for the table till just before serving. The following are the most popular modes of preparation: 1. Take ¼ lb. of chocolate; the same of sugar; 1 qt. of milk and water; mix them equally together; boil till the cake dissolves, and flavor with a stick of cinnamon.—2. Take 3 even tablespoonfuls of Baker's chocolate, grated; put in a bowl or dish holding over a qt.; add 2 tablespoonfuls of white granulated sugar; mix the chocolate and sugar thoroughly; add 1 tablespoonful of boiling water; be sure and have the water boiling; stir until smooth; then boil 1 pt. of milk and 1 pt. of water together; when it boils pour it gradually over the chocolate mixture, stirring all the time.

COFFEE.—This, from its large proportion of albumen, is a most nutritive beverage, but, at the same time, from its quantity of fat, difficult to digest. Its aromatic qualities, however, strengthen the digestion. A cup of coffee is an excellent restorative and invigorating refreshment even for weak persons, provided that their digestive organs are not too delicate. If taken in excess, coffee produces sleeplessness and many baneful effects. Coffee sometimes produces great excitement, and a sensation of restlessness and heat ensues. For throwing off this condition, fresh air is the best antidote.

COFFEE, Essence of.—1. Boil 1 lb. of good coffee with ½ gal. of water till reduced to 1 pt.; let it cool; filter, and then boil again; add enough sugar to make a thick syrup; cool it; pour into a bottle, and cork up. 2 teaspoonfuls will, with a cup of boiling water, make a good cup of coffee.—2. Place the coffee in a deep, narrow filter; pass cold or tepid water through. For greater economy, divide the coffee into a series of filters, and treat in succession with the same liquid. To understand this, call them *a*, *b*, *c*, *d*, *e*: the liquid from *a* goes in *b*, then in *c*, etc.; *a* receiving always the clean water, is first exhausted and rejected; *b* becomes No. 1; a fresh filter, *f*, is added, to receive the liquid from the others; after awhile *b* is rejected, and *c* becomes No. 1; add again a freshly filled filter, *g*, and so on. The liquid obtained condense by evaporation, and sweeten with sugar; if sufficiently condensed to the thickness of syrup, it will keep without sugar. If mixed with sugared condensed milk, it will keep any length of time.

COFFEE, Preparation of.—In the preparation of coffee, long boiling extracts the bitter principle of the coffee, and therefore should be avoided. A good way to make it is as follows: Fit a small muslin bag inside the top of the coffee pot; pour a little boiling water through this, and, when the pot is hot, pour it off and put the coffee into the bag; pour boiling water gradually over it, and when it has all drained through, remove the bag, and send to table. The water should be poured on a little at a time or the strength of the ground coffee will not be thoroughly extracted. When it can be done, coffee should be sent to table in the same pot in which it was made, as this will prevent its getting cool; and coffee for breakfast is nothing to speak of if it is not hot. Time, 2 or 3 minutes. The old style is to take 1 teacupful of ground coffee; moisten with the white of an egg and cold water stirred well together; pour on boiling water; set it on the stove, and let it boil up 3 times; stir it down twice with a spoon; but the third time pour in ½ cup of cold water; let it stand 2 or 3 minutes and serve boiling hot. Another way is as follows: (*Cafe au Lait.*) Add to a large proportion of good hot milk, about 6 tablespoonfuls of strong coffee, being quite sufficient for a breakfast cupful of milk. Of the essence, 2 tablespoonfuls to the cup is sufficient. A little cream mixed with the milk, if the latter cannot be depended on for richness, improves the taste of the coffee, so also the richness of the beverage.

COFFEE, Substitutes for.—1. Collect dandelion roots at the end of the year; dry them at a gentle heat and reduce to powder. Some mix

coffee with it; others roast the root in the manner of coffee, but probably at the expense of its medicinal virtues. When reduced to powder, it is well to mix coffee with it when used. If it is necessary to give it more color and flavor, mix with it a sufficient quantity of roasted chicory, not exceeding ⅓ of the whole.—2. Cut dry beet root into very small pieces; gradually heat it in a close pan over the fire for about 15 minutes; introduce a little sweet fresh butter, and bring it up to the roasting heat. When fully roasted, take it out, grind, and use like coffee.—3. Take good wheat bran; mix with molasses until just lightly wet by thorough stirring; put in a hot oven on shallow tins; let it brown like coffee; stir often; when brown it is ready for use.—4. Roast rye with a little butter, and grind to powder.—5. Make coffee from the raspings of the crust of loaves of bread, procured at the baker's.—6. Roast horse beans along with a little honey or sugar. When roasted, add a small quantity of cassia buds and stir the whole until cold.

COFFEE, To Roast.—Never buy ground coffee if you can get any other. Coffee loses its aroma so rapidly after it is ground that it is worth your while to buy it whole, either in small quantities, fresh-ly roasted, or raw, and roast it yourself. You can roast in a pan in the oven, stirring every few minutes, or in the same upon the top of the range. Stir often, and roast quickly to a bright brown, not a dull black. While still hot, beat up the white of an egg with a tablespoonful of melted butter, and stir up well with it. This will tend to preserve the flavor. Grind just enough at a time for a single making.

COFFEE. To Settle.—The most common mode of settling coffee is by adding the white of an egg, in which case the yolk may be utilized by beating and stirring it into the milk designed for the coffee. A piece of isinglass or fish skin may be used. Another method is to dip a cloth in cold water and wrap it around the hot coffeepot, and the coffee will clear rapidly. If the egg-shells are thrown into the coffee, they will settle it as well as if the white were used.

CREAM FOR COFFEE, Substitutes for.—1. Beat 1 egg; sweeten with 1 spoonful of sugar; pour over this 1 pt. of water; make over night for use in the morning.—2. Beat 3 eggs with 2 oz. of sugar, and a small piece of butter, until the combination is complete; add warm milk, 1 pt.; put the vessel into another containing hot water; stir it one way until it acquires the consistence of cream.—3. Mix ½ tablespoonful of flour with a pint of new milk; let it simmer for 5 minutes; beat up the yolk of 1 egg; stir it into the milk while boiling, and run it through a sieve.

SAGO MILK.—Sago, 1 oz.; cold water, 1 pt.; macerate ½ hour; pour off the water; add of milk, 1½ pts.; boil slowly until the sago is dissolved.

TEA.—After the use of tea the mind is clear, the imagination active, the senses alert, and the disposition to exert oneself increased. Too great an indulgence is followed by subsequent reaction; but it so far retards the action of the vital functions as to partially prevent the assimilation of food by the digestive organs. Therefore, the old, who require less vital force than the young and middle aged because they waste less, should use it freely, but it should be used sparingly by persons who draw constantly upon their vitality. Avoid it in the morning when the entire system requires all the nutriment it can assimilate from the morning meal.

TEA, Iced.—1. Make the tea in the morning, very strong, and do not allow it to steep too long; keep in the ice box till the meal is ready; then put in a small quantity of cracked ice.—2. Place the tea in a pitcher in the morning with just enough cold water to cover it; at dinner time fill the pitcher with cold water from the well, before serving with ice.

TEA, Preparation of.—A silver or metal teapot is better than an earthenware one for drawing out the flavor and strength of the tea. The amount of tea used must depend upon the quantity required. The old-fashioned allowance is a very sensible one, that is, 1 large teaspoonful for each of the company, and 1 for the teapot. Before making the tea, pour ½ pt. of boiling water into the teapot, and let it stand for 2 minutes. Pour it out, and immediately put in the tea. Close the lid, and let it remain for a minute to heat; then pour upon it ½ pt. of boiling water. Let it stand for 3 minutes, add sufficient boiling water to fill the teapot, and the tea will be ready for use. Be careful not to drain all the liquor from the pot so long as it is necessary to continue to add boiling water, or the tea will be very weak, and if it is desirable to add a little fresh tea, let it be brewed separately in a teacup before it is added to that which is already made, as its strength will not be drawn out if it is put upon the old leaves. Perhaps it is unnecessary to say, unless the water is really boiling when it is put upon the tea there will be no good tea. Boiling after the tea is made injures the flavor, either by deadening or making it rank. Another way is to make a strong infusion by pouring boiling water upon the tea, and let stand 20 minutes, putting into each cup no more than is necessary to fill it about ⅔ full; then each cup is filled with hot water from an urn or kettle; thus the tea is always hot and equally strong to the end.

Condiments and Flavoring Essences.

REMARKS.—Cooking is much nicer if it is seasoned with herbs and spices. These cost very little. The best kinds are sage, thyme, sweet marjoram, tarragon, mint, sweet basil, parsley, bay leaves, cloves, mace, celery seed and onions. If you plant the seed of any of these in little boxes on your window sill, or in a sunny spot in the yard, you can generally raise all you need. Gather and dry them as follows: Parsley and tarragon should be dried in June

and July, just before flowering; mint in June and July: thyme, marioram and savory in July and August; basil and sage in August and September. Gather the herbs in the sunshine and dry by artificial heat. Their flavor is best preserved by keeping them in air-tight cans or in tightly corked glass bottles. Flavoring essences are made, either by dissolving 1 fl. oz. of the essential oil of the particular substance in 1 pt. of rectified spirit, or by digesting 4 to 6 oz. of the bruised spice, or 5 to 10 oz. of the dried herb in a like quantity of spirit. There are a few leaves which are little known as flavoring essences, yet as such they are excellent. Peach, almond and laurel leaves are all richly charged with the essence of bitter almonds. Make an infusion of either green or dry leaves and use a teaspoonful of the flavoring liquid. The leaves of cucumbers have a flavor like the fruit. The external leaves of the celery and the young leaves of gooseberries are excellent.

ALLSPICE. Essence of.—Essential oil of pimento or allspice, 1 fl. oz.; strongest rectified spirit of wine, 1 pt.; agitate until perfectly united; the next day decant the clear portion, if there is any sediment.

ALMONDS. Essence of.—1. 1 fl. oz. essential oil of almonds; 7 fl. oz. of rectified spirit.—2. Distil the residue of the almonds after the oil has been expressed from them.

ANCHOVIES, Essence of.—1. Beat 1 lb. of anchovies in a Wedgewood mortar; put them into a pipkin with 4 oz. of vinegar; boil for a few minutes; rub the pulp through a hair sieve; boil the bones in 1½ lbs. of water; strain, and add 2 oz. of salt, 2 oz. of flour of starch, and the pulped anchovies; let it boil; pass it through a hair sieve; color with powdered bole, or with annatto.—2. Simmer anchovies in their own weight of water for 2 or 3 hours, removing any scum that may rise; strain with pressure through a strong canvas bag; filter through flannel. This has the pure flavor of the fish, but add a little cayenne and salt to preserve it.

ANCHOVY SAUCE.—1. Stir 2 or 3 teaspoonfuls of prepared essence of paste of anchovy into 1 pt. of melted butter; let the sauce boil a few minutes; flavor with lemon juice.—2. 3 or 4 anchovies, chopped small; butter, 3 oz.; water, 1 wineglassful; vinegar, 2 tablespoonfuls; flour, 1 tablespoonful; stir the mixture over the fire till it thickens; rub it through a coarse hair sieve.

APPLE, Essence of. — 1. An alcoholic solution of valerianate of amylic ether in the proportion of 1 part to 6 or 8 of alcohol, forms a flavoring liquid under the name of apple essence.—2. 2 parts of aldehyd; chloroform, acetic ether, nitrous ether and oxalic acid, of each 1 part; glycerine, 4 parts; amyl-valerianic, 10 parts.

APRICOT, Essence of.—Butyric ether, 1 parts; valerianic ether, 5 parts; glycerine, 4 parts; amylic alcohol, 2 parts; amyl-butyric ether, chloroform, œnanthic ether and tartaric acid, of each 1 part.

ARISTOCRATIQUE SAUCE. — Green walnut juice and anchovies, equal parts; cloves, mace, and pimento, of each, bruised, 1 dr. to every lb. of juice; boil and strain; add to every pt. 1 pt. of vinegar, ½ pt. of port wine, ½ pt. of soy, and a few shallots; let the whole stand for a few days; decant the clear liquor.

ASPIC.—2 calf's feet; 4 lbs. veal; 3 lbs. ham; 2 large onions; 3 carrots; 1 gal. water; boil 5 or 6 hours, or until reduced to less than ½; strain; when cold, put the jelly into a stewpan with the whites of 4 eggs well beaten, a large bunch of savory herbs, 3 blades of mace (in shreds), a teaspoonful of white peppercorns, and sufficient salt; keep it well stirred until pretty hot; then let it gently simmer for about 15 minutes; after settling, pass it through a jelly bag till quite clear; cool a little; or cool, and at any time remelt.

BACON DRESSING.—Cut ½ lb. bacon fat into slices, then into very small pieces; fry them until the oil extracted is a light brown; remove the pan from the fire and add the juice of a lemon, a wineglassful of strong vinegar and a saltspoonful of pepper; pour it over the salad with the pieces of bacon.

BARBERRY, Essence of. — Strip barberries; cover them with water; put them over the fire, and be careful they do not burn; don't boil them; but when cooked, squeeze and strain them carefully; to 1 pt. of warm juice add 2 pts. of sugar; put the sweetened juice into a pitcher, which pitcher put into hot water until the juice is dissolved; bottle it.

BASIL WINE.—Green basil leaves, 4 or 5 oz.; sherry, cape or raisin wine, 1 pt.; digest for 10 days; press and strain; use it to give a turtle flavor to soups and gravies.

BASSETT SAUCE. — 1 pt. of water; a large teacup of sugar; butter the size of an egg; little nutmeg and essence of lemon; bring to a boil; take a little flour or corn starch well beaten into a thin paste; stir in until of the consistency wished; add a large tablespoon of vinegar.

BECHAMEL SAUCE.—Mix cold, and well together, in a tin saucepan, 2 oz. of butter and a tablespoonful of flour; add a pt. of milk; stir continually, and when thickened take off the fire; beat the yolk of an egg in a cup, with a teaspoonful of water; turn into the sauce and mix well; salt a little, and add pepper for vegetable; for puddings, add instead nutmeg and brandy or wine.

BENGAL CHINTI.—1½ lb. chillies; 1 lb. unripe mangoes; 2 lbs. red tamarinds; 1 lb. sugar candy; 1½ lbs. fresh ginger root; 1½ lbs. garlic; 1½ lbs. sultana raisins; 1 lb. fine salt; 5 bottles best vinegar. Soak the chillies for an hour in the vinegar; grind all with a stone and muller to a paste.

BROWNING.—1. 4 oz. sugar; 1 oz. butter; melt these in a frying pan or ladle with about a tablespoonful of water. Continue the heat until the whole is a dark brown; then lower the head and pour in gradually 1 pt. port wine; now remove the pan from the fire; stir the mixture well until the roasted sugar is entirely dissolved; then bottle. Add ½ oz. each of bruised pimento and black pepper; 5 or 6 shallots, cut small; a little mace and finely grated lemon peel, and ¼ pt. mushroom catsup. Shake the bottle daily for a week. Let it alone 5 or 6 days

and then decant into another bottle.—2. Put into a tin or porcelain saucepan ½ lb. of white sugar and a tablespoonful of water; stir over a slow fire until of a clear, dark brown color; do not let it burn; add a teacupful of water and a teaspoonful of salt; boil 3 or 4 minutes; cool; strain, and put away in closely corked bottles.

CAMP VINEGAR.—1. 12 chopped anchovics; 2 cloves of garlic minced; 1 dr. of cayenne; 2 oz. of soy; 4 oz. of walnut catsup; a pt. of the best vinegar; digest for a month and strain. —2. Vinegar, 1 qt.; walnut catsup, 1 pt.; mushroom catsup, 4 tablespoonfuls; garlic, 4 heads; cayenne, ½ oz.; soy, 2 tablespoonfuls; port wine, 2 glasses; 3 anchovies; a tablespoonful of salt; put them into a bottle; shake daily for a month, and decant.

CAPER SAUCE. — Put 12 tablespoonfuls of melted butter into a stewpan; place it on the fire; when on the point of boiling, add 1 oz. of fresh butter and 1 tablespoonful of capers; shake the stewpan round over the fire until the butter is melted; add a little pepper and salt.

CARAWAY, Essence of. — Bruised caraway seed, 1 oz.; rectified spirit, 8 oz.; oil of caraway, ¼ oz.; brown sugar, ½ oz.; digest for 8 or 10 days, and filter.

CARRAC SAUCE.—2 heads of garlic sliced; 5 spoonfuls of soy; 5 spoonfuls of mushroom catsup; 8 spoonfuls of walnut pickle; 15 anchovies, or 5 spoonfuls of essence of anchovies; 3 spoonfuls of mangoe pickle; 1 qt. of vinegar; mix in a bottle, and set in the chimney corner; shake daily for a month.

CATCHUP, CATSUP, or KETCHUP.—1. (*Beer.*) Take of good old beer, 2 qts.; white wine, 1 qt.; anchovies, 4 oz.; mix; heat to a boil; remove it from the fire; add of peeled shallots 3 oz.; mace, nutmegs, ginger and black pepper, of each, bruised, ½ oz.; macerate for 14 days, with frequent agitation; allow it to settle; decant and bottle the clear portion.—2. (*Cherry.*) 1 pt. of cherry juice; ¾ lb. of sugar; a teaspoonful each of ground cloves and cinnamon, with a dash of cayenne pepper; boil until a thick syrup; bottle and seal.—3. (*Cold.*) Take ½ peck of ripe tomatoes, cut fine; 1 small cup of grated horse radish, and the same of salt and black and white mustard seeds mixed; 2 tablespoonfuls of black pepper; 2 red peppers, without the seeds, and 3 celery stalks, all chopped fine, or celery seed; 1 cupful of nasturtiums and onions, mixed and chopped; 1 teaspoonful of ground cloves; 2 teaspoonfuls cinnamon; 1 teaspoonful mace; 1 teacup brown sugar; 1 qt. best cider vinegar; mix well and put in air-tight jars; do not heat it.—4. (*Cucumber.*) 1 bush. of table-sized green cucumbers; pare and grate them on a large grater into a sieve; squeeze and drain the pulp till very dry; add black pepper and salt; rub in thoroughly with the hands. Fill ordinary fruit jars half full of pulp; take white wine vinegar, let it come to a boil, and fill the jars; stir thoroughly, and seal the jars while hot. Put a tablespoonful of oil on top each jar to keep it air-tight.—5. (*Currant.*) 5 pts. of ripe currants; 3 pts. of sugar; 1 pt. of vinegar; 1 tablespoonful each of cinnamon, cloves, allspice and black pepper; ½ tablespoonful of salt; boil all together for ½ hour.—6. (*Gooseberry.*) 10 lbs. of gooseberries; 7 lbs. of sugar; 3 pts. vinegar; add cinnamon, cloves and allspice to suit the taste; boil slowly for 2 hours; put the sugar in last, and let it boil for a short time only.—7. (*Grape.*) 5 lbs. of fruit; 3 lbs. of coffee sugar; 1 pt. of vinegar; 1 tablespoonful of cinnamon; 1 of allspice; 1 of black pepper; ½ of cloves, all ground, and ½ of salt; pulp the grapes, and boil the skins in clear water until tender; boil the pulps separately; strain to remove the seeds; mix the spices in a little cold vinegar; put all together; boil about 5 minutes.—8. (*Mushroom.*) Take the full-grown flaps of freshly-gathered mushrooms; crush them with the hands; throw a handful of salt into every peck, and let them stand a night or two; put them into pans and set them in a quick oven for 12 hours; strain them through a hair sieve and press out all the juice; to every gallon of liquor put of cloves, Jamaica pepper, black pepper and ginger, 1 oz. each, and ½ lb. of common salt; set it on a slow fire and let it boil until half the liquor is wasted; put it into another vessel; when cold, strain and bottle it; cork up closely and cover the cork with oiled paper.—9. (*Oyster.*) Open 100 oysters and preserve all their liquor; add to them 1 lb. of anchovies, 3 pts. white wine, and 1 lemon sliced with half the peel; let this boil gently ½ hour; strain it through muslin; add to it cloves and mace, ½ oz. each, and 1 grated nutmeg; let it boil ½ hour more; add to it 2 oz. of eschalots; when cold, bottle it with the spice and eschalots.—10. (*Pontac.*) Take of the juice of elderberries and strong vinegar, of each 1 pt.; anchovies, ½ lb.; shallots and spice, q. s., to flavor; boil for 5 minutes; cool, strain and bottle. Use to make fish sauces.—11. (*Red Pepper.*) Cut up red peppers and place them in a preserving kettle until it is full; cover with the best cider vinegar and boil until the peppers have dropped to pieces; after removing from the fire, as soon as the sauce is cool enough, rub it through a wire sieve; it is better without salt or any other condiments; put up for use in large mouthed bottles or jars.—12. (*Tomato.*) Select fair ripe tomatoes; cut out all blemishes, also the hard parts about the stem end; slice them into a porcelain kettle; fill in full; add a red pepper and put the kettle over a slow fire to stew; gradually stir to prevent burning; when reduced to half the original quantity, strain the whole through a common wire sieve; to 5 lbs. of the pulp add 1½ lbs. of sugar, 1 pt. of cider vinegar, 1 tablespoonful of cloves, 1 of allspice, 2 of cinnamon, 1 of salt; put the mixture back over the fire and boil until the thickness suits.—13. (*Walnut.*) Boil or simmer 1 gal. of the expressed juice of walnuts, when they are tender; skim it well; put in 2 lbs. of anchovies, bones and liquor, ditto of shallots, 1 oz. of cloves, ditto of mace, ditto of pepper, and 1 clove of garlic; let all simmer till the shallots sink; bottle, and divide the spice to each; cork closely; tie the bladder over, and put it in small bottles.

CAYENNE, Essence of.—Put ½ oz. of cayenne pepper into ½ pt. of brandy; let it steep for a fortnight; then pour off the clear liquor.

CEDRAT, Essence of.—Press the yellow part of citron peel between two glass plates, and distil the flowers of the citron-tree.

CELERY, Essence of.—Celery seed, ½ oz. to 1 oz.; brandy, 4 oz.; digest for 8 or 10 days, and filter.

CELERY SALT.—Sift 4 oz. of finely powdered celery seed with an equal quantity of fine salt; put into bottles; cork tightly, and use for seasoning soups, salads, and warmed up meats.

CELERY SAUCE.—Put 2 oz. of butter into a saucepan; melt it; add 2 heads of celery cut up into inch pieces; stir the celery in the pan until it is quite tender; add salt and pepper with a little mace; mix 1 tablespoonful of flour in 1 cupful of stock and simmer ½ hour; a cupful of cream may be used instead of the stock.

CHERRY, Essence of.—1. Benzoic ether, 5 parts; acetic ether, 10 parts; oil of persico (peach kernels) and benzoic acid, each 2 parts; oxalic acid, 1 part.—2. To 5 parts acetate of ethyl, 5 parts benzoate of ethyl, 1 part œnanthylate of ethyl, and 1 part saturated solution of benzoic acid in alcohol, add 3 parts glycerine.

CHERVIL SAUCE.—Put a few mushrooms, parsley, chervil, shallots, 2 cloves, a bay leaf, and a few tarragon leaves, into some melted butter; let them soak for some time; add a little broth, white wine, pepper and salt; reduce it to a proper thickness, but do not skim it; when done, put in some chervil scalded and chopped; warm it all up together.

CHESTNUT SAUCE.—Use very large Spanish chestnuts; cut a slice in the side of each; roast them well; peel the nuts and put them into a saucepan of rich melted butter. If you use American chestnuts, boil them till quite soft; peel them and thicken the melted butter with them.

CHILI SAUCE.—Take 2 qts. of ripe tomatoes, 4 large onions, and 4 red peppers; chop them together; add 4 cups of vinegar, 3 tablespoons of brown sugar, 2 tablespoons of salt, 2 teaspoons each of cloves, ground cinnamon, ginger, allspice, and nutmeg; boil all together for 1 hour; bottle for use after straining through a sieve or coarse netting.

CHUTNEY SAUCE.—Sour apples (pared and cored), tomatoes, brown sugar, sultana raisins, of each 3 oz.; common salt, 4 oz.; red chillies and powdered ginger, of each, 2½ oz.; garlic and shallots, of each 1 oz.; pound the whole well; add, of strong vinegar, 3 quarts; lemon juice, 1 do.; digest, with frequent agitation, for a month; pour off nearly all of the liquor, and bottle it. Use for fish or meat, either hot or cold, to flavor stews, etc.

CINNAMON, Essence of.—Bruised cinnamon, 2 dr.; oil of cinnamon, 1 dr.; highly rectified spirit, 3 oz.; digest and strain.

CINNAMON, Tincture of.—Bruised cinnamon, 3 oz.; a bottle of Cognac brandy; digest for a fortnight, and strain.

CREAM DRESSING.—Where oil is disliked in salads, rub the yolks of 2 hard-boiled eggs fine with a spoon; mix with them a dessertspoonful of made mustard; stir in a tablespoonful of melted butter, ½ teacupful of thick, sweet cream, a saltspoonful of salt, and a pinch of cayenne pepper with vinegar enough to reduce all to a smooth creamy state; pour it upon lettuce or other salad ready for the table.

CURRY POWDER.—1. Coriander seed, 6 dr.; turmeric, 5 oz.; fresh ginger, 4½ dr.; cumin seed, 18 gr.; black pepper, 54 gr.; poppy seed, 54 gr.; garlic, 2 heads; cinnamon, 1 oz.; cardamom, 5 seeds; 8 cloves; 1 or 2 chillies; ½ cocoanut, grated; all but the last ground on a stone.—2. Coriander-seed, ½ lb.; turmeric, ½ lb.; cinnamon seed, 2 oz.; cayenne, ½ oz.; mustard, 1 oz.; ground ginger, 1 oz.; allspice, ½ oz.; fenugreek seed, 2 oz.; dry all thoroughly; pound in a mortar; rub through a sieve, and mix together.

CURRY VINEGAR.—Infuse 3 oz. of curry powder in a quart of vinegar, near the fire, for 3 days.

DEILLETS, Essence of.—3 oz. cinnamon; cloves, 1½ oz. (both well bruised); rectified spirit, 1 qt.; digest for a week.

DRAWN BUTTER SAUCE.—Season 1 cupful of flour with salt, pepper, and a pinch of nutmeg; mix it with some water into a paste; work in a piece of butter about the size of an egg; put the pan over the fire and boil for 20 minutes; take it off, and add some fresh butter in small portions at a time; stir continually to prevent the butter from rising to the top; add the juice of ½ lemon before serving.

DUTCH SAUCE.—Blend together 2 oz. of butter and a teaspoonful of flour; put it into a stewpan with equal quantities of stock and vinegar; stir for 2 minutes; add the beaten yolks of 2 eggs; keep up the stirring till the mixture thickens; if you let it boil it will curdle; add the juice of ½ lemon before serving.

EGG SAUCE.—Put 2 oz. of butter into a saucepan with a dessertspoonful of flour and a very little water; simmer gently; when ready to boil take the saucepan from the fire and stir in 2 oz. more of butter and 3 cold hard-boiled eggs cut up small; sprinkle a little salt on the egg.

FLAVORING ESSENCE.—Purified oil of bitter almonds, 8 drops; essence of lemon, 12 drops; oil of cinnamon, 8 drops; oil of nutmeg, 4 drops; highly rectified spirit, 1 oz.; add a few drops to puddings, custards, etc.

FRENCH DRESSING.—3 tablespoonfuls of oil to 1 of vinegar; 1 saltspoon heaping full of salt; an even saltspoonful of pepper mixed with a little cayenne.

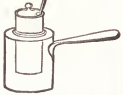
GARLIC SAUCE.—3 or 4 garlics; divide and boil in a little white vinegar and white stock, with a small piece of lean ham; when reduced, strain it off; add either white or brown sauce to the liquor; season with salt, pepper, and sugar; but leave out the vinegar.

GINGER, Essence of.—1. Fresh grated ginger, 3 oz.; fresh thin lemon peel, 2 oz.; brandy, 1½ pts.; macerate for 10 days.—2. Unbleached Jamaica ginger (bruised), 5 oz.; rectified spirit, 1 pt.; digest a fortnight; press, and filter.—3. The best Jamaica or China ginger, 2 oz.; proof spirit, 1 pt.; powder the ginger; mix it with the spirit; stop close; let it steep for 12 or 14 days.

GLAZE.—Gravy or clarified soups boiled until it gelatinizes on cooling. It is used as a species of varnish to cover various dishes for the table; may be spiced and flavored according to the fancy of the cook. White of egg is gener-

ally used as glaze for pastry, applied by a brush.

GOOSEBERRY, Essence of.—To 1 part aldehyd, 5 parts acetate, 1 part benzoate, and 1 part œnanthylate of ethyl, add 5 parts saturated solution of tartaric and 1 each of succinic and benzoic acids.



Glazing Pot.

GRAPE, Essence of.—Œnanthic ether, glycerine, each 10 parts; tartaric acid, 5 parts; succinic acid, 3 parts; aldehyd, chloroform, and formic ether, each, 2 parts; methyl-salicylic ether, 1 part.

Glazing Brush.

HARVEY SAUCE.— Chop 12 anchovies, bones and all, very small, with 1 oz. of cayenne pepper, 6 spoonfuls of soy, 6 ditto of good walnut pickle, 3 heads of garlic chopped not very small, ¼ oz. of cochineal, 2 heads of shallots chopped rather large, and 1 gal. of vinegar; let it stand 14 days; stir it well twice or thrice every day; pass it through a jelly bag; repeat this till it is quite clear; then bottle it; tie a bladder over the cork.

HIGDUM.—4 qts. of green tomatoes; 1 pt. of green peppers; 1 pt. white onions; all measured after chopping fine; add 1 pt. white mustard seed, 2 teacups fine salt, and 4 tablespoonfuls of ground cloves; let it stand over night; strain off the liquid; pour over sufficient boiling vinegar to cover the whole; put in bottles or cans, and cork closely.

HOT SPICE.—A delicious adjunct to gravies, steaks, chops and soups. 3 dr. each of ginger, black pepper, and cinnamon; 7 cloves; 1 oz. of mace; 1 of cayenne; 1 of grated nutmeg; 1 of white pepper; pound together; mix till well blended; then put in a perfectly clean, dry bottle for use.

KITCHENER'S SAUCE.—Salt, 3 oz.; black pepper, 2 oz.; allspice, horseradish, and shallots, of each, 1 oz.; burnt-sugar coloring, 1 wineglassful; mushroom ketchup, 1 qt.; bruise and scrape all; macerate for 3 weeks; strain and bottle.

LEMON, Essence of.—1. Fresh oil of lemons, 1 fl. oz.; deodorized alcohol (strongest flavorless rectified), 8 fl. oz.; exterior yellow rind of lemons (fresh), ½ oz.; digest 48 hours; filter.—2. To 1 part chloroform, 1 part nitric ether, 2 parts aldehyde, 10 parts acetate of ethyl, 10 parts valerianate of amyl, 10 parts saturated solution of tartaric acid, and 1 of succinic acid, add 5 parts of glycerine.

MAYONNAISE SAUCE.—Rub the yolks of 3 hard-boiled eggs with the yolk of 1 raw egg to a smooth paste; add a heaping teaspoonful of salt, 2 saltspoonfuls of white pepper, and 2 saltspoonfuls of made mustard; mix thoroughly and work a gill of oil gradually into the mixture, alternated with a teaspoonful of tarragon vinegar until you have used three tablespoonfuls of vinegar; if the sauce appear too thick, add a wineglassful of cream to it gradually.

MELON ESSENCE.—2 parts aldehyde; 1 part formiate; 4 parts butyrate; 5 parts valerianate of ethyl; 10 parts sebaic ether; 3 parts glycerine.

MINT SAUCE.—Wash the sprigs of mint; let them dry on a towel; strip off the leaves; chop them very fine; put in a sauce boat with a cupful of vinegar, a little salt and pepper, and 4 lumps of sugar; let it stand 1 hour; before serving, stir all together.

MUSHROOM SAUCE. — Have ready some cream sauce, rather thinner than usual; to this put a few small white mushrooms; reduce it to the proper consistence.

MUSTARD SAUCE.—1. Best flour of mustard, 2 lbs.; fresh parsley, chervil, celery and tarragon, of each ½ oz.; garlic, 1 clove; 12 salt anchovies (all well chopped); grind well together; add salt, 1 oz.; sweeten with grape juice or sugar; sufficient water to form the mass into a thinnish paste by trituration in a mortar; put into pots; thrust a red hot poker into each; and pour a little vinegar upon the surface.—2. Pour a very little boiling water over 3 tablespoonfuls of mustard; add 1 saltspoonful of salt; a tablespoonful of olive oil; stir slowly in; add 1 teaspoonful of sugar and the yolk of 1 egg; beat well together, and pour in vinegar to taste.—3. 1 cup of sugar; 1 cup of vinegar; 1 tablespoonful of butter; 4 eggs, and 1 tablespoonful of mustard; beat the eggs well; mix all together; turn into a new tin pail or basin and boil in water to a cream; strain through a thin cloth and it is done.

NUTMEG, Essence of.—Use essential oil of nutmeg, and proceed as for essence of allspice.

ONION SAUCE.—Boil the onions till they are tender; then squeeze the water from them; chop them; add butter that has been melted, rich and smooth, with a little good milk instead of water; give it one boil; serve it with boiled rabbits, partridges, scrag or knuckle of veal, or roast mutton; a turnip boiled with the onions draws out the strength.

ORANGE, Essence of.—1. Fresh yellow rind of orange, 4 oz.; rectified spirit and water, of each ½ pt.; digest for a week; press, filter and add of sherry wine, 1 qt.—2. To 2 parts aldehyde, 5 parts acetate of ethyl, 1 part each of formiate, butyrate, and benzoate of ethyl, 1 part salicyate of methyl, 10 parts essence of orange, 1 part saturated solution of tartaric acid, add 10 parts glycerine.

OYSTER FLAVOR.—Take fresh, large, plump oysters; beard them, and place them in a vessel over the fire for a few moments, in order to extract the juice; put them to cool; chop them very fine with powdered biscuit, mace and finely minced lemon peel; pound them until they become a paste; make them up into thin cakes; place them on a sheet of paper in a slow oven; let them bake until they become quite hard, pound them directly into powder, and place the powder in a dry tin box, well covered; keep in a dry place.

PEACH, Essence of.—Formic ether, valerianic ether, butyric ether, acetic ether, glycerine and oil of persico, each 5 parts; aldehyd, amylic alcohol, each 2 parts; sebaeylic ether, 1 part.

PEAR. Essence of.—Acetic ether, 5 parts; amyl-acetic ether and glycerine, each 2 parts.

PEPPERMINT, Essence of.— 1. A spirituous solution of the essential oil obtained by distillation and colored with spinach leaves.—2. Dissolve 1 oz. oil of peppermint in 15 oz. of strong alcohol; add 2 dr. peppermint in coarse powder, and after macerating 24 hours filter through paper.

PEPPER SAUCE.—Take 2 doz. peppers; cut them up fine, with double the quantity of cabbage; 1 root of horseradish grated; 1 handful of salt; 1 tablespoonful of mustard seed; 1 tablespoonful of allspice; 1 dessertspoonful of cloves; 2 tablespoonfuls of sugar, and a little mace; boil the spice and sugar in 2 qts. of the best cider vinegar, which, as soon as removed from the fire and while yet boiling, pour over the other ingredients; when cold, put it in jars; cover close and keep in a cool place.

PINEAPPLE, Essence of.—1. Butyric ether, 1 oz.; alcohol, 10 oz.; tincture of fresh lemon peel, 2 oz.; tincture of fresh orange peel, 2 oz.; rose water, 2 oz.; mix, and keep for 24 hours in a warm place; set aside for 3 days in a cool place; filter; 15 drops are sufficient for 1 qt. of pineapple lemonade.—2. To 1 part chloroform, 1 part aldehyde, 5 parts butyrate of ethyl, and 10 parts butyrate of amyl, add 3 parts glycerine and 100 parts alcohol.—3. Oil of pineapple, 1 dr.; tartaric acid, 1 dr.; simple syrup, 6 pts.—4. Pineapple juice (by expression), 1 gal.; sugar, 15 lbs.; fruit acid, 2 oz.

PORK SAUCE.—Cut 2 or 3 good sized onions into slices; fry them lightly; add a little broth, a few mushrooms chopped, a clove of garlic, vinegar and spice; let it boil ½ hour; reduce to a proper consistency; then skim and strain.

QUINCE, Essence of.—Pelargonate ethylie ether has the odor of the quince, and when dissolved in alcohol in due proportion forms quince essence.

RASPBERRY, Essence of.—1. Tincture of orris root (1-4), 2 oz.; acetic ether, 2 oz.; butyric ether, 1 dr.; spirit of nitrous ether, 1 oz.; chloroform, 1 dr.; glycerine, 1 oz.; alcohol 1 pt.; water enough to make 2 pts.—2. To 1 part each of nitric ether, aldehyde, formiate of ethyl, butyrate of ethyl, benzoate of ethyl, œnanthylate of ethyl, sebaic ethyl, salicylate of methyl, acetate of amyl, butyrate of amyl and succinic acid, and 5 parts each of acetate of ethyl and tartaric acid, add 4 parts of glycerine and 100 parts alcohol.

SALAD DRESSING.—Beat 2 eggs; add a piece of butter the size of ½ an egg; ½ teaspoonful of mustard, rubbed smooth in a little water; 4 tablespoonfuls of vinegar, and ½ teacup of boiling water; set it in a bowl in the top of the teakettle; stir occasionally till of the consisteney of cream.

SAUCE AU ROI.—Good brown vinegar, 3 qts.; soy and walnut ketchup, of each ½ pt.; cloves and shallots, of each 1 doz.; cayenne pepper, 1½ oz.; mix, and digest for 14 days.

SAUCE ROBERT.—Put 2 medium-sized onions, chopped very fine, with a large lump of butter in a stewpan; let them brown well, constantly stirring; add a teaspoonful of flour mixed with ½ pt. of good stock; salt and pepper; cook about 5 minutes; add a teaspoonful of mixed mustard and one of vinegar.

SOUP HERB SPIRIT.—Use prime thyme, sweet marjoram, sweet basil and summer savory; when thoroughly dried, pound and sift them; steep in brandy for a fortnight; the spirit will then be fit for use.

SOY.—Boil 1 gal. of the seeds of Dolichos soja till soft; add 1 gal. of bruised wheat; keep them in a warm place for 24 hours; add 1 gal. of salt and 2 gal. of water; after keeping them bunged up in a stone jar for 2 or 3 months press out the liquor. White haricots or kidney beans are good substitutes for Dolichos soja.

SPIRIT OF SAVORY SPICES.—Black pepper, 1 oz.; allspice, ½ oz.; nutmeg, ½ oz. (all pounded); infuse in 16 fl. oz. of brandy for 10 days.

STRAWBERRY, Essence of.—Butyric ether and acetic ether, each 5 parts; amyl-acetic ether, 3 parts; amyl butyric ether and glycerine, each 2 parts; formic ether, nitrous ether and methyl-salicylic ether, each 1 part.

SYRUP OF SUGAR.—To 1 lb. of crushed sugar put 1 pt. water; let boil slowly 10 minutes; skim well; squeeze the juice of ½ lemon in it; beat the white of 1 egg up very light; add to it 1 gill of cold water; stir it gradually into the boiling sugar; strain through a fine cloth.

TARRAGON VINEGAR.—Put fresh tarragon leaves into a stone jar; pour on them a sufficient quantity of the best wine vinegar to cover them; set the jar in a warm place for 14 days; then strain through a jelly bag.

TOMATO SAUCE, Preserved.—1. ½ a peck of ripe tomatoes, peeled and drained through a colander 24 hours, then made fine; put to them 1 small teacupful of salt, 1 full cupful of sugar, 1 cupful of white mustard seed, 1 gill of masturtium seed, 4 tablespoonfuls of horseradish, 2 doz. stalks of celery chopped up fine, or ½ oz. celery seed, 2 tablespoonfuls of ground black pepper, 1 qt. of good vinegar; do not boil; stir well, and bottle for use.—2. To 2 gals. of peeled and sliced green tomatoes put 5 tablespoonfuls of mustard, 3 gills of mustard seed, 2½ tablespoonfuls of black pepper, 2 of allspice, 2 of cloves, 1 gill of salt, 1 qt. of chopped onions, 2 qts. of brown sugar, 5 pts. of vinegar; beat the spice; boil all well together to the consistency of marmalade.

TOMATO SAUCE, Temporary.—(To serve with meats, etc.) Melt in a stewpan a dozen or two ripe tomatoes (which, before putting into the stewpan, cut in two and squeeze the juice and seeds out); then put 2 shallots, 1 onion, with a few bits of ham, 1 clove, a little thyme, 1 bay leaf, a few leaves of mace, and when melted rub them through a tamis; mix a few spoonfuls of good Espagnole and a little salt and pepper with this puree. Boil it for 20 minutes, and serve.

TURTLE, Essence of.— Essence of anchovies and shallot wine, of each, 3 oz.; basil wine, ½ pt.; mushroom ketchup, ½ pt.; the juice of 2 lemons; the yellow peel of 1 lemon; curry powder, ½ oz.; digest for a week. Use to impart the flavor of turtle to soups and gravies.

VANILLA, Essence of.—1. Vanilla (cut small), 2 oz.; rectified spirit, 1 pt.; digest a fortnight.—2. Vanilla, 2 oz.; water, 10 oz.; rectified spirit,

¾ oz.; cut the vanilla in small pieces; pound it fine in a marble mortar, with loaf sugar (about a pound); add the white of an egg and the spirit; put it into a glazed pot; tie a piece of writing paper over it; make a hole in it with a pin; stand the pot in warm water, keeping it at that heat for 24 hours; then strain for use.

WATERLOO SAUCE.—Strong vinegar, nearly boiling, 1 qt.; port wine, ⅜ pt.; mushroom ketchup, ½ pt.; walnut ketchup, ½ pt.; essence of anchovies, 4 oz.; 8 cloves of garlic; cochineal, powdered, ½ oz.; or red beet, sliced, 3 oz.; let them stand together for a fortnight or longer, occasionally shaking the bottle.

WESTPHALIAN ESSENCE.—1. Crude or empyreumatic pyroligneous acid, 1 pt.; sugar coloring, 2 oz.; dissolve; in a week decant the clear portion.—2. Tar, 3 dr.; sugar coloring, 2 oz.; hot crude pyroligneous acid, 1 pt.; agitate constantly for 1 hour; after repose decant the clear portion.

WHEY POWDER.—1. Gently evaporate whey to dryness; powder with about ½ its weight of lump sugar.—2. Sugar, 7 oz.; sugar of milk, 2 oz.; gum Arabic, 1 oz.; all in fine powder; mix well; 1 oz. dissolved in 1¼ pt. of water forms extemporaneous whey.

WORCESTERSHIRE SAUCE.—Mince 2 cloves of shallot, put the mince into a dry bottle, and pour over it a pint of Bordeaux vinegar; add 3 tablespoonfuls of essence of anchovy, 3 tablespoonfuls of walnut ketchup, 2 tablespoonfuls of soy, and as much cayenne as is approved; the quantity cannot be given, as cayenne varies so much in quality; cork the bottle, keep it in a cool place, and shake it twice a day for a fortnight; strain the sauce, put it in small bottles, cork closely, and store for use.

Custards, Puddings, Etc.

REMARKS.—Every sort of pudding, whether sweet or savory, should be dressed in a basin instead of in a cloth. To cause them to turn out well, rub the inside of the basin thoroughly with butter. In the preparation of meat puddings never use any meat that is tainted. The gradual heating of the meat will cause the smallest piece of tainted meat to contaminate all the rest. Also, be careful to see that the suet and fat are not rancid. The paste for puddings may be ordinary short paste (see Pastry) or that made with 2 to 6 oz. of butter or lard, or 3 to 8 oz. of chopped beef suet, to each lb. of flour, with or without an egg, and a little sugar. The first is most appropriate for those containing fresh fruit, and that with suet for meat puddings and those containing dried fruit. Milk, or milk and water, is often used instead of simple water to make the dough. Ginger, spices, savory herbs, etc., are common additions to the crusts of puddings. Where economy is an object, kitchen fat is frequently substituted for suet, and lard for butter. When self-raising flour is employed, an excellent plain pudding paste may be made by simply mixing it with very cold water, and immediately putting it into the water, which should be boiling, and kept in that state until the pudding is dressed. The water should boil quickly when the pudding is put in, and care be taken that it continues to do so, or the pudding will be heavy; and it should be moved about for a minute or two, that the ingredients may not separate. A pudding cloth should never be washed with soap, but simply dried as quickly as possible and kept dry and free from dust. Make the pudding bags of stout domestic or white flannel, tightly sewed, and the seam left on the outside. Wring it out of hot water and flour it well on the inside, before putting in the batter. Leave a space of nearly ½ for it to rise; tie tightly. When taken out, dip it in cold water, pulling the open end back over the pudding, letting it slip out without breaking.

ALMOND BREAD.—A loaf of Vienna bread, cut into slices; pound almonds with a little vanilla, and spread between the slices; turn the bread in milk to maintain the crust; tie the slices together and turn the loaf in 1 egg; fry on every side a few minutes in lard; pour over the whole a custard; beat an egg with a little milk; put a little sugar into milk already on the stove; add the egg, and remove as soon as the custard boils; season with cinnamon.

ALMOND CREAM CUSTARD.—Boil 1 qt. of cream; sugar and flavor to taste; blanch ¼ lb. of almonds; beat them fine; add a tablespoonful of rose water; beat well the whites of 9 eggs; add to the almonds; beat well together; mix with the cream; set on the fire, and stir until it almost boils; pour in a bowl and stir until cool; serve in glasses.

ALMOND CUSTARD.—1 pt. milk, half cream; ½ lb. almonds, blanched and powdered to a paste in a Wedgewood mortar; add gradually 2 tablespoonfuls rose water, yolks of 3 eggs and whites of 2, 4 tablespoons sugar; scald the milk; add the beaten eggs, sugar, and almond paste; boil, stirring constantly, till it thickens; make a meringue of the whites of 2 eggs and 2 tablespoonfuls powdered sugar; flavor with bitter almonds, and heap upon the top.

ALMOND PUDDING.—1 cupful of finely minced suet; 1 teacupful of milk; 4 oz. of bread crumbs; 4 oz. of well-cleaned currants; 2 oz. of almonds; ½ lb. of stoned raisins; 3 well-beaten eggs and the whites of 2 others; sugar, nutmeg, cinnamon, and a small glass of rum; butter a shape, and place part of the raisins neatly in rows; blanch the almonds; reserve half of them to be placed in rows between the raisins just before serving; mix all the remaining ingredients well together; put into shape and boil for 3 hours. The sauce: 1 tablespoonful of milk; yolks of 2 eggs, well beaten, and some sugar to taste; put it on the fire and stir it till it comes to the boil; let it cool; when lukewarm stir into it a glass of sherry or currant wine; serve in a sauce tureen.

AMBER PUDDING.—2 lbs. of raw apples; 3

oz. of sugar; 1 gill of cold water; 1 teaspoonful of lemon juice; yolks and whites of 4 eggs; 6 oz. of flour; 2 oz. of butter; ½ teaspoonful of yeast powder; a pinch of salt; put 2 oz. of the sugar in a saucepan, with ½ gill of water; place in the apples, pared and cored; squeeze over them the lemon juice; put the flour in a basin with 2 oz. of butter; rub the butter carefully in the flour; add the yeast powder, salt and remaining ½ gill of water; place the whole on a board and knead lightly together; roll the dough ¼ in. in thickness; wet the edges of a small pie dish with cold water, and line the edges with some of the dough; wet the dough with water or milk; roll the remaining dough thin; with a small cutter cut rounds out of the dough and place them on the edge of the pie dish, upon the dough already covering the edge; when the apples in the saucepan with the sugar, water and lemon juice have become soft, rub them through a wire sieve; then drop into the sauce, one at a time, the yolks of 4 eggs; mix the eggs and the apples together, without beating the yolks; pour them into the pie dish, in the hollow formed by the dough cakes; place the dish in the oven for 10 minutes.

ANGEL PUDDING.—2 oz. of flour; 2 oz. of powdered sugar; 2 oz. of butter melted in ½ pt. of new milk; 2 eggs; mix well; bake in small patty pans until nicely browned, and send to table on a dish covered with a small table napkin. A little powdered sugar should be sifted over each pudding, and slices of lemon served with them.

ANGEL'S FOOD.—1 box gelatine in 2 qts. of milk; put on the fire until dissolved; add 12 tablespoonfuls of sugar and yolks of 6 eggs, well beaten, let it boil a few minutes; flavor with wine or vanilla; stir in the whites of the eggs beaten to a stiff froth; put in molds to cool; serve with cream.

APPLE BATTER PUDDING.—4 beaten eggs; 1 pt. of rich milk; 2 cups of flour; 1 teaspoonful of salt; 2 even teaspoonfuls of baking powder; peel and core 8 ripe, tart apples; put into a deep baking dish; fill the centre of each with sugar, and pour the beaten batter over them; bake 1 hour; eat with cream and sugar; flavor with nutmeg or lemon.

APPLE BLACK CAP.—Divide 12 large apples in halves; core and place them on a thin patty pan close to each other, with sides downward; squeeze a lemon over them; shred some fine lemon peel; throw it over them; grate fine sugar over all; set in a quick oven and bake ½ hour; when served, strew the sugar all over the dish.

APPLE BLOSSOMS.—Stew ½ doz. large apples into a nice, smooth sauce; add while warm ½ teaspoonful of fresh butter and sugar enough to make thoroughly sweet; heat a little butter in the frying pan; pour in a cup of bread crumbs, which must be stirred over the fire until they are pale brown; sprinkle these on the bottom and sides of a buttered mold; put 3 well beaten eggs and ½ teaspoonful of lemon juice into the apple sauce; then pour it into a mold; strew some of the bread crumbs over the top and bake 15 minutes; turn out on a hot dish, and serve with wine sauce.

APPLE CHARLOTTE.—Butter and flour lightly the pudding dish; line it with thin slices of bread, buttered on both sides; put a thick layer of apples, cut in thin slices; sugar, and a little cinnamon and a few pieces of butter; another layer of bread and butter; apples, sugar, cinnamon, and butter last; bake slowly for 2 hours; keep the pan covered until ½ hour before serving; let the apples on top brown.

APPLE CUSTARD.—Peel and core 8 large juicy apples; boil them till tender, in clear water; take them out and pulp them smooth through a sieve; add ½ lb. sifted sugar and the grated rind of 2 lemons; put the mixture into a deep dish, about ½ filling it; beat the yolks of 4 eggs light; add ½ teacupful of white sugar, and stir into 1 qt. of sweet milk; stir this over the fire until it is quite thick; let it cool; when cold, pour it over the apples; whip the whites of the eggs to a stiff froth, and pour over the top.

APPLE DUMPLINGS.— 1. 1 pt. of flour; 1 tablespoonful lard and butter mixed; 1 cup of milk; ½ teaspoonful of soda, dissolved in hot water; 1 of cream tartar; a pinch of salt; chop the shortening into the flour, after you have sifted this and the cream tartar together, put in the soda and wet up quickly with the milk, just stiff enough to roll into a paste less than ½ in. thick; cut into squares; lay in the centre of each a tart apple, pared and cored; bring the corners of the square neatly together, and pinch slightly; bake in a moderate oven; eat it with a hot, sweet sauce.—2. Roll out some dough, thicker than pie crust; inclose a handful of sliced ripe apples, well covered with sugar and butter; bring the edges together as in any other dumplings; place them side by side in a pudding pan; spread butter and sugar over them, and pour boiling water to about half cover the dumplings; put them in the stove and cook moderately fast until they are nicely browned. The butter, sugar and water make a nice sauce, which can be enriched with more butter and flavored with nutmeg if desired.

Apple Corers.

APPLE PUDDING.—Make a good paste; roll it out and place in a basin rubbed with dripping; press out the plaits so that the crust may be of an equal thickness all round; peel and cut up 4 large apples; put ½ of them in; then add 1 tablespoonful moist sugar and 1 of cloves; put in the rest of the apples; cover the top well over with paste; press it down, that the water may not get in; tie a cloth over; put it into boiling water and boil fast for 2½ hours, if the crust be made of dripping, and 1 hour longer if it be made of suet; take off the cloth; pass a knife around the edge of the basin; turn out the pudding carefully when sending it to table.

APPLE SAGO PUDDING.—Take 6 heaping tablespoonfuls of sago; cover with water; let it stand over night; in the morning add nearly 1 qt. of water; put over the tea kettle; let it stand until it is clear; then add a little salt; prepare 6 medium-sized apples (pleasant sour are nicest) by paring and digging out the cores; fill the apples with sugar and place in a nappy; pour the sago over them; bake slowly 1½ hours; serve with milk and sugar.

APPLE TAPIOCA PUDDING.—1 large cupful of tapioca; 1 cupful of sugar; 1 teaspoonful of salt; 1 teaspoonful of essence of lemon; a little nutmeg; 3 pts. of cold water; 3 pts. of pared and quartered apples; wash the tapioca; soak it 3 hours in the water, or over night; cook the tapioca in a saucepan, with the water, until it looks clear; stir often to prevent burning. It will take from 20 minutes to ½ hour; add the sugar, salt and lemon flavoring, and then the apples; turn into a buttered dish, and bake 1½ hours; let it stand in a cool room ½ hour before serving; serve with sugar and milk.

ARROWROOT PUDDING.—From 1 qt. of new milk take a small teacupful and mix it with 2 large spoonfuls of arrowroot. Boil the remainder of the milk and stir it among the arrowroot; add when cold 4 well beaten eggs, with 2 oz. loaf sugar, and the same of fresh butter broken into small pieces; season with grated nutmeg. Mix it well together, and bake in a buttered dish 15 or 20 minutes.

BACHELOR'S PUDDING.—Beat up 3 eggs; flavor with essence of lemon and grated nutmeg; add them to 4 oz. each of finely minced apples, currants, grated bread crumbs, and 2 oz. of sugar; mix thoroughly and boil in a buttered mold nearly 3 hours.

BATTER PUDDING.—Take 1 small baker's loaf; cut off the crust; pour over the rest 1 qt. boiling milk; when cold, beat it to a pulp; stir in 4 well beaten eggs, 1 small teacup of flour, and ½ yeast cake dissolved; bake 20 minutes; serve with a very sweet and highly flavored sauce, when hot.

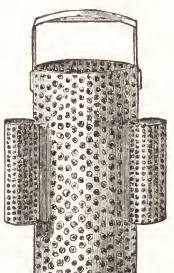
BERRY PUDDING.—Stew 1 qt. of blueberries or whortleberries; sweeten to taste; take stale bread, and butter each piece; immerse each piece in the berries; lay in a pudding dish first a layer of bread, then a layer of berries, taking care to have the last layer one of berries; eat cold, with milk and sugar.

BIRD'S NEST PUDDING.—Make the foundation of nest of blanc mange, corn starch or jelly; grate the rinds of 3 lemons or oranges, and arrange around the blanc mange to represent straw; extract the contents of four eggs through a small hole and fill the egg shells with hot blanc mange or corn starch; when cold break off the shells and lay the molded eggs in nest. Serve with jam or preserves.

Bird's Nest Pudding.

BLACKBERRY PUDDING.—3 pints of milk; 5 well beaten eggs; 3 pts. blackberries, which have been previously stewed, with a little sugar, flour, salt and 2 teaspoons of yeast powder.

BREAD PUDDING.—Cut slices of ½ in. thickness from a loaf of bread; take off the outside crust; cut the slices in small squares; pour enough warm milk over to moisten them; then beat 2 eggs light and stir them into a pint of milk; rub the inside of a tin mold with butter, and having picked and washed ½ lb. raisins, put them into the mold; lay the soaked bread on them; pour the milk and eggs over; dip a cloth in hot water; dredge flour over one side; tie it over the mold; boil for 1 hour; when done take the cloth from it, lay a dish over the mold, and turn the pudding upon it; serve with melted butter. —2. Put all scraps of bread into the oven until they become a nice brown; roll or grate them while hot quite fine; for a good-sized pudding, take ½ lb. of crumbs, ¼ lb. of brown sugar, ¼ lb. of currants or raisins, 1 pt. of milk, 1 teaspoonful of allspice and 1 pt. of boiling water; pour the boiling water over the crumbs; stir them well, and let them soak until soft; take all the ingredients; mix well; rub the pie dish with beef dripping; fill it; put some more dripping or butter on top of the pudding, and bake ½ hour.



Bread Grater.

BROWN PUDDING.—Take ½ lb. bread crumbs; ½ lb. of flour; 3 oz. of suet; 1 small teacupful of brown sugar; ½ teaspoonful of carbonate of soda; ½ teaspoonful of baking powder; ½ teaspoonful of salt; 1 teaspoonful of cinnamon; ½ teaspoonful of mixed spice; 1½ pts. of milk poured upon a tablespoonful of jam; mix well together; steam for 2 hours. Sauce for the pudding: Beat the yolk of an egg with 1 tablespoonful of sugar; add 1 teaspoonful of corn flour, 1 oz. of fresh butter, and 1 teacupful of water; pour it into a saucepan and stir it till it boils; add a glass of sherry and serve in a sauce tureen.

BUTTERMILK PUDDING.—Boil 1 qt. of fresh buttermilk; beat 1 egg, a pinch of salt, and a heaping teaspoonful of flour together; pour into the boiling milk; stir briskly, and boil for 2 or 3 minutes; serve while warm with sugar, or maple syrup.

CABINET PUDDING.—Spread the inside of a plain mold with butter, and ornament the sides with dried cherries and candied citron; fill the molds with alternate layers of slices of sponge-cakes and ratafia or macaroni; fill up the mold with a lemon custard made with 8 yolks of eggs, 1 pt. of milk or cream, 6 oz. of sugar, 1 glass of brandy, and the grated rind of 1 lemon; this custard must not be set, but merely mixed up; steam the pudding in the usual way, for about 1½ hours; when done, dish it up either with arrowroot sauce or a custard.

CANARY PUDDING.—The weight of 3 eggs in sugar and butter; weight of 2 eggs in flour; rind of 1 lemon; 3 eggs; melt the butter, but do not let it boil; add to this the finely-minced lemon

peel; gradually mix in the flour, stirring well all the time; beat up the egg well; blend the material perfectly; put in a buttered basin and boil for 2 hours; serve with a sweet sauce.

CATSKILL MOUNTAIN PUDDING.—1 pt. sweet milk; 1 qt. of flour; 1 tablespoonful of butter; same of sugar; ½ teaspoonful of salt; 2 eggs; 2 teaspoonfuls of baking powder; 1 teacup of currants or raisins; beat butter and sugar together; add eggs; stir milk and flour alternately until all is in, having previously mixed the powder into the flour; add fruit the last thing; steam 2 hours; eat with a rich egg sauce.

CHEESE PUDDING.—Into 2 qts. of boiling water, containing 2 tablespoonfuls of salt, stir 1 lb. of corn meal and ½ lb. of grated cheese; boil for 20 minutes, stirring it occasionally to prevent burning; put it in a greased baking pan; sprinkle over the top ½ lb. of grated cheese; brown in a quick oven; serve hot; if any remains, slice it cold and fry brown.

CHERRY DUMPLING.—Put cherries, fresh or canned, 3 in. deep on the bottom of a porcelain lined kettle; throw in sugar to sweeten; add ½ teacup of water; sprinkle over enough flour to slightly thicken the juice; roll out raised Graham biscuit crust, shortened with cream, about 1 in. thick; spread quite over the cherries; cover the kettle tight (shutting the cover in with a cloth spread over the top if need be); cook steadily on top of the stove (taking care that it shall not burn) ¾ hour or so till the crust is well cooked.

CHERRY PUDDING.—1 qt. of scalded milk; not quite a pt. of corn meal; a scant ½ pt. of sifted flour; 4 well beaten eggs; 2 teaspoonfuls of baking powder; 1 teaspoonful of salt; 1 pt. of whole ripe cherries; let the milk stand after heating until tepid; stir in the meal and flour, reserving a tablespoonful to mix the baking

Pudding Molds.

powder with; add the eggs and salt; then the cherries and baking powder; turn into a pudding mold or bag; steam 2 hours; eat with sugar and cream or butter sauce.

CHESTER PUDDING.—Take a large lemon; grate the rind and squeeze out the juice; 1 dozen sweet almonds; 1 dozen bitter almonds; pound them; 1 oz. butter; ½ lb. of loaf sugar; the yolks of 4 eggs; put all into a saucepan over a slow fire; when the butter melts, beat all together; line a dish with puff paste; lay in the mixture; bake in a quick oven; send to table on a napkin, with the whites of the eggs beaten and laid upon the top.

CHOCOLATE CUSTARD.—Scald a qt. of milk; stir in 4 heaping tablespoonfuls of grated chocolate and simmer 2 minutes to dissolve it; beat up the yolks of 6 eggs with 1 cup of sugar; add to the milk and chocolate; stir for a minute; then add vanilla flavoring and pour into your custard cups, which should be waiting in pan ½ full of boiling water in the oven; cook until you see that the custards are done; let them cool and then grate sweet almonds over the top; make a meringue of the whites of the six eggs and a little sugar; pile it on the top of each custard; grate more sweet almonds over that; set them in the oven to brown a little, or brown by holding a salamander or hot stove lid over them.

CHOCOLATE MERINGUES.—½ doz. eggs; 1 lb. sugar; 1 qt. milk; 6 tablespoonfuls of corn starch; 1 spoonful of vanilla, and 5 oz. of chocolate; break up the chocolate; put it in a pan; nearly cover it with milk; put it where it will heat very gently; as it dissolves, stir it into a smooth paste; add the milk gradually; stir until it reaches the scalding point; mix corn starch with 2 or 3 spoonfuls of milk; pour it slowly in; stir all the time until it is of the consistency of very thick boiled custard; set it aside to cool before putting in the vanilla; turn the rich brown creamy stuff into small glass dishes; cover the contents with a layer of batter made of the remaining sugar and eggs, the sugar boiled to a syrup, and the eggs beaten up and dropped suddenly into it; pour this on so as to stand up in little snowy peaks.

CHOCOLATE PUDDING.—1 pt. of rich milk; 2 tablespoonfuls of corn starch; 1 scant ½ cup of sugar; whites of 4 eggs; a little salt; flavoring. Beat the eggs to a stiff froth; dissolve the corn starch in a little of the milk; stir the sugar into the remainder of the milk, which place on the fire; when it begins to boil, add the dissolved corn starch; stir constantly for a few minutes, when it will become a smooth paste; now stir in the beaten whites of the eggs, and let it remain a little longer to cook the eggs; flavor the whole with vanilla; take out ½ of the pudding; flavor the remainder in the kettle with a bar of chocolate, softened, mashed and dissolved with a little milk; put ½ of the chocolate pudding in the bottom of a mold wet with water; smooth the top; make a layer with the white pudding; smooth it also; next the remainder of the chocolate pudding; serve with whipped cream, or a boiled custard made with the yolks of the eggs and flavored with vanilla.

CITRON PUDDING.—Sift 2 tablespoonfuls of flour; mix with the beaten yolks of 6 eggs; add gradually 1 pt. of sweet cream, ½ lb. of citron cut in strips, and 2 tablespoonfuls of sugar; mix thoroughly; pour the batter into buttered tins; bake 25 minutes; serve with wine or vanilla sauce.

COCOANUT PUDDING.—1. Beat 2 eggs with 1 cupful of new milk; add ½ lb. of grated cocoanut; mix it with 3 tablespoonfuls each of grated bread and powdered sugar, 2 oz. of melted butter, 5 oz. of raisins, and 1 teaspoonful of grated lemon peel; beat the whole well together; pour the mixture into a buttered dish;

bake in a slow oven; turn it out; dust sugar over it, and serve. This pudding may be either boiled or baked — 2. 3 slices of bread soaked in 1 pt. of milk; 6 eggs; beat the yolks well into the bread, using 1 egg at a time; add 1 oz. of butter; mix ½ lb. of desiccated cocoanut with the bread; add another pt. of milk; sweeten to taste; beat the whites of the eggs to a froth; mix with the compound just before baking; put in a moderately hot oven and bake for 1 hour.

COFFEE PUDDING.—Make 2 cupfuls strong extract of coffee by dripping it as slowly as possible; 8 cupfuls of milk; beat into the milk the yolks of 6 eggs; add 3 oz. powdered sugar; mix into this the coffee; pour the mixture into cups; put the cups in a pan with boiling water; the level of the water ought not to stand higher than half the cup; boil about 15 minutes.

CORN STARCH PUDDING.—4 tablespoonfuls (heaping) of corn starch; 1 pt. boiling water; the same quantity of scalding milk; salt; heat milk and water to scalding in a pail set in a pot of hot water; wet up the corn starch with a little cold milk; add the salt; stir this into the boiling milk and water until the mixture is about as thick as hot mush; turn into an uncovered deep dish, and set in hot water to keep warm until you are ready to eat it; eat with sifted sugar mixed with nutmeg or cinnamon and milk or cream, or with a simple custard poured over it, or with butter and sugar. If you have plenty of milk, use no water.

COTTAGE PUDDING.—1 cup of sugar; 1 tablespoon of butter; 2 eggs; 1 cup sweet milk; flour enough to make a tolerably stiff batter; ½ teaspoon of soda; 1 teaspoon of cream tartar; sift with the flour; 1 teaspoon of salt; rub the butter and sugar together; beat in the yolks, then the milk, soda, salt, and the beaten whites alternately with the flour; bake in a buttered mold.

CRACKED WHEAT PUDDING.—Take 1 qt. of unskimmed milk; then add to it 1 gill of cracked wheat, uncooked, 1 gill of sugar, and a small piece of stick cinnamon; place it in an oven of moderate heat; when about half done, stir the crust already formed, and leave it to form another, which will be sufficiently brown.

CRACKER PUDDING.—Mix 10 oz. finely powdered crackers with a wineglass of wine, a little salt, and ½ nutmeg, 3 or 4 tablespoonfuls of sugar, 2 of melted butter; beat 8 eggs to a froth; mix them with 3 pts. of milk; turn them on to the rest of the ingredients; let it remain till the crackers begin to soften; then bake it.

CRANBERRY DUMPLING.—1 qt. of flour; 1 teaspoonful of soda, and 2 teaspoonfuls of cream of tartar; sift together; mix into a soft dough with sweet milk; roll the dough out very thin in oblong shapes; spread over it 1 qt. of cranberries, picked and washed clean; add ½ lb. of sugar; sprinkle evenly; fold over and over; tie in a pudding cloth and put in a steamer, where let it cook over a steady fire for 1 hour.

CREAM CUSTARD.—1. Sweeten a pt. of cream with powdered white sugar; set it on a few coals; when hot, stir in white wine until it curdles; add rose water or essence of lemon to the taste; turn it into cups.—2. Mix a pt. of cream with 1 of milk; 5 beaten eggs; 1 tablespoonful of flour, and 3 of sugar; add nutmeg to the taste; bake the custards in cups or pie plates in a quick oven.

CURD PUDDING.—Pour 1 qt. of boiling milk on 1½ pts. of buttermilk; strain and press the curd lightly; beat well with 1 oz. of butter, 1 oz. of sugar, 1 teaspoonful of bread crumbs and 4 eggs; bake in cups ½ hour.

CUSTARD, Baked.—Beat the yolks of 4 fresh eggs for at least ½ hour; add 5 oz. of pulverized sugar; stir into the sugar and eggs 1 qt. of rich new milk, cold; add a teaspoonful of distilled rose water, or any flavoring extract you fancy; fill your custard cups and set them in a stone pan half filled with water, which may be warm at first—not hot; put the pan in a rather cool oven; gradually increase to a moderate heat; in about 20 minutes dip a teaspoon into one of the custards to ascertain if it is firm.

CUSTARD, Boiled.—1 qt. of milk; yolks of 5 eggs and the whites of seven; 6 tablespoons sugar; vanilla flavoring—1 teaspoon to the pint; heat the milk almost to boiling; beat the yolks light and stir in the sugar; take the milk from the fire; put a spoonful or two of the milk to the beaten eggs; beat well all the while; add more and more milk as you mix, until there is no longer danger of sudden curdling; stir in 5 whites whipped stiff; return to the fire; stir until thick, but not until it breaks; season with vanilla; pour into glass cups; whip the whites of 2 eggs to a meringue with a heaping tablespoon of powdered sugar; when the custard is cold, pile a little of this on the top of each cup.

CUSTARD BREAD PUDDING.—Make a custard with 1 pint of milk, 3 eggs, some sugar and flavoring; put it into a neat pudding dish; fit thin slices of buttered bread over the custard; don't lap the slices over each other; grate a little nutmeg over the top; bake in a moderate oven until the custard is done, but not until it turns to whey; serve warm.

CUSTARD, Burned.—Fill a glass bowl nearly full with 3 pts. of nice boiled custard; beat until perfectly light the whites of 6 eggs; to each egg allow 1 tablespoonful of puiverized white sugar; add gradually, beating all the time; heap the bowl with this meringue; with an iron plate or clean shovel, heated red hot, brown well all over until the delicate flavor is imparted that gives the name of burned custard.

DAMASCENE ROLLS.—Stew the cherries or whatever fruit you desire with a little sugar; roll out the pastry into a thin sheet, the thinner the better; spread over a thick layer of the fruit; then, commencing at one side, roll carefully until all the fruit is inclosed within the paste; pinch together at the ends; tie up in a strong cotton cloth; drop into a pot of boiling water; serve with sweet sauce.

DIPLOMATIC PUDDING. — Decorate a plain mold with a lining of currants and pistachio nuts; fill the outer part with jelly; when the jelly is set remove the lining by putting a little warm water in it; make a custard with a pt. of milk and 4 yolks of eggs; flavor the milk with

vanilla; add ½ oz. of isinglass; stir it into the custard when hot; break up 1 or 2 sponge cakes and maccaroons; cut up a few dried fruits; put a layer of each until the mold is full; pour in the custard; leave it in a cool place untill wanted; then dip the mold into tepid water a second; turn it out on a cold dish and serve.

DRIED APPLE PUDDING.—Wash 10 oz. of apples well in warm water; boil them in 1 qt. of water; when soft, add 10 oz. of sugar, 8 oz. of butter, and the juice and grated rind of 2 lemons; when cold, and ready to bake, add 5 well beaten eggs; bake with or without pastry.

DRIED PEACH PUDDING.—¾ lb. flour; 1 pt. dried peaches; 3 gills of beef suet; 1 teaspoonful of salt, and cold water. Chop the peaches and suet; mix them with the flour and salt; add water to stick the ingredients together in as stiff a dough as can be easily made with a spoon; tie it in a cloth, leaving room to swell, and steam or boil from 3 to 4 hours.

EGG DUMPLINGS.—Make a batter of 1 pt. of milk, 2 well-beaten eggs, a teaspoonful of salt, and flour enough to make as thick as for pound cake; have a clean saucepan of boiling water; let the water boil fast; drop in batter by the tablespoonful; take them with a skimmer on a dish; put a bit of butter and grated nutmeg, with syrup or sugar over them.

EGGLESS CUSTARD.—1 qt. of new milk; 1 teaspoonful of rennet wine, or a small piece of rennet; a little lemon, nutmeg, or vanilla, or any spice you prefer; 1 teaspoonful of sugar; if too sweet, the milk will not set firmly or quickly; stir all together and set by the stove or near the fire; cover closely; it should begin to stiffen in an hour; if it does not, add more wine or rennet; when firm, before the whey separates, take out the piece of rennet, if the skin was used, and set on ice till dinner. Eat with sugar and rich cream.

EGG PUDDING.—4 eggs, well beaten; 4 tablespoons of flour; add to the eggs until a smooth mass; then add 1 pt. of milk, slowly, and a pinch of salt; beat all smooth together; put in a well buttered dish, and bake about 20 minutes; eat with sauce made of butter and sugar, beaten together to a cream, and flavor with vanilla.

EXETER PUDDING.—Put in a proper sized basin 10 oz. of fine bread crumbs; 4 oz. of sago; 7 oz. of suet, chopped fine; 6 oz. of moist sugar; the peel of ½ lemon, grated; ¼ pt. rum, and 4 eggs; stir for a few minutes with a spoon; add 3 more eggs and 4 tablespoonfuls of clotted cream; mix well; it is then ready to fill the mold; butter the mold well; put in a handful of bread crumbs; shake the mold well till the greater part sticks to the butter; then throw out the remainder, and have ready 6 little sponge cakes, 2 oz. of ratafias and ½ lb. of either raspberry or strawberry jam; cover the bottom of the mold with a layer of ratafias; just cover them with a layer of the mixture; cut the sponge cake lengthwise; spread quickly each piece with some jam; put a layer in the mold; then a few ratafias; afterwards some of the mixture; and so on, until the mold is full; take care that a layer of the mixture is on top of the pudding; bake 40 minutes.

FARINA PUDDING.—Heat 1 qt. of milk to the boiling point; stir in dry 5 tablespoonfuls of farina; continue to stir it until quite thick; add 1 cupful of sugar and ½ teaspoonful of salt; flavor with lemon or vanilla; eat with sweetened milk or cream, with a little nutmeg or other flavoring added.

FARMER'S PUDDING.—1 cup of corn meal; ½ cup of flour; ½ cup of sugar; moisten with a little milk; boil 3 pts. of milk; pour slowly on the meal and stir until quite thick; add ½ cup of molasses and a little salt; bake in an earthen dish 2 hours.

FIG PUDDING.—Chop ½ lb. figs very finely; mix them with ¼ lb. of coarse sugar, 1 tablespoonful of syrup for 1 tablespoonful of milk, ½ lb. flour, ½ lb. suet, 1 egg, and a pinch of grated nutmeg; put the pudding into a buttered mold and boil for 4 or 5 hours.

FRANCATELLI PUDDING.—Pour 1 pt. of boiling milk on 10 tablespoonfuls of grated bread crumbs; let them stand 10 minutes; add the yolks of 4 eggs well beaten, 6 tablespoonfuls of sugar, 2 of butter; season with lemon or what you like; when beaten light, stir in the whites of the eggs, which have been well whipped; pour into a buttered dish and bake quickly.

FRUIT PUDDING.—Put a layer of any kind of fruit (previously stewed with sugar and allowed to get cold) in a deep glass dish; mix 3 tablespoonfuls of corn starch with 1 gill of milk; boil 1 pint of milk with the thin rind of 1 lemon; sugar to taste; when well flavored with the lemon, pour the boiling milk through a strainer on to the corn starch; stir and return to the saucepan; boil 5 minutes, or until it thickens; when cool enough not to break the glass pour on the fruit; leave it to get quite cold and set.

GELATINE PUDDING.—1 oz. gelatine; 1 pt. cold milk; set on the stove; let it come slowly to a boil; stir occasionally; separate the yolks and whites of 6 fresh eggs; beat the yolks well and stir slowly into hot milk; add ½ lb. of granulated sugar; when quite cold stir in 1 qt. of whipped cream; flavor with vanilla and lemon extract mixed; have the whites of the eggs beaten very stiff, and stir in the last thing; pack on ice.

GINGER PUDDING.—1 cup of butter; 2 of sugar; 1 of milk; 4 of flour; 1 tablespoonful of ginger; 1 teaspoonful of saleratus; 2 of cream of tartar; 4 eggs; beat the sugar and butter to a cream; stir in the eggs, which are to be well beaten; then the milk, and last the flour, in which the saleratus, ginger and cream of tartar are well mixed; bake in a pudding dish for 45 minutes; serve with lemon or vinegar sauce. After adding the flour beat but little.

GRAPE JELLY PUDDING.—Make in a pipkin or other closely covered dish; to 3 gills of rice take 1 qt. of grapes stemmed and washed; place a layer of the latter on the bottom of the pipkin; sprinkle upon them sugar enough to sweeten them; then a thin layer of rice, and so on, finishing off with the rice; handle carefully, so that the rice shall not mostly settle to the bottom; after it is set into the oven, put in water enough

to cover it; cook slowly 2 or 3 hours, or until the rice is very tender; serve cold, with a dressing of sweetened milk or cream, or grape juice if wanted.

HALF-PAY PUDDING.—Carefully wash and dry ¼ lb. of currants; stone the same quantity of raisins; chop an equal amount of suet; mix them with 8 oz. of stale bread, 3 table-spoonfuls of molasses, ½ pt. of milk, and 1 teaspoonful each of spice, salt and baking powder; put these ingredients into a mold which has been well buttered and floured; steam them about 3 hours. If the top of the pudding is watery, put it into a hot oven for 10 or 15 minutes to brown; when ready to use it, turn from the mold, and send to the table with cream sauce.

HARLAN'S PUDDING.—Take 3 oz. each of butter, sugar and flour; whisk 2 eggs thoroughly, and gradually mix with them the loaf sugar, which must be rubbed well on the rind of a lemon before it is pounded; add the flour and the butter partially melted, 1 saltspoonful of salt, and a little grated nutmeg; butter the insides of several cups; put a little jam at the bottom of each; fill them nearly full with the mixture; bake ½ hour; turn them out and serve with wine sauce.

HASTY PUDDING.—Put 1 pt. of milk, properly salted, into a clean qt. stewpan; have ready a basin of flour; as soon as the milk boils, take some flour in the left hand; let it fall lightly into the milk (which must be kept boiling fast the whole time); stir without ceasing; add flour until it is about the consistency of porridge; then let it boil a few minutes longer, still keeping it stirred; turn it out on a hot dish, stick pieces of butter all over it, sprinkle sugar and grate some nutmeg; the butter and sugar will melt and mingle, and, running all over and around it, form a delicious sauce. Do not be too sparing of butter and sugar.

HINGHAM PUDDING.—1 cup of molasses; ⅔ cup of butter or suet; 1 cup of water; 3 cups of flour; 1 cup of raisins and currants; 1 teaspoonful of soda; steam 3 hours. It is as good when 2 or 3 weeks old as when fresh; put it in and steam when wanted.

HOLIDAY PUDDING.—Take 2 large lemons and grate off the peel of both; use only the juice of 1, unless you like quite a tart flavor; add to the lemon ½ lb. of fine white sugar, the yolks of 12 and the whites of 8 eggs well beaten; melt ½ a lb. of butter in 4 or 5 tablespoonfuls of cream; stir all together; set the mixture over the fire; stir it until it begins to be pretty thick; take it off; when cold fill your dish a little more than ½ full, having previously lined its bottom with fine puff paste; bake carefully.

HOME PUDDING.—1 qt. milk; 4 eggs, beaten separately; 8 tablespoonfuls baking powder; ½ cupful sugar; bake in a greased pan 35 minutes. Sauce for this pudding: ½ pt. milk, 3 tablespoonfuls sugar, 1 tablespoonful of butter, 1 small tablespoon flour; heat the milk boiling hot; mix sugar, butter and flour, previously well beaten together, into it; flavor with vanilla.

HONEY PUDDING.—½ lb. honey; 6 oz. butter; ¼ oz. bread crumbs; 8 eggs; beat the honey and butter to a cream; add the bread crumbs; beat all together for 10 minutes with the yolks of the eggs; put into mold; boil 1½ hours; serve with any nice pudding sauce.

HUCKLEBERRY PUDDING.—1 qt. flour; 3 teaspoonfuls of baking powder; 1 pt. sweet milk; 1 egg; 3 tablespoons of sugar; a lump of butter the size of an egg; a little salt; stir in as many berries as you choose, not less than 1 pt.; steam or boil in a bag for 1 hour. Sauce: 1 cup of sugar; 1 egg; ½ cup butter; beat these together till light; fill the dish with boiling water; there will be a sort of cream on the top; when serving dip the gravy ladle deep in the bowl, so that the first one helped to pudding will not have all the cream; flavor with vanilla.

INDIAN SUET PUDDING.—½ lb. suet; 1 cup of molasses; 1 pt. of milk; 1 egg; 1 teaspoonful of ground cloves; 1 teaspoonful of ground cinnamon; 1 teaspoonful of salt, nutmeg and raisins; mix the suet and molasses and put on the fire to warm; add milk, eggs, spices and fruit, either chopped raisins or currants, then Indian meal sufficient to make a thin butter; boil or steam 3 hours; serve with sauce.

JELLY CUSTARD.—To 1 cupful of any sort of jelly add 1 egg; beat well together with 3 teaspoons cream or milk; after mixing thoroughly bake in a good crust.

KING GEORGE'S PUDDING.—1 pt. of bread crumbs; ½ pt. flour; 1 teaspoonful of baking powder, sifted in flour; a little salt; ½ lb. raisins; ½ lb. currants; ½ lb. chopped suet; coffeecupful of milk; 1 egg; tie tightly in a bag; boil 3 hours; eat with hard sauce.

LEMON CUSTARD.—Stir 3 wineglassfuls of lemon juice, with ½ lb. of powdered loaf sugar, 1 glass of white wine and ½ wineglass of water with a little grated lemon peel; mix all together; put the ingredients into a saucepan on the fire; stir it until it becomes thick and of a proper consistence.

LEMON DUMPLING.—Mix with 10 oz. of fine bread crumbs, ½ lb. of beef suet chopped extremely fine, 1 large tablespoonful of flour, the grated rinds of 2 small lemons, or of 1 very large lemon, 4 oz. pounded sugar, 3 large or 4 small eggs, beaten and strained; last of all the juice of the lemons strained; divide the mixture into 4 equal portions; tie in well floured cloths; boil them 1 hour.

LEMON MERINGUE PUDDING.—1 qt. milk; 2 cups bread crumbs; 4 eggs; ½ cup butter; 1 cup white sugar; the juice of 1 large lemon and ½ the rind grated; soak the bread in the milk; add the beaten yolks, with the sugar and butter rubbed to a cream, also the lemon; bake in a buttered dish until firm and browned slightly; draw to the door of the oven and cover with a meringue of the whites whipped to a froth with 3 tablespoonfuls of powdered sugar and a little lemon juice; brown very slightly; sift powdered sugar over it and eat cold.

LEMON PUDDING.—9 eggs, the whites beaten to a stiff froth; 2 lemons, the grated rind and juice; 1 lb. of sugar; nearly 3 oz. of butter creamed; 1 pt. of milk; 1½ even tablespoonfuls of flour; beat the yolks and sugar until very light; add the butter, with which the flour has been smoothly mixed; then the lemons, the

milk, and the eggs, which must be beaten in slowly, gently and thoroughly; bake in deep, paste lined plates; put it in quite a hot oven, reducing the heat after the first 8 or 10 minutes.

LEMON TAPIOCA.—Take a teacup of large tapioca and soak it over night in a pint of water; in the morning make a rich lemonade with 2 or 3 lemons and 1 pt. of water; put it with the tapioca, and boil until clear; if too thick, add more water; boil until tender; drain off the water and add the peel, cut into straws, to the tapioca before quite done; eat cold with cream.

LEMON WHIP PUDDING.—Soak 1 oz. of gelatine and the thin rind of 2 lemons in 1 pt. of cold water for 1 hour; take out the rind; set the water and gelatine on the fire, and when the latter is all dissolved add $\frac{3}{4}$ lb. of loaf sugar and the juice of 3 lemons; let all boil together for 5 minutes; then pour out the mixture and let it stand until it is cold and beginning to set; beat stiffly the whites of 2 eggs; add them to the mixture; beat the whole for about $\frac{1}{2}$ hour, till it becomes of the consistency of sponge; pile it lightly in a dish, leaving it rocky in appearance; pile fresh lady fingers around the base; serve with boiled custard poured around it on the pudding plates. The custard is made with the yolks of the 2 eggs and 1 whole egg.

MACARONI PUDDING.—Butter a pie-dish; cover the bottom with $2\frac{1}{2}$ oz. uncooked macaroni; pour over it 1 qt. of cold milk; add 2 tablespoonfuls of sugar; stir in 2 well-beaten eggs; flavor with 1 teaspoonful of vanilla or any flavoring desired; put bits of butter over the top; dust a little grated nutmeg over top; bake slowly 2½ hours.

MALAGAN PUDDING.—$\frac{1}{2}$ cup of rice; 1 cup sugar; 2 eggs; 1 pt. of milk; $\frac{1}{2}$ lemon and salt; soak the rice over night; beat the yolks of the eggs with 1 tablespoon of the sugar, and grate in the lemon rind; add the rice and milk; bake 1 hour; take the whites of the eggs and beat to a stiff froth with the rest of the sugar; then add the lemon juice; pour it over the pudding after it is baked, and brown it in the oven 2 or 3 minutes; eat cold.

MANHATTAN PUDDING.—Dissolve a walnut of saleratus in 1 tablespoonful of hot water; mix 1 cupful of milk, 3 well-beaten eggs, 2 tablespoonfuls of flour (mixed with cold milk), 1 pinch of salt, and 4 oz. of chopped citron; add saleratus, and mix all thoroughly; pour the mixture into a buttered mold; tie the mold in a floured cloth; boil 1½ hours; turn out, and serve with a fruit sauce.

MARLBOROUGH PUDDING.—Grate apples enough to make 8 oz.; add to this 8 oz. of fine white sugar which has been well rubbed on the rind of a large lemon, 6 well-beaten eggs, 3 tablespoonfuls of cream, the strained juice of 3 lemons, 8 oz. of butter; add quantity at pleasure of orange flower water, and the grated peel of an orange and a lemon; line the pie dish with rich puff-paste; put in the mixture, and let it bake in a quick oven.

MERINGUES.—1 pt. clear white sugar syrup; slowly boil it till it begins to bubble; test it by rubbing a spoonful against the side of the pan, where it turns white. Vigorously whisk the whites of ½ doz. eggs in a basin; pour its contents into the boiling sugar; mix the whole into a stiff batter or paste; lay large egg-shaped spoonfuls of it on to strips of paper laid on a long narrow board of hard wood; spoon out a long row of these ½ eggs at about 1 in. distance from each other; sift some finely powdered white sugar over the whole; as soon as that is a little dissolved, place the board in a rather slow oven; watch them rise; in a few minutes slip them out; strip off the papers with a broad knife; pop a pat of preserve or jelly on the flat side, so as to stick it fast to another half, and so form a complete egg-shaped meringue, which pile up with others on a large silver waiter.

MILK PUDDING.—With 1 pt. of milk thicken 3 gills of flour; stir it gradually till quite smooth; boil until done; stir in ¼ lb. of butter while hot; put by until just before dinner; then beat 5 eggs very light, the whites and yolks separately; add 5 large tablespoonfuls of powdered sugar, a little mace or rind of lemon, and a little juice; bake quickly, and serve immediately from the oven.

MINUTE PUDDING.—Place over the fire 1 teacup sweet milk for every guest; let it come to a boil; stir in 1 egg and 1 teaspoon flour wet with a little milk; stir well; let it cook a few minutes; oil common teacups with butter and put the pudding into them; when cool turn the cup in a saucer; the pudding will slip out; serve with sweetened cream.

MOLASSES PUDDING.—3 cups of flour; 1 each of molasses, melted butter, and hot water; 1 teaspoonful of soda; steam 3 hours; serve with sauce of sugar and butter worked to a cream with a little hot water added, and flavoring.

MONDAY'S PUDDING.—Cut the remains of a good cold plum pudding into finger pieces; soak them in a little brandy and lay them cross-barred in a mold until full; make a custard with 1 pt. of milk and 5 eggs; flavor with nutmeg or lemon rind; fill up the mold with it; tie it down with a cloth; boil or steam it for an hour; serve with a little of the custard poured over, to which has been added a tablespoonful of brandy.

NOODLE PUDDING.—3 eggs beaten light; add a little salt and flour to make a paste that will roll; roll the paste ⅛ in. thick; fold the paste and shred fine; boil in clear water with a little salt; put them into the water while it is boiling; do not allow them to stick together, or uncover the pot for 10 minutes; take them out and drain well; bake them 1 hour; beat 2 eggs light; mix them in a qt. of milk; stir in the noodles; add salt, sugar, and spices to taste; bake as custard.

ORANGE CUSTARD.—Boil the rind of ½ good orange very tender; then beat till it is fine; add to it a spoonful of the best brandy, the juice of an orange, ¼ lb. of loaf sugar, and the yolks of 4 eggs; beat well for 10 minutes; pour in by degrees 1 pt. of boiling cream; keep beating as you pour into your cups; set the cups in an earthen dish of hot water; let them stand till they are set; take them out and spread preserved orange peel over the top of each cup; serve hot or cold, according to taste.

ORANGE MARMALADE PUDDING.— 1 cupful of fine bread crumbs; ½ cupful sugar; 1 cupful of milk or cream; 4 eggs; 2 teaspoonfuls of butter; 1 cupful orange, or other sweet marmalade; rub the butter and sugar together; add the yolks well beaten, and the milk, bread crumbs and the whites whipped to a froth; put a layer of this in the bottom of a well-buttered mold; spread thickly with some pretty stiff marmalade; then another layer of the mixture, and so on until the mold is full; have the custard mixed on top; bake in a moderate oven about an hour; turn out of the mold upon a dish; serve with sweetened cream or custard.

ORANGE PUDDING. — Peel and slice 3 or 4 oranges; lay in a pudding dish with ½ cup of sugar; make a custard of 1 pt. of milk, the yolks of 3 eggs, 1 spoonful of corn starch, and ½ cup of sugar; when cold pour over the oranges; beat the whites of 3 eggs and ½ cup of pulverized sugar to a stiff froth and pour over; put in the oven a few minutes to brown; eat cold.

PARADISE PUDDING.—3 eggs; ½ lb. of bread crumbs; 3 apples; currants; juice of ½ lemon; nutmeg; salt; mince the apples; beat the eggs and stir them into the bread crumbs and other ingredients; rub the currants in a small quantity of flour before they are put into the mixture; boil 1½ hours; eat hot with sauce.

PEACH TAPIOCA.—Soak ½ pt. tapioca in ½ pt. of cold water for several hours or over night; fill a baking dish ½ full of nice canned peaches; leaveing out the syrup; sprinkle sugar over the peaches, to suit the taste; bake ½ hour; add ½ pt. of the peach syrup to the tapioca, as much boiling water as is needed to thin it, and ½ teacup of sugar; boil this till perfectly clear; then pour over the peaches; bake slowly for another ½ hour; when cold, serve with sugar and rich cream.

PINE-APPLE CUSTARD.—On the day before you wish to use the custard, peel and pick to pieces with 2 forks a nice pine-apple; put plenty of sugar over it and set it away; next day make a custard; when cool, mix with the pine-apple which will have become soft and luscious and thoroughly sweetened.

PINE-APPLE PUDDING. — Butter a pudding dish, and line the bottom and sides with slices of stale cake (sponge cake is best); pare and slice thin a large pine-apple; place in the dish first a layer of pine-apple; then strew with sugar, then more pine-apple, and so on until all is used; pour over a small teacupful of water, and cover with slices of cake which have been dipped in cold water; cover the whole with a buttered plate, and bake slowly for 2 hours.

PINE-APPLE TAPIOCA.—Allow to 1 large cup of tapioca ½ large pine-apple, or the whole of a small one; pare and grate the fruit; put a small quantity of tapioca in the bottom of a dish, then some of the grated fruit and sugar, mixing it more through and through than for strawberries or peaches; add water, and bake.

PLUM PUDDING.—1. 1 loaf of baker's bread; cut in thin slices and buttered; butter the pan well; put a layer of bread and of raisins, a little cinnamon, nutmeg and sugar; then a layer of buttered bread; continue until the pan is full; put milk enough around it to soak it 1 night; cover with a plate to keep it down; before putting it into the oven, heat from 3 to 7 eggs, according to size of pudding; add milk enough to have it moist, but not to have it run over in the oven; add also a little wine or brandy; eat with brandy sauce.—2. 1 lb. of beef kidney grease; 1 lb. of dry raisins; 1 lb. and 3 oz. of fresh bread crumbs; 1 tablespoonful of flour; 12 oz. of brown sugar; 9 oz. of orange peel and citron mixed; a little salt; ½ grated nutmeg; a pinch pulverized ginger; some lemon peel chopped fine; 10 eggs; 4 tablespoonfuls of good brandy or rum; and 1 tablespoonful of sweet cream; wash the raisins in lukewarm water; place them in a basin or wooden bowl, with the peel already cut into square pieces, and steep in a little brandy; trim the beef kidney fat, and chop it very fine, with 1 spoonful of flour; mix it well with the crumbs of bread, brown sugar and the eggs; add the raisins, the peel, the rest of the brandy, salt, nutmeg, ginger, and, last of all, and after it is all well mixed, the cream; spread all this in a large napkin, well buttered; fold up the corners of the napkin; tie to the level of the pudding, so as to make it round; plunge into a saucepan of boiling water; let it boil at least 4 hours constantly; take it out and let it drain in a sieve; cut it from the top so as to keep on a level; then turn it out on a dish, removing the napkin carefully, so as not to disturb the fine part of the pudding; sprinkle with a little rum sauce; apply a match to the pudding when it is on the table or when entering the dining-room; serve a little rum sauce separately.

Plum Pudding.

POOR MAN'S PUDDING.—1 cup molasses; 1 of sour milk; ½ cup butter or beef drippings; 1 teaspoonful soda; flour to make as stiff as can be easily stirred; use raisins as taste or purse dictate; put in a spouted cake tin and steam 3 hours; eat with sweetened cream, or any sauce preferred.

PRUNE PUDDING.—Heat a little more than 1 pt. of sweet milk; when boiling, stir in gradually the following: 1 large spoonful corn starch (or 2 of flour, if more convenient); mix smoothly with a small quantity of cold milk; add 3 or 4 well-beaten eggs, enough sugar to sweeten, 1 teaspoon butter, and a little grated nutmeg; let this come to a boil; then pour it into a well buttered dish; add 1 teacup seeded prunes just before placing in the oven; bake about 20 minutes. The prunes must be previously stewed until tender; serve with or without sauce, as is preferred.

PUDDING SAUCES.—1. 1 cupful cream; 2 of sugar; 1 egg well beaten; 1 tablespoonful butter; 1 teaspoonful corn starch; boil all together till a thick syrup; take off the fire; add grated nutmeg and a glass of wine. — 2. 4 tablespoonfuls of sugar; 2 of butter; 1 of flour, beaten to a cream; add the white of an egg,

beaten to a froth; pour into the whole a gill of boiling water; stir it very fast; flavor with lemon, rose water, nutmeg or wine. — 3. ½ cup of butter; 2½ cups sugar; 1 dessertspoon corn starch wet in a little cold milk; juice of 1 lemon and ½ the grated peel; 1 glass wine; 1 cup boiling water; cream the butter and sugar well; pour the corn starch into the boiling water; stir over a clear fire till it is thickened; put all together in a bowl; beat several minutes before returning to the saucepan; heat once almost to boiling; add the wine, and serve. — 4. Beat 1 egg and 1 cup of white sugar to a froth; make ready a very thin batter with 1½ cups of water, and a piece of butter ½ the size of an egg; pour this batter boiling hot over the egg and sugar just as it goes to the table; flavor to taste; beat, while mixing, the boiled butter and sugar. — 5. (*Plum Pudding.*) Take ½ cupful of butter, and stir in a tablespoonful of flour; 1 cupful of sugar; 2 tablespoonfuls of vinegar; 1 pt. of boiling water, and ½ teaspoonful of cinnamon; set it on the stove, and stir until it boils.—6. (*Whip.*) Break 4 eggs; put the yolks into a small, deep stewpan; add 2 oz. of sifted sugar, a glass of sherry, a little lemon juice and grated peel, and a grain of salt; whisk the sauce over a moderate heat; take care to set the stewpan which contains the whip sauce in another of somewhat larger size, already containing a little hot water; as soon as it presents the appearance of a well-set creamy froth, pour over it the fig pudding or serve separately in a sauce boat. — 7. (*Wine.*) Boil the thin rind of half a lemon in 1 wineglass of water till the flavor is extracted; take it out and thicken the sauce by stirring into it 1 saltspoonful of rice flour or arrowroot which has been mixed in water or milk, and a walnut of butter; boil a moment; add ½ tumblerful of good wine; let the sauce get quite hot without boiling; sweeten a little; serve with the pudding.—8. (*Cream Sauce.*) Boil ½ pt. of cream, thicken it with 1 teaspoonful of corn starch, arrowroot or flour, a large lump of butter, with sugar to taste; when cold add either wine or brandy.—9. (*Hard Cream.*) Take 2 cupfuls of loaf sugar, finely pulverized, 1 teacupful of butter, which cream, until white and springy; then mix the sugar and butter till like cream. Stir in as much wine as it will take, or cream with any extract preferred, or grated nutmeg.

PUFF PUDDING.—4 eggs, yolks and whites beaten separately; add 3 cups of sweet milk, a tablespoonful of melted butter and 3 cups of sifted flour; stir in the whites the last thing; bake in buttered cups; eat hot with sauce.

PUMPKIN PUDDING. — 1 qt. of pumpkin after it is stewed and mashed fine through a sieve; 1 pt. of rich cream; 6 spoonfuls of chopped beef suet, or a ¼ lb. of butter; 8 tablespoonfuls of sugar; 4 eggs; a wineglass of wine, and half that quantity of brandy; ½ nutmeg, and a dessertspoonful of ground ginger; line pie-plates with pastry rolled thin at the bottom; ornament the tops with strips laid crosswise.

QUAKER PUDDING.—Slice up ¾ lb. of baker's bread; beat 8 eggs to a froth; stir in several large spoonfuls of sugar; mix it with 1 qt. of milk and a grated nutmeg; turn it on to the sliced bread; let the whole remain till the bread has soaked up most of the milk; stir in a couple of tablespoonfuls of flour, and a teaspoonful of salt; turn it into a pudding bag and boil it an hour; serve it with rich sauce.

QUEEN'S PUDDING.—8 or 10 fine juicy apples, pared and cored; ½ lb. macaroons, pounded fine; 2 tablespoonfuls sugar; ½ lb. cinnamon; ½ cup sweet, firm jelly; 1 tablespoonful brandy; 1 pt. milk; 1 tablespoonful best flour or corn starch; whites of 3 eggs; a little salt. Put the apples into a pudding dish, well buttered; fill ½ full of water; cover closely and steam in a slow oven until tender; cover, cool, and drain off the water; put into each apple a spoonful of jelly and a few drops of brandy; sprinkle with cinnamon and sugar; cover again, and leave alone for 10 minutes; scald the milk and stir in the macaroons, salt and flour; wet in a little cold milk; boil all together 1 minute; take from the fire; beat for a few minutes, and let it cool before whipping in the beaten whites; pour over the apples, and bake ½ hour in a moderate oven; eat hot with cream sauce.

RASPBERRY DUMPLING.—Make a puff paste and roll it out; spread on raspberry jam and make into dumplings; boil them an hour; pour melted butter into a dish and strew sugar over it for sauce.

RHUBARB PUDDING. — Line your pudding dish with slices of bread and butter; cover with cut up rhubarb strewed with sugar; then slices of bread and butter; and so on alternately, until your dish is full, having the rhubarb and sugar on top; cover with a plate and bake ½ an hour; eat warm.

RICE BLACK-CAP PUDDING.—Butter a pudding basin and stick raisins or prunes all over the bottom; pour into the center a teacupful of dry rice; tie a cloth tightly over the basin and plunge it into boiling water; boil for an hour, when it will turn out a nice shape with the raisins or prunes covering the top of the rice, which form the black cap.

RICE PUDDING. — 1. Wash a large cupful of rice in cold water; boil it in water for 6 minutes; drain off the water; put the rice on in 1½ pts. milk; let it boil until soft; stir occasionally to prevent its burning; when done, put into a basin; stir in a pat of butter; when cold, add 4 eggs, a little ground cinnamon, grated nutmeg and lemon zest; sweeten to taste; bake in a buttered pudding dish, in a moderate oven, putting a few bits of butter over the pudding; when done, serve with a dust of sugar. — 2. Wash 4 oz. of rice through two waters; put it into a baking dish with 3 oz. of sugar and a teaspoonful of flavoring; pour in 3 pts. of milk; put it into a moderate oven to bake 1½ hours, or until it is of a creamy consistence.

ROLY-POLY PUDDING. — Make a rich pudding paste with flour and butter, without suet, but as light as possible; roll it out thin and cut to the breadth of 8 or 10 inches, making it at the same time as long as you please; use ½ lb. flour and 5 oz. of butter wet with water; when rolled out quite smooth, spread on it a thick layer of any jam, but leave about an inch of all

the edges bare; roll it round and twist the ends together; wrap it in a nicely floured cloth, and boil it for 2 or 3 hours, according to size; take it up quite hot, and when served cut it cross-wise.

SAGO APPLE PUDDING. — 1 qt. of boiling water turned upon a cup of pearl sago; have the pudding dish filled with apples pared and quartered; stir the sago well and turn over the apple; bake and eat with sauce.

SAGO PUDDING. — Soak 1 cupful of sago in warm water until it is all swelled alike; add water as it thickens, keeping it warm on the back part of the stove; when all swelled, peel 6 sour apples; core them; put them in the sago; sprinkle some sugar on the top; bake until the apples are soft—say ½ hour; eat with cream and sugar.

SAVORY CUSTARD. — Take the yolks of 2 eggs and the white of 1; put in a small basin; add 1 gill of beef tea and ½ saltspoonful of salt; whip up the eggs and the beef tea; take a small cup which will hold the mixture, and butter it; take a piece of white letter paper and butter it; tie it on the cup; have a saucepan with hot water and put it on the fire to boil; when the water is boiling, put in the cup, so that the water stands below the top of the cup; let it simmer for ½ hour; serve hot.

SCHOOL PUDDING. — Swell a teacupful of rice in 1 pt. of milk, sweetened and flavored to taste; when cold mix with it a well-beaten egg; have ready a pt. basin well buttered, and a breakfast-cupful of bread crumbs with a teaspoonful of moist sugar well mixed with them; lay the crumbs all round the basin thickly with a knife and the rice in the centre; lay more crumbs on the top and bake ½ hour in a quick oven; eat with jam.

SNOWBALL PUDDING. — Boil 1 qt. of rich milk and then thicken it with a tablespoonful of flour or arrowroot; beat up the yolks of 4 eggs with 3 tablespoonfuls of white sugar; pour the milk slowly into the eggs and sugar, stirring all the time; pour this custard into a pudding dish and brown it slightly; beat up the whites to a stiff froth; add 4 tablespoonfuls of sugar, and flavor with lemon; drop it on the custard (when browned) in the form of balls as large as an egg; set it back in the stove to brown a little.

SNOW PUDDING. — Cover ½ package of gelatine with a little cold water and, when softened, stir into a pint of boiling water; add 1 cupful of sugar, and the juice of 2 lemons; when cold and beginning to thicken, add the well-beaten whites of 3 eggs; beat all smoothly and lightly together; pour the mixture into a mold and set it away until hard; serve in the centre of a platter, with a boiled custard poured around, made with the yolks of 3 eggs, 1 pt. of milk, and ½ cupful of sugar.

SOROSIS PUDDING. — 3 sweet oranges; ¾ lb. sugar; ½ lb. sweet almonds; rose water; 16 eggs; 1 lb. fresh butter; puff paste; take the outside rinds of the orange; boil in several waters until tender; pound them in a mortar with the sugar; blanch the almonds and beat them very fine with rose water to keep them from boiling; break the eggs and froth 6 of the whites; beat very lightly the yolks and remaining whites; cream the butter, and beat all the ingredients together until perfectly light; line pie plates with a thin puff paste, and bake; sift sugar over tops of the pudding when drawn from the oven.

SPANISH CUSTARD. — 8 yolks of eggs; 8 teaspoonfuls of sugar; beat very light; add flavor if you like; put over a slow fire, stirring all the time until quite thick; then have small saucers, either of glass or china, and pour some on each saucer; serve in this way cold.

SPICED PUDDING. — Take 1 small square loaf of baked bread; peel off the crust; cut in pieces; pour upon it 1 pt. of boiling water; add 1 teaspoonful of salt; take 1 pt. of flour; add 1 heaping teaspoonful of baking powder; 2 coffeecups of raisins, seeded and chopped; mix all well with the flour, first powders and next raisins; add soaked bread, and 1 teaspoonful each of allspice, cinnamon, mace and cloves; add by degrees 1 coffeecup of sweet milk, and beat the mass well together; scald pudding bag, and put in the pudding, which should be pretty stiff; boil 3 hours.

SPONGE PUDDING. — 1 cupful of flour and 1 of powdered sugar mixed together, with 1 teaspoonful cream of tartar and ½ teaspoonful soda; 3 eggs; bake in 3 pie tins and spread with currant jelly; make a custard and pour over it, of 3 eggs, 1 cupful white sugar, 1 pt. of milk, and 1 teaspoonful of vanilla; stir the beaten eggs and sugar into the scalding milk; take from the fire as soon as it begins to thicken; flavor when cool; eat quite cool.

STRAWBERRY CUSTARD. — Make a nice boiled custard of 1 qt. of milk and the yolks of 5 eggs properly sweetened; boil till it thickens to the right consistency; take it off the fire, and put in the flavoring; take a gill of sugar and a pint of ripe strawberries; crush them together, and pass through a fine strainer; take the whites of 4 of the eggs; while beating them to a stiff froth add a gill of sugar, a little at a time; to the sugar and egg add the sweetened strawberry juice, beating all the while to keep it stiff.

STRAWBERRY PUDDING. — Cream a cup of sugar and a tablespoonful of butter; add the beaten yolks of 5 eggs and 2 cups of fine bread crumbs soaked in a quart of sweet milk; flavor with lemon or vanilla; pour into a deep pudding dish and bake until the custard is set; roll a pint of nice strawberries in powdered sugar; spread over the pudding and cover with a meringue made of the beaten whites and 3 tablespoonfuls of powdered sugar; return to the oven until the top is delicately browned.

STRAWBERRY PUFF PUDDING. — Sift 2 teaspoonfuls of baking powder with 1 pt. of flour; beat well 1 egg; add a little salt; mix with sweet milk till of the consistency of thick batter; place well-greased cups in a steamer; put into each a spoonful of batter; then a spoonful of strawberries, and cover with another spoonful of batter; steam 20 minutes; eat with cream and sugar, or a liquid hot sauce with a cupful of strawberry juice added.

STRAWBERRY TAPIOCA. — Soak over night 1 large teacupful of tapioca in cold water; in the morning put half of it in a yellow ware baking

dish, or in the porcelain one of a silver pudding dish; sprinkle sugar over the tapioca; then on this put 1 qt. of berries, sugar and the rest of the tapioca; fill the dish with water, which should cover the tapioca about ½ in.; bake in a moderately hot oven until it looks clear; eat cold with cream or custard.

SUET PUDDING.—1. Mince fine ½ lb. kidney suet, taking out all strings and skins; grate 1 pt. of bread crumbs, and pour over them 1 qt. of boiling milk; let steep for 1 hour; stir the suet and 6 even teaspoonfuls flour alternately into the bread and milk; add by degrees 6 eggs beaten very light; lastly a pinch of salt, 1 teaspoonful nutmeg and cinnamon, 1 wineglassful wine, and 1 of brandy; bake 1 hour; serve as soon as it comes from the oven with wine sauce.—2. ½ cupful chopped suet, 1 cupful corn meal, ½ teaspoonful soda; scald these together; make a thick batter; 1 cupful chopped apples; ½ cupful sugar; 2 eggs; 2 large tablespoonfuls of flour; ½ lb. raisins; spices to taste; bake in a hot oven for 2 hours.

SWISS PUDDING.—Sift together ½ lb. flour, 1 heaping tablespoonful of baking powder, and 1 of salt; rub together 4 oz. of granulated sugar and 2 oz. of butter; when they are well mixed, so as to be granular, but not creamy, add the flour gradually until all is used; make a hollow in the middle of the flour; put into it 1 egg, ½ teaspoonful of lemon flavoring, and ½ pt. of milk; mix to a smooth paste; put into a well buttered and floured mold, and set this into a large pot, with boiling water enough to come ⅔ up the side of the mold; steam the pudding ¾ hour; turn the pudding out of the mold and send it to the the table with this sauce: Stir together over the fire 1 oz. each of flour and butter; as soon as they are smooth pour into them ½ pt. boiling milk; add 2 oz. sugar and ½ teaspoonful of lemon flavoring; use with the pudding as soon as it boils up.

TAPIOCA MERINGUE.—Set 1 cupful of tapioca, with 1 pt. of water, on the back of the stove to swell; when it has taken up all the water, add milk till it is of a proper pudding consistency; let it stand on the stove about 1 hour; then pour it into a pudding dish; flavor and sweeten to taste; add, while it is hot, the yolks of 3 eggs; spread over the top a layer of jelly or jam; beat the whites of the eggs to a stiff froth; add 3 tablespoonfuls of sugar, spread over the top, and set it back in the oven to brown.

TAPIOCA PUDDING.—1. Soak till quite soft 1 cup of tapioca; boil in milk enough to make it like jelly; constantly stir; salt when put to soak; pour out in molds; eat with cream, and sugar and currant jelly.—2. To 2 qts. of warm milk put 8 tablespoonfuls of tapioca, 4 beaten eggs, 1 tablespoonful of butter, and cinnamon or mace to the taste; mix 4 tablespoonfuls of white powdered sugar and 1 wineglass of wine; stir it into the rest of the ingredients; turn the whole into a pudding dish that has a lining of pastry; bake immediately.

TRANSPARENT PUDDING.—Beat 8 eggs very well; put them into a stewpan, with ½ lb. sugar pounded fine, and the same quantity of butter; some nutmeg grated; set it on the fire; keep stirring till it thickens; put a rich puff paste round the edge of the dish; pour in the pudding when cool; bake it in a moderate oven; candied orange and citron may be added.

VANILLA CUSTARD.—Boil for ¼ hour a piece of vanilla in 1 qt. of milk, with 6 oz. of powdered sugar; break into a dish 6 eggs; beat the 6 yolks with the white of 1; mix them with the milk; then pour into the cups; cook in a pan surrounded by water.

VIRGINIA PUDDING.—Take 5 eggs, reserving 3 whites for sauce; 1 pt. milk; 1 gill of cream or 1 oz. of butter; 3 tablespoonfuls of flour; bake ½ hour; beat the whites of 3 eggs to a froth with 6 tablespoonfuls of sugar; pour over the pudding just before it is eaten; flavor to taste; serve cold.

WASHINGTON PUDDING.—Put 1 teacup of seeded raisins into the flour, and add ½ teaspoonful of salt, the same quantity of good cinnamon, and ½ teaspoon of ground cloves; sift the flour and spices from the raisins, and make a batter with 1 cupful of sweet milk, 1 cup of molasses and 1 egg; add a cupful of chopped suet (sprinkle with flour while chopping), and ½ teaspoonful of soda dissolved in 1 tablespoonful of hot water; last of all the floured raisins; steam in a buttered mold 2½ hours; serve with any nice sauce.

WEE PUDDING.—¼ lb. of flour; ¼ lb. butter; ¼ lb. sugar; 2 eggs; the rind of 1 lemon; beat for 20 minutes; ½ fill teacups; bake 20 minutes.

Eggs, Cheese and Toast.

REMARKS.—There are over a hundred ways of cooking eggs. Hard boiled eggs cannot be recommended to any one; but if the white of eggs is eaten slightly coagulated, it is digested quite as rapidly as any article of diet in use. If it is cooked so long that it is formed into hard congula, and then swallowed in pieces, it takes a long time for the gastric juices to chymify it. Therefore, if hard boiled eggs are preferred, cut them up very fine and masticate carefully. If the eggs get frozen so as to crack the shells in severe cold weather, keep them frozen until wanted for use; then bring them into a warm room, pour boiling water over them and leave them to cool; then they should be used immediately.

BAKED EGGS.—1. Butter a clean, smooth saucepan; break as many eggs as will be needed into a saucer, one by one; allow no broken yolk to remain, nor let them crowd, lest the yolks break; put a small piece of butter on each; sprinkle with pepper and salt; set it in a well heated oven and bake until the whites are set.—2. Beat up 6 eggs, 1 tablespoonful of flour, and 6 of sweet milk; melt a piece of butter in a frying pan; when hot turn the whole in and bake in a very hot oven; serve as soon as done.

BOILED EGGS.—Hold the eggs for an instant

over the steam of the saucepan before they are placed in it, which do very gently. Boil 3 minutes and the whites will become partially solid; 5 minutes and the whites will become hard and the yolks partially hard; 8 or 10 minutes and they will become hard throughout.

BREADED EGGS.—Boil hard and cut in round, thick slices; pepper and salt, and dip each in beaten raw egg; then in fine bread crumbs, or powdered cracker crumbs, and fry in butter, hissing hot; drain off every drop of grease and serve hot.

BUTTERED EGGS.—4 new laid eggs; 2 oz. of butter; break them into a basin, and beat them well; put the butter into another basin, which place in boiling water; stir till the butter is melted; pour that and the eggs into a lined saucepan; hold it over a gentle fire, and as the mixture begins to warm pour it two or three times into the basin and back again, that the two ingredients may be well incorporated; keep stirring the eggs and butter one way until they are hot, without boiling; serve on hot buttered toast.

CHEESE FONDU.—1 cup of bread crumbs, dry and fine; 2 scant cups of fresh milk; ½ lb. dry, rich cheese, grated; 3 eggs, whipped light; 1 tablespoonful of melted butter; pepper and salt; a pinch of soda; dissolve in hot water; soak the crumbs in the milk; beat in the eggs, the butter, seasoning and cheese; pour into a neat pudding dish; strew dry bread crumbs over the top; bake in a quick oven until delicately browned; serve in the pudding dish at once.

CHEESE OMELET.—Beat up 3 eggs with pepper and salt to taste, and 1 tablespoonful of grated (Parmesan is best) cheese; put a piece of butter the size of an egg into the omelet pan; as soon as it is melted pour in the eggs, and, holding the handle of the pan with one hand, stir the omelet with the other, by means of a flat spoon; the moment the omelet begins to set, cease stirring, but keep shaking the pan for a minute or so; with the spoon, double up the omelet, and keep on shaking the pan until the under side is of a good color; turn it out on a hot dish, colored side uppermost, and serve quickly.

CHEESE SANDWICHES.—2 parts of grated Parmesan or Cheshire cheese; 1 of butter; a small proportion of made mustard; pound them in a mortar; cover slices of bread with a little of this; lay over it slices of ham, or any cured meat; cover with another slice of bread; press them together; cut into mouthfuls that they may be lifted with a fork.

EGG OMELET.—1. Break 3 eggs and beat for 1 minute with ½ spoonful of salt and ¼ as much pepper; have your pan hot, with 1 tablespoonful of melted butter in it; pour in the eggs; scatter over them 3 crushed square crackers; when cooked sufficiently roll the omelet toward one side of the pan by slipping a fork under one side and turning it over; place the omelet on a hot dish and serve at once.—2. Take 6 eggs and beat separately; allow 1 tablespoonful of milk to each egg; stir in flour to make a batter; take 1 cupful of milk, put on the stove, and stir in the batter until it is like starch; add a piece of butter the size of a walnut, and a pinch of salt;

Omelet Pan.

take this from the stove; pour into the dish in which you would serve; stir in the yolks of the eggs, which have been beaten; beat the whites until you can turn the platter bottom side up; add them, mixing thoroughly; put in a quick oven and bake 10 minutes; eat immediately. It is better to fry omelets in regular omelet pans, as they are made thin in order that the omelet may be done quickly.

EGGS. A la Creme.—Hard-boil 12 eggs; slice them thin in rings; in the bottom of a large baking dish place a layer of grated bread crumbs, then one of eggs; cover with bits of butter, and sprinkle with pepper and salt; continue thus until the dish is full; be sure that the crumbs cover the eggs upon top; over the whole pour 1 large teacupful of sweet cream, and brown nicely in a moderately heated oven.

EGG SANDWICH.—Boil fresh eggs 5 minutes; put them in cold water; when quite cold peel them; then after taking a little white off each end of the eggs cut the remainder in 4 slices; lay them between bread and butter.

EGGS, Au Gratin.—Cut some hard boiled eggs in slices; lay them on a well buttered dish with grated Parmesan cheese, black pepper and the least bit of powdered nutmeg; sprinkle some baked bread crumbs over all; put the dish in the oven, and serve as soon as the contents begin to color.

FRENCH EGGS.—Boil hard; remove the shells; roll in cracker crumbs; fry in butter until brown; make a gravy of butter, crumbs and cream and pour over them.

FRICASSEED EGGS.—Boil eggs hard; take out a portion of the yolks whole; cut the remainder into quarters with the whites; make some good gravy boiling hot; put in minced thyme and parsley; add it to the eggs with a little grated nutmeg; shake the whole up with a piece of butter until it is of the proper consistence; garnish with eggs boiled hard and chopped up fine.

FRIED EGGS.—Have ready a frying pan containing hot fat; drop the eggs in separately; let them fry for 1 minute; drop some more hot fat over them; 3 minutes will cook them.

ITALIAN CHEESE.—Boil a knuckle of veal; when perfectly cooked, strain the liquor, remove the fat, take out the bones, and chop the meat fine; add 1 grated nutmeg, ½ oz. each of cloves, allspice and pepper; put the entire mixture on

the fire to simmer gently; when the liquor becomes jelly, pour into a mold; let it remain until the next day; line the mold with hard-boiled eggs cut in slices.

PICKLED EGGS.—1. Boil the eggs for 10 or 12 minutes; throw into cold water; when cold, take off the shells; cover them with vinegar, containing a mixture composed of beets, boiled very soft and mashed fine, with salt, pepper, cloves, and nutmegs to suit the palate.—2. Put the eggs on the stove in cold water; let it stand and boil for 1 hour—the heart is then mealy; remove the shells; stick 4 or 5 cloves in each egg; pour hot vinegar over; add other spices if you like; let stand a few days.

POACHED EGGS.—Place some water in a frying pan and let it boil; then add a little salt and break the eggs in the water; let them remain about 2 minutes, or until they are done, then remove with a strainer and serve immediately with butter, pepper and salt; or, a better plan to keep the eggs from spreading, place small muffin rings in the boiling water, pour the eggs into the rings and boil the same time; remove the rings and take up the eggs singly. They may be served on slices of nicely browned and buttered toast, or on slices of fried ham. The following is a good sauce for poached eggs: Make the sauce by putting ½ cupful of hot water in a saucepan, with a teaspoonful of lemon juice, 3 tablespoonfuls of veal or chicken broth (strained), pepper, salt, mace, and a tablespoonful of butter, with a little minced parsley; boil slowly 10 minutes; stir in a well-whipped egg; then pour over the eggs.

RAMEQUINS.—Grate ½ lb. of cheese; melt 2 oz. of butter; when the butter is cool, mix it up with the cheese and the whites of 3 eggs well-beaten; lay buttered paper on a frying pan; put slices of bread upon it; lay the cheese on the top; set it on the fire for about 5 minutes; take it off and brown it with a salamander.

SCRAMBLED EGGS.—1. Place butter the size of a walnut in the pan and allow it to melt; take care to prevent browning or burning; break 3 eggs and beat sufficiently to break the yolks, about a dozen strokes of the fork being sufficient; turn into the melted butter; stir from the bottom of the pan to prevent it from sticking until done; add salt and pepper, and turn into a hot dish.—2. Grate an ordinary sharp cheese, 1 tablespoonful for every 2 eggs; put some butter into a frying pan; when melted throw in the cheese; stir for a minute or two until the cheese melts; add the eggs, pepper and salt; mix with a fork until cooked; serve with fried bacon and baked potatoes.

SHIRRED EGGS.—6 eggs; 3 tablespoonfuls of gravy; enough fried toast to cover the bottom of a flat dish; a very little grated cheese; 1 teaspoonful of butter; melt the butter in a frying pan; when hot, break into this the eggs; stir in the gravy; pepper and salt to taste; continue to stir very quickly until the whole is a soft, yellow mass; have ready in a flat dish the fried toast, spread thinly with anchovy paste; heap the shirred eggs upon this, and serve before it has time to harden.

STUFFED EGGS.—Boil the eggs hard; cut them in two lengthwise, and remove the yolks, which chop; add some cooked chicken, lamb, veal or pickled tongue chopped fine; season the mixture; add enough gravy of the raw yolk of eggs to bind them; stuff the cavities; smooth them and press the two halves together; roll them in beaten egg and bread crumbs twice; when just ready to serve, dip them, in a wire basket, into boiling lard, and when they have taken a delicate color, drain; serve on a napkin and garnish with parsley or any kind of leaves, or serve with tomato sauce.

TOAST, Buttered.—Have a small bowl of boiling water on the range, in which put a good bit of butter; as you draw each piece of toast from the fork dip it in the hot water till thoroughly moist; place it in a plate; keep it warm until you have finished toasting all the slices; when all are done if you have any hot water and melted butter remaining, pour it over the toast.

TOAST, Dry.—Procure a loaf of bread about 2 days old; cut off as many slices as may be required; trim off the crusts and ragged edges; put the bread on a toasting fork; hold it before a very clear fire; move it backward and forward until the bread is nicely colored; turn it and toast the other side, and do not place it so near the fire that it blackens.

Toasting Forks.

TOAST, Milk.—1. Toast the bread until it is nicely colored; in the meantime place your milk on the stove to boil; then add a little butter and salt to the milk; when both toast and milk are ready, pour the latter over the toast and serve hot; a little flour may be added to the milk to thicken it.—2. Stir enough flour into milk, when boiling, to make it like thick cream; add enough sugar to sweeten to the taste, vanilla to flavor, and a small piece of butter; put this over the toast just before setting on the table.

TOMATO OMELET.—Break 6 eggs into a bowl; give about a dozen whirls of the beater; have ready in a frying pan a great spoonful of butter; heat it; run quickly over the bottom of the pan; pour in your eggs; with one hand loosen all around the edges of the omelet with a cake turner, and with the other shake the pan; let an assistant lay on ½ the omelet 5 or 6 slices of canned tomatoes; invert a hot dish over the pan; upset the latter; dish the omelet; strew the omelet thickly with dry cheese, grated and seasoned; singe with a red hot shovel held very close to the cheese; serve hot.

WELSH RAREBIT.—1. Select rich cheese, the milder the better; to make 5 rarebits take 1 lb. of cheese; grate it; put it in a tin or porcelain-lined saucepan; add ale enough to thin the cheese sufficiently; stir until melted; have a slice of toast ready for each rarebit (crusts

trimmed); put a slice on each plate and pour cheese enough over each piece to cover it; eat while hot. — 2. Put into a frying pan ¼ lb. of cheese cut into thin slices; pour on ½ pt. of sweet milk; stir in a beaten egg; add ½ teaspoonful of mustard, a little less red pepper, already ground, and a teaspoonful of nice butter; stir this mixture all the time; add lastly a few crackers well broken up; after thoroughly incorporating them into the mixture, turn it all into a heated dish and cover it.

FARINACEOUS FOOD.

FOR much of this kind of cooking, the farina boiler, made like the glazing pot (see *Glaze*, in CONDIMENTS AND FLAVORING ESSENCES), is a great convenience, saving labor of constant stirring and preventing burning.

CORN MEAL MUSH. — The meal should be ground very fine, and made from white-fleshed grain. Sift 1 qt. of corn meal; add a teaspoonful of salt; stir in as much boiling water as will make it of the required stiffness; stir rapidly to prevent burning, and in a few minutes it will be done; serve with milk.

CORN MEAL MUSH, Fried. — Prepare the quantity you wish as above directed; set it aside to become cold; when ready for it, cut into square or oblong strips; fry in nice pure lard, or merely with a piece of bacon fat, if it is not in the least degree rancid.

CRACKED WHEAT. — 1 pt. of the cracked grain; 2 qts. of water; boil in a smooth iron pot over a quick fire; stir in the wheat slowly; boil fast; stir constantly for the first ½ hour of cooking, or until it begins to thicken; lift from the quick fire, and place the pot where the wheat will cook slowly for an hour longer; keep it covered closely; stir now and then, and be careful not to let it burn at the bottom. When ready to dish out, it is a neat way to have molds moistened with cold water; cover lightly and set in a cool place; eat warm or cold with milk and sugar.

GRAHAM MUSH.—Stir Graham flour slowly into boiling water until it is the desired thickness; salt to taste; keep it boiling all the time; then set it back and let it cook slowly about 5 minutes.

GRAHAM MUSH, Fried. — Thicken boiling water with Graham flour until it forms a stiff mush; salt to taste; pour into a pan to cool; cut in thin slices; roll in flour, and fry brown, using plenty of lard to keep from burning.

GRITS.—Cook in the same way as corn meal mush, only boiling a little longer. Eat with milk, or butter and syrup.

HOMINY, Lye, or HULLED CORN. — Fill a large kettle half full of sifted wood ashes; fill up with cold water and boil until the lye is very strong; put it aside to settle; drain off the lye; return to the kettle, and when it is boiling hard, put in shelled corn; keep boiling as fast as possible for 5 or 10 minutes, or until the hull is eaten off; skim the corn into a colander, and pour plenty of cold water over it; rinse and rub it in a pan of water, after which it must be boiled in clear water for 3 or 4 hours, or until tender; be careful not to burn, and put no salt in while cooking; have the tea-kettle full of boiling water, and add to the corn as occasion requires; during the last hour let the water boil away so that when done it will be almost dry.

HOMINY, Baked.—To 1 cupful of boiled hominy (small kind) allow 2 cups of milk, a heaping teaspoonful of butter, a teaspoonful of white sugar, a little salt, and 3 eggs. Beat the eggs very light, yolks and whites separately; work the yolks first into the hominy, alternately with the melted butter; when thoroughly mixed, put in sugar and salt, and go on beating while you soften the batter gradually with the milk. Be careful to leave no lumps in the hominy; stir in the whites, and bake in a buttered pudding dish until light, firm and delicately browned.

HOMINY CROQUETTES.—Mix a tablespoonful of melted butter with a pt. of small, cold boiled hominy; add a teaspoonful each of salt and sugar, and 2 beaten eggs; beat until smooth; then make into small cakes or balls; flour each one well; fry in butter or dripping, or both.

MACARONI. — This is made of flour, water, butter, and the yolk of 1 egg; when these are mixed into a paste, roll it out as thin as a wafer; leave it to dry from ½ to 1 hour; then roll it round and round; cut the roll into narrow strips.

MACARONI, A la Creme.—Cook the macaroni 10 minutes in boiling water; drain this off, and add a cupful of milk, with a little salt; stew until tender; in another saucepan heat a cup of milk to boiling; thicken with a teaspoonful of flour; stir in a tablespoonful of butter, and lastly a beaten egg; when this thickens pour over the macaroni after it is dished.

MACARONI, Baked. — Prepare in the dish in which it is to be served; fill the dish ½ full of macaroni broken in length of 1 or 2 in.; cover with boiling water and place on the back of the stove for ½ hour; if there is any water remaining in the dish, drain it off; drop lumps of butter here and there over it; season with pepper and salt; cover with rich milk; grate a layer of cheese all over the top; bake in a moderate oven ½ hour or more.

MACARONI, Boiled.—Boil ½ lb. of macaroni, and, while draining it from the cold water, stir together over the fire 1 oz. each of butter and flour; as soon as they bubble, gradually pour into the sauce they make, 1 pt. of boiling water; beat it with a fork or egg-whip until it is smooth; season with a teaspoonful of salt and a saltspoonful of pepper; put the macaroni in it to heat; cut an onion in small shreds; brown it over the fire in a very little fat; when both are done, dish the macaroni, and pour the onion out of the frying pan upon it.

MACARONI, With Horseradish. — Grate the horseradish and mix with vinegar; first beating up the yolk of an egg, and mix it with the vin-

egar; boil the macaroni; lay it in salt and water in a deep dish, with a little bit of butter or cheese on top to make it brown; eat it with the horseradish sauce.

MACARONI, With Kidney.—Wash and cut 1 kidney small; chop an onion fine, and fry a light brown in 1 tablespoonful of butter; add 1 teaspoonful of salt, a saltspoonful of white pepper, and a very little red pepper; put the kidney in this; cover closely; let them stew for 2 hours; stew ½ can of tomatoes, seasoned with salt, pepper and butter; boil ½ lb. of macaroni in 2 qts. of water and 1 tablespoonful of salt; let the water come to the full boil before putting in the macaroni; boil 20 minutes, or till tender; put the macaroni in the colander and run cold water over it; put a layer of macaroni in a baking dish, spread over it a teaspoonful of butter, part of the stewed kidney, some of the gravy from the kidney, and a layer of stewed tomatoes, and so on till the dish is full; let the macaroni and the butter be on top; sprinkle with a tablespoonful of fine bread crumbs; bake for ½ hour in a quick oven.

MACARONI, With Oysters.—Boil macaroni in a cloth to keep it straight; put a layer in a dish seasoned with butter, salt and pepper; then a layer of oysters; alternate until the dish is full; mix some grated bread with a beaten egg; spread over the top and bake.

MACARONI, With Tomato Sauce.—Throw 1 lb. of macaroni into a saucepan of boiling water and salt; when tender, strain off all the water; put it into a saucepan with 3 oz. of butter, 3 oz. of grated Parmesan cheese and tomato sauce, made as follows: Ripe tomatoes; wash, dry and cut them into a saucepan without any water, with salt, pepper, a few cloves, a little onion and celery; boil till sufficiently done; pass through a sieve and pour into the saucepan of macaroni.

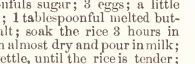
MACARONI, With White Sauce.—Warm ½ lb. macaroni, boiled and washed, in the following sauce: Stir over the fire 1 oz. each of butter and flour; pour in 1 pt. of boiling water and milk as soon as the butter and flour are mixed; season with salt and pepper to taste.

OATMEAL MUSH.—Soak the oatmeal over night in enough water to wet it; in the morning stir into boiling water; cook a few minutes.

POLENTA.—Boil coarse meal in water until it is rather thick and pasty; when it sets, and is still hot, cut it in thin slices; sprinkle it over with grated Parmesan cheese; fry in butter or sweet oil.

RICE.—1. Pick over the rice and wash it in cold water; to 1 pt. of rice put 3 qts. of boiling water and ½ teaspoonful of salt; boil it just 17 minutes from the time it begins to boil; turn off all the water; set it over a moderate fire with the cover off; steam 15 minutes; milk used instead of water improves this.—2. Chop an onion very fine and fry it in butter till it be of a gold color; stir in a teacupful of rice; let it cook in the butter for a few minutes; stir all the time; add 1 pt. of good gravy and let it simmer slowly; when nearly cooked, add a little grated nutmeg, Parmesan cheese, salt and pepper to taste; mix it up well; when thoroughly done let it stand a few minutes before the fire; just before serving stir in a small piece more butter; serve garnished with croquettes of any kind of meat, with stewed tomatoes or with slices of fried bacon.

RICE CROQUETTES.—½ cup of rice; 1 pt. of milk; 2 tablespoonfuls sugar; 3 eggs; a little grated lemon peel; 1 tablespoonful melted butter; 1 spoonful salt; soak the rice 3 hours in warm water; drain almost dry and pour in milk; stew in a farina kettle, until the rice is tender; add the sugar, butter and salt; simmer 10 minutes; whisk eggs to a froth; add them cautiously; remove saucepan from range; return and stir awhile; remove and add grated lemon peel; turn out upon a well-greased dish to cool; when cold, flour your hands and roll into oval balls; dip in beaten egg, then in cracker crumbs, and fry in lard.



Rice Croquettes.

RYE TOAST.—To 1 qt. rye flour add 1 even teaspoonful of salt and sufficient boiling water to make a stiff dough; put it in a buttered pan; have a bright, clear fire, and the grate well raked; prop the pan in front of the grate, and as brown crust forms strip it off and keep it hot and dry; repeat this till it is all brown; break it up; pour hot cream over it, and serve in a covered dish.

TURKISH PILAU.—1. 1 cup of beef stock; 1 cup of tomato juice strained; 1 cup of rice; boil these together 20 minutes; add ½ cup of butter and boil 10 minutes; it must be boiled in an inner kettle or stirred all the time, as it burns easily; the rice must be whole when done; eat while very hot or it is not good.—2. Cut up 6 small onions and a carrot; chop up ½ bunch parsley fine; fry it in butter; add salt, pepper, and a clove; moisten with 3 tablespoonfuls of broth; let it cook ½ hour; then strain, having added more soup; if no soup is ready, water will do; take ¾ lb. of rice, well cleaned; put it in the sauce; cook it all until done; having greased a form with butter, put in the rice; bake it in a hot oven for 10 minutes.

FISH.

REMARKS.—On the proper cleaning of fish preparatory to dressing it, depends much of its delicacy and flavor. Slit the fish sufficiently open to permit the inside to be thoroughly washed, and use sufficient water. The flavor of all fish is improved by adding a little salt or vinegar to the last water in which they are washed. The sound, milt, and roe, should be carefully cleaned and preserved. When boiled, place all large fish, with the skin whole, on the fire, in cold water; if crimped, or cut into slices or pieces, in boiling water; if whole, do not cover with more than 2 or 3 in. of water, or the skin will crack. To scale fish easily, dip it in boil-

ing water 1 minute. Salt fish are quickest and best freshened by soaking in sour milk. Large fish should be boiled or baked; small ones fried or broiled. In broiling fish, butter the gridiron and place the flesh side next the fire; when this side is done turn over and cook the other side more thoroughly. It may be remarked here, as indeed it should be in regard to the whole culinary art, that dressings and sauces, as well as even modes of cooking, are largely interchangeable; so that when a receipt is deemed too costly or elaborate, some simpler one will not be difficult to find to substitute, though applied to a different fish or other article of food.

ANCHOVY. — 1. Fry to a pale amber color, in oil or butter; having previously scraped clean, soak an hour or two in water, wipe dry, open it without dividing the fish, and remove the back bones. — 2. Remove the larger bones from the fish; pound them to a smooth paste in a marble mortar; add a little bay salt and cayenne pepper at will; rub the pulp through a fine hair sieve, and about ¾ fill the pots with it; cover the surface of each to the depth of about ½ inch with good butter in a melted state; keep in a cool situation.

BAKED FISH.—1. Scale, wash, and wipe dry, inside and out, a 2 or 3 lb. fish; make a stuffing of 1 pt. grated bread, 2 tablespoonfuls melted butter, pepper and salt to taste, 1 raw egg, a little celery salt, 1 onion chopped fine; do not wet the bread crumbs; the egg and melted butter will moisten sufficiently; tie over the fish thin slices of salt pork; fill a dripping pan ½ full of hot water; place the gridiron on the pan; after laying the fish on the gridiron cover all with another pan; bake in a hot oven till the pork is well shriveled; remove the upper tin, allowing the fish to brown. — 2. Take any nice fish, boil it; remove the bones; chop considerable parsley very fine, with 1 small onion; have about as much bread crumbs as fish; take a pudding dish and butter it; lay in a layer of bread crumbs, then a layer of fish, ending with the bread crumbs; mix parsley and onion, with salt and pepper through your bread crumbs; put lumps of butter over the top, with a very slight grating of nutmeg, and pour over it all sweet cream or very rich milk, till it rises nearly to the top; bake in a quick oven till it has a nice, rich brown crust.

BLUE FISH. — Chop an onion and fry it in butter; add ½ lb. of soft, fine bread crumbs, a teaspoonful of fresh butter, a little chopped parsley, pepper, salt, and a few drops of lemon; after cooking a very little take it up and add a well-beaten egg; stuff your blue fish with this; serve the fish with a drawn butter sauce having a little finely-chopped pickled asparagus in it.

CATFISH.—Take a large catfish and cut it up into pieces 2 in. in length and 1 in. in thickness; beat up 3 eggs with a little salt and pepper and a teaspoonful of Worcestershire sauce; dip the fish in the egg batter, and roll in corn meal or bread crumbs; fry a deep brown; garnish with lemon, parsley, or celery tops, and send to the table with a cucumber salad.

CHOWDER. — Have a good haddock, cod, or any other solid fish; cut it in pieces 3 in. square; put 1 lb. of fat salt pork in strips into the pot, set it on hot coals and fry out the oil; take out the pork and put in a layer of fish, over that a layer of onions in slices, then a layer of fish, with slips of fat salt pork; another layer of onions, and so on alternately until your fish is consumed; mix some flour with as much water as will fill the pot; season with black pepper to the taste; boil for ½ hour; have ready some crackers soaked in water till they are a little softened; throw them into the chowder 5 minutes before taking up; serve in a tureen.

CLAM CHOWDER.—Boil a peck of clams and pick them out, being careful to preserve the clam water clear; let it stand to settle the sand; fry a few pieces of salt pork; mince fine with sliced onions, until all are browned; add the clam water with about twice as much clear water; boil some potatoes, thinly sliced, 15 minutes; stir 4 teaspoonfuls of flour in 1 pt. of milk; let it boil up once or twice; set the pot where it will scald but not boil; add the clams and a few split crackers; salt and pepper to taste.

CLAM FRITTERS. — Put into an earthen dish 3 spoonfuls of flour, a teaspoonful of yeast powder and 2 whole eggs; mix this with a little clam juice; mince a pint of clams and mix with this batter; put 2 or 3 spoonfuls of lard into a shallow frying pan, while hot; deposit your mixture therein by spoonfuls to fry; turn over after 3 or 4 minutes; let them fry a moment longer; take them out, and after draining them on a cloth, serve.

CLAMS, Deviled. — Chop clams fine; season with melted butter and salt; add the yolk of an egg, lemon juice, and a little mace; put in the shells; sprinkle with cracker dust; baste with melted butter or sweet oil; set in an oven to bake.

CLAMS, Scalloped. — Chop the clams fine; season with pepper and a little salt; mix in another dish some powdered cracker moistened with a little warm milk, part of the juice of the clams, a beaten egg or two, and a small spoonful melted butter; stir into this the chopped clams; bake in small patty pans; send them to table in the tin pans; or wash, wipe, and butter some of the large clam shells; fill them with the mixture and bake.

CODFISH. Baked.—Cut a large fine piece out of the middle of the fish; skin it carefully; stuff with a stuffing composed of the yolks of 2 eggs boiled hard, the roe half boiled, bread crumbs, grated lemon peel, butter, pepper, and salt to taste; bind it with the undressed white of an egg; sew in the stuffing with white thread; bake in a Dutch oven before the fire; turn it frequently; baste with butter; serve with shrimp sauce, plain butter, or oyster sauce.

CODFISH BALLS.—Take of nice white codfish, 2 lbs.; put into a kettle with sufficient cold water to cover the fish, and let it boil till perfectly tender; remove it to a pan of cold water; separate from bones, skin, etc.; place in an earthen or bright tin mixing pan; mash fine, with about double the quantity of nicely steamed potatoes; add 3 or 4 slices of light bread crumbed, or previously soaked in milk; add 2

eggs and a teacup of butter, with black pepper to suit taste; mash and mix thoroughly; make as moist as is wished with sweet milk; make into flat balls; fry in hot lard, as you would mush.

CODFISH, Boiled. — Tie up the head and shoulders well; place it in the kettle, with enough cold water to cover it; cast in a handful of salt; when done enough drain it clear of the scum; remove the string; send it to table garnished with the liver, the smelt and the roe of the fish, scraped horseradish, lemon sliced, and sprigs of parsley; or, with oysters fried, or small fish fried; serve with anchovy or oyster sauce.

Cod for Table.

CODFISH, Broiled.—Clean the fish; cut it into slices of about 1 in. thick; dry them well with a clean cloth; rub them with thick melted butter; sprinkle a little salt over them; place them on a gridiron over a clear fire; when one side is done, turn them carefully to broil the other; serve with melted butter and anchovy sauce.

CODFISH CUTLETS. — Steam the cod till nearly done; cut a slice and have a batter of self-raising flour ready; mix the batter with 1 egg and water; put the piece of fish in the batter in the pan; fold it over when it sets, having first sprinkled pepper and salt on; make the cutlets as well shaped as you can; have potatoes cut in small balls and fried.

CODFISH, Fried.—Cut the middle or tail of the fish into slices 1 in. thick; season them with salt and pepper; fry them of a light brown on both sides; drain them on a sieve before the fire; serve them on a well heated napkin with plenty of crisped parsley round them; serve with melted butter and anchovy sauce.

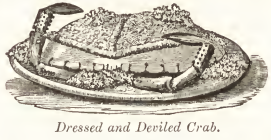
CODFISH, Matelote of.—Cut off the head of a codfish weighing 5 lbs.; remove bones from the the fish, and fill it with a dressing made of ½ pt. oysters, 1 scant pt. of bread crumbs, ½ tablespoonful of pepper, 2 teaspoonfuls of salt, 2 tablespoonfuls of butter, ½ onion, 1 egg, and ½ tablespoonful of chopped parsley; place 5 slices of pork both over and under the fish; boil the bones in a pint of water; pour this around the fish; bake an hour and baste often with gravy and butter; have a bouquet in a corner of the baking pan; make a gravy and pour around the fish; garnish with fried smelts.

CODFISH MAYONNAISE. — Take the fish, when cold, and remove the skin and bones; for sauce put some thick cream in a porcelain saucepan and thicken it with corn flour, which has been mixed with cold water; as it begins to boil stir in the beaten yolks of 2 eggs; as it cools, beat it well to prevent the mixture from becoming lumpy; when nearly cold stir in the juice of 2 lemons, a little tarragon vinegar and a pinch of salt, with a little cayenne pepper; peel and slice some very ripe tomatoes or cold potatoes; steep them in vinegar, with cayenne, powdered ginger and plenty of salt; lay these around the fish; pour over the cream sauce.

CODFISH OMELET.—Break into small pieces the thickest parts of a dressed cod; season with a little grated nutmeg and a little pounded mace; beat up 6 eggs well; mix it; form it into a paste; fry it as an omelet; serve as hot as possible.

CRABS, Baked.—Remove the meat from the shell; mix it with bread crumbs—crout ¼ will be sufficient; add white pepper, salt, a little cayenne, grated nutmeg, and ½ doz. small lumps of butter, each about the size of a nut; add the butter to the fish, after it has been returned to the shell; squeeze lemon juice over it; lay a thick coat of bread crumbs over all, and bake.

CRABS, Cold Dressed.—Open the crabs; take out all the flesh and fat, and the white meat from the claws; mix the meat well with ½ tablespoonful mustard, ½ spoonful vinegar, and ½ tablespoonful white pepper, and a pinch of cayenne; wash and clean the shells; fill with the meat thus prepared and serve; garnish with parsley.



Dressed and Deviled Crab.

CRABS, Deviled.—Boil your hard crabs and take out the meat and mince it; grate 2 oz. of bread crumbs and mix them with 2 hard boiled eggs chopped fine, some cayenne, salt and lemon juice; add all this to 6 oz. of the crab meat; make moist and rich with cream; clean the shells; fill them with the mixture; put some bread crumbs over the top and brown in a hot oven.

CRABS, Minced.—Extract the meat from the shell; mince small; place it in a saucepan with a gill of white wine, pepper, salt, nutmeg, cayenne pepper, and 2 tablespoonfuls of vinegar; stew it for 10 minutes; melt 2 oz. of butter with an anchovy and the yolks of 2 eggs; mix the whole well together; thicken with stale bread crumbs; garnish with strips of thin toast and sprigs of parsley.

CRABS, Potted.—Cut the meat of a crab, parboiled, into small pieces; put a layer of these into a potting can, or any deep tin dish; sprinkle salt, pepper, cayenne and pounded mace over; add a layer of the spawn and coral, then a layer of the cut meat, and so on, till all is used; press it down; pour melted butter over it, and

let it stand for ½ hour in a slow oven; take it out; leave it to cool; remove the butter, and turn the meat into small pots; pour clarified butter over them, and put by for use.

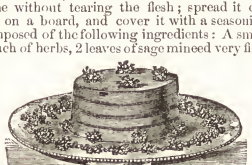
CRABS, Stuffed.—Let your crabs cook 20 minutes; take them out, and let them cool; cut the crabs in 2 parts; keep the shells, which clean well; take the meat out and hash it; make a milk sauce, not too thick; add an onion hashed fine, and previously cooked in butter; spice the sauce very strongly with salt, cayenne pepper, mustard, spices, nutmeg, etc.; let the crabs cook in this sauce 10 minutes; add some bread crumbs to the preparation, to give it some consisteney, and thicken with a few yolks of eggs.

CURRY OF COLD FISH.—Bone, skin and cut up the large kinds, and do the smaller sorts in rather thick cutlets or whole; put into a stewpan a good lump of butter, and 1 tablespoonful each of chopped pickles and preserved tomatoes; when these are hot add 1 tablespoonful of curry, which has been mixed with ½ pt. of milk or cream and the beaten yolks of 2 eggs; make the whole quite hot; stir gently; add the fish, and when hot serve all together, with a good rim of boiled rice round the dish, and the juice of ½ lemon squeezed over.

EEL PATTIES.—Take 3 medium-sized eels and cut them up into inch pieces; put them in a stewpan; add salt; cover them with cold water; when the water comes to a boil take them off the fire; wash them in cold water; scrape off any fat that may adhere; return them to the stewpan with just enough hot water to cover them; add a blade of mace, a bay leaf, a few whole peppers, a few sprigs of parsley, and a lemon cut into slices; stew gently until the fish will separate from the bone; remove the fish from the broth, pick it into small pieces; set them aside; reduce the broth a little, strain, and thicken with flour and butter; return the fish to the broth; simmer a moment; fill your patties and serve; make patty shells as directed for oyster patties.

EELS, Boiled.—Choose the smallest; simmer in a small quantity of water, into which a quantity of parsley has been put; garnish and serve with sauce.

EELS, Collared.—Take a large eel, cut off the head and tail, and remove the skin and backbone without tearing the flesh; spread it out flat on a board, and cover it with a seasoning composed of the following ingredients: A small bunch of herbs, 2 leaves of sage minced very fine,



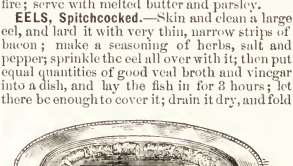
Collared Eels.

2 cloves, 2 blades of mace, and a little allspice and whole pepper well pounded, with salt to taste; roll up the eel, beginning with the broad end, and bind it tightly with a tape; boil down the backbone, head and tail with pepper, salt, mace and vinegar; put the eel into this liquor, and stew about ¾ hour; when tender set it aside; boil up the liquor with more vinegar and spice, if required, and when cold add it to the fish.

EELS, Fricasseed.—Cut up 3 lbs. of eels into pieces of 3 in. in length; put them into a stewpan and cover them with Rhine wine, or ¾ water and ¼ vinegar; add 15 oysters, 2 pieces of lemon, a bouquet of herbs, 1 onion quartered, 6 cloves, 3 stalks celery, a pinch of cayenne; pepper and salt to taste; stew the eels 1 hour; remove them from the dish; strain the liquor; put it back into the stewpan with a gill of cream and an ounce of butter rolled in flour; simmer gently a few minutes; pour over the fish; serve with a toasted milk cracker.

EELS, Fried.—Clean and skin the eels; cut off their heads; divide them into pieces 3 or 4 in. long; then score across in 2 or 3 places; season them with pepper and salt, and dust them in flour, or dip them into an egg beaten up; sprinkle them with finely grated bread crumbs; fry them in fresh lard or dripping; let them drain and dry on the back of a sieve before the fire; serve with melted butter and parsley.

EELS, Spitchcocked.—Skin and clean a large eel, and lard it with very thin, narrow strips of bacon; make a seasoning of herbs, salt and pepper; sprinkle the eel all over with it; then put equal quantities of good veal broth and vinegar into a dish, and lay the fish in for 3 hours; let there be enough to cover it; drain it dry, and fold



Spitchcocked Eels.

it in a buttered paper, first turning and skewering it backwards and forwards, that it may be more conveniently cooked. When on the spit, baste frequently, and add ½ pt. of white wine to mix with the drippings in the pan for this purpose. Take off the paper a few minutes before it is quite done, and baste and flour, that it may be of a nice brown. Fried bread may be placed round the dish, and broiled slices of salmon; or they may be varied with small soles fried of a beautiful color. Time to roast, from 30 to 35 minutes.

EELS, Stewed.—Skin, empty and wash the fish well in cold water; cut off the heads, and the rest into short lengths; wipe dry with a clean cloth; put them into a deep pie dish with some veal stock, more than sufficient to cover them; first rub over each piece of eel, separately, with a mixture of cayenne pepper, salt, and some finely powdered, dried savory herbs, and minced parsley; cover the pie-dish over

with a plate; put it in the oven; let the contents stew until the fish is sufficiently cooked and tender; remove all the fat which has risen to the surface; 5 minutes before serving it, lift the fish out carefully into a hot dish; stir into the gravy 1 large wineglass of port wine, the juice of half a fresh lemon, and 1 teaspoonful of Worcestershire sauce; when hot, pour over the fish and serve; garnish the dish with fried parsley and slices of lemon.

FISH CROQUETTES. — Pick the fish left over from a previous meal, carefully removing skin and bone. Make a sauce with 1 oz. of butter, and the same of sifted flour; put this in the saucepan, with a pint of boiling water, salt-spoonful of salt, a very little white pepper, and a dust of nutmeg; stir thoroughly, so that it is smooth; cook the fish slightly in this sauce; put it aside in a dish to cool; when cold, flour a board and lay the fish paste on it; dust with a pounded cracker and roll out the paste. Have the yolks of 2 eggs well beaten; cut the paste in strips about 2 in. long and an in. wide; roll them over on themselves; dip in egg and fry in hot fat; let them just brown, do not break the croquettes; if they are greasy, put them on paper to absorb the excess of fat; sprinkle a little well-chopped parsley over them.

FISH STEW. — Take 1 onion, cut very fine; have lard quite hot in a good-sized stewpan; drop the onion in and let it fry brown; dust in 2 tablespoonfuls of flour; as soon as it is brown pour in boiling water; season the gravy with salt, black and red pepper and a piece of garlic; have a good-sized fish cut in half, put it in the stewpan, having enough gravy to cover it; let it cook slowly, merely simmering, and keep well covered; when the fish is nearly done add a tumblerful of claret wine and a wineglassful of Madeira; do not stir it; just shake until it mixes; let simmer a few minutes; take the fish up as whole as possible and put on a dish; pour gravy over it and garnish with thin slices of lemon and sprigs of parsley and celery.

FLAKED FISH. — Make a sauce by dredging some flour in 2 oz. of hot butter in a stewpan; add ½ lb. of cold fish nicely flaked, 1 oz. of cold butter, a dessertspoonful each of anchovy sauce and mixed mustard, 1 teacupful of cream, some pepper, salt, and a few bread crumbs; make hot and serve in a buttered dish, with the addition of a few bread crumbs; brown the top in the oven.

FROGS. — Only the hind legs are eaten; fry them brown in sweet table butter, first dipping them in a batter of cracker dust, which should adhere closely when cooked, forming a dainty cracknel of a golden brown color, with a crisp tang to it when submitted to the teeth.

GRAVY, For Baked Fish. — Brown a sliced onion in a little butter; add gradually a pint of stock; thicken with a tablespoonful of prepared flour; let the mixture simmer with a bunch of parsley nearly ½ hour; strain the gravy; add salt and a teaspoonful of walnut catsup.

HALIBUT, Baked. — Put a halibut steak weighing about 1 lb., in the middle of a pan; sprinkle it with a piece of garlic the size of a pea; cut fine; spread with tomato enough to cover the fish; cover with bread crumbs; add a little butter and salt; then garnish the fish with more tomatoes and bake 20 minutes; take on the dish in which it is served.

HALIBUT, Broiled. — Nape of halibut; butter; pepper and salt; wash and wipe the nape very dry; sprinkle a little flour on it; put the skinny side next to the fire; broil moderately ½ hour, turn when necessary; when done put on butter and salt; serve hot.

HALIBUT, Head of.—Put 1 pt. of wine, a few anchovies, an onion stuck with cloves, a bunch of sweet herbs, and some pepper into a stewpan; fill it nearly with water; stew for an hour; strain it, and put in the head of a halibut; stew it till tender; when done enough thicken the gravy with butter and flour; add a little fish sauce and serve it up with force-meat balls made of a part of the fish pounded and rolled up with crumbs of bread, thyme, marjoram and nutmeg, bound together with the yolk of an egg. If the fish has been stewed in plain water add a glass of wine to the sauce.

HASHED FISH. — Make a sauce by putting together in a saucepan over the fire, some white wine, butter rolled in flour, shred shallot, grated lemon rind, chopped anchovy, and enough water to moisten with; when quite hot, place in it sufficient boned and sliced fish; keep the whole closely covered over the fire until it is made perfectly hot; add herbs at discretion.

HERRINGS, Baked.—Take off the heads of the fish; remove the entrails; wash and dry them with a cloth; sprinkle them with a seasoning of black pepper, cloves and salt, mixed; tie paper over them; put them in a pan, with a few bay leaves, and bake in a moderate oven; eat either hot or cold.

HERRINGS, Boiled.—Clean them; wash them over with vinegar; fasten the heads to the tails; put them in boiling water 10 or 12 minutes; garnish with parsley; serve with melted butter in which 1 tablespoonful of ketchup, 1 teaspoonful of chili vinegar, and 1 of made mustard has been mixed while making.

HERRINGS, Broiled. — Steep first in vinegar and water into which a handful of salt has been thrown; let them remain 10 minutes; take them out and broil them over a clear fire; rub the bars of the gridiron with suet; serve garnished with parsley; eat with melted butter with a little mustard and vinegar in it, or lemon juice instead of the latter.

HERRINGS, Fried.—Slice small onions; lay in the pan with the fish, or fry separately; serve the fish with the onions laid round them.

HERRINGS, Kippered.—Put the herrings in a basin; pour over enough boiling water to cover them; take them out immediately and put them skin downward in a frying pan; for 2 herrings put ½ oz. of butter and a tablespoonful of hot water into the pan; baste them frequently with it for 10 minutes; take care the fire is not strong enough to boil the fish; the slower the cooking proceeds the better; when placed on a hot dish, spread a small piece of butter over the fish; sprinkle lightly with pepper; serve very hot.

HERRINGS, Potted. — Take from 1 to 2 doz.

herrings, according to the number you purpose potting; choose them as large, fresh, and fine as you can; take 2 oz. of salt, 1 of saltpeter, 2 of allspice; reduce them to an impalpable powder; rub them well into the herrings; let them remain with the spice upon them 8 hours to drain; wipe off the spice clean; lay them on a pan on which the butter has been rubbed; season with nutmeg, mace, pepper, salt, and 1 clove in powder; 1 oz. each, save the last; lay in 2 or 3 bay leaves; cover with butter and bake gently 3 hours; when cool, drain off the liquor; pack the fish in the pots intended for their use; cover to the depth of ½ in. with clarified butter, just sufficiently melted to run; do not permit it to be hot; eat in 2 days.

KEDGEREE. — Chop small some cold boiled fish; add double the quantity of boiled rice; season with cayenne, white pepper, and salt; boil 2 or 3 eggs 3 minutes; add to the above chopped small with a large piece of butter; warm in a pan, and serve up hot.

LOBSTER, Boiled.—Set over the fire a saucepan containing water salted in the proportion of a tablespoonful of salt to 1 qt. of water; when the water boils put the lobster in; keep boiling briskly from ½ hour to an hour, according to the size of the fish; take the lobster out; wipe all scum from it; rub the shell with a very little oil or butter, to gloss.

LOBSTER, Broiled. — Cut the tail part of a lobster in two; rub a little sweet oil over the meat and broil; when done brush a little butter over it, with the juice of ½ lemon and just the suspicion of cayenne; put the meat back into the shell; send to table with a dish of broiled tomatoes and a fresh baked potato.

LOBSTER CROQUETTES.—Take the meat of 2 lobsters and chop it; slice 1 small onion, and brown it in a tablespoonful of butter; when cooked and off the fire, incorporate into this 2 tablespoonfuls of flour; add a little milk; to the chopped lobster add parsley, a little salt and a little red pepper; bind the lobster together with the yolks of 4 eggs; mix thoroughly with the butter in which the onion was cooked; shape properly and dip them in cracker crumbs and the yolk of an egg; fry in boiling lard.

LOBSTER CUTLETS.—Make a milk sauce well reduced; incorporate 2 shallots hashed very fine and cooked slightly before in a little butter; hash also very fine a small piece of boiled ham and the tails of 2 lobsters; which cook 10 minutes in sauce; add a little butter of lobster; thicken with 2 yolks of eggs and cool; divide the preparation in 2 equal parts, to which give the form of a cutlet; soak them in beaten eggs; roll them in some bread crumbs and fry them until they get a nice yellow color; arrange on a plate and put at each end of the cutlets a little claw of lobster or a curled paper; put round the plate some parsley and a few pieces of lemon, and serve.

LOBSTER, Deviled.—Take the meat out of the main shell of the fish; divest of the uneatable parts; mix the remainder with a little shred anchovy, olive oil, lemon juice, and what seasoning you may fancy; place the mixture in the shell; butter it outside; bake or broil until thoroughly hot; serve with dry toast and crisp parsley.

LOBSTER, Dressed.—Wipe over the shell of the lobster, when it is boiled, with salad oil; rub it off again; separate the body from the tail; break off the great claws; crack them at the joints; split the tail in halves; place the halves of the body upright in the dish; lay the claws and half tails round it; garnish with parsley.

LOBSTER, Fricasseed.—Boil the meat of a good sized lobster; when tender, cut it in small pieces; stew or simmer it gently for 10 minutes with a little chicken or lamb broth, a lump of butter, with pepper and salt to suit the taste; when almost ready to serve add a little cream, thickened with flour; stir in the gravy; let it come to a boil; toast some thin slices of bread, or some milk crackers; lay in the bottom of a deep vegetable dish, and pour lobster over them; add lemon juice.

LOBSTER, Rissoles of.—Extract the meat of a boiled lobster; mince it as fine as possible; mix it with the coral pounded smooth, and some yolks of hard boiled eggs, pounded also; season with cayenne pepper, powdered mace and a very little salt; take a batter of beaten egg, milk and flour; to each egg allow 2 large tablespoonfuls of milk and 1 large teaspoonful of flour; beat the batter well, and then mix the lobster with it gradually, till it is stiff enough to make into oval balls about the size of a large plum. Fry them in the best salad oil; serve them up either warm or cold.

LOBSTER, Roasted. — Take a live lobster; half boil it; take it from the kettle in which it is boiling; dry it with a cloth; while hot, rub it over with butter; set it before a good fire; baste it with butter; when it produces a fine froth, it is done; serve with melted butter.

LOBSTER, Stewed. — A middling-sized lobster is best; pick all the meat from the shell as whole as possible; put it in a stewpan with a piece of butter the size of a large egg, a little pepper, salt, and a teacupful of weak vinegar; stew about 20 minutes; eat when very hot.

MACKEREL, Baked.—Open and clean thoroughly; wipe very dry; pepper and salt the inside; put in a stuffing composed of powdered bread crumbs, the roe chopped small, parsley, and sweet herbs, but very few of the latter; work these together with the yolk of an egg; pepper and salt to taste; sew it in the fish; place the latter in a deep baking dish, and dredge it with flour slightly; add a little cold butter in small pieces; put the fish into an oven; 28 or 30 minutes will suffice to cook it; send in a hot dish to table, with parsley and butter.

MACKEREL, Boiled. — Clean and roll in a clean cloth; put in cold water; cook for 5 minutes after coming to a boil; serve with parsley sauce, made with a tablespoonful of flour; mix smooth with cold milk, and a piece of butter the size of a small egg; garnish with green parsley, and eat with stewed gooseberries.

MACKEREL, Broiled. — After taking out the gills and inside, clean and dry the mackerel with a damp cloth; fold in an oiled paper and put on the gridiron; when done on one side turn on the other; remove the paper and dress

on the dish in which it is to be served; split it down the back and put in a lump of butter mixed with finely chopped parsley and shives; add salt and pepper and a squeeze of lemon juice; serve before the butter is quite melted.

MACKEREL, Butter Sauce for.—½ cup of flour mixed with cold water till a smooth paste; stir enough of this paste into ½ pt. of boiling water over the fire to form a thick cream; add a little salt; stir steadily with an egg-whip for 2 minutes; remove from the fire and stir in ¼ lb. of butter, 2 tablespoonfuls of chopped parsley and the juice of ½ lemon; set it on the back part of the stove to keep warm, but on no account let it boil.

MACKEREL, Fillets of.—Split and cut a Spanish mackerel into fillets 2 in. square; season with salt and pepper; dip in butter and fry in hot lard; serve with boiled potatoes and a mayonnaise sauce containing a little parsley, onion, and cucumber pickle chopped fine.

MAITRE DE HOTEL BUTTER.—1 tablespoonful of butter; 1 of parsley chopped fine; 1 teaspoonful of lemon juice; 1 saltspoonful of salt; ¼ saltspoon of pepper; mix cold and spread over the fish on coming from the fire.

MOCK TERRAPIN.—½ calf's liver; season; fry brown; hash not very fine; dust thickly with flour, a teaspoonful mixed mustard, as much cayenne pepper as will lie on a half-dime; 2 hard eggs, chopped fine, a lump of butter as large as an egg, a teacup of water; let it boil a minute or two; cold veal will do, if liver is not liked.

OYSTER FRITTERS. — Drain some oysters thoroughly; chop fine; season with pepper and salt; make a batter of eggs and flour; stir the chopped oysters in this, and fry in hot butter; fry them whole; envelope in batter, 1 in each fritter.

OYSTER PATTIES.—1. Roll out some very light puff paste ½ in. thick; stamp it in rounds with a cutter 3 in. in diameter; press a small cutter, 2 inches in diameter on the middle of each to the depth of ½ inch; place the rounds on a buttered tin; baste them lightly with egg; bake in a quick oven; when done, take them out; remove the centre piece; scoop out a little of the inside, and fill the shells with prepared oysters.—2. Parboil 25 oysters in their own liquor; remove the oysters and season the liquid with lemon peel, nutmeg and pepper; strain and thicken with a heaping tablespoonful of flour, 1½ oz. of butter, a wineglassful of rich cream; mix, and then add the oysters; simmer all together a few minutes; fill the shells, and serve.

Oyster Patties.

OYSTER PIE.—Line a deep dish with a crust made as follows: To 2 qts. of flour add 3 teaspoonfuls of baking powder, 4 tablespoons of lard or butter and a little salt; mix with water as for biscuit; wash the oysters and strain the liquor; pour it over them; thicken a cup of water with a tablespoonful of flour; butter the crust on both sides; cut across in the centre; pepper and salt the oysters; bake well.

OYSTER SAUCE.—1. Blanch 1 doz. oysters in their own liquor; take the oysters out and add 2 blades of mace, 1 oz. of melted butter, and a cupful of thickened cream; return the oysters to the sauce; let them come to a boil; serve; salt to taste.—2. Set a basin on the fire with ½ pt. of oysters and 1 pt. of boiling water; let them boil 3 minutes and then stir in ½ cup of butter beaten to a cream, with 2 tablespoonfuls of flour; let this come to a boil and serve.

OYSTER SHORT-CAKE.—Boil 1 qt. of oysters with ½ cup of water, ½ cup of milk and ½ cup of butter; season with pepper and salt; thicken with a spoonful of corn starch; when the cake is done split open and spread the oysters between the pieces.

OYSTERS, Fricasseed. — For 1 qt. can, drain the oysters as dry as possible; put a piece of butter the size of an egg into your spider; let it get quite brown; put in your oysters; as soon as they commence to cook add as much more butter, which has been previously well mixed with a teaspoonful of flour; let it cook a moment and add 1 egg, beaten with a teaspoonful of cream; let this cook a moment and pour all over toasted bread.

OYSTERS, Fried. — Use the largest and best oysters; lay them in rows upon a clean cloth and press another upon them to absorb the moisture; have ready several beaten eggs; in another dish some finely crushed crackers; in the frying pan heat enough butter to entirely cover the oysters; dip the oysters first into the eggs, then into the crackers; roll them over that they may become well incrusted; drop into the frying pan and fry quickly to a light brown; serve dry and let the dish be warm.

OYSTERS, Panned. — Cut stale bread in thin slices; round them, removing all crust; make them to fit patty pans; toast them; butter, and place in pans; moisten with 3 or 4 teaspoons of oyster liquor; then place on the toast a layer of oysters; sprinkle with pepper; put on top a small piece of butter; place pans in a baking pan and put in oven; cover with a tin lid, or, if not large enough, another pan to keep in the steam and flavor; have a quick oven and when cooked 7 or 8 minutes, until "ruffled," remove cover and sprinkle with salt; replace cover and sprinkle with salt; replace cover and cook 1 minute longer; serve in the patty pans.

OYSTERS, Pickled.—Put the oysters and liquor in a porcelain kettle; heat slowly until the oysters are hot but not to boiling; take them out with a skimmer; let them cool; to the liquor, which remains in the kettle, add salt; a few pepper-corns, cloves, and a blade or two of mace; add the same quantity of vinegar as oyster juice; let the whole boil 15 minutes; then turn it out on the oysters.

OYSTERS, Roasted. — 1. Open 1 doz. large oysters on deep shell; add a walnut of butter, with a little salt and mixed pepper, red and black, and a pinch of cracker dust to each; place them on a broiler, over a sharp, clear fire, until done, and serve.—2. Large oysters not opened; a few minutes before they are wanted, put on a gridiron over a moderate fire; when done they will open; do not lose the liquor that

is in the shell with the oyster; send them in hot upon a napkin.

OYSTERS, Scrambled.—Take canned oysters; drain off the liquor; chop them up; season with pepper, salt, a little sage and thyme; add 2 eggs well beaten; put into a pan with melted butter; stir till done.

OYSTERS, Steamed.—Lay some oysters in the shell in some air-tight vessel; place the upper shell downwards so the liquor will not run out when they open; set them over a pot of boiling water where they will get the steam; steam them till they open; serve at once and heat hot, with salt and a bit of butter.

OYSTERS, Stuffed.—Chop fine 1 doz. oysters; mix with them the beaten yolk of 1 egg; thicken with bread crumbs and a tablespoonful of thick cream; salt and pepper to taste; fill the shells, rounding them nicely on the top; brown in a quick oven.

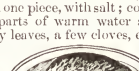
OYSTER STEW.—1. Take 1 qt. of oysters; put the liquor (a teacupful for 3 persons) in a stewpan; add ½ as much more water; salt, a good bit of pepper, a teaspoonful of butter for each person, and a teaspoonful of rolled cracker for each; put on the stove and let it boil; have the oysters ready in a bowl; the moment the liquor begins to boil, pour in all the oysters, say 10 for each person; watch carefully, and as soon as it begins to boil, count just 30 seconds, and take the oysters from the stove; have a big dish ready with 1½ tablespoonfuls of cold milk for each person; pour the stew on this milk and serve immediately.—2. In all cases, unless shell oysters, wash and drain; mix ½ cup of butter and a tablespoonful of corn starch; put with the oysters in a granite sauce pan; stir until they boil; add 2 cups of cream or milk; salt to taste; do not use the liquor of the oysters.

PERCH, Boiled.—First wipe or wash off the slime; scrape off the scales, which adhere rather tenaciously to this fish; empty and clean the insides perfectly; take out the gills; cut off the fins; lay the perch into equal parts of cold and of boiling water; salt as for mackerel; from 8 to 10 minutes will boil them unless they are very large; dish them on a napkin, garnished with curled parsley; serve with melted butter.

PIKE, Baked.—For a pike of 2 lbs. weight, chop 2 small onions, or shallots, if preferred, quite fine; also a good pinch of parsley; add a little grated nutmeg, pepper and salt; put ½ these in a fish pan, which should be rather flat and long; place the fish, well washed and cleaned, in the pan; sprinkle the other half of the ingredients over it; add a small tumbler of hock wine; put the fish into a moderately heated oven to bake; take care to baste it well occasionally; if required, add a little white stock; when thoroughly done, take it out and place it on the dish; take a piece of butter the size of a large hen's egg; mix it with 2 teaspoonfuls of flour; incorporate this with the gravy remaining in the pan, and stir it well until the butter is dissolved, when it will form a nice sauce.

PIKE, Boiled.—Wash and clean the fish thoroughly; skewer the head to the tail; lay it upon a drainer and put it in the fish kettle; let it have plenty of water, into which throw a handful of salt and a glassful of vinegar; when it boils, remove the scum as fast as it rises; it will take ¾ hour dressing, if a tolerable size; if very large, 1 hour; if small, ½ hour; serve with melted butter, and lemon sliced or whole.

SALMON, Boiled.—Boil a salmon whole, or head and shoulders in one piece, with salt; cover the fish with equal parts of warm water and Rhine wine, 2 or 3 bay leaves, a few cloves, etc.; when done use the water in making sauce by reducing it; add butter rolled in flour, to thicken, a pinch of cayenne, and the juice of 1 lemon. Serve with lobster sauce, or melted butter with a few sprigs of parsley boiled a few minutes in it.



Boiled Salmon.

SALMON, Canned.—Set the can in a kettle of hot water for about 20 minutes; while it is heating make a nice drawing of butter; add chopped parsley and hard boiled eggs, cut small; turn your salmon into a dish; pour over the drawing of butter; eat with mashed potatoes.

SALMON PIE.—Take a can of Oregon salmon, empty it carefully from the can so as not to break it; prepare a crust in a high dish beforehand; take a spoonful of flour, half as much butter and as much ground mace as will go on a penknife, a teaspoonful of salt, and work it well together; thin it with some of the liquor from the fish; add some chopped parsley to it, with a few peppercorns; stew the sauce; stir it so that it shall be smooth; when the sauce is done put on the fish; pour the whole carefully into the crust; bake for 10 minutes, until it is hot through, and serve.

SALMON, Roasted.—Take a large piece of the middle of a very fine salmon; dredge well with flour; while roasting, baste it with butter; serve garnished with lemon.

SALMON, Steamed.—Take a couple of pounds of salmon and steam them; place the fish in a tin dish; trim it with finely cut pieces of cooked tongue; here and there place little butter pieces on it; pour 2 or 3 glasses of sherry and 1 tablespoonful of the water from the fish over it; cover it up and let it well steam through without simmering; eat with potatoes in parsley sauce, or with stewed or frizzled mushrooms.

SALMON, Stewed.—Scrape the scales clean off; cut it in slices; stew them in rich white gravy; add, immediately previous to serving, 1 tablespoonful of essence of anchovies, a little parsley chopped very fine, and a pinch of salt.

SARDINE OMELET.—Take ½ doz. good sardines; drain them thoroughly; remove carefully the scales, and get them dry; make an omelet as usual, but the minute it begins to cook on the sides, place the fish lengthways on the omelet and turn the edges over them; put a very little chopped anchovy inside of each fish; do not cook too much.

SAUCE FOR FISH.—Take 1 pt. of milk and the fish drippings mixed; a little salt and pepper; mix until smooth 2 oz. of butter and 2 teaspoonfuls of flour; stir into the liquor when boiling; have ready a hard boiled egg, chopped fine, to add when ready for the table.

SHAD, Baked.—Make a dressing of bread crumbs, butter, pepper and salt, worked to a paste; fill the shad with the mixture; sew it up, and place it lengthwise in a baking pan with a little water and 1 oz. of butter; fill the space between the fish and the sides of the pan with slices of raw potatoes ¼ in. thick; serve fish and potatoes together; add a spoonful of self-raising flour to the gravy, and serve.

SHAD, Boiled.—Clean, wash and wipe a large shad; stuff with a dressing of bread crumbs, butter, salt and pepper; wet with milk, and sew up carefully with fine cotton; lay in the dripping pan; pour over it a cupful of hot water, and bake 1 hour; cover, except when you are basting it with butter and water; put into a hot dish and keep warm while you add to the gravy juice of 1 lemon and a tablespoonful of browned flour; wet with cold water and pepper; boil up well and serve in a gravy boat; garnish the fish with sliced lemon and sprigs of celery.

SHAD, Broiled.—1 shad; 2 oz. of butter; ½ teaspoonful of pepper; ½ teaspoonful of salt; split the shad, when cleaned, directly through the backbone with a strong sharp knife; grease the broiler slightly; place the fish between its leaves, and broil over a quick fire for 10 minutes; when done, remove quickly from the broiler; dress with the butter, pepper and salt; send it to the table as hot as possible; garnish with lemon quarters and a sprig of parsley at either end.

SHAD, Fried.—Clean the fish; cut off the head and split it down the back; save the roe and eggs when taking out the entrails; cut the fish in pieces about 3 in. wide; rinse each in cold water; dry on a cloth; use wheat flour to rub each piece; have ready hot salted lard and lay in the fish, inside down; fry until of a fine brown; turn and fry on the other side; fry the roe and egg with the fish.

SHRIMP SAUCE.—Take ½ pt. of shrimps; pick out all the meat from the tails; pound the rest in a mortar with the juice of half a lemon and a piece of butter; pass the whole through a sieve; make a pint of melted butter; put the meat from the tails into it; add a dust of cayenne; when the sauce boils stir it into the shrimp butter that has come through the sieve, with or without a tablespoonful of cream.

SMELTS, Baked.—Wash and dry the fish thoroughly in a cloth; arrange them nicely in a flat baking dish; cover them with fine bread crumbs; place little pieces of butter over them; season and bake for 15 minutes; just before serving, add a squeeze of lemon juice, and garnish with fried parsley and cut lemon.

SMELTS, Fried.—Let them be carefully floured; fry them in plenty of hot lard; when done drain them well in front of the fire, sprinkle them all over with very fine salt, and serve with fine parsley and lemon cut into quarters.

SMELTS, Potted.—Draw out the insides of the fish; season with salt and pounded mace and pepper; lay them in a pan with butter on the top; bake them; when nearly cold, lay them upon a cloth; put them into pots; clear off the butter from the gravy, clarify and pour it over them.

STURGEON, Baked.—Let it lie several hours in salt and water; boil it until the bones can be removed; pour vinegar over your fish and in the water and salt; when done, take it out to cool; then egg and bread crumb it; sprinkle clarified butter over it; place it in a moderate hot oven to brown; make a very thick sauce from the kidneys and good stock, with a tablespoonful of essence of anchovies; season it with cayenne pepper, salt, dust of sugar, juice of lemon, and a glass of wine.

STURGEON, Broiled.—Cut a fine piece of the fish, and, skinning it, divide it into slices; beat up 3 eggs, and dip each of the slices into them; powder fine bread crumbs mixed with finely chopped parsley; pepper and salt them; fold them in paper; broil them; be careful that the fire is clear; send them to table with essence of anchovies and soy, accompanied by cold butter.

TERRAPIN.—Put them in boiling water alive, and let them remain until the claws become soft; after they are cool, open them and pick out the meat, being careful not to break the gall; use only the meat and liver and claws; to 1 large terrapin use the yellows of 3 hard boiled eggs, mashed very fine, with 1 tablespoonful of flour, a little cream, salt and pepper, and sherry wine to taste; put in a clean tin pan with not quite ¼ lb. butter; let it melt, not allowing it to get brown; put in the terrapin (nicely picked); when warmed through pour in the dressing; let it boil up once or twice, and it is finished.

TROUT, Baked.—Clean the trout nicely, but handle very gently; lay in a dripping pan with water and butter just sufficient to keep it from scorching; bake slowly; baste often; when nearly done, prepare a sauce in the following manner: Have ready ½ pt. of cream, 1 gill of milk, 2 tablespoonfuls of melted butter, the beaten white of 1 egg, and some chopped parsley; put these ingredients into a farina kettle and let it get boiling hot; serve the fish in a hot dish with a few spoonfuls of this sauce over it.

Baked Trout.

TROUT, Fried.—Dry them thoroughly, and fry in hot oiled butter without shortening, or in pork fat; if the latter rub salt on the fish; lay on the fish, before serving, lumps of sweet butter.

TROUT, Stewed.—Wash and clean the fish; wipe it perfectly dry; put into a stewpan 2 oz. of butter; dredge in flour as it melts; add grated nutmeg, a little mace, and a little cayenne; stew well and, when fluid and thoroughly mixed, lay in the fish; slightly brown; cover with a pint of veal gravy; throw in a little salt, a small fagot of parsley, and a few rings of lemon peel; stew slowly 40 minutes; take out the fish; strain the gravy clear and pour it over the fish.

WHITE FISH, Boiled.—Lay the fish open; put it in a dripping pan, with the back down; nearly cover with water; to 1 fish put 2 tablespoons salt; cover tightly and simmer ½ hour; dress with gravy, butter and pepper; garnish with sliced eggs; for sauce use a piece of butter the

size of an egg, 1 tablespoon of flour, ½ pt. boiling water; boil a few minutes, and add 3 hard boiled eggs, sliced.

WHITE FISH, Broiled.—Cut in 2 pieces down through the centre of the back; lay in a pan and cover with cold water; add 1 tablespoonful of salt; let it lay about 2 hours; take it and wrap in a dry cloth; let it remain until ready for cooking; have a nice bed of coals, grease your gridiron well, salt a very little, and pepper your fish, and broil ½ hour, turning it when done on one side; lay it on a plate and pour melted butter over it.

FRITTERS, PANCAKES, ETC.

REMARKS.—To do away with the grease on the griddle for baking cakes, have the ordinary iron griddle ground smooth on a grindstone and rubbed off with a piece of fine sand paper wrapped round a block of wood. If the griddle be rubbed with a turnip, the desired smoothness will be obtained and the unpleasant smoke done away with.

APPLE PANCAKES.—Make 1 qt. of batter as for any other pancake; add 1 cup of finely chopped apple; stir each time a spoonful is taken out, in order to equalize it.

BARLEY CAKES.—Dissolve 1 yeast cake in 3 pts. of warm water; add barley flour enough to thicken, and salt to taste; let it rise over night, and in the morning, before using, add 1 teaspoonful of baking soda dissolved in a cupful of warm water and milk, or sufficient water and milk to make the batter suitable for baking; leave enough batter to raise the next portion, with milk, water and flour added.

BATTER CAKES.—With 1 qt. of flour sift 5 times 2 heaping teaspoonfuls of baking powder, or 1 teaspoonful of soda and 2 of cream tartar; add a tablespoonful of salt and sweet milk till the batter is of the right consistency; add 2 eggs, beaten whites and yolks apart, and then together; fry on a hot griddle, using as little fat to fry with as possible; if the griddle is of polished steel no fat at all will be needed.

BELL FRITTERS.—1 qt. of water; while boiling put in a piece of butter the size of an egg; draw it from the fire and add enough flour to make a thick batter; when it cools beat in 6 eggs, each one separately, and until batter is very light; have ready a kettle of boiling lard; drop the batter in from a spoon; place the fritters in a colander as soon as they are lifted with a fork from the lard, which keep at a boiling heat all the time they are cooking; serve either with a nice sauce, wine and sugar, or a small quantity of molasses made boiling hot.

BREAD GRIDDLE CAKES.—Soak 5 or 6 slices of stale bread over night in 3 cupfuls of buttermilk; in the morning mash the bread fine; add 2 well-beaten eggs, 3 teaspoonfuls of soda, a little salt and flour to make of the right consistence to fry.

BUCKWHEAT PANCAKES.—Take 1½ pts. of warm water, 2 teaspoonfuls of salt, ½ cupful of yeast, flour enough to make a batter as thick as you can stir easily with a spoon; mix thoroughly and set in a warm place to rise; in the morning add ½ teaspoonful of soda and warm water enough to make the batter as thin as you can bake it; have a hot griddle; rub it lightly with a nice piece of fat pork; bake cakes about 3 in. in diameter.

CHEESE FRITTERS.—Put about 1 pt. of water into a saucepan with a piece of butter the size of an egg, the least bit of cayenne, and plenty of black pepper; when the water boils throw gradually into it sufficient flour to form a thick paste; take it off the fire and work into it about ½ lb. of grated Parmesan cheese; then add the yolks of 3 or 4 eggs, and the whites of 2 beaten up to a froth; let the paste rest for a couple of hours; proceed to fry by dropping pieces of it the size of a walnut into plenty of hot lard; serve sprinkled with very fine salt.

CHERRY FRITTERS.—Make a batter of 1 pt. of milk, 4 beaten eggs, a pinch of salt, 2 even teaspoonfuls of baking powder and enough flour to make a little stiffer than pancake batter; beat thoroughly; stir in 1 pt. of stoned cherries and drop by the spoonful into hot fat; as they are taken from the fat, drain on an old but clean napkin; dust with powdered sugar and season with liquid sauce.

CORN MEAL CAKES.—2 cups of corn-meal; 1 cup of flour; a little salt; mix well together; 2 eggs well beaten; 1 pt. of thick sour milk; stir into a little of this, 1 even teaspoonful of soda; mix well together in a batter; fry on a well-greased griddle.

CORN MEAL FRITTERS.—Scald well a teaspoonful of corn meal by pouring boiling water over it; add ½ teacupful of sweet milk, an egg, a spoonful or two of flour, and a teaspoonful of baking powder; have ready a kettle of boiling lard; dip into the batter a teaspoonful at a time; if they fry into pieces, thicken with flour; when one side is brown turn them over and brown the other.

CRACKER GRIDDLE CAKES.—To 1 beaten egg add 2 pounded crackers, a pinch of salt, and milk enough to make a thin batter.

CREAM FRITTERS.—Heat 1 pt. of rich milk to a boiling point; have a thin stick of cinnamon in it to flavor; add ½ cup of sugar, after taking out the cinnamon, 2 tablespoonfuls of corn starch and 1 of flour, made smooth with a little cold milk; cook about 2 minutes; stirit to keep it from burning; take it off the stove; add the yolks of 3 eggs well beaten; return it to the fire a moment or two to set them; remove again from the fire; add a small bit of fresh butter and ½ teaspoonful of any flavor you prefer; butter a dish and pour the custard on it until ¼ in. thick; when cold and stiff cut into pieces 3 in. long and 2 in. wide; roll these gently in sifted cracker crumbs; then in egg beaten and sweetened; then in cracker crumb again; put them in a wire basket and fry in hot lard to a good color; put them in the oven for 2 or 3 minutes, to soften inside; dredge with fine sugar; serve

immediately on a plate with a spoonful of quince jelly.

CRULLERS.—¾ lb. granulated sugar; ½ lb. butter; 1 cupful milk; 5 eggs; a pinch of salt; teaspoonful vanilla extract; nutmeg to taste; 3 lbs. sifted flour; mix butter, sugar and part of the milk to a very creamy batter; then the eggs, rest of milk and flavoring; then some of the flour; beat till very light, adding the flour till very stiff; with the hands knead in nearly all the flour, reserving a little for flouring the pastry board; cut off a lump; roll out ½ in. thick; cut in pieces 3 in. long and 2 wide; twist in fancy shapes; drop a few at a time in boiling hot lard; sift powdered sugar over them; when cool slip on a large meat dish.

CRUMPETS.—Beat 2 eggs very well; put to them 1 qt. of warm milk and water, and 1 large spoonful of yeast; beat in as much fine flour as will make them rather thicker than a common batter pudding; make the pan hot, and rub it with a little butter wrapped in a clean linen cloth; pour a large spoonful of the batter upon the iron; let it run to a circle the size of a saucer; turn them with the elastic blade of an old knife; when wanted for use, toast them quickly and butter.

CURD FRITTERS.—1 qt. sweet milk; 2 glasses white wine; 1 teaspoonful liquid rennet; 5 eggs whipped light; 4 tablespoonfuls prepared flour; 2 tablespoonfuls powdered sugar; nutmeg to taste; scald the milk; pour in the wine and rennet; take from the fire; cover and let stand until curd and whey are separated; drain off the latter; dry the curd upon a cloth; beat yolks and sugar together; whip in the curd until mixed; then the flour, nutmeg and whites; have ready some butter in a frying pan; fry quickly; drain upon a warm sieve; lay within a dish lined with a clean napkin; sift on powdered sugar; eat with jelly sauce.

CUSTARD Fritters. — Boil ½ pt. of milk with cinnamon, lemon and bay leaves; add 2 oz. of sugar, 1 oz. of flour, a little salt and 3 eggs; beat all together and steam the custard in a plain mold or basin previously spread inside with butter; when done firm and quite cold, cut into square pieces; dip in frying batter; drop separately into boiling fat; fry a light brown color, and dish them up on a napkin.

DOUGHNUTS. — 1. ½ lb. butter; ¾ lb. sugar; 1 pt. sweet milk; 4 eggs; ½ cup yeast; 1 teaspoonful each nutmeg and cinnamon; cream the butter and sugar; add the milk, yeast and 1 qt. of flour; set to rise over night; in the morning beat the eggs light; stir in the batter with the spice and rest of the flour; set to rise until night; roll in a thick sheet; cut out and fry in boiling lard.—2. 2 cups of sugar; 2½ cups of sour milk; 6 tablespoonfuls of melted lard; 1 teaspoonful of soda; try them; they may need just a little more lard; they can be made of sweet milk and baking powder if liked, but many think them better with sour milk.

FLAB-DABS.—3 well-beaten eggs; a saltspoon of salt; flour enough for a stiff paste; roll and cut into very thin cakes and fry in lard; when they rise to the surface they are done; put 2 together, with jam or jelly between.

FLANNEL CAKES. — Mix 3 tablespoonfuls of flour with ½ pt. of cream; add 2 eggs, and beat the whole well till quite smooth; add slowly ½ pt. of new milk; into which has been put a teaspoonful of baking powder; beat all well together; fry with lard, a little of which should be made hot for each cake; eat with powdered sugar; mix with cinnamon or grated nutmeg.

FRUIT FRITTERS. — Make a batter of 10 oz. of flour, ½ pt. of milk, and 2 oz. of butter; sweeten and flavor to taste; add a glass of brandy, rum, or sherry; stir in the whites of 2 eggs well beaten; mix any small fruit with the batter and fry.

GOOSEBERRY FRITTERS.—Make a thick batter, composed of 6 eggs well beaten, ¾ pt. of cream, 1 tablespoonful of yeast, 1 tablespoonful of orange flower water, and a little grated nutmeg; add as much flour as may be necessary to produce the proper consistence; stew some gooseberries till quite tender; mix them with the batter; drop it into boiling lard, and fry to a good color; strew sugar over them and serve.

GRAHAM GRIDDLE CAKES.—3 teaspoonfuls yeast; 2 cups Graham flour; 1 cup wheat flour; mix at bed time with warm water or milk; set where it will keep warm; bake on a griddle for breakfast.

HIGHLAND SCONES.—To 1 lb. of flour allow from 2 to 4 oz. of butter; add as much hot milk as will make a dough of the flour, and 2 beaten eggs; roll and cut into any shape; bake on a griddle; handle, serve and eat quickly.

HOMINY FRITTERS. — 2 teacupfuls of cold boiled hominy; stir in 1 teacupful of sweet milk and a little salt, 4 tablespoonfuls of sifted flour and 1 egg; beat the white separately and add last; have over the fire a pan of hot lard; drop the batter in by spoonfuls, and fry a nice brown.

LEMON FLAPJACKS.—1 pt. milk; 4 eggs; juice of 1 lemon; flour to make a light batter; a pinch of soda; fry in hot lard; serve with sugar and nutmeg.

MOLASSES CRULLERS. — 2 teaspoonfuls of molasses; 2 teacupfuls of cream; 2 eggs; 1 teaspoonful of saleratus; flour to mix and roll.

PEACH FRITTERS.—Make a smooth batter of ½ lb. of flour, ½ oz. of butter, ½ saltspoon of salt, 2 eggs, and enough warm milk to make it of a proper consistency; pare, halve and stone the peaches; dip them in the batter; fry in hot lard from 8 to 10 minutes.

PINE-APPLE FRITTERS.—1 pt. of flour; ½ pt. of milk; 3 eggs; ½ teaspoonful soda; ¾ teaspoonful cream tartar; 1 tablespoonful sugar; salt to taste; peel and slice 1 juicy pine-apple, and cover with sugar; let it stand over night; stir in the batter when ready to fry; eat while hot, with sugar.

RICE FRITTERS.—Boil 1 teaspoonful of rice until it is tender; strain upon it 1 qt. milk; let it boil 10 minutes; cool it; add flour enough to make a batter as thick as will fry easily on the griddle; 2 tablespoonfuls of yeast; let it rise 3 hours; add 2 well beaten eggs, and cook on a heated griddle.

RICE PANCAKES. — Boil rice until it is soft; while warm make into cakes or flat balls; dip the balls into a beaten egg; roll them in corn

meal till thoroughly coated; fry them in lard, which is better than butter for this purpose; serve with sauce, butter, or with cream and sugar.

RICE PUFFS.—To 1 pt. of rice flour add 1 teaspoonful of salt and 1 pt. of boiling water; beat up 4 eggs, the whites and yolks separately; stir them well together; add 1 spoonful of butter at the same time; have ready a skillet of boiling lard; drop in the batter, a spoonful at a time; send to table just as fritters; to be eaten with wine and sugar, or sauce.

RICE WAFFLES.—Beat together 1 pt. of milk, the yolks of 3 eggs, 2 oz. of butter and ½ teacup of thoroughly boiled rice; sprinkle a little salt and ½ teaspoonful of soda into 1 pt. of flour; then sift it in; beat thoroughly and bake in waffle irons.

RYE DROPS, Fried.— 1 cup sour milk or buttermilk; 3 tablespoonfuls sugar; 1 of butter, if buttermilk is not used; 1 egg; a scant teaspoonful soda; 1 of cinnamon; add rye flour sufficient to make a stiff batter; take it up by the tablespoonful and drop into boiling hot lard, first dipping in the spoon to prevent the dough sticking.

RYE GRIDDLE CAKES.— 1 qt. rye flour and 1 cup of wheat flour; wet it up with sour milk, or buttermilk, until the batter is thick enough to cook easily on a griddle; add a little salt and a scant teaspoonful of soda, dissolved in warm water, and 1 well beaten egg.

SHORT-CAKES.—Dissolve ½ lb. of fresh butter in as much milk as will make 1½ lbs. of flour into a paste; roll it out about ¼ in. thick; cut it into large round cakes; cook them in a frying pan; serve hot; eat with butter.

SNOWBALLS.—1 cup of sugar; 6 tablespoonfuls of melted butter; 2 eggs; 1 cup of sweet milk; 2 teaspoonfuls of cream tartar; 1 of soda; a very little nutmeg; 1 teaspoonful of salt; mix middling soft and roll out; cut with a small round cutter; fry in hot lard; have ready a small bowl with a little fine white sugar in it; as you take them from the lard drop them in the sugar and roll around quickly until the surface has a very thin coat of sugar all over it, then lay carefully on a plate; repeat with each cake separately; add a little fresh sugar occasionally.

SNOW CAKES.—Make a stiff batter with 4 oz. of flour, ¼ of a pt. of milk, or more if required, a little grated nutmeg, and a pinch of salt; divide the batter into any number of pancakes, and add 3 large spoonfuls of snow to each; fry them lightly, in very good butter, and serve quickly.

SNOW FRITTERS.—Cut some slices of bread into any shape you like; pour a very little brandy on each piece, mix 2 eggs with 2 spoonfuls of flour and a little milk; cover the pieces of bread with this batter; let them rest for ½ hour; then fry in lard or butter; serve hot with a little pepper on each fritter.

SPANISH PUFFS.—Put into a saucepan a teacupful of water, 1 teaspoonful of powdered sugar, ½ teaspoonful of salt, and 2 oz. of butter; while it is boiling add sufficient flour for it to leave the saucepan; stir in one by one the yolks of 4 eggs; drop a teaspoonful at a time into boiling lard; fry a light brown.

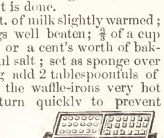
SPONGE CAKE FRITTERS.—6 or 8 small square sponge cakes; 1 cup cream, boiling hot, with a pinch of soda stirred in; 4 eggs, whipped light; 1 tablespoonful corn starch, wet up in cold milk; ½ lb. currants, washed and dried; pound the cakes fine; pour the cream over them; stir in the corn starch; cover for ½ hour; beat until cold; add the yolks, light and strained, and the whipped whites; then the currants thickly dredged with flour; beat all hard together; drop in spoonfuls into the boiling lard; fry quickly; drain upon a warmed sieve, and send to table hot.

VANITY CAKES.—Yolks of 8 eggs and 1 cup of sugar; knead with flour, and fry in hot fat; roll and cut in fancy shapes before frying.

VENETIAN FRITTERS.—Wash and drain 3 oz. of whole rice; put it into a full pt. of cold milk; bring it very slowly to a boil; stir it often and let it simmer gently until it is quite thick and dry; when about 3 parts done, add to it 2 oz. of pounded sugar, and 1 of fresh butter, a grain of salt, and the grated rind of ½ small lemon; let it cool in the saucepan; when only just warm, mix with it thoroughly 3 oz. of currants, 4 of apples, chopped fine, a teaspoonful of flour and 3 large, or 4 small well beaten eggs; drop the mixture in small fritters; fry them in butter from 5 to 7 minutes; let them become quite firm on one side before they are turned; do this with a slice; drain them as they are taken up, and sift white sugar over them after they are dished.

VICTORIAS.—1 cupful sugar; 1 egg; 1 teaspoonful of soda dissolved in 1 pt. of water; beat butter and sugar together; add the water; stir in enough flour to make a thin batter; bake on a hot griddle without turning over; butter each one the instant it is done.

WAFFLES.—1. 1 qt. of milk slightly warmed; 5 cups of flour; 3 eggs well beaten; ⅛ of a cup of home-made yeast, or a cent's worth of bakers', and ½ teaspoonful salt; set as sponge over night; in the morning add 2 tablespoonfuls of melted butter; have the waffle-irons very hot and well greased; turn quickly to prevent scorching.—2. Make a thin paste with 8 oz. of flour; 6 oz. of pulverized sugar; 2 eggs; a few drops of essence to flavor; ½ a liquor-glass of brandy or rum, and milk; warm and butter both sides of the mold; put some of the paste into it; close it gently; set it on the fire; turn it over to heat both sides equally; dust them with sugar when done; serve either warm or cold.



Waffle Irons.

FRUITS.

AMBROSIA.—Spread in a glass dish a layer of grated cocoanut and sugar; then a layer of peeled oranges, sliced thin; so on alternately until the bowl is full, having the top layer of cocoanut.

APPLE COMPOTE.—Pare and core 6 large apples of nearly the same size; drop them as they are done into cold water, with the juice of a lemon squeezed into it to prevent their turning brown; have ready a strong syrup (made with 1 lb. of sugar and 1 qt. of water) boiling hot; put the apples into this, with the thin rind of a lemon and 2 or 3 cloves; as soon as they are cooked take them out carefully and dispose them on a glass dish; pour the syrup over them and garnish with sliced citron. It is an improvement to quarter large apples.

Compote of Apples.

APPLE CREAM.—Peel and core 5 large apples; boil them in a little water till soft enough to press through a sieve; sweeten, and beat with them the whites of five eggs; serve with cream around them.

APPLE FOOL.—Peel and core some fruit; place it in a jar with moist sugar sufficient to render it palatable; add a very little cider; set the jar in a saucepan of water over the fire; continue the heat until the apples become quite soft; then pulp them through a colander; add a sufficient quantity of milk, a little cream and some sugar.

APPLE SAUCE.—Pare and core the apples; remove every particle of skin, core and dark-colored portion; cook well in only as much water as is needed; add sugar as desired.

APPLES, Baked.—Take a deep pie tin and scatter sugar liberally over the bottom; ½ in. of sugar if the apples are pretty sour. Pare the apples and cut into halves; remove the cores carefully; then lay them core side down into the sugar; add a small cupful of water; bake till perfectly tender, but do not let them stew to pieces; when cold take up in a deep dish; if any juice remains in the tin turn it over the apples; add a little sweet cream in dishing them out.

APPLES, Fried.—Slice juicy, thin skinned, and not very sour apples; leave the skins on; fry in melted butter; add a very little water as often as proves necessary to keep them from scorching; stir them quite often; when nearly done add a little salt and sugar to taste of company.

APPLES, Iced.—Pare, core and slice apples of a large tart kind; bake them till nearly done; put them away to get entirely cold; prepare some sugar icing; first pour off all the juice; lay the icing thickly on the tops and sides as much as you can; return them to the oven to just harden and set; serve with cream.

BANANA CREAM.—Procure 5 ripe bananas; take off the skins and pound the fruit in a mortar with 5 oz. of white sugar to a pulp; beat up ½ pt. of good cream to a stiff froth; add the pounded bananas, ½ glass of brandy and the juice of 1 lemon; mix well together; then add ½ oz. of isinglass dissolved in a little boiling water; gently whisk in and fill the mold; set in a cool place until wanted; when required dip the mold in warm water for a few seconds; wipe with a cloth and turn out into a glass or silver dish.

BANANAS AND ORANGES.—Slice the oranges as for ambrosia; slice the bananas; spread in the dish a layer of oranges; sprinkle them slightly with sugar; over this place a layer of banana slices; then oranges, sugar, and bananas in turn, until the dish is full; prepare an hour or so before serving.

BANANAS, Fried.—Peel and slice the bananas; sprinkle with salt; dip in thin batter; fry in butter; serve immediately.

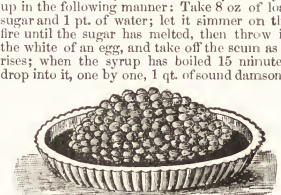
BLACKBERRY MUSH.—2 qts. of ripe berries; 1 qt. of boiling water; 2 cups of white sugar and a little salt; boil slowly for 5 minutes; thicken with Graham flour and cook a few minutes longer; put into a greased mold to cool; serve with cream.

CANTALOUPE.—Cut out carefully the end with the stem, making a hole large enough to admit an apple; with a spoon remove the seed; fill with ice, replace the round piece taken out, and place on end; eat with powdered sugar, salt and pepper, as preferred.

CRANBERRY SAUCE.—Pour hot water on the berries and let them stand until cold; to 1 qt. of them add 1 pt. of sugar and 1 pt. of water; let boil 20 minutes; add sugar and boil 15 minutes more; stir the berries often and mash evenly; when done strain the sauce in a bowl; when cold, serve in slices.

CURRANT SAUCE.—Heat the currants slowly almost to a boil; turn into a colander; allow all the juice possible to drain off without pressing; measure the fruit; to each quart add 1 lb. of sugar, 1 cupful of raisins, and water to thin the sauce.

DAMSONS, Compote of.—Make a pint of syrup in the following manner: Take 8 oz. of loaf sugar and 1 pt. of water; let it simmer on the fire until the sugar has melted, then throw in the white of an egg, and take off the scum as it rises; when the syrup has boiled 15 minutes, drop into it, one by one, 1 qt. of sound damsons,



Compote of Damsons.

and simmer until soft, without breaking them; remove them from the syrup, and boil it again

until rather thick; let it cool, and pour it over the damsons, which should have been previously arranged in a glass dish; a glass of whipped cream is a nice accompaniment to this dish; time to boil syrup, 15 minutes; damsons, about 5 minutes.

FRUIT GLACE.—Boil together for ½ hour 1 cupful of granulated sugar, 1 of water, and the juice of 1 lemon; dip the point of a skewer in the syrup after it has been boiling the given time, and then in water; if the thread formed breaks off brittle the syrup is done; have oranges pared, divided into eighths and wiped free of moisture; pour part of the hot syrup into a small cup, which keep in boiling water; take the pieces of oranges on the point of a large needle or skewer and dip them in the syrup; place them on a dish that has been slightly buttered.

GOOSEBERRY FOOL.—Put green gooseberries into a jar with 2 tablespoonfuls of water and a little moist sugar; place the jar in boiling water and let it boil till the berries are soft enough to mash; then beat it to a pulp; to every pint of pulp add 1 pt. of milk, and add plenty of sugar; serve in glass dishes.

GOOSEBERRY SAUCE.—Wash some sorrel; put it into a cloth and press out the juice; melt a piece of butter with flour; use this juice instead of water; let it be very thick; scald green gooseberries until they are very tender and add them to the sauce.

ORANGE CREAM.—Squeeze the juice from 6 large oranges and 1 lemon; strain and put in a saucepan with 1 oz. of isinglass and sufficient water to make in all about 1½ pts.; put the sugar on the orange and lemon rinds; add to it the other ingredients; boil all together for about 10 minutes; strain through a muslin bag, and when cold beat up with it ½ pt. of thick cream; wet a mold; pour in the cream; put in a cool place to set.

ORANGES AND JELLY.—When a large variety of dishes is required, orange skins are sometimes emptied entirely of the fruit, cut out in the shape desired and filled with bright, clear jelly of different colors; they look pretty; very great care and a sharp knife, however, are required to make them appear an ornamental dish.

Oranges Filled with Jelly.

ORANGE SAUCE.—Place on the fire in a porcelain saucepan ¼ lb. of white sugar, ½ pt. of water, juice of 1 large orange, and the rind cut off exceedingly thin; boil 5 minutes; strain; add 1 glass of white wine.

ORANGES, To Cut.—Make 2 cuts around it, just through the rind; locate them as if the orange was the globe, the stem and the blossom ends being the poles, and the tropic lines on each side of the torrid zone were being laid off; remove the rind from the ends, leaving that portion of it representing the torrid zone undisturbed; cut this across immediately over one of the division lines between the sections of the pulp, and open it, leaving the back of each section of pulp adhering to the strips of rind.

PEACHES, Stewed.—Make a syrup of 6 oz. of sugar to ½ pt. of water; add a tablespoonful of lemon juice and the kernels of 3 peaches, blanched and split; peel 6 or 7 peaches; put them whole into the syrup; stew gently for 20 minutes; arrange them on a dessert dish; turn the syrup and kernels out upon them; leave them to get thoroughly cold before using.

PEARS, Boiled.—Wash ½ peck of tart pears; cut the stems so as to leave only 1 in. in length; put them in an iron pot over the fire, with ½ pt. of water and 1 pt. of molasses to them; cover the pot or kettle; let them boil rather gently until the pears are soft and the syrup rich, almost like candy; take care not to scorch it.

PEARS, Stewed.—Pare them after scalding thoroughly; cut in halves and core; or, if small, leave them whole, as in preserving; put them in a porcelain kettle and let them stew slowly until tender; add only enough water to keep them from burning; when nearly stewed enough add a coffeecupful of sugar; stew until cooked sufficiently; add grated or sliced lemon and a glass of claret wine just before they are done.

PINE-APPLE, To Eat.—Do not peel; cut off the bottom; insert a fork over one of the lower eyes, press downward, and thus pull off a little cone; the cones gradually torn off are much softer than slices of pine-apple bit across the grain.

PRUNES, Stewed.—Use 1 lb. of prunes; wash well; boil in 2 qts. of water until the water boils down over ½; they should simmer slowly an hour or longer; use 4 tablespoonfuls of white sugar or more, and cut in slices 1 large lemon; put the sugar, prunes, lemon, and cold water all on to cook at the same time.

GAME AND POULTRY.

REMARKS.—Kill the fowl (no matter what kind it may be) by cutting off the head; hang up by the feet till free from blood; carefully remove all the entrails and crop; use no water in the operation, save upon your hands before commencing. Begin to bone any bird by taking out the breast bone; then there will be sufficient space to remove the back with a sharp knife, and then the leg bones; the skin must not be broken, but the meat of the legs must be pushed inwards. To roast fowls the fire must be quick and clear. If smoky it will spoil both taste and looks. Baste frequently and keep a white paper pinned on the breast till it is near done. Among the edible birds are found the grouse, partridge, pheasant, quail and prairie chicken. These terms are sometimes used synonymously, although they are distinct varieties

of birds. The ruffled grouse is sometimes called the pheasant in New England; in the Middle States it is called the partridge; and in the Western States the prairie chicken. There is no bird of the partridge genus in America, the name being applied to both grouse and quail. The quail is also loosely called a grouse, and the grouse a quail. The hare may be considered as an English dish; but receipts for cooking it are given, as they may be applied as well to the American rabbit.

BREAD SAUCE.—Cut in slices the crumb of a French roll; add a few peppercorns, 1 whole onion, a little salt, and boiling milk enough to cover it; let it simmer gently by the side of the fire till the bread soaks up the milk; add a little thick cream; take out the onion and rub the whole through a sieve; make it very hot, and serve with game or fowls.

CHICKEN, A l' Italienne.—½ lb. of macaroni; boil it in water with a lump of butter; when it has boiled ½ hour, drain off the water and cover the macaroni with milk; add salt and pepper and a whole onion, stuck with a few cloves; boil until the macaroni is tender but unbroken; boil a chicken in the usual manner; cut it up and lay it on a hot dish; pour the macaroni over it; remove the onion; grate ¼ lb. of Parmesan cheese over the dish; brown it in the oven or with a salamander.

CHICKEN, Boiled.—Take a young fowl; fill the inside with oysters; put it into a jar; plunge the jar in a kettle or saucepan of water; make the gravy from the juices of the fowl and oysters left in the jar, into a sauce, with the addition of egg, cream, and a little flour and butter; add oysters to it, or serve up plain with the fowl.

CHICKEN, Braised.—Take out all the bones except those of the wings and legs; do this by splitting the chicken down the back with a sharp knife and then scrape the flesh down the sides; stuff with cold lamb finely minced and richly seasoned with powdered herbs, a little minced pork and mushrooms, and some lemon juice; stew up the chicken, lard and breast; put it into a stewpan on a layer of herbs, minced onion and parsley, and a few slices of bacon; pour around it some good stock and sherry; cover the pan and let it cook slowly for two hours; then take up the chicken; strain the liquor; put it back on the range and let it boil quickly to a glaze; brush the chicken over with this, and serve on a platter surrounded with mushrooms cooked in a brown gravy.

CHICKEN, Broiled.—Boil a chicken gently for 5 or 10 minutes; leave it to become cold; divide it, and dip into egg and well seasoned bread crumbs; plentifully sprinkle with clarified butter; dip again into the crumbs; broil over a clear and gentle fire from ½ to ¾ hour; serve very hot, with mushroom sauce or with plain gravy thickened and flavored.

CHICKEN CHEESE.—Boil 2 chickens till tender; take out all the bones and chop the meat fine; season to taste with salt, pepper and butter; pour in enough of the liquor they are boiled in to make moist; mold it any shape you choose; when cold turn out and cut into slices.

CHICKEN CROQUETTES.—To 1 chicken and 1 lb. of cold veal chopped very fine, almost to a paste, add ½ chopped onion, 1 tablespoonful parsley (chopped), 1 saltspoonful mace and 1 egg; take the same quantity of stale bread crumbs as there is of chopped meat; if you have any gravy or stock, heat and gradually stir in bread crumbs until the bread absorbs all the gravy; add that to the meat; if the mixture is not thin enough, add a little cream or milk; roll the croquettes egg-shaped or cone-shaped in an egg beaten with a tablespoonful of milk, then in bread crumbs dried in the oven; fry in boiling grease in a deep pan; when done, put on brown paper to absorb the grease.

CHICKEN CUTLETS.—Skin and cut into joints 1 or 2 young chickens; remove the bones with care from the breast, merrythoughts and thighs, which separate from the legs. Mix well together a teaspoonful of salt, nearly ¼ as much of mace, a little grated nutmeg and some cayenne; flatten and form into good shape the boned joints of chicken and the flesh of the wings; rub a little of the seasoning over them in every part; dip them into beaten egg; then into very fine bread crumbs, and fry them gently in fresh butter until of a delicate brown; boil some of the bones and trimmings down in ½ pt. of water, with a roll of lemon peel and a little salt and pepper to make gravy; after straining and clearing from fat, pour hot to some thickening made in the pan with a slice of fresh butter and a dessertspoonful of flour; pile the cutlets high in the centre of the dish; serve the sauce under them, or separately in a tureen.

CHICKEN, Fricasseed.—Take the remains of a cold chicken, cut it into joints; make a gravy by simmering the trimmings in stock enough to cover them, with 1 onion stuck with three cloves, a bouquet of herbs, salt and pepper; simmer the gravy for 1 hour; strain and thicken a cupful of it with a teaspoonful of flour; let this boil, then put in the chicken; draw the saucepan from the fire a few minutes; mix a little of the sauce with the beaten yolks of 2 eggs and a cupful of cream; add this last mixture to the saucepan; let it get hot, but on no account allow it to boil, or the eggs will curdle; serve with the sauce poured over the chicken; sprinkle a little chopped parsley on top.

CHICKEN, Fried.—Take a nice, tender chicken; open it down the back; after cleaning it well pound all the bones flat; wash, and wipe it dry on a clean towel; season with pepper and salt; fry slowly in sweet lard until tender, and a fine brown on both sides; put it on a dish where it will keep warm; pour off the lard in the pan and any brown particles that may remain; add ½ pt. of hot water and flour enough to make the gravy of the proper consistency; to this can be added, if desired, about 25 large oysters, which remove from their liquor and put into the pan with the gravy; let them simmer until their gills begin to shrivel; stir them all the time; when done, pour them over the chicken and send to the table hot.

CHICKEN FRITTERS.—Cut into neat pieces some tender cold chicken; let it stand awhile in a mixture of lemon juice, salt and pepper; make

a batter of milk, egg, flour and salt; stir the chicken into it and fry in hot lard, a bit of chicken in each spoonful of batter; serve very hot; first drain off all the fat; garnish with parsley.

CHICKEN LIVERS.—½ doz. of chicken livers; ½ lb. of fat bacon; 1 saltspoonful of pepper; 1 saltspoonful of salt; place the livers into a saucepan; cover them with cold water; throw in the salt; bring the water quickly to the boiling point; let the livers boil for 5 minutes; when done, remove the livers from the water; slice them lengthwise carefully in order not to break them; cut the bacon in very thin slices, and of a size similar to the slices of liver; thread alternate slices of liver and bacon upon a spit; broil all over a bright fire 5 minutes; turn them constantly in order that they may brown easily; when broiled sprinkle over all the pepper, and send them to the table on spit.

CHICKEN PIE.—Line the sides of a pie dish with a good puff paste; have your chicken cooked as for a fricassee, seasoned with salt and pepper and a little chopped parsley; when nearly cooked lay them in a pie dish with ½ lb. of salt pork cut into 1 in. squares, and some of the paste cut into 1½ in. pieces; pour in a part of the chicken gravy; thicken with a little flour; cover the dish with the paste cover; cut a hole the size of a dollar in the cover; cover it with a piece of dough twice the size of the hole; when baked, remove this piece occasionally and examine the interior; brush egg over the pie, and bake in a quick oven.

CHICKEN, Potted.—Take a roast fowl and carve off all the meat; take 2 slices of cold ham and chop it with chicken; add to this ¼ lb. of the best butter; add salt and pepper to taste; pound this all together to a paste; put the mixture into a jam pot; cover closely.

CHICKEN, Roasted. — Having picked and drawn them, wash out well in two or three waters, adding a little soda to the last but one; prepare a stuffing of bread crumbs, butter, pepper, salt, etc.; fill the bodies and crops of the chickens, sew them up, and roast 1 hour or more, in proportion to their size; baste 2 or 3 times with butter and water, afterward with their own gravy; if laid flat within the dripping pan, put in at first a little water to prevent burning; stew the giblets and necks in enough hot water to cover them, and when you have removed the fowls to a hot dish, pour this into the drippings; boil up once; add the giblets, chopped fine; thicken with browned flour; boil again, and send to table in a gravy boat; serve with crab apple jelly or tomato sauce.

CHICKEN, Steamed.—Rub the chicken on the inside with pepper and ½ teaspoonful of salt; place in a steamer in a kettle that will keep it as near the water as possible; cover, and steam 1½ hours; when done, keep hot while dressing is prepared; cut them up; arrange on the platter; serve with the dressing over them. Dressing: 1 pt. of gravy from the kettle without the fat; add cayenne pepper and ½ teaspoonful of salt; stir 6 tablespoonfuls of flour into 1 gill of cream until smooth, and add to the gravy.

CHICKEN STEW.—Peel 2 onions, 1 turnip, 1 scraped carrot in 2 qts. of boiling water, with 6 cloves, 1 doz. allspice, the same of whole white peppers, a leaf of mace, a pinch of cayenne pepper, 1 tablespoonful of salt, 3 bay leaves, the same of sage, and a sprig of thyme; let them boil for 2 hours; have the chickens cut up; stew for 2 hours steadily, but not too fast; if the chickens are tough, give them 1 hour longer cooking; take the chicken out on the dish it is to be served on; keep it warm; strain the sauce, and put it back into the stewpan; rub 1 tablespoonful of flour and butter smoothly together; add the yolks of 2 eggs and 1 tablespoonful of finely chopped parsley; stir gradually in a cup of boiling water; pour the whole into the chicken sauce; boil for 5 minutes; stir continually, to keep it from curdling; pour over the chicken and serve.

DUCK, Boiled.—Clean and pluck; take care that the skin be preserved from rents while plucking; salt for about 30 hours previous to cooking; flour a clean white cloth and boil in it; a moderate sized duck will take about 1 hour's boiling; make a rich onion sauce with milk, and send it to the table with the duck. When the duck is boiled fresh, stuff as for roasting, and serve with the same description of gravy.

DUCK, Roasted.—Clean, wash and wipe the ducks very carefully; to the usual dressing add a little sage (powdered or green), and a minced shallot; stuff and sew up as usual, reserving the giblets for the gravy; if they are tender they will not require more than 1 hour to roast; baste well; skim the gravy before putting in the giblets and thickening; the giblets should be stewed in a very little water, then chopped fine and added to the gravy in the dripping pan, with a chopped shallot and a spoonful of browned flour; accompany with currant or grape jelly.

DUCK, Salmi of.—Cut up a couple of cold roast ducks and heat the pieces in a saucepan with a rich brown sauce, into which has been put a glass of wine; season to taste; add some stoned olives; arrange on a hot dish, placing about the meat *croutons* of fried bread; cut the bread for these into small slices of any shape and fry in boiling lard.

DUCK, Stewed.—The ducks should be cut into joints; lay in a stewpan with 1 pt. of good gravy; let it come to a boil; as the scum rises remove it; season with salt and cayenne; let them stew gently ¾ hour; mix smoothly 2 teaspoonfuls of fine ground rice, with a glass of port, which stir into the gravy; let it have 7 or 8 minutes to amalgamate with it; dish and send to table very hot.

FORCEMEAT.—1. 6 eggs boiled hard; 1 cupful of minced chicken, veal, ham or tongue; 1 cupful rich gravy; ½ cupful bread crumbs; 2 tablespoonfuls of mixed parsley, onion, summer savory, or sweet marjoram, chopped fine; juice of ½ lemon; 1 egg beaten light; while the eggs are boiling, make the forcemeat by mixing the minced meat, bread crumbs, herbs, pepper and salt together, and work well into this the beaten raw eggs; when the eggs are boiled hard, drop for a minute into cold water, to loosen the shells; break these away carefully; divide each egg into halves; cut a piece of white off at each end, that they may stand firmly when dished;

coat them thickly with the forcemeat; brown them by setting them in a tin plate on the upper grating of a very hot oven, and heap neatly upon a hot dish; pour the boiling gravy, in which a little lemon juice has been squeezed at the last, over them. 2. Soak a cupful of stale bread in cold water for 5 minutes; squeeze it as dry as possible in a clean cloth; while the bread is soaking chop fine 1 tablespoonful of parsley, or any green savory herb, or ½ that quantity of any dried herb; chop also 1 teaspoonful of onion; put these ingredients with the bread into a frying pan containing 1 tablespoonful of melted drippings or butter; season highly with salt and pepper; stir over the fire until they are scalding hot, when the forcemeat is ready for use.

GAME HASH.—Take underdressed or half roasted game; strip the skin from the thighs, wings and breast; arrange the joints evenly in a clean stewpan; keep them covered till wanted; cut into cubes 4 oz. of the lean of an unboiled ham; put it, with 2 oz. butter, into a thick well turned saucepan or stewpan; add 3 or 4 shallots minced, 1 carrot sliced, 4 cloves, 2 bay leaves, 1 doz. peppercorns, 1 blade of mace, 1 small sprig of thyme, and 2 or 3 of parsley; stew them over a gentle fire; stir them frequently, until the sides of the saucepan appear of a reddish brown; mix well with them a dessertspoonful of flour; let it take a little color; add by degrees, making the sauce boil as each portion is thrown in, ¾ pt. of strong veal stock or gravy, and ½ pt. sherry or Madeira; put in the bodies of the birds, well bruised; boil them for from 1 to 1½ hours; strain, and clear the sauce from fat; pour it on the joints of the game; heat them in it slowly; when they are near the point of boiling, dish them immediately with sippets of toast arranged round the dish.

GAME, To Keep Fresh.—Game can be kept by placing finely pulverized charcoal in a thin muslin bag inside; change the charcoal every day, and wash the meat clean before cooking. Pare a fresh lemon very carefully, without breaking the thin white inside skin; put it inside a wild duck and keep it there for 48 hours, and all of the fishy taste so disagreeable in wild fowls will be removed. The lemon should be removed and a fresh one put in its place every 12 hours.

GIBLETS.—Cut the pinions into two and the neck into four pieces; slice the gizzard and wash it well; clean the head and liver; fry all these a golden brown, in either butter or lard; flour each piece separately; put them into a stewpan with some clear beef stock, a bunch of savory herbs, a few peppercorns and cloves, 2 grated raw potatoes, and 1 onion cut into slices; salt and pepper to taste; let these all stew gently together; take 3 or 4 large turnips; quarter them and fry a golden brown color in butter; put them into another saucepan with the butter in which they have been fried, and a little beef stock; let these stew until quite tender; about ½ hour before the giblets are served add the turnips to them.

GOOSE, Boiled.—Dress and singe; put into a deep dish; cover with boiling milk and leave over night; in the morning wash off the milk; put the goose into cold water on the fire; when boiling hot take it off; wash it in warm water and dry with a cloth; fill the body with a dressing of bread crumbs, seasoned with pepper, salt, butter, 2 chopped onions and a little sage; put the goose into cold water and boil gently until tender; serve with giblet sauce, and with pickles, or acid jellies.

GOOSE, Roasted.—Singe, draw, and truss the goose; if an old one parboil it; the best stuffing is a sage-and-onion stuffing; boil the onions in 1 or 2 waters; mix with bread crumbs, powdered sage, salt and pepper, nutmeg, and 2 small apples chopped fine; fill the bird with the stuffing; sew it up with coarse thread; sprinkle salt over it; set it in a pan with a little warm water; baste frequently; do not take it from the oven until thoroughly cooked.

GROUSE, Broiled.—Carefully pluck the birds; remove the first joints of the wings, the heads, and the legs at the knees; split the grouse evenly in half; pepper them; dip them in butter made liquid, and sprinkle them with bread crumbs; repeat this process; make a gridiron hot over a clear fire; rub it with suet; lay upon it the grouse; be careful to do the insides first, or the gravy will get too quickly drawn, and you will not be able to turn the birds; when done enough, and nicely browned, dish them up on a poivrade or tomato sauce rendered rather piquant.

GROUSE, Larded.—Wash the grouse; be careful to pick out the shot; lard the breast with pork, cut in narrow strips; truss and rub over with butter; sprinkle with salt and pepper, and very thickly with flour; bake 20 minutes in a very quick oven; baste twice with butter and water; dredge the bird with flour; serve on toast with bread sauce.

GROUSE, Roasted.—Split them; fry until brown; stew them gently in good, well-seasoned beef gravy with the giblets of the birds and a spoonful of tarragon vinegar; when the grouse are tender strain the gravy and take off all fat; cut slices of fillet steak ¼ in. thick, perfectly free from skin and fat; lay them at the bottom of a pie dish; mince the stewed heart, liver, and gizzard of the birds; mix them with the yolks of 2 hard-boiled eggs; bind them into a paste with the yolk of a raw egg; season with cayenne pepper and salt; draw a knife twice over a clove of garlic, and stir the paste with it; roll into balls the size of marbles; place between the slices of steak, on the top of which put the grouse; season with salt and pepper; pour in the gravy; cover up with good puff paste; bake for an hour, or until done.

HARE, Jugged.—1 hare; a bunch of sweet herbs; 2 onions, each stuck with 3 cloves; 6 whole allspice; ½ teaspoonful of black pepper; a strip of lemon peel; thickening of butter and flour; 2 tablespoonfuls of mushroom ketchup; ½ pt. of port wine; wash the hare nicely; cut it up into joints not too large; flour and brown them; put them into a stewpan with the herbs, onions, cloves, allspice, pepper, and lemon peel; cover them with hot water; when it boils carefully remove all the scum; let it simmer gently till tender, which will be about 1¾ hours, or longer

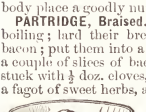
should the hare be very old; take out the pieces of hare; thicken the gravy with flour and butter; add the ketchup and port wine; let it boil for about 10 minutes; strain it through a sieve over the hare and serve; add a few fried forcemeat balls at the moment of serving, or, instead of frying them, stew in the gravy, about 10 minutes before the hare is wanted for use; serve red currant jelly with it.

HARE. Stewed.—Skin the hare; cut it up; do not wash or wipe it; toss it in butter for about 5 minutes; add 1 qt. of brown stock nicely flavored; stew all together very slowly till the meat is sufficiently tender; add some port wine, flour and butter; serve it with small sippets of fried bread.

MOCK DUCK.—Take a round of beef steak; salt and pepper either side; prepare bread or crackers with oysters or without, as for stuffing a turkey; lay the stuffing on the meat; sew up and roast about an hour.

OPOSSUM.—Boil the 'possum in salt and red-pepper water until quite tender; brown well in an old-fashioned oven or skillet; around his body place a goodly number of potatoes.

PARTRIDGE, Braised.—Truss 2 birds as for boiling; lard their breasts very finely with fat bacon; put them into a small braising pan over a couple of slices of bacon; add 2 small onions stuck with ½ doz. cloves, 2 carrots cut in pieces, a fagot of sweet herbs, and pepper and salt to taste; add a cupful of stock and 1 of white wine; place a buttered paper over all and braise them gently for 2 hours; keep a few hot embers on the lid of the pan; serve with their own liquor, strained and free from fat, or with truffle sauce.



Braising Pot.

PARTRIDGE, Broiled.—Divide the birds into 2 pieces; flatten them; wipe them dry all over with a soft cloth; prepare a very clear, brisk fire, sprinkle the birds over with salt and cayenne; broil them; lay them on a hot dish, and directly they are cooked, stick them over with lumps of fresh butter; pour mushrooms, stewed in a good, brown gravy, on top.

PARTRIDGE, CROQUETTES.—Pick out from remnants of partridges a quantity of meat from the breasts; mince it all finely; put it into a saucepan, with a piece of butter previously melted and amalgamated with a pinch of flour; add pepper and salt and a grate of nutmeg; stir well; add, off the fire, the yolk of an egg beaten up with the juice of a lemon and strained; spread out this mince when it is nearly cold, fashion it into small portions in the shape of balls or corks; dip each in a beaten-up egg; roll it in very fine baked bread crumbs; let the croquettes rest awhile; fry them in hot lard to a golden color; serve on a napkin with plenty of fried parsley.

PARTRIDGE. Stewed.—Fix the wings over the back, and skewer the legs; take a piece of bacon and put it with a small piece of butter in a stewpan; fry it brown; put in the partridges so that the bacon covers the breast; let them be very brown; add ½ pt. of gravy; boil a cabbage so that it is ready by the time the partridges are fried brown; chop it with pepper and salt, and a lump of butter; add it with gravy to the partridges; stew slowly for an hour; when dishing place the bacon in the center of the dish; lay the partridges upon it; make a wall of the cabbage round.

PATE DE FOIE GRAS.—These pasties are prepared from the livers of geese, which have been tied down for 3 or 4 weeks to prevent them from moving, and forcibly compelled to swallow, at intervals, a certain amount of fattening food; when they have become so fat that they would die in a short time, they are killed, and their livers, which have become very rich, fat, and pale during the process, are made into pies.

PATE DE FOIE GRAS, Imitation.—The livers of 4 fowls and as many gizzards; 3 tablespoonfuls melted butter; a chopped onion; 1 tablespoonful pungent sauce; salt and white pepper to taste; boil livers until quite done; drain and wipe dry; when cold, rub to a paste; let butter and chopped onion simmer together slowly for 10 minutes; strain through thin muslin, pressing the bag hard; turn into a larger vessel; mix with the rest of the seasoning; work all together for a long while; butter a small earthen jar or cup; press the mixture hard down, interspersing with square bits of the boiled gizzards to represent truffles; cover all with melted butter, and set in a cool, dry place.

PHEASANT, Roasted.—Let it hang as many days as possible without becoming tainted; pluck off the feathers carefully; cut a slit in the back of the neck to remove crop; then draw the bird in the usual way, and either wipe the inside very clean with a damp cloth or pour water through it; wipe the outside also, but with a dry cloth; cut off the toes; turn the head of the bird under the wing, with the bill laid straight along the breast; skewer the legs, which must not be crossed; flour the pheasant well; lay it to a brisk fire; baste it constantly and plentifully with well-flavored butter; send bread sauce and good brown gravy to table with it.

PHEASANT, Stewed.—Truss the pheasant as for boiling; put it into a saucepan which is just large enough to hold it; pour in enough veal gravy, and stew it slowly, till sufficiently done; add about a score of chestnuts, previously boiled and blanched, 1 or 2 sliced artichoke bottoms, already dressed, pepper, salt, a glass of white wine, and a little butter rolled in flour; make all hot; squeeze into it the juice of ½ lemon; put the pheasant in a dish and pour the sauce over it.

PIGEONS, Boiled.—Boil about 15 minutes by themselves; then boil a piece of bacon; serve with slices of bacon and melted butter.

PIGEONS, Broiled.—Split the backs; season them highly; lay them over a clear, brisk fire; serve with mushroom sauce.

PIGEONS, Potted.—Season well with pepper, cayenne, a little mace and salt; pack them closely in a pan; cover them with butter, and bake them; let them get cold; take off the fat; put the pigeons into pots; pour melted butter over them.

PIGEONS, Stewed.—Take a white cabbage; cut it as if for pickling; rinse in clear cold water; drain well; put it into a saucepan with equal quantities of milk and water; boil and strain off the milk; take a portion of the cabbage and lay it in a stewpan; soak the pigeons for ½ hour in cold milk and water; season well with salt and pepper, adding a little cayenne; place them in the stewpan with the cabbage; cover them over with what remains; add some white broth; stew slowly until the pigeons are tender; thicken with a little cream, flour and butter; let it boil, and serve with a *puree* of the cabbage.

PLOVERS.—These birds must not be drawn; roast them before a brisk fire, but at a distance; serve on toast with melted butter.

PRAIRIE CHICKEN, Fried.—Cut in pieces of good shape; pepper and salt them; dip in batter made of beaten egg with milk, flour and salt added; fry in hot lard; serve piled upon a hot dish and garnished with parsley; serve lettuce mayonnaise at table with the chicken.

PRAIRIE CHICKEN, Roasted.—This bird being a little strong, and its flesh when cooked a little dry, lard or place wide strips of bacon or pork over its breast; use mild seasoned stuffing; dust a little flour over it; baste occasionally, and serve.

QUAIL, Broiled.—Carefully pick, cut open down the back, and pound slightly with the steak-pounder, to break the bones, so they will lie flat on the gridiron; salt and pepper them; broil to a nice brown; have a pan of melted butter ready to dip each piece in as soon as cooked; have ready slices of bread, toasted to a light brown, and well buttered; lay a quail on each slice of the toast; then pour the butter which they were dipped in over the whole; serve hot.

QUAIL PIE.—Cut the quail in pieces, and stew them about 10 minutes, or till tender; line your baking dish with a nice paste; put in the birds with a little of the water in which they were stewed, thickened with a little flour; shake in pepper and salt and bits of butter; cover with a nice crust and bake a delicate brown.

QUAIL, Roasted.—Clean, truss and stuff as usual; cover the entire bird with thin slices of ham or salt pork, binding all with buttered packthread; roast ¾ hour; baste with butter and water 3 times, then with the dripping; when done dish with the ham laid about the body of the bird; skim the gravy; thicken with browned flour mixed in a little cold water, pepper and salt; boil up once and pour over the bird.

RABBIT, Boiled.—After skinning the rabbit wash it in cold water; put it into warm water for about 20 minutes to soak out the blood; draw the head round to the side; secure it with a thin skewer run through that and the body; put the rabbit into a stewpan of hot water; let it boil gently until tender; when done, place it on a dish; either smother with onion sauce, or with parsley and butter.

RABBIT CUTLETS.—Prepare the rabbits as for a stew; cut the different limbs into the size of cutlets—such as the shoulders cut in half; also the legs with the ends of the bones chopped off, and pieces of the back, even to the half of the head; have ready some bread crumbs and the yolk of an egg beat up; drop each cutlet into the egg and then cover with bread crumbs, as for veal cutlets; fry them a nice brown; when you dish them pour round them some rich brown gravy, which flavor with tomato sauce, if approved; put round them rolls of fried bacon.

RABBIT, Fricasseed.—Clean; cut into joints; soak for 1 hour in salt water; do not use head or neck; season each piece with pepper and salt; dredge with a little flour; fry in butter until brown; remove the rabbit from the pan; leave the grease; place it in a saucepan; pour over enough lamb or veal broth to cover the joints; add a finely chopped onion, 1 tablespoonful of walnut catsup, a bunch of sweet herbs, 1 pinch of cloves, same of allspice, and a little cayenne pepper; cover closely; let simmer for 25 minutes; lay the joints in order upon a heated dish; strain the gravy; return it to the pan; thicken with flour; add a lump of butter and the juice of ½ lemon; pour the gravy over the joints; serve hot.

RABBIT PIE.—Cut up two young rabbits; season with white pepper, salt, a little mace and nutmeg, all in fine powder; add also a little cayenne; pack the rabbit with slices of ham, forcemeat balls, and hard eggs, by turns in layers; bake in a dish; add a little water; omit the water if it is to be raised in a crust; by the time it is taken out of the oven have ready a gravy of knuckle of veal, or a bit of the scrag, with some shank bones of mutton, seasoned with herbs, onions, mace, and white pepper; if the pie is to be eaten hot, add truffles, morels or mushrooms, but not if intended to be eaten cold; if it be made in a dish put as much gravy as will fill the dish, but in raised crusts the gravy must be carefully strained, and then put in cold as jelly.

RABBIT, Roasted.—After cleaning and washing well, let it soak in cold water for an hour or more; have the water a little salty and change it once or twice; parboil the heart and liver; chop up fine with one slice of fat salt pork; make your dressing of bread-crumbs; mix in the chopped heart, liver and pork; season well with pepper and salt; moisten with a little of the water in which the heart, etc., were boiled; stuff the rabbit with this dressing; sew it up; spread or rub butter all over it, and roast; occasionally baste with melted butter and water; when the gravy flows freely enough, baste with that; a few moments before removing from the oven sift a little flour over; place it on a heated dish; take the dripping-pan containing the gravy and place it on the top of the range; have prepared a small onion chopped very fine; add it to the gravy; also a small lump of butter; thicken with a little flour; let it boil up; just before removing from the fire add the juice of ½ lemon; serve the gravy in a sauceboat; garnish the rabbit with sliced lemon; cut off the head just before sending to the table; serve with currant jelly.

RABBIT, Stewed.—Wash a rabbit thoroughly; let it lie for 2 or 3 hours in cold water; cut it into joints; dry them upon a cloth; dredge

them with flour; fry them of a light brown with butter; stew them in the following sauce: Brown 3 oz. of butter in a stewpan, with a tablespoonful of flour, a minced onion, some pepper and salt; add a pint of gravy and the rabbits; stew them till they are tender; just previous to serving, stir in a tablespoonful of ketchup. When the rabbit is to be dressed with a white sauce, it should not be fried, but stewed in the white stock, which is seasoned with white pepper and salt; thicken with a piece of butter mixed with flour; a few minutes before serving add a little cream, and a tablespoonful of lemon pickle.

REED BIRDS.—Pluck, draw, and arrange nicely in a dripping pan with bits of fresh butter between them; allow them to cook for a few minutes on one side; then turn them over to brown on the other side; add a little salt; place them on a hot platter and pour gravy over them; serve with Saratoga chips.

SNIPE HASH.—Cut the meat from the bones and roughly mince it; stew down the bones and insides together with herbs, shallots, champagne, and stock; when this is pretty thick strain it; add to it the flesh of the snipes; make all thoroughly hot, by which time the birds will be sufficiently done; serve it in a dish garnished round the margin with sippets of bread fried in butter; decorate each sippet with an egg nicely poached and trimmed.

SNIPE, Roasted.—Pluck and draw the snipe; preserve the trail and head; tie a thin strip of bacon over the breast; chop up the trail and spread it on buttered toast, one slice for each bird; lay the birds in the pan with the toast between them; roast 20 minutes; remove the bacon, place the birds on the toast and serve.

TURKEY, Boiled.—Take a plump hen turkey, singe, draw, and truss as you would to roast; make a stuffing of herbs, salt, pepper, bread crumbs, a little mace and grated lemon peel, with a few oysters chopped up, a spoonful of butter and a raw egg; mix your dressing well together; fill the bird; sew it up; tie up the turkey in a floured cloth to make it white; simmer until tender.

TURKEY, Boned.—Buy a turkey, one that has not been drawn, so as to have no openings in it, if possible; if drawn sew up openings firmly before boning; take 2 chickens, 1 beef tongue, 1 can oysters, 1 lb. fresh, lean side pork; have the turkey frozen and thawed, the tongue boiled and skinned, the pork roasted, the oysters taken out of the liquor, and the chickens cut in small pieces; put on to boil with just water enough to cover; lay the turkey on its breast; cut off the legs and wings at first joint; cut down the whole length of the back; with a sharp knife scrape the meat at each side from the bones; throw the bones in with the chickens to boil. For the filling: Lay the whole tongue to form the breast; clear all the chicken meat from the bones; cut the pork in small pieces; fill up your turkey, legs, wings and all, after tying ends of legs and wings tight, with chicken, pork and oysters, and a little dressing; have the chicken liquor well boiled and seasoned; strain it into the turkey, which will form a jelly; sew up the turkey firmly; turn it over and shape it nicely with the hands; tie a cord tightly to the neck, and draw it round and tie it to the right wing close to the body; tie down legs and wings, inserting skewers if you have them; sew around it a piece of strong cloth, and steam or roast; leave the cloth on till cold; carve cold in round, thin slices, commencing at the neck.

TURKEY, Deviled.—Place the legs and wings on a gridiron; broil slowly; have ready a sauce made of 1 tablespoonful each of pepper, vinegar, made mustard, celery sauce, and acid fruit jelly with a little salt; lay the broiled turkey on a hot dish; pour the dressing over it and sift cracker dust over the whole.

TURKEY, Roasted.—Draw the turkey; rinse out with several waters; and in next to the last mix a teaspoonful of soda; prepare a dressing of bread crumbs mixed with butter, pepper, salt, thyme, or sweet marjoram, and wet with hot water or milk; add the beaten yolks of 2 eggs; mince a dozen oysters and stir into the dressing; if desirable, wet the bread crumbs with the oyster liquor; stuff the craw with this, and tie a string tightly about the neck to prevent the escape of the stuffing; then fill the body of the turkey and sew it up with strong thread. In roasting, if the fire is brisk, allow about 10 minutes to 1 lb.; but it depends much upon the turkey's age if this holds good in all cases. Dredge it with flour before roasting, and baste often; at first with butter and water, afterward with the gravy in the dripping pan. Lay the turkey in the pan with a teacupful of hot water. Roast to a good brown, and if it threatens to darken too rapidly, lay a sheet of white paper over it until the lower part is also done. Stew the chopped giblets in just enough water to cover them, and when the turkey is lifted from the pan add these with the water in which they were boiled, to the drippings; thicken with a spoonful of browned flour, wet with water to prevent lumping; boil up once more, and pour into the gravy boat. If the turkey is very fat, skim the drippings well before putting in the giblets. Serve with cranberry sauce; some lay fried oysters in the dish around the turkey.

TURKEY, Steamed.—Let it, after dressing, remain in cold water from 20 minutes to ½ hour, to extract the blood; hang in a cool place for 24 hours, in winter even longer. See that every pin feather is taken out; rinse in cold water; wipe dry; rub the inside with pepper and salt; fill with oysters carefully washed in their own liquor to remove bits of shells; sew up the turkey, place in a large dish, and set it in a steamer over boiling water; lay a clean cloth over the steamer and shut the cover on tight; steam till tender, 2½ hours, or, if large, 3 hours; run a fork into the breast to see if done; if it seems tender and no reddish juice flows out, it is ready to take up; strain the gravy and put in the oyster sauce (which should be ready while the turkey is cooking), made like stewed oysters, and thickened with farina or butter and flour; let it just boil up, and add a little boiled cream; pour this over the steamed turkey, and serve hot. Or stuff, as for a common baked

turkey, and steam; stuff with good plump chestnuts after the skins are removed, and the gravy made with giblets chopped fine; add a little flour as you chop, and the gravy from the dish stirred to it; set over the fire to boil up; while the gravy is being made, rub a little butter over and sprinkle the turkey with flour very slightly; set in a hot oven to brown delicately.

TURKEY, Stewed.—An old turkey is more tender stewed than when cooked in any other way. Put into a large pot ½ lb. bacon cut in slices, ¼ lb. of knuckle veal, 3 sprigs of parsley, 2 of thyme, 6 small onions, 1 carrot cut in small pieces, 3 cloves, salt and pepper, and then the turkey; add 1 pt. each of broth and white wine, cover as closely as possible, and simmer gently about 2½ hours; then turn the turkey over and put it back on the fire for 2½ hours; dish the turkey; strain the sauce; put it back on the fire, and after reducing it to a glaze, spread it over the turkey and serve. Some prefer stewed turkey when cold.

VENISON, Boiled.—Boil till tender with sufficient water to keep from burning; when done put in some butter, pepper and salt; let it brown in the kettle.

VENISON CHOPS.—Cut the chops as nearly one size as possible; flatten them nicely; lard them with slips of fat bacon; soak them for a day in a marinade; drain them; toss them in scalding hot olive oil; do them quickly over a brisk fire; when they are nicely browned arrange them in a dish; serve with tomato sauce.

VENISON HASH.—Cut into small square pieces; put into a saucepan with about 2 tablespoonfuls of sweet oil; when they are well rendered, add 2 tablespoonfuls of flour; a little bacon cut in small squares, and a few shallots; let the whole simmer until of a nice color; add about 1 pt. of claret wine, the tenth part of stock, and a bunch of parsley, thyme and sage tied together; let it simmer on a slow fire about 1 hour; before serving, you must be careful to remove all the grease; serve with toast, fried in butter, around the dish.

VENISON, Roasted.—Hang the venison for 10 days or a fortnight in a cool dry place; at the end of that time wash and wipe it; then beat it well; flay off the skin; take bacon strips rather more than 2 in. long and lard all over the fleshy parts; roast or bake the meat, basting constantly; use sour cream or butter and milk for the purpose; send to table with a sauce made by adding water to the bastings, skimming and straining, and adding pepper, salt and lemon juice.

VENISON STEAK.—From a small neck of venison neatly cut 4 or 5 steaks; remove a portion of the bone from each, and divest them of all superfluous parts; give each steak a good blow with the blade of the chopper, so as to flatten the steaks evenly; rub a gridiron with a bit of the fat; place the venison upon it; broil it over a clear charcoal fire until the steaks are done; serve with a sauce made by simmering together red wine and currant jelly until they form a syrup.

VENISON STEAK SAUCE.—Put a cup of stock, a small teaspoonful of salt, ½ teaspoonful of pepper, and a very little cayenne, 2 or 3 cloves and a few allspice in a saucepan; let all boil up; then stir in a piece of butter, half the size of an egg, in which a teaspoonful of flour has been well mixed; 1 teaspoonful of currant jelly; 1 wineglass of claret; heat it once more; pour it through a strainer, so as to remove the pieces of spice.

WOODCOCK, Boiled.—Pluck and draw the birds; truss and boil them for 10 minutes in nice clear savory beef stock; while they are doing, chop the trails, etc., and the livers; mix these in a saucepan with a few tablespoonfuls of the liquor in which you boil the birds; add a piece of butter rolled in flour and 2 tablespoonfuls of port wine; when the butter is melted, put in a teacupful of fried bread crumbs; as soon as these are hot, place the woodcocks in a dish; mask them with the sauce; garnish with thin slices of fresh lemon.

WOODCOCK, Roasted.—Carefully pluck the birds; omit drawing them; they should not be spitted, but suspended with the vent downwards; place a nice round of toast underneath to catch the trail; about 20 minutes roasting will be enough; baste simply with fresh butter, and send the birds to table as hot as possible; they should be laid upon the toast in a dish, and slices of orange employed as a garnish.

MEATS.

REMARKS.—All meats and game are the better for slight cooking, with the exception of veal and pork. Have a hot oven for whatever is to be roasted; a bed of very hot coals for broiling; and fat that is hot enough to send up blue smoke for frying. For roasts have a very hot oven at first; and do not season until the meat browns; these precautions keep the juices intact. But the joints must not be suffered to burn, and the oven must be cooled off a little as soon as the outside is well coated. After this, the old rule of 15 minutes to a lb. can be varied to suit the taste. The meat must be elastic to the pressure of the finger, or it is done to death. Keep a basin or cup of water in the oven; the steam generated prevents scorching. When the joint is to be boiled, if the juices are to be retained in the meat itself, put the meat into fast boiling water, and let it boil for 10 minutes to make the outside hard and thus prevent the juice escaping, then add cold water equal in quantity to about ½ of the boiling water, and then boil till done. Remove the scum when the water is on the point of boiling, or it will quickly sink and spoil the appearance of the meat. If it is desired to extract the juice from raw meat, cover it with cold water and simmer slowly. Soak dried and smoked meat for some hours before putting into the water. Place the meat in a saucepan sufficiently large to

contain the joint easily, and just cover with water —no more. To lard a piece of meat, get a larding needle—that is a piece of steel from 6 to 9 in. long, pointed at one end and having 4 slits at the other, to hold a small strip of bacon when put between them; cut the bacon in pieces 2 or 3 inches long and ¼ to ½ in. square; put each, one after the other, in the pin; insert it in the meat; leave only about ½ in. out, using 8 pieces to each lb.

BACON, Boiled.—Boil some fine streaked parts of bacon with a little stock; add the ends of 8 or 10 sausages; boil in same stock some white cabbages for 2 hours; add salt and spice; serve very hot; place sausages and cabbages around the dish, and the bacon in the middle.

BACON, Steamed.—Scrape the outer rind or skin well; wash the bacon; put it into a steamer over a pot of boiling water; steam it as long as required by the weight; serve with veal or fowl, or by itself with greens.

BEEF, A la Mode.—1. Take 8 or 10 lbs. of beef (the rump or buttock), or the same weight of a breast of veal; divide it into neat pieces of 3 or 4 oz. in weight; put it into a large stewpan with 4 oz. of good beef dripping; but first make the dripping hot, and flour the meat; add 2 large onions minced fine, dredge with flour, and stir with a wooden spoon for about 10 minutes, or until the contents of the pan be thick; then pour in about 1 gal. of water; do this gradually, stirring all together; bring it to a boil; then skim, and add 1 dr. of ground black pepper, 2 of allspice and 2 bay leaves; set the pan where it will stew gently for about 3 hours; when the meat is tender serve.—2. Rump, sirloin or rib of beef; lard through with 10 or 12 long pieces of fat bacon; put it into an earthen pan with a calf's foot, 4 onions, 2 carrots sliced, a bunch of parsley, 2 bay leaves, 2 sprigs of thyme, 2 cloves, ½ teaspoonful of pepper, 1 teaspoonful of salt, 4 wineglassfuls of sherry, 4 wineglassfuls of water, and 1 lb. of streaky bacon.

BEEF, Au Gratin.—Take cold beef, either boiled or roast; cut it in thin slices; grease a tin pan; dust with bread crumbs; put in a little chopped parsley and lay on the slices of beef; put salt, pepper and parsley on top; dust with bread crumbs; drop on lemon juice and a little broth, just to cover the bottom of the pan, and place it in the oven.

BEEF, Boiled.—Melt about 3 oz. butter, over a slow fire, into 1 tablespoonful of flour; when they have simmered a little, add some chopped onion and a dessertspoonful of shred parsley; when the whole is browned, season with pepper; add ½ or ¾ pt. of good stock or gravy; mince the meat finely; put it in with the rest; let it heat gradually; when near boiling, thicken with a small tablespoonful of flour; just before serving, add a tablespoonful of catsup.

BEEF, Curried.—Cut your beef into pieces 1 in square; put some butter in a saucepan along with 2 onions; fry until brown; add sufficient curry powder, and mix thoroughly; add ½ pt. of milk and the beef; let it stew gently for 1 hour; stir it occasionally to prevent burning; serve with rice.

BEEF, Dried.—Heat milk and water; thicken with a beaten egg and a little flour; when nicely boiled, add the beef sliced as thin as possible; immediately remove from the fire, as the less it is cooked the better; if very salty, freshen in a little hot water before going into the gravy.

BEEF, Fillet of.—Slice a tenderloin of beef; salt and pepper it; let it lay 1 hour in melted butter; brown it quickly on both sides in this same butter; take out the beef; add to the butter a spoonful of flour, soup, gravy, or meat juice, as convenient, and mushrooms to taste; put back the slices of tenderloin; cover the spider and stew slowly until sufficiently cooked; put the slices of meat on a platter with the mushrooms around it; add the juice of a lemon and a glass of Madeira wine to the sauce.

BEEF, FRICASSEED.—Take any piece of beef from the forequarter, such as is generally used for corning; cook it tender in just sufficient water to have it all evaporate in cooking; when about half done put in salt enough to season it well; add ½ teaspoonful of pepper; if the water should not be done out soon enough, turn it off and let the beef dry 15 minutes, turning it often; make the gravy of the water turned off, or add water from the tea-kettle, and 1 or 2 tablespoonfuls of flour; serve with vegetables and salad, or apple sauce.

BEEF GRAVY.—Take 3 lbs. of beefsteak, a knuckle of veal, 5 carrots, 6 onions, 2 cloves, 2 bay leaves, a bunch of parsley, and scallions; put all these into a stewpan with two ladlefuls of broth; set them over a good fire to reduce them; cover the stove; let the stewpan stand over it until the meat begins to give out the gravy and adheres slightly; when the jelly at the bottom of the stewpan is nearly black, take it from the stove; let it stand for 10 minutes; fill the stewpan with good broth or water; if the latter, not so large a quantity; let this simmer for 3 hours; skim and season well; if water is used instead of broth, strain the gravy first.

BEEF, Grenadins of.—Cut some beef fillet in slices ½ in. thick; trim them all to the same size in the shape of cutlets; lard them finely and thickly with fat bacon; lay them, larded side uppermost, into a baking dish; add as much rich stock or gravy as will come up to, but not cover the larding; cover the dish and put in the oven to cook gently for ½ hour; take off the cover; baste the grenadins with the gravy; let them remain in the oven for the larding to brown; cut equal quantities of carrots and potatoes into the shape of small olives; boil them so that they remain whole; make a sauce of butter and flour in a saucepan; add as much of the grenadin gravy as will make a nice sauce; stir well; put in the vegetables, and when very hot, arrange the grenadins around a dish with the vegetables and gravy in the centre.

BEEF, Potted.—Take a piece of lean beef weighing 5 lbs.; free it from the skin and gristle; put in a covered stone jar with ½ teacupful of water; stand the jar in a kettle of boiling water to boil from 5 to 6 hours; see that the water does not boil into the jar; when done, take it up and cut into shreds; pound in a mortar with a

seasoning of pepper, salt, and ground cloves; when smooth and like paste, mix with 10 oz. of clarified butter; press into little jars; pour butter over the top, and tie down for use.

BEEF, Ragout of. — Take equal quantities of good gravy and boiling water, a pint in all; pour it into a stewpan, in which 2 lbs. of cold roast beef, sliced, have been put; add 5 or 6 small onions, some mixed spices, pepper and salt to taste, and let the whole stew very gently until tender, which will be in about 2 hours; before serving, add capers and pickled walnuts to the gravy.

BEEF, Roasted. — Prepare for the oven by dredging lightly with flour; season with salt and pepper; place in the oven; baste frequently while roasting; allow ¼ hour per lb. of meat, if you like it rare; longer, if you like it well done; if wanted part rare and part well done, let the outside be well done, but take care that the inside is not well done through; serve with a sauce, made from the drippings in the pan, to which has been added a tablespoonful of Harvey or Worcestershire sauce, and a tablespoonful of tomato catsup; thicken with browned flour, and serve in a gravy boat.

BEEF, Spiced. — Mix in a jar or bowl that can be covered, 2 lbs. common salt, 1 lb. dark brown sugar, ¼ lb. ground allspice, 1 oz. ground cloves, 2 oz. black pepper, 1 teaspoonful cayenne; use a wooden bowl or unpainted tub that will just hold the round; fill the hole from which the marrow bone was taken with marrow or nice fat; bind into nice shape with strips of cotton and skewers; rub with a tablespoonful of powdered saltpetre on both sides and in all crevices; leave for 24 hours in a cool, dry place, that will not freeze; rub daily with some of the above mixture for 2 or 3 weeks, turning every 2 days and ladling its own liquor over it; when ready to cook the round, provide a tin dish that will just hold it; place small pieces of hard wood to keep the meat from sticking to the tin underneath; also chopped vegetables, carrots, onions, celery tops, and suet or drippings; strew some of these thickly on the top; cover all with a coarse paste rolled to keep moist and retain their flavor; bake 6 hours in a moderate oven; when done, take off the paste cover; remove the vegetables, etc.; put on the round heavy weights until quite cold; slice thinly.

BEEFSTEAK, Broiled. — A rump steak; 1 oz. of butter; pepper and salt; have the steak cut about ¼ or ½ in. in thickness; place the gridiron over a clear fire; rub the bars with fat; place the steak on it and broil it; turn frequently; carefully prick the fork through the fat; have ready a hot dish on which you have placed a lump of butter the size of a large walnut, the ketchup, and pepper and salt; lay the steak, rubbing it lightly over with butter, on the dish; serve as quickly as possible.

BEEFSTEAK, Fried. — Pound, but do not hack it; have your pan very hot; put a small piece of butter in it; let it brown; season the steak on both sides with salt and pepper; place in the pan and turn constantly; let it cook quickly; when done and nicely browned, turn a plate over it and stand where it will cook slowly a few minutes; add a spoonful of mushroom or tomato catsup to the gravy, to give it piquancy.

BEEFSTEAK PUDDING. — 1 lb. of flour; 6 oz. of chopped suet; a little salt; 1½ lbs. of steak; pepper and salt to taste; water; make a paste of the flour, suet, and salt; butter a round-bottomed basin; line it with paste, turning a little over the edge; cut up the steak into small pieces with a little fat; flour them lightly; season highly with pepper and salt; lay them in the basin; pour over them ½ cupful of water; cover the top of the basin with paste, pressing it down with the thumb; tie the basin in a floured pudding cloth; put it into a saucepan of boiling water; keep it boiling for 2 hours, occasionally adding a little water; when done, untie the cloth, turn the pudding over on a dish, and take the basin carefully from it.

BEEF STEW. — Take a 3 lb. piece of rump of beef; remove the bone; bind it up tight; put it in a pot or stewpan that will just hold it; season with ground spices; fry 2 large onions sliced; add them to it, with 2 carrots, 2 turnips, a few cloves, a blade of mace, a head of celery, and a potato quartered; add stock enough to cover the meat; simmer as gently as possible until quite tender; remove the fat; take out the meat; add ½ pt. of port, a wineglassful of vinegar, and a tablespoonful of Worcestershire sauce to the gravy; strain over the meat; serve with a garnish of assorted vegetables arranged neatly around the dish.

BLOOD GRAVY. — Put a few slices of ham into a thick stewpan; lay over it some slices of lean veal; half cover the meat with jelly stock; stew it over a brisk fire; take care that it does not burn; when the broth is reduced, thrust a knife into the meat so that the gravy may run out; stew it more gently till brown; turn the meat frequently; when of dark red color, moisten with hot stock; season with shred mushrooms, parsley and green onions; when it has boiled an hour, skim and strain it through a tammy to clarify for use.

BROWN GRAVY. — Take 2 or 3 onions; fry them in butter until they are a very nice brown, be careful not to let them burn; take a slice of bread and slowly toast it till it is quite hard and brown; take a stewpan and put them into it along with some bones, pieces of meat, some thyme, etc.; add water enough and stew until the ingredients form a thick gravy; add pepper and salt; then strain it and keep in a cool place until wanted.

BUBBLE AND SQUEAK. — Slices of cold boiled beef; chopped potatoes; chopped up cabbage; both previously boiled; pepper, salt and a little butter; chop up and fry the cold potatoes and cabbage with a little pepper, salt, and a good large piece of butter; set it aside to keep hot; lightly fry some slices of cold boiled beef; put them in a hot dish with alternate layers of the vegetables, piling high in the middle.

CALF'S HEAD, Baked. — Butter the head; powder with seasoning composed of very fine bread crumbs, a few sweet herbs and sage, chopped very fine, and cayenne, white pepper, and salt; divide the brains into several pieces not too small; sprinkle them with bread crumbs; lay them in the dish with the head; strew a quantity of

small pieces of butter over the head and in the eyes; throw crumbs over all; pour in $\frac{3}{4}$ of the dish full of water; bake in a fast oven 2 hours.

CALF'S HEAD, Boiled. — $\frac{1}{2}$ calf's head; $\frac{1}{2}$ pt. of melted butter; parsley; 1 lemon; a pinch of pepper and salt; soak the calf's head in cold water for $1\frac{1}{2}$ hours; then for 10 minutes in hot water before it is dressed; put it into a saucepan with plenty of cold water, enough for the head to swim; let it boil gently; when the scum rises skim it very carefully; after the head boils let it simmer gently for $1\frac{1}{2}$ hours; serve it with melted butter and parsley over it; garnish with slices of lemon and tiny heaps of fried parsley.

CALF'S HEAD, Boned.—Remove the brains; throw them into cold water for an hour; drain; then boil them in salt and water for 20 minutes, and set aside; put the head into cold water and wash it well; leave it there to draw out the blood for an hour; take it out and dry it well with a towel; place the calf's head on the table with the front part of the head facing you; draw the sharp point of a knife from the back part of the head right down to the nose, making an incision down to the bone of the skull; with the knife clear the scalp and cheeks from the bones right and left; always keep the point of the knife close to the bone; when the head has been boned wash it well; wipe it with a clean cloth; season the inside with salt and pepper; roll it up with the tongue; tie it, and blanch in hot water for 10 minutes; put it into cold water a few minutes; wipe it dry and set it aside until wanted.

CALF'S HEAD, Broiled.—Cut a prepared calf's head into pieces quite 3 in. wide; place them in a saucepan; cover with water; add a wineglassful of vinegar; simmer $\frac{1}{2}$ hour; place them in cold water a few minutes; dry them on a towel; rub a little sweet oil over each piece; broil; when done brush melted butter over them with the juice of $\frac{1}{2}$ lemon.

CALF'S HEAD, Collared.—Bone a calf's head carefully; wash it well; wipe it dry; lay the head on the table; spread on it a forcemeat made of the brain and tongue, and a very little ham mixed with 1 tablespoonful of chopped parsley, 1 teaspoonful of thyme, 1 teaspoonful of marjoram, the minced yolks of 3 hard boiled eggs, 1 wineglassful brandy, and a little salt, pepper and nutmeg; roll the head as tightly as possible; tie it in a cloth; bind it with tape; put it into a saucepan with stock enough to cover it; add a carrot, a parsnip, an onion, a sliced lemon, a few bay leaves, salt, and a doz. bruised peppers; let it boil gently 3 hours; take it out of the cloth and pour round it a sauce made of 1 pt. of the liquid in which it was boiled, with a little lemon juice, 2 small pickles, and 4 button mushrooms chopped fine.

CALF'S HEAD, Fried.—Cut the prepared calf's head into pieces 2 in. wide; lay them for 3 hours in a pickle made of 2 tablespoonfuls of lemon juice, 1 wineglassful of Rhine wine, salt and pepper, and a pinch of mace; take them out; drain them; dip each piece in egg batter; roll in cracker dust; fry in hot fat; send to table with some hot condiment.

CALVES' BRAINS, Fried.—Lay 4 pieces of calves' brains in cold water and salt for 1 hour, to draw out the blood; remove the outer skin without breaking the brains; put them over the fire in enough cold water to cover them, with $\frac{1}{2}$ gill of vinegar, 2 bay leaves, a sprig of parsley, and an onion stuck with 3 cloves; bring them to a boil, and simmer slowly for 10 minutes; take them up carefully and lay them in cold water and salt to cool; when cold cut each one in 2 pieces; roll them first in cracker dust, then in 1 raw egg beaten with a tablespoonful of cold water, then again in cracker dust; fry them in plenty of smoking hot fat; as soon as they are golden brown take them up on a skimmer; lay them on a soft paper or napkin to absorb the fat; arrange on a platter, containing $\frac{1}{2}$ pt. tonato sauce.

CALVES' BRAINS, Stewed.—Take the strings from $\frac{1}{2}$ doz. calves' brains; let them drain in cold water for about 1 hour; render a little bacon in a saucepan with a few sliced carrots and onions mixed, some parsley, thyme, bay leaves, etc.; when they have simmered a little while, add $\frac{1}{2}$ a bottle of claret wine, with a little salt and a whole pepper; as soon as it commences to boil, add the brains; let them boil about 20 minutes on a slow fire; then take them out; bind the liquid with a little flour and butter mixed, and already cooked; let it reduce until only about $\frac{1}{2}$ the quantity is left; strain through a sieve; put it into a saucepan with some bacon cut in small squares, about 2 doz. small onions, a few mushrooms and the brains; let them simmer about 12 or 15 minutes; serve them on a dish garnished with toast fried in butter; dress with chopped pickles.

CALVES' FEET, Stewed.—Wash them clean; divide without entirely separating them; lay them open in the stewpan; cover them with veal broth; cut into pieces a slice of tender beef; add to the stew; when it boils throw in a little salt; clear the scum as it rises; throw in a fagot of parsley, a small head of celery, an onion stuck with cloves, 3 small ones plain, 1 good size carrot, 2 blades of mace, and 2 doz. peppercorns; stew until the flesh separates from the bones; take it off carefully; strain off $\frac{1}{2}$ the gravy, or so much as you require; put in 2 spoonfuls of Harvey sauce; thicken with flour and butter; when it is very hot, return the feet; pour in a glass of wine and serve.

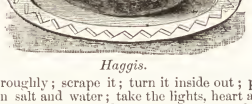
CLEAR GRAVY.—Slice some beef thinly; broil a part of it over a clear, quick fire, just enough to give color to the gravy, but not to dress it; put this with the raw remainder into a tinned stewpan with a couple of onions, 1 or 2 cloves, a whole black pepper, berries of allspice, and a few sweet herbs; cover it with hot water; give it one boil; skim it 2 or 3 times; then cover it; let it simmer till quite strong.

CORNED BEEF, Boiled.—Choose either a solid cut from the round, with a little fat, or a brisket piece; remove the bones from the latter; then roll it and tie securely; allow 20 minutes for every pound of meat; put it over the fire in cold water; let it gradually reach the boiling point; boil slowly; if the water is changed as soon as it boils, vegetables may be cooked with the meat, time being allowed according to the season.

CORNED BEEF, Stuffed.—Take a piece of well corned rump or round, 9 or 10 lbs.; make several deep cuts in it; fill with a stuffing of a handful of soaked bread, squeezed dry, a little fat or butter, a good pinch of cloves, allspice, pepper, a little finely chopped onion, and a little marjoram or thyme; tie it up tightly in a cloth and saturate with vinegar; boil about 3 hours.

DELMONICO STEW.—Cut cold cooked fresh meat of any kind into small thin slices; put them into a stewpan with a little hot water; season with mace, pepper and salt to taste; use partly cayenne pepper; should there be any cold gravy left use this, and butter enough to make the stew rich; put all in the stewpan, cover it, and let the meat simmer 10 or 15 minutes; cut up a lemon and remove the seed; add this to the stew; grate the yolks of 2 hard boiled eggs; mix with it 2 teaspoonfuls of good English mustard; put in a small bowl; pour the gravy to this slowly, making it to a smooth paste; put this over the meat; remove it from the fire and serve immediately.

HAGGIS.—Take a sheep's stomach; clean it



Haggis.

thoroughly; scrape it; turn it inside out; put it in salt and water; take the lights, heart and liver of the sheep and mince them quite fine; add to them a lb. of shredded suet, which also divide finely; bake into sconces a lb. of oatmeal; to do this, mix the oatmeal with a little salt and water; spread the paste thin on a baking tin and bake it crisp; pound up fine these sconces; if not dry enough, toast them; add 1 chopped onion, and season with salt and pepper; add to this a teacupful of good strong stock; put it all in the stomach, and sew it up tight; put it into a pot of boiling water with a plate on top of it; prick the bag in a good many places to prevent bursting; cook 5 hours.

HAM, Baked.—If the ham be hard and salty, soak it for several hours; if a fresh cured ham, do not soak; trim and cut away all the rusty parts; completely cover it with a coarse paste of flour and water ½ in. thick to prevent the juice escaping; bake until done; remove the paste and skin while the ham is hot; cover the fat with a sugar paste, moistened with port (see *Boiled Ham*); return it to the oven a few minutes to brown.

HAM, Boiled. — Soak the ham over night; scrape off the rusty spots; put into a pot; cover with plenty of cold water; add a bouquet of herbs and a few cloves to the water; boil very slowly until done; remove the pot from the fire; when cold, take out the ham; take off the skin; trim the fat off around the edge; take ½ cupful of brown sugar, a teaspoonful of prepared browned flour, and moisten with port wine; cover this paste over the fat of the ham; set it in a very hot oven until the mixture froths;

Boiled Ham.

send to the table with dots of pepper or dry mustard on the top, a tuft of fringed paper twisted about the shank, and garnished with parsley; cut very thin in carving. If the ham is not glazed, the rind while warm may be carved in any ornamental device, then garnished as before.

HAM, Broiled.—Should the ham be very salty, soak the slice to be used in warm water; let it remain about 20 minutes before broiling; take out; wipe dry; broil on a gridiron; turn often; season with pepper and butter.

HAM CROQUETTES. — Take ¼ lb. of grated ham; mix with it 2 oz. of mashed potatoes; melt a piece of butter in a saucepan; add the mince; season with a little powdered sweet herbs and chopped parsley; stir until quite hot; add, off the fire, the yolks of 2 eggs; lay the mince on a plate to cool; make it into croquettes; roll them in egg and then in baked bread crumbs; fry in hot lard; serve with fried parsley.

HAM, Fried.—Soak as for broiling; cook in a hot frying pan, turning often until done; serve with or without gravy, as you please; after taking the meat from the pan cream may be added to the gravy; thicken with flour; boil up once and pour over the ham; add a little chopped parsley to its gravy.

HAM OMELET.—Chop up fine ½ lb. of cold boiled ham; add to it 4 eggs, well beaten, with a little salt and pepper; place in a pan a small piece of butter; turn in the eggs and ham, and brown.

HAM, Potted.—Take the remains of a boiled ham; cut it in small pieces; pound it, little by little, in a mortar; soften it during the process with a little melted butter; add cayenne pepper to taste; put it in small bowls, glasses, or potting jars; press it down very smooth; over the surface pour a little more melted butter; cover tight, and set away.

HAM, Steamed.—Lay the ham in cold water for 12 hours; wash very thoroughly; rub with a stiff brush to dislodge the salt and smoke on the outside; put it into a steamer; cover closely; set it over a pot of boiling water; allow 20 minutes to the pound; keep the water at a hard boil; if it is served hot, skin, and immediately strew thickly with bread or cracker crumbs to prevent the waste of the flavor; put a frill of paper about the knuckle.

HASH.—Cut some beef in nice little slices from the bone; remove all the hard parts and skin; put the gravy in a saucepan with 1 pt. of water, 3 tablespoonfuls of catsup, 1 dessertspoonful of minced savory herbs, 1 onion chopped fine, ½ teaspoonful of salt and ⅛ of cayenne; let these stew together for 15 minutes; take a cupful of flour; stir it well into the stewpan and stew for 10 minutes longer; strain it through a sieve; return it to the pan; place the slices of beef in it and keep the saucepan on the side of the range until the meat is heated through—not boiled, or it will become hard; a few minutes before serving add ½ wineglass of tarragon vinegar; arrange some toasted sippets round a very hot dish, and serve the hash immediately after it is cooked.

HEAD CHEESE.—Have the head and feet of a pig nicely cleaned and boiled until tender; chop it very fine; season with salt, pepper and sage while hot; put in a deep dish and cover with a plate smaller than the dish, that it may rest on the meat; place on the plate a heavy weight and let it stand 24 hours.

IRISH STEW.—Take about 2 lbs. of scrag or neck of mutton; divide it into 10 or 12 pieces; lay them in the pan; add 8 large potatoes and 4 onions cut into slices; season with 1½ teaspoonfuls of pepper, 3 teaspoonfuls of salt; cover all with water; put it into a slow oven or on a stove for 2 hours; stir it all up well; serve it in deep dishes.

KIDNEY PUDDING.—Slice an ox kidney on 8 mutton kidneys in thin slices; lay them on a dish; season well with black pepper and salt; shake 1 oz. of flour over; mix all well together; line a pudding dish with paste; put in the sliced kidney; pour a gill of water over; cover with paste; tie the basin in a cloth; put it into a pot of boiling water and boil 2 hours; add boiling water to supply that which wastes; serve hot.

KIDNEY, Fried.—Cut your kidneys lengthways, but not through; put 4 or 5 on a skewer; lay them on a gridiron, over clear, lively coals; pour the red gravy into a bowl each time they are turned; 5 minutes on the gridiron will do; take them up; cut them in pieces; put them into a pan with the gravy you have saved, a large lump of butter, with pepper, salt, a pinch of flour, and a glass of Madeira or champagne; fry the whole for 2 minutes, and serve very hot.

LAMB, Baked.—Lay a hind quarter of lamb in a baking pan; sprinkle with pepper and salt; add a little cold water; baste frequently; remove the fat from the gravy; thicken with browned flour, and season with a little Worcestershire sauce; serve the lamb on a bed of spinach that has been boiled, drained and heated with a little butter, pepper, salt, and stock or brown gravy. If peas are in season, substitute them for the spinach.

LAMB, Boiled.—Put in sufficient clear, cold water to cover it; let it remain ½ hour; a tablespoonful of vinegar, or a half handful of salt may be thrown in; put it into a thin white cloth which has been floured; boil it in enough water to cover it; a good-sized bundle of sweet herbs may be thrown into the saucepan; if 6 lbs., it will be done in 1½ hours; serve with spinach or French beans; if sent to the table cold, lay handsome sprigs of parsley about it tastefully; if hot, garnish with parsley, with thin slices of lemon laid round the dish.

LAMB CHOPS, Broiled.—Trim off the flap from a fine loin of lamb; cut into chops about ¾ inch in thickness; have ready a bright, clear fire; lay the chops on a gridiron or toaster, and broil them a nice pale brown, turning when required; season them with pepper and salt; serve very hot and quickly; garnish with crisp parsley, or place them on mashed potatoes.

Toaster.

LAMB, Forced.—Carefully take out all the meat with a sharp knife; leave the skin whole with the fat on it; convert the lean which has been cut into a forcemeat, thus: To 2 lbs. of meat add 2 lbs. of beef suet chopped small; beat it in a marble mortar till it is very fine; take all the skin off the meat and suet; mix it with 4 spoonfuls of grated bread, 8 or 10 cloves, 4 or 5 blades of mace dried and beaten fine, ½ nutmeg grated, a little pepper and salt, some lemon peel cut fine, a small portion of thyme and parsley, and 4 eggs; mix all together; put it into the skin, so that it may assume its original form; sew it up; roast it; baste it with butter, and serve with stock cut from the loin and fried in gravy.

LAMB, Saddle of.—Sprinkle a little salt over it; set it in the dripping pan with a few small pieces of butter on the meat; baste it occasionally with tried out lamb fat; dredge a little flour over it a few minutes before taking from the oven; serve with the very best of currant jelly; send to table with a few choice early vegetables. Mint sauce may be served with the joint, but in a very mild form.

LAMB SAUCE.—Roll a piece of butter in bread crumbs; shred parsley and shallots; boil it in a little stock and white wine, equal quantities; a few minutes are sufficient; squeeze in a little lemon or orange juice.

LIVER CHEESE.—Boil a beef's liver, heart and tongue; remove all the hard and sinewy parts, and chop the remainder fine; add to this ½ lb. of boiled pork also chopped fine; season it with sweet herbs, some grated nutmeg, a bay leaf, the flavor of an onion, pepper and salt; put it in a pan and press upon it a heavy weight; in a few hours turn it out in a solid cake for the table on a platter, accompanied by a knife to cut it with.

LIVER, Fried.—Cut the liver in slices about ⅜ in. in thickness; soak in cold water about ½ hour; have ready some butter in the spider; when hot, put in liver; season with salt, pepper, and an onion chopped fine; dust a little flour over the top; cover tight to keep steam in as much as possible; add a little water while cooking, to keep it from getting dry; do not

let it burn; when brown, turn on the other side; put on a little more salt, pepper, and flour; when done, take the liver out on a platter; put in about a teacup of sweet milk; if not thick enough, add a little more flour, wet in milk, until you get it about the thickness of beef gravy; pour over the liver and serve.

LIVER HASH.— Boil the liver until thoroughly tender; mince it finely with a chopping knife; heat the mince very hot in a sauce of butter and browned flour; season with pepper, salt, a dash of lemon, or a little piquant sauce, such as mushroom catsup.

LIVER, Roasted.— Wash thoroughly, and wipe dry; cut a long, deep hole in the side; stuff with crumbs, bacon and onions chopped; salt and pepper to taste; bit of butter and 1 egg; sew or tie together the liver; lard it over; bake in the oven; baste frequently; serve with gravy and currant jelly.

LIVER, Smothered.— Lard the liver with strips of pork; brown nearly ½ lb. of butter in a stewing pot; roll the liver all over in it; add salt, pepper, onions, carrots, and herbs, with some wine; cook slowly for 2½ hours very tightly covered; frequently shake the pot so that the liver may not stick to the bottom; ½ hour before serving add some carrots, cut into long square strips; add a few little onions; when served, the liquor and vegetables are to be poured over the liver as sauce.

LIVER STEW.—Cut a long strip of pork 1 in. wide; inclose it in the middle of the liver; lay the 2 sides completely lapped over; tie it around in 2 or 3 places; take sauce, gravy, or any drippings from roast meat and put it in a saucepan with a short handle; when the sauce is hot place the liver in the pan and cover tight; let it stew over the fire about 1½ hours; then place in the oven for ½ hour, and it is browned a little and very tender.

MARROW BONES.— Saw the bones any size you may prefer; cover the ends with a common paste of flour and water; tie a cloth over them; place them in a small stewpan with sufficient boiling water to cover; when sufficiently boiled, serve them upright on a napkin; or, when boiled, take out the marrow and spread it on toasted bread; cut into small square slices; season it with a little pepper and salt, and send it to table very hot on a napkin or toast.

MEAT BALLS.—Chop fresh meat very fine— beef, veal, mutton or chicken; roll dried bread very fine; add salt, pepper, cloves and mace, and 1 egg; mix this with the meat; pound all well together and make into balls a little larger than a hen's egg; roll in bread crumbs and egg; fry in hot lard; dish with a nice gravy flavored with walnut ketchup.

MEAT RISSOLES.—Chop fine the cold meat; carefully exclude every particle of fat, skin and outside; pound in a mortar with a small piece of butter, adding pepper, salt and powdered fine herbs; moisten with stock; put this into a pan on the fire, and take off as soon as hot; stir in the yolk of an egg beaten up with a little lemon juice and put the mixture by to cool; make a paste of 6 oz. of flour, 2 oz. of butter, a pinch of salt, the yolks of 2 eggs, and a little water; roll it out and cut into small squares; put the meat in the centre and paste the corners over, pressing them well down; fry in hot lard, and serve with parsley.

MUTTON, Breast of.—Bone it; score it; season well with cayenne, black pepper and salt; boil it, and while cooking skim the fat from the gravy in which it has been stewed; slice a few gherkins; add with a dessertspoonful of mushroom ketchup; boil it, and pour over the mutton when dished.

MUTTON, Curry of.— Put 6 button onions, cut fine, and 1 oz. of butter into a saucepan, with 1 oz. of curry powder, a teaspoonful of salt, a tablespoonful of flour, and ½ pt. of cream; stir until smooth. Remove the bones from 2 lbs. of mutton; cut it into neat pieces; fry a light brown; put the meat into a saucepan; pour the sauce over it; boil gently 1½ hours; place the meat on a hot dish, and arrange a border of broiled rice neatly round it.

MUTTON, Leg of, Boiled.—Soak for 1½ hours in salt water; wipe, and boil in a floured cloth; serve with mashed potatoes, turnips, greens and caper sauce.

MUTTON, Leg of, Roasted.—Take a leg of well kept mutton; rub it lightly with salt; put it into a dripping pan with a very little water; cut a potato in two lengthwise and set it under the leg; baste with a little good dripping at first; when within 20 minutes of being done, dredge it with flour to get it frothed; turn the joint two or three times while cooking.

MUTTON, Loin of.—Follow the directions given for roast leg of mutton, but trim off all unnecessary fat; cover the joint with paper until within 20 minutes of its being done; then remove, baste and flour slightly; serve with currant jelly.

MUTTON, Pish Pash of.—Take any lean mutton; cut it in small pieces without any fat or gristle; boil it down into a nice broth; take out the meat; wash a teacup of rice nicely and boil it for a little while in the broth, until it begins to look transparent; skim all grease off; take a mutton chop or two; take out the bone; cut in dice; boil the whole together with a whole onion and a little pepper and salt for ½ hour; serve without straining.

MUTTON, Ragout of.—Slice 2 turnips, 2 carrots and 2 onions; put them in a saucepan with 2 oz. butter, and brown them; dust in a little flour, and stir the whole to prevent browning too quickly; turn them out upon a hot dish until wanted. Cut up cold roast mutton into square pieces; brown them on each side in the same pan in which you browned your vegetables; add ½ pt. of hot water, salt and pepper, a few sprigs of parsley, and the sliced vegetables; stew gently until the vegetables are tender; arrange the vegetables in the center of the dish, with the meat as a border; pour the sauce over all, and serve.

MUTTON STEW.—Take 3 lbs. of breast or neck of mutton; cut in pieces; put in a stew pan with just enough water to cover; add a pinch of salt; let it stew gently for 1 hour; skim off all the fat; peel and slice 6 potatoes and 4 onions; sprinkle and put all the ingredients into

another stewpan in layers, first a layer of vegetables, then one of meat, and sprinkle seasoning of pepper and salt and savory between each layer; cover closely; let the whole stew very slowly for one hour; shake it frequently to prevent its burning.

OX HEAD.—$\frac{1}{2}$ an ox head; a bunch of sweet herbs; 1 head of celery; 1 small onion; 4 cloves; pepper and salt; 3$\frac{1}{2}$ pts. water; well wash the ox head; let it soak in cold water for several hours; then put it into a stewpan, with a bunch of herbs, 1 onion, the celery cut into slices, 4 cloves, and pepper and salt; pour in about 3$\frac{1}{2}$ pts. of water, or rather more; set it over a gentle fire to simmer slowly; when tender take out the head, and cut the meat from it in rather small pieces; strain the gravy, and put about the third part of it into a stewpan with the pieces of head; make all very hot, and serve it up quickly.

PIG, Baked.—Take a pig about 6 weeks old, nicely prepared; score in squares; rub lard all over it; make a dressing of 2 qts. of corn meal; salt as if for bread; mix to a stiff bread with boiling water; make into pans and bake; after this is baked brown, break it up; add to it $\frac{1}{4}$ lb. butter, pepper to taste, and thyme; fill the pig till plump; sew it up; place it on its knees in the pan, which fill with as much water as will cook it; baste it very frequently with the gravy, also 2 red pepper pods; turn while baking, same as a turkey; continue to baste till done.

PIG'S FEET, Boiled.—Take the forefeet; cut off the hock; clean and scrape them well; place two feet together and roll them up tightly in common muslin; tie and sew them so they will keep in perfect shape; boil them 7 hours on a moderate fire; lift them out carefully and let them cool off; remove the muslin and you will find them like jelly; serve with vinegar, or split them and roll in bread crumbs or cracker dust; and fry or broil them; serve with a little tart sauce.

PIG'S HEAD, Baked.—Clean and wash it well; pare and slice 1 qt. of onions; chop $\frac{1}{4}$ lb. suet; grate $\frac{1}{2}$ loaf of stale bread; put into a dripping pan 1 oz. of drippings, 1 gill of vinegar, then the onions, next the head, skin up; then add the bread, suet and seasoning, well mixed; bake in a moderate oven for about 1$\frac{1}{2}$ hours.

PORK CHEESE.—Chop, not very fine, 2 lbs. lean pork with 1 lb. inside fat; strew over and mix thoroughly with them 3 teaspoonfuls of salt, nearly half as much pepper, $\frac{1}{2}$ teaspoonful of mixed parsley, thyme and sage (and sweet basil, if it can be procured), all mixed, extremely small; press the meat closely and evenly into a shallow tin; bake it in a very gentle oven from 1 to 1$\frac{1}{2}$ hours; serve cold in slices.

PORK CHOPS.—1. Broil 3 nice pork chops; when well done sprinkle them with pepper and salt; place on a hot dish; serve with tomato sauce poured around them.—2. Cut the chops about $\frac{1}{4}$ in. thick; trim them neatly and beat them flat; put a piece of butter into the frying pan; as soon as it is hot, lay in the chops; turn them frequently; they will be well browned in $\frac{1}{2}$ hour; take 1 upon a plate and try it; if done, season it with a little finely minced onion, powdered sage, pepper and salt.—3. Prepare some sweet herbs, sage and onion chopped fine, and put all into a stewpan with a bit of butter; give them one fry; beat two eggs on a plate with a little salt, and the minced herbs; mix it all thoroughly together; dip the chops in, one at a time; cover them with bread crumbs, and fry them in hot lard or dripping till they are of a light brown.

PORK, Leg of, Boiled.—Salt and wash in clean cold water; scrape thoroughly white and clean preparatory to cooking; then put into a floured cloth, and into cold water on the fire; when the rind is quite tender the pork is done; let the water be well skimmed; serve with such vegetables as are in season; should the joint be large, allow $\frac{1}{4}$ hour to each lb., with an additional 20 minutes from the time it boils.

PORK, Leg of, Roasted.—The pork should be young and dairy fed; score the skin with a sharp penknife; rub a little fresh butter over the skin to make it brown and crisp without blistering; chop some sage that has been scalded very fine; add to it an onion parboiled; mix some bread crumbs and a small portion of finely chopped apple, mix all together; season with pepper and salt; make an incision by separating the skin from the fat in the under and fillet end of the leg; place the stuffing there; serve with apple sauce.

PORK, Loin of, Roasted.—1. Score before roasting; joint to make the chops separate easily; then roast as a loin of mutton.—2. Put into enough water to cover it; simmer until it is nearly done; then take it out; strip the skin off; coat it well with yolk of egg and bread crumbs; roast until it is thoroughly done.

PORK, Scrambled.—Freshen nice salt pork; cut it in mouthfuls; partly fry it; just before it is done, break into the pan with the pork from 6 to 12 eggs; break and mix the yolks with the whites; stir them quickly with the pork; if the pork is fried brown before the egg is added, there may be too much fat for the egg; if so, put it in a gravy boat if needed for the table, or save it for shortening.

PORK TENDERLOINS, Baked.—Cut a slit in the sides of 2 quite large tenderloins; fill them with forcemeats; sew them up; lay them in a dripping pan; bake them slowly for 1$\frac{1}{2}$ hours; remove the strings, and serve them hot.

PORK TENDERLOINS, Fried.—Cut the tenderloin open; stew in water till nearly done; then, with a little butter hissing in a spider, fry to a light brown, not too hard; have a small piece of toast buttered for each piece of meat; place the meat on the toast; pepper and salt; then throw a thin milk gravy over all.

ROLICHES.—Take fresh tripe; cut it into square pieces; and also cut into small bits pieces of flank of beef large enough to fill the tripe; add a little fat with the lean beef; season with salt, pepper, and sweet herbs; sew up in the pieces of tripe in little round balls; put them into a pot of boiling water and boil slowly till you can pierce them with a straw; skim off the fat; put a press on them while in the water; let them stand till the next morning. Make a mixture of half the pot liquor and half

vinegar; cover them with it, and put them away in a stone jar, and when needed take from the liquor and cut in slices for supper.

SAMP.—Soak 1 qt. of cracked Indian corn over night; put it on the fire the first thing after breakfast, with 3 lbs. of beef, not too salt, and 1 of pork; cover with water; let it cook slowly 5 hours, being very careful not to let it burn.

SAUSAGE, Baked.—Place them in a baking pan in a single layer; bake in a moderate oven; turn them over when they are half done, that they be equally browned all over; send to table with pieces of toast between each sausage; cut the toast about the same size as the sausage, and moisten it with a very little of the sausage fat.

SAUSAGE, Fried.—6 lbs. lean fresh pork; 3 lbs. fat fresh pork; 12 teaspoons powdered sage; 6 teaspoons black pepper; 6 teaspoons salt; 2 teaspoons powdered mace; 2 teaspoons powdered cloves; 1 grated nutmeg; chop the meat fine; mix the seasoning in with your hands; pack down in stone jars; pour a layer of melted lard on top; when wanted, take enough for a meal; form into small cakes and fry; put no other grease but their own in the pan.

SHEEP'S BRAINS, Baked. — Prepare the brains as for stewing; procure as many slices of bacon as there are brains; after they have been boiled and thrown into cold water, drain and dry them perfectly; brush over with oil; roll them in highly seasoned bread crumbs; bake in a well heated oven, turning them about that they may be equally cooked; baste occasionally; when nicely browned, take them up; lay the slices of bacon on toast; put the brains upon them; serve with sharp sauce or tomato sauce in a separate tureen.

SHEEP'S HEAD.—1 head; 2 onions; 2 carrots; 2 turnips; a piece of celery; 5 cloves; a sprig or two of thyme; 1 bay leaf; ¼ oz. of pepper; 3 qts. of water; salt to taste. Put the head into a gallon of water; let it soak for 2 hours; wash thoroughly; saw it in two from the top; take out the brain; cut away part of the uncovered portions of the skull and the ends of the jaws; wash it well once more; put the onions, carrots, turnips, celery, thyme, bay leaf and seasoning, into a stewpan, with 3 qts. of water; let it simmer very gently; take out the vegetables and bunch of herbs; skim off the fat; lay the head on a dish; have the brain ready boiled; chop it up fine; warm it in parsley and butter; put under the head, and serve.

SMOKED MEAT.—Take a smoked tongue or ham that has been well boiled; grate it with a coarse grater and mince it fine; mix it with cream and beaten yolk of egg; let it simmer over the fire. Prepare some nice slices of toast; butter them rather slightly; lay them in a flat dish that has been heated over the fire; cover each slice with the meat mixture, that should be spread on hot; place on the table in a covered dish.

SWEETBREADS, A la Financiere.—Put your sweetbread in cold water and put it on the fire; when it boils take it off; let cold water run over it until it is thoroughly cold; press tightly for a few minutes and then lard it; take some spare lard and put it in a saucepan with some sliced onions, carrots, thyme, whole pepper and cloves; put your sweetbread in with a little *consommé*; put it on the fire until it boils; keep it closely covered all the time; when it comes to a boil put it in a hot oven for half to three quarters of an hour; half-bake some chicken livers; take a small piece of sweetbread, some truffles and olives; put all in a saucepan with brown sauce; dish up the sweetbread; put the garniture around the dish and serve.

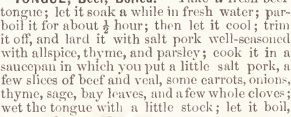
SWEETBREADS, Braised. — Soak the sweetbreads an hour in cold water; then lard them; line the bottom of a covered pan with slices of bacon with a very little finely-chopped parsley and onion scattered over them; lay the sweetbreads on the bacon, and pour on some nice meat stock so that it shall not cover the sweetbreads; let it cook gently for nearly ¾ hour; add a little stock from time to time, if that in the pan gets low; brown the tops of the sweetbreads by holding a hot stove lid over them.

SWEETBREADS, Broiled.—Parboil them; put them on a clean gridiron for broiling; when delicately browned, take them off; roll in melted butter to prevent their being dry and hard.

SWEETBREADS, Fricasseed.—Procure 4 nice sweetbreads; wash them carefully; remove the skin and gristle; cover with boiling water; boil 15 minutes; then plunge into ice-cold water, to which you have added a little salt; leave them in this 20 minutes; take out and cut into crosswise slices ½ in. thick; have ready 3 or 4 tablespoonfuls of butter heated in a frying pan and fry the slices until nicely browned, but not burnt; into a saucepan turn 2 cups of strong broth; season well with salt, pepper, a dash of cayenne, cloves, a little chopped onion boiled in it and strained out; thicken with browned flour; put in the sweetbreads; cover and simmer 15 minutes longer.

SWEETBREADS, Fried. — Take 3 doz. sweetbreads; put them into hot water and let them boil 10 or 12 minutes; when cold skin, but do not break them; take 6 eggs and beat them well; season well with pepper and salt; roll in bread crumbs; fry them in salt pork to a nice brown; serve hot with butter and parsley sauce.

TONGUE, Beef, Boiled. — Take a fresh beef tongue; let it soak a while in fresh water; parboil it for about ½ hour; then let it cool; trim it off, and lard it with salt pork well-seasoned with allspice, thyme, and parsley; cook it in a saucepan in which you put a little salt pork, a few slices of beef and veal, some carrots, onions, thyme, sage, bay leaves, and a few whole cloves; wet the tongue with a little stock; let it boil,



Boiled Beef Tongue.

and reduce during 4 or 5 hours, according to

the softness of the tongue; when it is cooked, take it out; skin it and split it so as to form a kind of a heart on the dish; then add a sauce piquant, which is composed of pickles, onions, and vinegar, and a good thickened sauce. Dress the dish with a few sliced pickles, and serve the tongue with its own sauce; or, garnish it with a frill of paper and parsley.

TONGUE. Calf's, Fricasseed.—Boil the tongue 1 hour; pare and cut into thick slices; roll them in flour and fry in drippings 5 minutes; put the tongues into a saucepan; add sliced onion, thyme, and parsley; cover with a cupful of your soup or other gravy; simmer ½ hour; cover lightly; take up the tongues and keep them warm; strain the gravy; thicken; put in 4 or 5 thin slices of lemon from which the peel has been taken; boil 1 minute and pour over the fricassee.

TONGUE. Potted.—Procure a beef tongue; rub it over with 1 oz. of saltpetre and 4 oz. of moist sugar; let it remain for 2 days; then boil it until it is quite tender; cut off the quantity required for potting; remove the skin; then weigh the meat; cut it up into small pieces; pound it as fine as possible; add a few oz. of cold fowl or veal, or any other roasted meat or game which may be at hand, minced and pounded likewise; to every pound of meat add ½ lb. of clarified butter, or a little ground mace, pounded cloves, and cayenne pepper; beat the spices well into the meat, in a marble mortar, and taste it if sufficiently seasoned; press it closely down into small pots; pour clarified butter on the top; keep in a cool larder until wanted.

TRIPE. Boiled.—Take 2 lbs. tripe; wash it thoroughly; cut it in small pieces; put it in a stewpan with plenty of water; let it simmer for 2 hours; take 8 large onions, put them in a saucepan and boil until they are done; strain the onions and cut them up, and strain the tripe; put them both together; add 1 qt. of milk, some pepper and salt; let it come to a boil; take 2 tablespoonfuls of flour, mix it with a little milk and stir it in; let it boil fast for 10 minutes, stirring all the time, to prevent burning.

TRIPE. Broiled.—Cut up honeycomb tripe into pieces of 3 or 4 in. wide; rub a little oil or melted butter over them; dredge them in flour; broil over a charcoal fire; squeeze a little lemon juice over each piece and serve.

TRIPE, Fried.—Cut the tripe into pieces about 3 in. square; dip into a batter made of 6 oz. of flour, 1 tablespoonful of oil, or 1 oz. of butter, and ¼ pt. of tepid water; mix the oil with the flour; add the water by degrees; whip the whites of 2 eggs to a stiff froth; stir into the batter; dip the tripe in; throw it into a saucepan of boiling fat; let it fry 3 or 4 minutes; take it out and drain.

TRIPE, Lyonnaise.—Take 1 lb. of cold boiled tripe and cut it into pieces 1 in. square; dissolve 2 oz. of butter in a frying pan; add a sliced onion to it; fry until it is tender; put the pieces of tripe with the onion, 1 tablespoonful of chopped parsley, 1 tablespoonful of vinegar, salt and a little cayenne; heat all gently together; cover the bottom of a platter with tomato sauce; add the tripe and serve.

VEAL. Broiled.—Cut steaks from the round, or take the chops, which are preferable; broil them handsomely; butter them well and serve very hot.

VEAL COLLOPS.—Cut part of a leg of veal into pieces 3 or 4 in. broad; sprinkle flour on them; fry in butter until brown; then turn in water enough to cover the veal; when it boils take off the scum; put in 2 or 3 onions, a blade of mace, a little salt and pepper; stew until tender; then take up the meat; thicken the gravy with flour and water mixed smoothly together; squeeze in the juice of a lemon, or a very good substitute is a teaspoonful of catsup; turn the mixture over the brown collops; garnish with thin slices of lemon.

VEAL CROQUETTES.—Remove the gristle, skin and sinews from 1 lb. of cold veal; mince it finely with 4 oz. of cold boiled beef or calf's tongue; season with salt, pepper and nutmeg; put into a saucepan 1 oz. of butter rolled in flour and 1 wineglassful of cream; add the minced meat, and stir for 20 minutes over a slow fire; if too dry moisten with stock; turn the preparation upon a round pie board; spread it to a smooth layer about 1 in. thick; set it in the ice box to get cold and stiff; divide into about 2 doz. pieces, each piece rolled into the form of a cork or round ball over bread crumbs; then dip in beaten egg and roll again in crumbs; handle carefully so as not to break them; fry in boiling fat.

VEAL CUTLETS, Braised.—Lard some veal cutlets on one side; place them on a layer of minced onion and carrot in the bottom of a stewpan; add rich stock enough to cover them completely, and then let them cook; serve them with a nice brown gravy made with the stock strained.

VEAL CUTLETS, Fried.—Make a batter of 1 cup of milk, 1 beaten egg, a pinch of salt and flour, with ½ teaspoonful of baking powder mixed in; fry the veal a nice brown in drippings or butter; then dip into the batter and fry again brown; any batter that may be left drop by the small spoonful into the hot fat; turn, and when browned place on the meat.

VEAL HASH.—Take a teacup of boiling water in a saucepan; stir in an even teaspoon flour wet in a tablespoon cold water; let it boil 5 minutes; add ½ teaspoon black pepper, as much salt, and 2 tablespoons butter, and let it keep hot, but not boil; chop the veal fine; mix with it half as much stale bread crumbs; put it in a pan and pour the gravy on it; then let it simmer 10 minutes; serve this on buttered toast.

VEAL, Leg of, Boiled.—Let the water boil before putting the meat in; boil a few slices of salt pork with it, but no vegetables; when done, make a gravy of drawn butter.

VEAL, Leg of, Roasted.—Take out the bone and stuff the hollow with highly seasoned stuffing; baste often.

VEAL LOAF, or CAKE.—Take a cold fillet of veal, mince as fine as possible; mix with ¼ lb. of fat ham chopped fine, 1 teacup of grated bread crumbs, 1 grated nutmeg, 2 beaten eggs, a little salt and a very little cayenne; mix in form of a loaf; glaze over with the yolk of an egg; strew on pounded cracker; bake 1 hour; make a gravy of the trimmings of veal; thicken

with the yolk of an egg dropped in just before taken up; serve the loaf with gravy poured over it.

VEAL, Loin of, Boiled.—Take a loin of about 8 lbs.; skewer down the flap without disturbing the kidney; put the loin in the kettle with enough cold water to cover it; let it come gradually to a boil; continue for 2½ hours; remove the scum as it rises; send it to the table in white broth, thickened with cream; or with parsley and melted butter.

VEAL, Loin of, Browned.—Put a piece of butter in a covered pan; place into it about 3 lbs. of veal; choose the thick end of a shoulder or loin; brown well for at least twenty minutes; sprinkle over a little flour; add also some warm water, just to make a little gravy; add also 4 slices of lemon, some mace, a little nutmeg, salt, and whole peppercorns; place 2 pieces of bacon on top of the meat; close up tight; let it gently simmer for ¾ hour more; do not boil it fast; take out the meat and strain the gravy over it; trim with lemon.

VEAL, Loin of, Roasted.—Make an incision in the flank or skirt of the loin of veal; into the cavity thus made, just over the end of the bone, put a well flavored veal forcemeat; roll in the flank to cover the kidney fat; bind it firmly with string or tape; place a few small veal bones with a few assorted vegetables; cut up in a dripping pan; put the loin upon this bed; add ½ pt. of stock or water; set it in the oven for 20 minutes; in the meantime work together 1 tablespoonful of flour with 2 tablespoonfuls of melted butter; draw the joint from the oven; baste it with the flour and butter; return it to the oven again; baste occasionally until done.

VEAL, Neck of, Braised.—Lard with bacon; roll in chopped parsley, pepper, salt and nutmeg, placed with the scrag in a tosser, in which place lean bacon, celery, carrots, 1 onion, 1 glass sherry or Madeira, with sufficient water to cover it all; stew over a quick fire until it is sufficiently tender; remove the veal; strain the gravy; place the veal in a stewpan, in which some butter and flour has been browned; let the bones be uppermost; when the veal is nicely colored it is enough; boil as much of the liquor as may be required; skim it clear; squeeze a lemon into it; pour it over the meat and serve.

VEAL QUENELLES.—Mix in a saucepan on the fire 1 oz. of butter and a handful of flour; add enough water to make a thick paste; let it come to boiling point; put it by to get cold; take 1 lb. of uncooked veal cutlet; cut it up small and pound it to a pulp in a mortar; take of paste half the quantity there is of meat pulp; of butter half the quantity there is of paste; mix the whole thoroughly in the mortar; then pass the mixture through a sieve; return it to a clean mortar; add pepper, salt and spices to taste; work into it with the pestle the whites of 1 or 2 and the yolks of 4 or 5 eggs; poach a piece of the mixture, to try it as to taste and consisteney; alter it by adding more condiments or whites of eggs; shape the quenelles neatly with two tablespoons; dispose them in a well buttered saucepan; leave a clear space on one side in which to put a pinch of salt; pour in sufficient boiling water to cover the quenelles; leave them to poach for 10 minutes; drain and arrange them neatly on a bed of tomato sauce.

VEAL RAGOUT.—Place a breast of veal in a pan with a pint of water, a little pepper, salt and mace; stew this 1½ hours, turning once or twice; make forcemeat balls with a little veal chopped fine, crumbs, herbs, spices, a little butter and 1 egg; mix these together; make into small balls; put them on the meat; baste with butter; dredge on a little flour; put in the oven 20 minutes; add a little batter and flour to the gravy; let it boil; pour over the meat.

VEAL RISSOLES.—Mince some veal; pound it in a mortar; grate some cooked ham into it; mix well with white sauce; flavor with mushrooms; make them into balls; inclose in pastry; fry brown in butter; if fried without pastry, bind them together with egg and bread crumbs.

VEAL, Scalloped.—Chop cold cooked veal fine; put a layer in a baking dish; alternate with a layer of powdered crackers, salt, pepper and butter, until you fill the dish; beat up 2 eggs; add a pint of milk; pour it over the veal and crackers; cover with a plate and let the top brown.

VEAL, Shoulder of, Roasted.—Remove the knuckle; roast what remains; it may or may not be stuffed; if not stuffed, serve with oyster or mushroom sauce; if stuffed, with melted butter.

VEAL, Shoulder of, Stewed.—Bone the shoulder, and lay in the orifice a veal forcemeat; roll and bind the shoulder; roast it 1 hour; then put it into a stewpan with good white or brown gravy; stew 4 or 5 hours, regulating the time to the size of the joint; when done, strain the gravy to clear it of fat; serve with forcemeat balls.

VEAL STEW.—Cut 4 lbs. of veal into strips 3 in. long and 1 in. thick; peel 12 large potatoes; cut them into slices 1 in. thick; spread a layer of veal on the bottom of the pot; sprinkle in a little salt and pepper; then a layer of potatoes; then a layer of veal seasoned as before; over the last layer of veal put a layer of slices of salt pork; over the whole a layer of potatoes; pour in water till it rises an inch over the whole; cover it close; heat 15 minutes, and simmer 1 hour.

YORKSHIRE PUDDING.—Make a thin batter, as for frying, with 1 pt. of milk and some flour; season with salt, pepper and a little nutmeg grated fine; beat up the yolks of 4 eggs and the whites of 2 with 1 or 2 teaspoonfuls of brandy; strain them into the batter; beat it well with a fork for some minutes; pour the mixture to the thickness of 1 in. into a tin buttered freely, and put it into the oven; when the pudding is set lay it in the tin, slanting in front of the fire under the beef which is roasting; when the top is well browned, take the pudding out of the tin and expose the under side of it to the action of the fire; when done, cut it up in diamond shaped pieces and garnish the joint with them.

MISCELLANEOUS DESSERTS.

ALMOND CREAM.—Sweet almonds, 2 oz.; 4 bitter almonds; blanch and beat in a mortar to a smooth paste; add a teaspoonful of water to prevent oiling; afterwards a pt. of cream, and enough powdered lump sugar to sweeten; then whisk to a froth; fill the glasses with the liquor, and place some of the froth on the top of each.

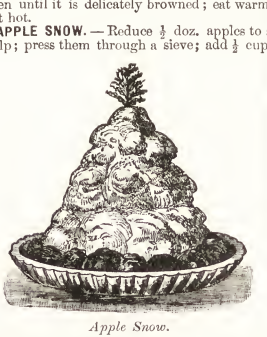
APPLE FLOAT.—Stew 1 qt. of dried apples until perfectly tender; flavor with extract of lemon and sweeten; spread it on a flat dish to cool; mash fine with a silver fork; beat the whites of 8 eggs very light; add to the apples; after thoroughly mixing, turn into a glass dish, and eat with cream.

APPLE FOLLY.—Whites of 2 eggs, 1 cup of sugar, 3 sour baked apples, vanilla; beat together a little the whites of the eggs and sugar; flavor the inside of the baked apples; put to the eggs; beat till quite stiff; serve with cake.

APPLE ISLAND.—Pare carefully 8 large apples; core them; chop fine with the beaten whites of 8 eggs, ½ lb. of white sugar, and a little lemon flavoring; drop on cream as for floating island.

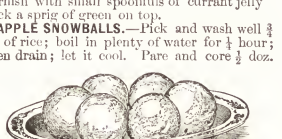
APPLE OMELET.—6 large pippins or other tart apples; 1 tablespoonful of butter; 3 eggs; 6 tablespoonfuls of white sugar; nutmeg to taste; 1 teaspoon of rose water. Pare, core and stew the apples as for sauce; beat them very smooth while hot; add butter, sugar and flavoring; when quite cold add the eggs, beaten separately very light; put in the whites last, and pour into a deep bake dish, previously warmed and well buttered; bake in a moderate oven until it is delicately browned; eat warm, not hot.

APPLE SNOW.—Reduce ½ doz. apples to a pulp; press them through a sieve; add ½ cupful powdered sugar and a teaspoonful of extract of lemon; take the whites of 6 eggs; whip them for several minutes; sprinkle 2 tablespoonfuls of powdered sugar over them; beat the apple pulp to a froth; add the beaten egg; whip the mixture until it looks like stiff snow; pile it high in rough portions on a glass dish; garnish with small spoonfuls of currant jelly stick a sprig of green on top.



Apple Snow.

APPLE SNOWBALLS.—Pick and wash well ¾ lb. of rice; boil in plenty of water for ½ hour; then drain; let it cool. Pare and core ½ doz. large apples; inclose them in the rice separately; boil them for 1 hour; when eaten, add a little butter and sugar, with powdered nutmeg or cinnamon.



Apple Snowballs.

APPLE SOUFFLE.—12 large apples; ½ lb. sugar; 6 eggs; 1 pt. milk; 1 lemon; 1 tablespoonful powdered sugar. Pare and core the apples; stew them with the lemon peel till quite soft; press through a sieve; make a custard with the yolks of the eggs and the milk; half fill a pie dish with the apples; cover with the custard; beat the whites of the eggs to a stiff froth and lay on the custard; sift the loaf sugar over all; bake in a moderate oven for 10 minutes.

Ornamental Soufflé Dish.

APRICOT CREAM.—8 ripe apricots or 1 doz. clear stone soft peaches; 8 oz. powdered white sugar; 1 oz. isinglass; put the fruit into a stewpan with 1 gill of water and 4 oz. of sugar; let them cook; when cooked let get cold; whisk up ½ pt. of cream very stiff; add the fruit, passed through a metal strainer, and 4 oz. powdered white sugar; dissolve 1 oz. isinglass in a little hot water; mix it with the cream; stir well together and pour in a mold; stand it in ice water to get cold; when required for the table dip the mold in warm water for a few seconds; wipe with a cloth and turn out on to a silver dish; garnish with white flowers and green leaves.

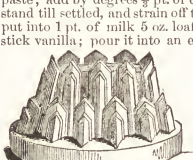
ARROWROOT BLANC MANGE.—Mix 1 teacupful of arrowroot with a little cold milk; rub it smooth; boil 1 pt. of milk with 10 sweet and 4 bitter almonds, having pounded and blanched them; sweeten this milk to taste with pulverized sugar; strain carefully; pour the milk gradually into the arrowroot; stir all the time; boil for 5 minutes, and pour into a mold to cool.

BAVARIAN CREAM.—Whip 1 pt. of cream to a stiff froth; set in a colander 1 minute, to allow the unwhipped portion to drip away; boil 1 pt. of milk with 1 stick of vanilla and ½ cupful of sugar till flavor is extracted; take out the stick of vanilla; remove saucepan from fire; add ½ box

of gelatine that has been soaked in water; add the well beaten whites of 4 eggs; when the mixture has become quite cold, add the whipped cream gradually until it is well mixed; put into individual molds 1 teaspoonful of some bright jelly or jam; pour in the mixture and place in ice box until wanted.

BLANCHED CREAM.—Take 1 qt. of the thickest cream that can be got; sweeten it with fine sugar and orange flower water; boil it and beat the whites of 20 eggs with a little cold cream; strain it, and when the cream is upon the boil, pour in the eggs; stir it well till it comes to a thick curd; take it up and strain again through a hair sieve; beat well with a spoon till it is cold, and put into a dish.

BLANC MANGE.—Blanch 10 bitter almonds with 2 oz. of sweet almonds; pound them to a paste; add by degrees ½ pt. of cold water; let it stand till settled, and strain off the almond milk; put into 1 pt. of milk 5 oz. loaf sugar and 3 in. stick vanilla; pour it into an enamelled saucepan; boil slowly till the sugar is dissolved; stir in 1 oz. of well soaked isinglass; strain into a basin; add the milk of almonds with 1 gill of cream; remove the sticks of vanilla; when cold pour the mixture into a mold, or into individual molds, and place in an ice box till wanted.



Blanc Mange Mold.

CALEDONIAN CREAM.—2 oz. of raspberry jam or jelly; 2 oz. of red currant jelly; 2 oz. of sifted loaf sugar; the whites of 2 eggs put into a bowl and beaten with a spoon for ¾ hour.

CHARLOTTE RUSSE.—Take 1-5 package of gelatine and ½ cupful cold milk; place in a farina boiler; stir gently over the fire until the gelatine is dissolved; pour into a dish; place in a cool room; take 1 pt. of rich cream and whisk it with a tin egg beater until it is thick; flavor the cream with either vanilla or wine; sweeten to taste; when the gelatine is cool, strain carefully into the prepared cream; line a mold with lady-fingers; pour the cream in carefully until it is filled; cover with lady-fingers.

CHESTNUTS, Boiled.—Make a slight incision in the outer skin only of the chestnuts, to prevent bursting; when all are done, throw them into plenty of boiling water, with about 1 dessertspoonful of salt to the ½ gal.; as soon as they are soft through, drain them; wipe them in a coarse cloth, and send them to table quickly in a hot napkin.

CHOCOLATE BLANC MANGE.—Take 3 pts. of warm milk and soak in it 1 package of gelatine; allow it to remain for 2 hours; sweeten with 4 tablespoonfuls of sugar, after the gelatine is softened or melted; scrape a square of sweet chocolate; put in a small saucepan with 2 spoonfuls of hot water; if you use unsweetened chocolate, add to the water 2 tablespoonfuls of sugar; stir this all the time, until perfectly smooth; then, having your milk and gelatine on the fire, watching it closely so that it will not burn, add by degrees your chocolate mixture; have molds ready in which to put your blanc mange.

CHOCOLATE CHARLOTTE RUSSE.—½ box gelatine; 1 qt. milk; yolks of 2 eggs; 1 small teacupful of sugar; 1 large tablespoonful of vanilla; 7 squares of Baker's chocolate; dissolve the gelatine in about 1 gill of cold water; let it stand for 2 hours; grate the chocolate fine; dissolve it in a little of the milk, slightly warmed; scald the remainder of the milk; beat the yolks of the eggs and sugar together until very light; when the milk is well scalded, add the gelatine, chocolate, eggs and sugar; let this simmer gently for 15 minutes; strain the mixture into a mold; put it on ice.

CHOCOLATE WHIP.— Take 1 oz. of cocoa paste, or the same quantity of sweet chocolate scraped fine; add it to 1 qt. of rich cream and ½ lb. of pulverized sugar; place on the fire and bring to the boiling point; stir constantly with a whisk; then remove it; when it is thoroughly cold, add to it the whites of 4 eggs; whisk briskly, and remove the froth as it forms with a perforated skimmer; lay it on a hair sieve to drain; when you have a sufficient quantity to whip, fill your glasses or cups ¾ full of the cream; pile the whip on top of them; sprinkle a little vanilla sugar or powdered cinnamon on the whip, and serve.

COFFEE CREAM. — Sweeten 1 pt. of rich cream rather liberally; roast 2 oz. coffee beans; when they are lightly browned throw them into the cream at once and let the dish stand 1 hour before using; strain and whip the cream to a firm froth; add 1 teaspoonful of powdered gum Arabic, dissolved in a little orange flower water, to give the cream more firmness, if desired.

CORN STARCH BLANC MANGE. — Take ½ gal. milk, 8 eggs, 1 pt. of sugar, 2 tablespoonfuls of corn starch; boil the milk; add the eggs, sugar and corn starch; let it thicken; use the whites of the eggs, with 6 tablespoonfuls of sugar; season to taste and put on the top of the custard.

CRACKER DESSERT. — Choose whole soda crackers; lay each upon a separate small plate; pour upon it enough boiling water to soak it well; leave none upon the plate; cover with a dressing of sweetened cream, with a spoonful of jelly in the centre if you choose, or dip upon it a portion of nice fruit, canned, stewed, or fresh, as is convenient.

FLOATING ISLAND.—1. Into ¾ pt. of cream put sugar to make it very sweet, and the juice and rind of a lemon grated; beat it for 10 minutes. Cut French rolls into thin slices, and lay them on a round dish on the top of the cream; on this put a layer of apricot or currant jam, and some more slices of roll; pile up on this, very high, a whip made of damson jam and the whites of 4 eggs. It should be rough, to imitate a rock. Garnish with fruit or sweetmeats.—2. Beat the yolks of 3 eggs until very light; sweeten and flavor to taste; stir into 1 qt. of boiling milk; cook till it thickens; when

cool, pour into a low glass dish; whip the whites of the eggs to a stiff froth; sweeten and pour over a dish of boiling water to cook; take a tablespoon and drop the whites on top of the

Floating Island.

cream, far enough apart so that the little white islands will not touch each other; drop little specks of bright jelly on each island.

FLUMMERY.—1 pt. cream; 1 oz. gelatine, soaked 1 hour in 1 cup cold water; 1 cup milk; ½ cup sugar; heat the milk to boiling; put in the gelatine and sugar and stir 5 minutes, or until they are thoroughly dissolved; strain through thin muslin, pressing the cloth well; when cool, beat in the cream, a little at a time, with an egg whip, or churn in a syllabub churn until thick and stiff; wet your mold; put in the mixture; let it stand 7 or 8 hours in a cold place; flavor with vanilla.

FRIAR'S OMELET.—Stew 6 or 7 good-sized apples, as for apple sauce; stir in, when cooked and still warm, butter the size of a pigeon's egg and 1 cupful of sugar; when cold, stir in 3 well beaten eggs and a little lemon juice; put a small piece of butter into a pan; when hot, throw in a cupful of bread crumbs; stir them over the fire until they assume a light brown color; butter a mold, and sprinkle crumbs on the bottom and sides; fill in with apple preparation; sprinkle the top with bread crumbs; bake it for 15 or 20 minutes, and turn it out on a good-sized platter.

FRUIT TRIFLE.—Put 1 qt. of strawberries, or any other fresh fruit, in the bottom of a glass dish; sugar the fruit; cover it with a layer of macaroons; pour over it a custard made with 1 qt. of milk and the yolks of 5 eggs well beaten; sweeten to taste; when cold, place on the top the whites of the eggs, beaten to a stiff froth with a little sugar.

HARLEQUIN.—Wet a jelly mold thoroughly with white of egg; melt a little currant jelly; pour it into the mold and let it cool; when cold, melt some plum jelly; pour it in, and let this cool; melt apple jelly, and add that, alternating the colors until the mold is full; make the jellies only warm enough to run; if they are hot and thin they will mix and spoil the effect; when cold and stiff, turn out on a glass dish.

HEDGE.—Bake sponge cake in thin sheets or cakes; make a custard of 1 qt. of milk and the yolks of 6 eggs; sweeten and flavor to taste; put in a pan, which set in a kettle of hot water, and stir until it boils; when it thickens, pour over the cake; before sending to table, beat the whites of the eggs to a froth and place on the top; then add a quantity of blanched almonds.

IRISH MOSS.—Soak a scant handful of Irish moss in strong soda water until it swells; squeeze the moss until it is free from water; put it in a tin bucket which contains 6 pts. of sweet milk; set the bucket in a large iron pot which holds several pts. of hot water; stir seldom; let it remain until it will jell slightly by dropping on a cold plate; strain through a sieve; sweeten and flavor to taste; rinse a mold or a crock with tepid water; pour in the mixture; set it away to cool; eat with cream and sugar; some add jelly.

ITALIAN CREAM.—Put 1 oz. of soaked isinglass, 6 oz. of loaf sugar, ½ stick of vanilla, and 1 pt. milk into a saucepan; boil slowly; stir all the time till the isinglass is dissolved; strain the mixture; when a little cool, mix it with 1 pt. of thick cream; beat thoroughly until it thickens; pour into a large or individual molds; put into an ice-box until wanted.

LEMON BLANC MANGE.—Pour 1 pt. of hot water upon ½ oz. of isinglass; when it is dissolved, add the juice of 3 lemons, the peel of 2 lemons grated, 6 yolks of eggs beaten, with about one good wineglass of Madeira wine; sweeten to your taste; let it boil; then strain it and put it in your molds.

LEMON CREAM.—Take 1 pt. of thick cream; put to it the yolks of 2 eggs well beaten, 4 oz. of fine sugar and the thin rind of 1 lemon; boil it up; then stir till almost cold; put the juice of a lemon in a dish or bowl and pour the cream upon it; stir till quite cold.

MOONSHINE.—Beat the whites of 6 eggs into a very stiff froth; then add gradually 6 tablespoonfuls of powdered sugar, beating for not less than 15 minutes; then beat in 1 heaping tablespoonful of preserved peaches, eat in tiny bits; serve; pour in each saucer some rich cream sweetened and flavored with vanilla; on the cream place a liberal portion of the moonshine.

ORANGE FLOAT.—1 qt. of water; juice of 2 lemons; 1 cup sugar; when boiled, add 4 tablespoonfuls of corn starch, mixed in a little water; let it boil; stir 15 minutes; when cool, place it over 4 or 5 sliced oranges; over the top spread the beaten whites of 3 eggs, sweetened; flavor the whole with vanilla; eat with cream.

PEACH BAVARIAN CREAM.—1 qt. canned peaches; 1 large cupful of sugar; 1 pt. of cream; ½ box of gelatine; ½ cupful cold water; mash the peaches; rub them and the juice through a sieve; add the sugar; soak the gelatine 2 hours in the cold water; whip the cream to a froth; put the peaches in a saucepan and let them simmer 20 minutes; stir often; add the gelatine to the hot peaches and remove from the fire immediately; place the saucepan in a pan of ice water and beat till the mixture begins to thicken; then stir in the cream; mix thoroughly and pour into the mold; set away to harden; serve with whipped cream or custard flavored with peach kernels or almond extract.

PERSIAN CREAM.—Dissolve gently 1 oz. of isinglass in 1 pt. of new milk, and strain; then put it in a clean saucepan with 3 oz. of sugar broken small; when it boils, stir into it ½ pt. of

good cream; add this liquid, at first by spoonfuls only, to 8 oz. of apricot or raspberry jam; mix them very smoothly; stir the whole until it is nearly cold, that the jam may not sink to the bottom of the mold; when the liquid is put to the fruit, and has been stirred until nearly cold, whisk them briskly together; last of all, throw in by very small portions at a time the strained juice of a good lemon; put it into a mold; let it stand at least 12 hours in a cold place before turning out.

RASPBERRY CHARLOTTE.—Take 1 doz. of the square or oblong sponge cakes that are commonly called Naples biscuits; they should be quite fresh; spread over each a thick layer of raspberry jam, and place them in the bottom and around the sides of a glass bowl; take the whites of 6 eggs and mix with them 6 tablespoonfuls of raspberry or currant jelly; beat the eggs and jelly very light; then fill up the bowl with it; for this purpose cream is better than white of eggs.

ROCK CREAM.—Boil 1 teacupful of the best rice till quite soft in new milk; sweeten with powdered loaf sugar; pile it upon a dish; lay on it in different places square lumps of either currant jelly, or preserved fruit of any kind; beat up the whites of 5 eggs to a stiff froth, with a little powdered sugar; flavor with either orange flower water or vanilla; add to this when beaten very stiff, about 1 teaspoonful of rich cream; drop it over the rice, giving it the form of a rock of snow.

ROCKY MOUNTAIN PUFFS.—3 eggs well beaten; 1 cup sweet milk; 1½ cups flour; a pinch of salt; fill buttered cups half full and bake in a hot oven 20 minutes; serve hot with brandy sauce, made as follows: Melt 1 cup sugar; add to it ½ cup butter and ¼ cup brandy, and ½ nutmeg; serve hot.

RUSSIAN CREAM.—4 eggs; 1 cup sugar; 1 qt. of milk; ½ box gelatine, dissolved in ½ pt. of warm water; beat the yolks of the eggs and sugar together; cook with the milk, like custard; take this off the stove; add the well beaten whites of the eggs; stir rapidly for a few moments; now add the gelatine, and then a teaspoonful of lemon; pour it into a pretty shaped dish to harden, turn it out on a platter, and cut off in blocks (as ice cream).

SPANISH CREAM.—Boil in ½ pt. water ½ oz. of isinglass until dissolved; strain; mix with it 1 qt. of cream or good milk; stir it until it comes to a boil; when a little cooked, add the beaten yolks of 6 eggs, with a glass of white wine; pour in a dish; sweeten to taste; stir until cold; flavor with lemon or vanilla; put in a form, and set in a cool place.

STRAWBERRY BAVARIAN CREAM.—1 qt. of ripe strawberries; 1 heaping cup of sugar; ½ box of gelatine; 1 pt. of cream; ½ cup of hot water; pick the strawberries and wash them in a colander; mash them, and add the sugar; let them stand a little while—½ an hour or more; soak the gelatine in cold water enough to cover it, for 1 hour or more; whip the cream to a froth; strain the strawberries and sugar through a rather coarse strainer; dissolve the gelatine; add it to the strawberries; place a basin in another of ice water; stir the mixture until it begins to thicken; when it begins to thicken, add the whipped cream; turn into the mold and set away to harden; serve with whipped cream around or in the centre.

SWISS CREAM.—½ lb. soft macaroons, or 6 sponge cakes; sherry; 1 pt. of cream; 5 oz. of sugar; 2 large spoonfuls of arrowroot; juice of half a lemon; rind of 1 lemon; 3 tablespoonfuls milk. Lay macaroons in a glass dish; pour over enough sherry to soak them; put the cream into a lined saucepan, with sugar and lemon rind; let it remain by the side of the fire until the cream is well flavored; take out the rind; mix smoothly with cold milk and arrowroot; add to the cream; boil gently for 3 minutes; stir it well; take it off the fire; stir till nearly cold; add lemon juice and pour over cake; garnish with strips of candied fruit, ginger or citron, or preserve.

VELVET BLANC MANGE.—2 cups of sweet cream; ½ oz. gelatine, soaked in a very little cold water 1 hour; ½ cup white powdered sugar; 1 teaspoonful extract of bitter almonds; 1 glass of white wine. Heat the cream to boiling; stir in the gelatine and sugar; as soon as they are dissolved take from the fire; beat 10 minutes until very light; flavor and add the wine by degrees; mix it well; put into molds wet with clear water.

WIGWAM.—1 lb. of lady fingers; open and spread on a dish; cover them with currant jelly; on the jelly spread meringue; then another layer of lady fingers, jelly and meringue; and so on for several layers, making each layer smaller in order to have it pyramidal in form; cover the whole with meringue; put it in the oven a few minutes to brown. The meringue is made of whites of eggs with sugar beaten in; do not make it too stiff; 2 oz. of sugar to each white is suffieient; beat the whites very light, then stir the sugar in gently without beating.

PASTRY.

REMARKS.—Before making paste, wash the hands in hot water. Touch and roll the paste but little. Keep all utensils very clean. Choose the coolest part of the day and house to make the pies. Sift and pound the flour and sugar before using them. Lightly flour both sides of paste when you roll it, in order to prevent its turning gray in baking; but if much flour is sprinkled on it the paste will not be clear. If too light, roll out once or twice more than directed, as the folding mainly causes it to rise high and even. Invariably roll puff paste from you. Those who are not practiced in making puff paste work the butter in by breaking it into small pieces, and covering the paste rolled out; dredge it lightly with flour; fold over the sides and ends; roll it out very thin; add the remainder of the butter; fold and roll as before.

After the pies are filled and the upper crust is rolled out, set the pie on the crust and cut it out around just a little larger than the bottom of the pie tin; spread it over the top and it will barely cover the filling and just reach the under crust without lapping any upon it. Do not pinch it down, but leave the edge open, thus giving vent for the steam; it may boil furiously, but it will not overflow. The edges of the pie and top can be ornamented according to the taste of the operator. The following are a few good receipts for making the pastes: 1. When boiling beef, before you put in vegetables, skim the grease into a dish, and set aside to cool; when cold, scrape off the under side; take 1 teacup of melted beef fat, 2 cups of sour milk, 2 teaspoonfuls of saleratus; mix quickly; flour your board well when you roll it out.—2. Take 3 cups of sifted flour, 1 cup of lard, a little salt, and ½ a cupful of cold water; handle as little as possible.—3. 1 lb. of flour; ½ lb. of butter; ½ lb. of lard; with a little water make a dough of the flour and lard; roll it; spread a portion of the butter over it; fold and roll again; add more butter, and so on until you have used the ½ lb. all up.—4. (*Puff Paste.*) Put 1 lb. of flour into a bowl, and rub lightly into it ½ lb. of fresh butter; add ½ a teaspoonful of salt, and make the mixture up into a smooth stiff paste, by stirring into it 2 fresh eggs which have been beaten up with rather less than ½ pt. of water; roll the pastry out, give it 2 or 3 turns, and bake as soon as possible; time, 10 minutes to prepare.

Pie Crimper.

ACID TARTS.—Take 1 egg, 1 cup of sugar, 1 cup of water, 1½ teaspoonfuls tartaric acid, 1 teaspoonful flour, 1 teaspoonful extract of lemon, a piece of butter the size of a walnut; cook over steam; fill the paste and bake moderately; put the lemon in just before baking; ice them if you wish.

ALMOND CHEESE CAKES.—Take 3 or 4 bitter and 1 oz. of sweet almonds; boil and skin them; put them into a mortar with 2 oz. of loaf sugar and the yolks of 2 eggs; pound them fine; then rub 2 oz. of butter to a cream; mix all together; put puff paste in the patties; fill it three parts full with the butter; lay a few cut almonds over the top; sugar over, and bake them in a steady oven.

ALMOND CROQUETTES.—Blanch and dry 1 lb. almonds; pound in a mortar with 1 lb. powdered sugar; rub through a wire sieve; then rub in ¾ lb. butter, grated rind of ½ lemon and yolks of 3 eggs; make into a paste; cut in shapes; bake in a quick oven; when done, dip them in sugar boiled to a syrup.

AMBER PIES.—1 cup each of butter, sugar and jelly; add the yolks of 8 eggs, well beaten, and bake. Frosting: Beat whites of 8 eggs to a froth, add 1 cup of white sugar and bake quickly.

APPLE CHEESE CAKES.—Take 1 lb. of apples, boiled and pulped through a sieve, 1 lb. powdered white sugar, the juice and grated rinds of 3 large fresh lemons, and 4 eggs well beaten; mix these ingredients carefully; put them into a saucepan in which you have ½ lb. of fresh butter melted; stir it constantly over a slow fire for ½ hour, and let it cool; line pie dishes with fine puff paste; pour in the apple mixture; bake, without upper crust, in a quick oven; sprinkle with powdered sugar, and serve when perfectly cold.

APPLE CUSTARD PIE.—Beat up 6 eggs with a cupful of sugar; add them to 3 cupfuls of stewed apples, cold; add gradually 1 qt. of milk to the mixture; season with nutmeg; cover the pie plate with a good crust, with the edge neatly arranged; fill the pie with the custard, and bake.

APPLE LEMON PIE.—Rind and juice of 1 lemon, piece of butter size of a walnut, 2 apples chopped fine, 1 egg, 1 cup of sugar; bake with upper crust.

APPLE PIE.—Make a good light crust; wet the edge of the pie dish, and lay a thin strip all round; pare, core and slice the apples, and lay them in the dish with a little sugar and any flavoring that may be preferred; lay a crust over the top, and ornament with pastry cut into leaves. If the apples are dry, the parings and cores may be boiled with a little sugar and flavoring, and the strained juice added to the fruit; bake the pie in a quick oven; it may be served hot or cold; a little custard or cream is an improvement; time, ¾ hour to bake.

APPLE TARTS.—Take about 2 lbs. of apples; peel them; cut each into 4 pieces; remove the cores; then let each of the quarters be subdivided into 2 or 3 pieces, according to the size of the apple; having done this, put half the pieces into a pie dish; press them evenly down; sprinkle over them 2 oz. of brown sugar; add the remaining apples; afterwards another 2 oz. of sugar, so that the apples shall form a kind of dome, the center of which is about 2 in. above the sides; add a wineglassful of water; cover the top over with short paste; let bake in a moderately heated oven from ½ to ¾ hour.

CHEESE CAKES.—Put 4 well beaten eggs into a saucepan containing 1 pt. of boiling milk, and let it remain on the fire until it curdles; pour off the whey, and put the curd on an inverted sieve to drain; when it is quite dry, add 2 tablespoonfuls of sugar, a little salt, 6 oz. of carefully washed currants, a piece of butter about the size of an egg melted, 2 spoonfuls rose water or cream, and ½ teaspoonful of pounded cinnamon; line the tartlet tins with good puff paste; three parts fill them with the mixture, and bake them in a good oven; if a little vinegar or lemon juice is mixed with milk, then placed on the fire, it will curdle; time to bake, 20 minutes.

CHOCOLATE TARTS.—Mix 2 spoonfuls of rice flour in a little milk; add 10 raw eggs; beat up in 1 qt. of cream and some salt; simmer the cream, but do not curdle it; remove from the fire and add some powdered chocolate; take care to mix it thoroughly with the cream; cover the inside of a tart pan with some thin paste; pour the chocolate cream into it and bake; as soon as the tart is done, cover its surface with powdered loaf sugar.

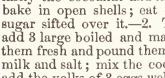
CIDER PIE.—Take 4 tablespoonfuls of boiled

cider, 3 tablespoonfuls each of sugar and water, 2 tablespoonfuls of flour, and 1 egg; beat all together; bake in a deep plate with upper and under crusts.

CINNAMON PIE.—1 lb. brown sugar; 2 oz. cinnamon; ½ cupful butter; divide in 3 parts; mix 2 eggs and 1½ cupfuls milk together; for the crust take 4 cupfuls flour, 1½ cupfuls lard or butter, 2 heaping teaspoonfuls baking powder, and salt to taste; mix with milk sufficient to make soft dough; divide in 3 parts and roll thin; put 1 layer of crust in a deep pie dish; cover it with sugar, then cinnamon, and a small piece of butter; wet with the mixture of milk and egg; save enough for the other 2 parts; lay the 2d and 3d crusts on, and do the same as with the 1st; there should be no crust on top; bake in a quick oven.

COCOANUT PIE.—1. 1 lb. grated cocoanut; ½ lb. butter; ½ lb. powdered sugar; 1 glass brandy; 2 teaspoonfuls lemon juice; 4 eggs, whites and yolks separated; 2 teaspoonfuls vanilla; rub the butter and sugar together; beat light with the brandy and lemon juice; stir in the beaten yolks; lastly the cocoanut and the whites alternately; bake in open shells; eat cold with powdered sugar sifted over it.—2. To 1 grated cocoanut add 3 large boiled and mashed potatoes; boil them fresh and pound them; add a little butter, milk and salt; mix the cocoanut and potatoes; add the yolks of 3 eggs well beaten; put in only an under crust; when the pie is baked, beat the whites of 3 eggs very light; add a little white sugar and put it on the top while hot.

CRANBERRY PIE.—Do not stew the berries, but slit each one with a knife; bake as usual; sift a little flour over the fruit to give a thicker consistence; add a small teacupful of water; bake this without an upper crust, or place strips of paste across.



Cranberry Pie.

CREAM PIE.—Bake a crust in a large pie pan; lift it out on a plate; for filling, take 1 pt. of very rich milk; boil ¾ of it; with the remaining ¼ stir 2 tablespoonfuls of corn starch; add to the boiling milk; stir all the time; then add ½ teacup of sugar; then the yolks of 2 eggs, well beaten and thinned with a little milk; remove from the fire; flavor with vanilla and nutmeg, and pour into the crust; whip the whites; add ½ teacup sugar; frost the pie; place in the oven to brown slightly; serve cold.

CREAM TARTLETS.—Make a short paste with 1 white and 3 yolks of eggs, 1 oz. of sugar, 1 oz. of butter, a pinch of salt, and flour; work it lightly; roll it out to the thickness of ¼ of an inch; line some patty pans with it; fill them with uncooked rice to keep their shape; bake them in a moderate oven till done. Remove the rice; fill the tartlets with jam, or with stewed fruit; on the top put a heaped-up spoonful of whipped cream.

CUSTARD PIE.—Line a well buttered pie plate with a good paste; arrange a thick pie rim round the edge of the plate; beat up 4 eggs with 1 cupful of sugar; gradually add 1½ pts. of milk; fill the pies while in the oven; grate a little nutmeg over them; bake about 20 minutes.

DRIED APPLE PIE.—Put in 2 or 3 pieces of lemon or orange peel, previously dried and saved for cooking purposes; flavor with a very little spice of any kind; sweeten and season before putting into the pie pan; stir in a beaten egg; bake with two crusts rolled thin, and warm slightly before eating.

GRAPE TART.—Take a tart dish; line the bottom and sides with a paste, and bake it; if the dish has been well greased, the crust will turn out easily of the same form. Make a syrup of ½ pt. of water and ¾ lb. of white sugar; bring it to the boil; have the grapes ready picked from the stalks and washed; put them into the hot syrup for ½ minute; allow all to cool in a bowl; when wanted, put the syrup and grapes into the crust wall and serve.

GREEN TOMATO PIE.—Select nice smooth ones; pare them very thin; slice them into a pie dish lined with a nice paste; put about ½ cup of sugar to a pie; a few bits of butter; a little flour sifted on; and sliced lemon, lemon essence, or nutmeg, for flavoring; put on the upper crust carefully so that the juice will not escape in baking.

JAM TURNOVERS.—Roll out some short paste about ⅛ in. thick; cut it in pieces about 4 in. in length, and between 2 and 3 in. in breadth. Lay on each a little apple jam, or any other preserved fruit, without syrup; turn the edges over; wet them as little as possible with water; press them lightly together, also the ends; lay them on tins; bake in a moderately hot oven; ice them very perfectly, and return them to the oven for a few minutes, or set them in a Dutch or American oven before the fire.

LEMON BUTTER TARTS.—1 lb. white sugar; whites of 6 eggs and yolks of 2; grated rind and juice of 3 lemons; cook 20 minutes over a slow fire, stirring all the time; line pans with puff paste; fill and bake.

LEMON CREAM PIE.—Boil 1½ pts. of milk; add 3 tablespoonfuls of corn starch dissolved in a little cold milk; return the milk to the fire; take the juice of 2 lemons, 4 eggs, 1 cupful of sugar, and 2 tablespoonfuls of butter; beat these ingredients together; add to the milk; flavor with 1 teaspoonful of extract of lemon and grated nutmeg; pour the mixture into the pies and bake; when done remove from the oven and set it aside; whip up the whites of 4 eggs to a froth; add gradually a cupful of powdered sugar; spread ⅔ of the mixture on the pie; put the other ⅓ into a cornucopia, and by squeezing it decorate the pie according to fancy; return it to the oven a few minutes to set the meringue.

LEMON PIE.—1. Boil in 1½ qts. of water, the juice, pulp, and grated peel of 2 lemons; when it boils, add 3 heaping tablespoonfuls of flour; mix smooth with cold water; before it cools add 2 teacupfuls of sugar, 3 well beaten eggs, a piece of butter half the size of an egg, and a little salt; this will keep all winter; bake with upper and under crusts.—2. Line your pie dish with a good crust; roll your lemons to soften

them; grate the rind of 1 large or 2 small lemons; cut the lemons in thin slices; pick out the seeds; spread evenly one layer over the crust; spread 1 cup of sugar over the lemon; add 1 cup of paste, made by taking 4 tablespoons of flour, wet with cold water the same as in making starch; turn boiling water on it; stir while cooking on the stove a few minutes; add a pinch of salt with the grated rind of the lemons; when thickened enough, pour it over the sugar and lemon; cover with a crust; cut slits in to let out the air; bake slowly.

MAIDS OF HONOR.—1 cup each of sour and sweet milk; 1 small cup of pounded white sugar candy; 1 tablespoonful of melted butter; the yolks of 4 eggs; the juice and rind of 1 lemon. Put both kinds of milk together in a double saucepan; let it become sufficiently heated to set the curd; strain off the milk; rub the curd through a strainer; add butter to the curd; also the sugar-candy, well-beaten eggs, and lemon; line the little pans with the richest of paste; fill with the mixture; bake until firm in the centre.

MAPLE SYRUP PIE. — Take 1 cup of thick maple syrup, and juice of 1 lemon (the rind grated); bake with under crust and narrow strips laid in a network over the top.

MINCE PIES.—1. Chop 1 lb. of beef suet very fine; 2 lbs. of apples pared, cored and minced; stoned raisins, 1 lb., minced; and 1 lb. currants; add of mixed spice, in powder, ½ oz., 1 lb. of powdered sugar, 1 teaspoonful of salt, the juice of ½ lemon; cut small 3 oz. of candied orange peel, 1 oz. of citron, and 1 oz. of lemon; mix all well together with ½ pt. brandy; tie down close in a jar, and keep for use. A large quantity may be made in these proportions. Make the pies with rich, flaky crusts.—2. 4 lbs. meat; 3 lbs. suet; 3 lbs. raisins; 3 lbs. currants; 1 lb. citron; 3 lbs. brown sugar; 1 pt. syrup or molasses; grated rind and juice of 8 lemons; 2 oz. ground cinnamon; 1 oz. of cloves; 1 oz. of nutmeg; boil the meat very tender; pick out all bits of fat and gristle; chop the suet fine; remove all strings and threads; mix thoroughly together; season with salt and black pepper; wash many times the currants; let them well dry; then add to the mixture; seed the raisins, and chop—not fine; add the syrup and spices; slice the citron thin; to 1 qt. of the above add 1 pt. of chopped apples; wet with sweet cider till the mixture is juicy; when ready to bake, take mince meat, just enough for the number of pies wanted; place it on the stove in a crock or jar and let it get heated through; taste and add whatever you think it needs; make rich pastry; place the mince meat in the pie, not too full; add some little bits of butter, a few whole raisins, and a few slices of citron; keep the mince meat well covered, and in a cool place.

MOCK APPLE PIE.—Take 1½ cupfuls of soda crackers, 1 cupful of water, 1 cupful of sugar, 1 teaspoonful of tartaric acid, and 1½ teaspoonfuls of soda; break the crackers fine; flavor with lemon, and bake with 2 rich crusts.

MOCK LEMON PIE.—1 cup of sugar; 1 heaping tablespoonful of flour; the yolks of 2 eggs; 1 teaspoonful of extract of lemon; ⅔ cup of stewed pie plant; mix the sugar, flour, eggs and extract together; pour on the water, then the pie plant; bake with one crust; when done, beat the whites to a stiff froth; spread it over the pie; set it back in the oven for 4 minutes.

MOLASSES LEMON PIE.—Peel and take the juice of 6 lemons; 4 cups molasses; 2 cups sugar; 4 tablespoonfuls flour; 2 cups water, boiling; take the peel of 3 of the lemons; put in cold water; set it on the fire till it comes to a boil; change the water 3 times; chop this peel with the pulp of the 6 lemons after they have been squeezed; put all together.

OPEN TARTS.—Make a nice paste of flour, lard and dripping; place it in a flat dish, cutting the edge round neatly and ornamenting it in a flat style; bake the paste before spreading on the preserve; when the preserve or marmalade is spread, lay ornamental bars of pastry prettily across it; place it for a few minutes more in the oven to heat.

ORANGE PIE.—1. Take the juice and grated rind of 1 orange; 1 small cup of sugar; yolks of 3 eggs; 1 tablespoon of corn starch, made smooth with milk; piece of butter as large as a chestnut, and 1 cup of milk; beat the whites of 3 eggs with sugar; place on the top after the pie is baked; leave in the oven until browned.—2. Grate the rind of a large, sweet orange; squeeze the juice and press off the pulp; pick out the seeds; cream, ½ cup, or butter; ½ cup of sugar; 1 egg beaten light; 1 tablespoon of flour rubbed smooth in ½ cup of water; stir in the orange, and bake with 2 crusts.

ORANGE TARTS.—Take 6 or 7 fine, large oranges; roll them under your hand on a table to increase the juice; squeeze them through a strainer over ½ lb. or more of crushed sugar; mix the orange juice and the sugar thoroughly together; break 12 eggs into a large, shallow pan and beat them till thick and smooth; stir in gradually the orange juice and sugar; line some patty pans with good puff paste, having first buttered them inside; then fill with the orange mixture; set them immediately into a brisk oven; bake the tarts a light brown; when done set them to cool; when quite cold, take them out of the patty pans; put them on a large dish and grate sugar over their tops.

PASTIES, PATTIES, or TARTS.—1. Rub a full ½ lb. of lard into 2 lbs. of flour; beat the whites of 2 eggs light; mix in 1 pt. of water; wet the flour; leave out some to work the crust with; take 1 lb. of butter; roll out the crust 4 times, each time putting in with a knife ½ of the butter; use flour freely when rolling out; cut it round; lay in your preserve or apple, which must be dry; turn over the paste to join a half circle; nip the edge with the thumb and forefinger to confine the preserve; dip the hand in water; pass it lightly over the paste; then sift sugar thick upon them; bake in a quick oven.—2. Roll out your dough to a thickness of ¼ in., and in a square shape; cut out the patties with a tin cutter, round or oval as wished; place them on a cake pan, which must not be too thin, and must be wetted with water; take 1 egg, well whipped, and a few drops of milk; with a brush color the tops, without touching the sides; then, with a

smaller tin cutter (half the size of the first), mark the patties, but not too deeply, in the centre, and push in an oven hot enough to roast a chicken; when cooked, take out the centres with a small pointed knife, and use them as covers.—3. Sift ½ lb. of flour; beat to a froth 3 eggs; add to it 3 tablespoonfuls of powdered sugar; take ¼ lb. of butter and mix all together, as for puff paste; roll and fold it alternately for 20 minutes; then roll it out into a circle ½ in. in thickness; trim the outside edge into an exact circle; crimp the outer edge; slip a tin plate under it; bake in a brisk oven; when well browned, take it out; when cool, spread it over with raspberry or strawberry jam, or stripe it with apricot and raspberry jam, put on in rows.

PEACH COBBLER.—Make a rich biscuit crust; put it, rolled thick, around the dish; put in a layer of peaches, then butter and sugar, and a very little flour; then peaches, and so on till the dish is full; cover with a thick crust; cut a slit in the centre; pour in boiling water till full; bake in a moderate oven.

PEACH CUSTARD PIE.—Use 1 crust; peel peaches and halve them; turn the hollow side upward; sweeten as you would a peach pie; take 1 egg, a pinch of salt, 1 tablespoonful of sugar; beat; add milk enough to cover the peaches; bake; eat when partly cool.

PEACH PIE.—Stew and sweeten your peaches; mash smooth; season with a very little nutmeg; stew with them a little lemon peel, and remove when cold; fill your crust and bake till just done; spread over the peaches a thick meringue, made by whipping to a stiff froth the whites of 3 eggs for each pie; sweeten with 1 tablespoonful of powdered sugar for each egg; flavor this with rose water or vanilla; beat until it will stand alone; cover the pie ¾ in. thick; set back in the oven until the meringue is well "set;" should it color too darkly, sift powdered sugar over it when cold; eat cold.

PRUNE PIES.—Take 1 lb. prunes and soak them over night, so that the stones will slip out easily; stew in some water with as many raisins as you wish; sweeten; use less water than for sauce; when both are soft grate in the rind of 2 lemons and fill the pie, allowing 2 crusts.

PUMPKIN PIE.—(See *Squash Pie.*)

QUINCE TART.—Take a few preserved quinces; put an equal weight of syrup, made with sugar and water and preserve, into a preserving pan; boil; skim; put in the fruit; when somewhat clear, place the quinces in a tart dish with puff paste as usual; cover; bake; when done, lift top gently; put in the syrup; ice it, and serve.

RAISIN PIE.—Take 1 lb. raisins; turn over them 1 qt. of boiling water; keep adding, so there will be 1 qt. when done; grate the rind of 1 lemon into 1 cup of sugar; add 3 tablespoonfuls of flour and 1 egg; mix well together; turn the raisins over the mixture, stirring the while.

RAISIN TURNOVERS.—1 cup of raisins chopped fine; butter the size of ½ egg; ½ cup sugar and a little nutmeg, with a very little water to mix the ingredients together; make the crust the same as for pies; roll out thin, and cut in small, square pieces; put a spoonful of the raisins in each square; wet the edges of the crust with water and fold one-half over on the other.

RASPBERRY TART.—Roll out some thin puff paste and lap it in a patty pan of what size you choose; put in raspberries; strew over them fine sugar; cover with a thin lid; then bake; cut it open; have ready the following mixture, warm; ½ pt. of cream, the yolks of 2 or 3 eggs well beaten, and a little sugar; when this is added to the tart, return it to the oven for 5 or 6 minutes.

RHUBARB PIES.—Take the tender stalks of the rhubarb; strip off the skin; cut the stalks into thin slices; line deep plates with pie crust; then put in the rhubarb, with a thick layer of sugar to each layer of rhubarb; add a little grated lemon peel; cover the pie with a crust; press it down tight round the edge of the plate; prick the crust with a fork; bake about 1 hour in a slow oven.

RHUBARB TARTLET.—Make a short paste with 1 white and 3 yolks of eggs, 1 oz. of sugar, 1 oz. of butter, a pinch of salt, and flour of sufficient quantity; work it lightly; roll it out to the thickness of ¼ in.; line some patty pans with it; fill them with uncooked rice to keep their shape; bake them in a moderate oven till done; remove the rice and fill the tartlets with rhubarb; stew with plenty of sugar and a dash of lemon juice; at the top put a heaped spoonful of whipped cream.

SILVER PIE.—Peel and grate 1 large white potato; the juice and grated rind of 1 lemon; the beaten white of 1 egg; 1 teacupful of white sugar; 1 of cold water; bake with only an under crust; when done, beat the whites of 3 eggs to a stiff froth; mix with 3 heaping tablespoonfuls of white sugar; spread this over the top of the pie; brown in the oven; when cold, lay a few pieces of jelly on the top.

SQUASH PIE.—1. Stew the squash or pumpkin with a little salt; rub it through a colander; have it perfectly smooth; mix the squash with sweet milk; if you have cream all the better; make it about as thick as batter; add the yolks of 2 eggs; sweeten with pulverized sugar to taste; line a pie dish with crust; fill with squash and bake for ½ hour.—2. Steam the squash or pumpkin over a pot of corn beef until it is well done; mash fine; add 2 eggs well beaten to each pie; add sugar; season with pepper, salt and ginger; thin with milk and cream mixed together, or milk alone; bake without top crust, quite brown.

STRAWBERRY TARTS.—Make some short paste with 2 oz. of sugar, 2 oz. of butter, the yolks of 4 eggs, a little water, a pinch of salt, and flour just enough; work it lightly and roll out to the thickness of ¼ in.; line some patty pans with it; fill them with uncooked rice to keep their shape; bake in a moderate oven till done; when brown remove the rice from each tartlet; fill it with strawberries which have been previously heated through in an oven in a covered dish, with sugar, but no water; serve cold.

SUGAR PIE.—1. ½ cup brown sugar; ½ cup butter; yolks of 3 eggs; nutmeg; bake; frost with whites of 3 eggs; ½ cup or more of white sugar; flavor with lemon; set in the oven to brown.—2. Flour; sugar; butter; 1 tablespoon-

ful vinegar; lemon, and warm water. Make a rich crust; line the bottom of the pie pan and sprinkle flour over the bottom of the crust until about ½ in. thick; same amount of sugar; mix this together thoroughly; add small lumps of butter; then the vinegar; flavor with lemon; lastly enough warm water to fill the pie pan over ½ full; stir carefully without breaking the crust; bake quickly.

SWEET POTATO PIE.—1. Boil the potatoes; peel and slice them; put a layer in the baking dish, either with or without pastry; dot it over with butter; sprinkle with sugar and a little allspice, or any other seasoning; proceed in this way until the dish is full; pour over the top milk or cream until the pieces are well soaked; bake slowly and regularly until done.—2. Wash the potatoes and boil them until they are cooked; take off the skins and mash them; to 1 large teacupful of the potato take 1 qt. of milk, 3 eggs, sugar to the taste, a pinch of ginger or a little nutmeg; before mixing all the milk with the potato, pour about 1 teacupful of the milk in the potato; rub them together until they will run through a colander; take out the lumps and woody fibres; bake with 1 crust; when done they should be light and soft like a pumpkin pie; if they are hard and heavy they have too much potato in them.

VINEGAR PIE.—4 eggs; ¼ lb. of butter; 2 cups molasses; 2 cups vinegar; 4 tablespoonfuls of flour; put your molasses, vinegar and butter into a porcelain or tin kettle; set it on the stove and let it come to a boil; after beating the eggs and flour together, stir in and boil 2 minutes; grate your nutmeg on the top of the pies and bake without tops.

WASHINGTON PIE.—1. Rub together 1 lb. butter and 1½ lbs. powdered sugar; add 1 pt. of eggs, a little at a time; beat up well; add ½ oz. soda dissolved in ½ pt. milk; flavor with extract lemon; stir up; add 2 lbs. flour and 1 oz. cream tartar; mix together; put on pans ¼ in. thick, and bake in a quick oven.—2. 1 cup of sugar; 1 tablespoonful of butter; 4 tablespoonfuls sweet milk; ½ teaspoonful of soda; 1 teaspoonful cream tartar; 1 cup flour; bake in 2 layers, with jelly, fruit or cream between.

WHIPPED CREAM PIE.—Sweeten 1 teacupful of very thick, sweet cream; make as cold as possible without freezing; line 2 small pie tins with moderately rich crusts, pricked in several places to prevent blistering, and bake in a quick oven; flavor the cold cream, and whip as you would eggs for frosting; when the crusts are cold, spread on the cream; put bits of jelly on top.

—o—

SALADS.

ALLIGATOR PEAR.—Cut the pear in two; remove the large seed; cut away the outer rind; cut the fruit into strips, and season with a saltspoon of salt, 2 tablespoonfuls best olive oil, and 1 teaspoonful of tarragon vinegar.

ANCHOVY EGGS, With Endive.—Boil ½ doz. eggs quite hard; shell them carefully; then cut the white with a sharp knife carefully across the middle of the egg; take care not to break it; remove it like a case from the yolk; mix the yolk with a little anchovy sauce; form it again into a ball; replace it within the white; close the latter carefully; when the eggs are thus prepared place them in a pile upon a nest of endive, the points of the leaves toward the edge of the dish, which should be round.

BEAN.—Cover the bottom of your salad dish with cold boiled potatoes, sliced thin; over this spread a layer of cold baked (or boiled) beans; above this a layer of onions, sliced very thin; salt and pepper each layer; heat a piece of butter the size of a walnut in sufficient vinegar to cover the salad, and pour over it while hot.

BEEF.—Cut in very thin small slices and put on a dish with chopped parsley; mix in a bowl one part vinegar to two of sweet oil, pepper, salt and mustard; beat together and pour over the meat.

CABBAGE, or SLAW. — 1. Cut a head of hard white cabbage into very fine shavings; for a quart of cabbage take the yolks of 3 eggs; beat them well; stir into 1½ tumblers of vinegar, 2 spoons of loaf sugar, 1 teaspoon of olive oil, 1 of thick sweet cream, or a piece of butter as large as a walnut and a heaped tablespoon of mustard; salt and pepper to suit the taste; mix with the egg; put this sauce into a stewpan; when hot add the cabbage; stew until thoroughly hot, which will only require 4 or 5 minutes; toss it from the bottom with a silver or wooden fork; take it up and set it where it will become perfectly cold.—2. One small, firm head of cabbage, shred fine; 1 cup of vinegar; 1 tablespoonful of butter; 2 tablespoonfuls of sugar; 2 tablespoonfuls of sour cream; ½ teaspoonful of made mustard; 1 saltspoonful of pepper and the same of salt; put the vinegar and all the other ingredients for the dressing, except the cream, in a saucepan and heat to a boil; pour scalding hot over the cabbage; return to the saucepan and stir and toss until all is smoking again; take from the fire; stir in the cream; turn into a covered dish and set in hot water 10 minutes before sending it to the table.

CARROT.—Select very tender, rich colored carrots; scrape and boil in fast boiling water till tender; cut into very thin slices; put them into a glass salad bowl; sprinkle with sifted loaf sugar; add the juice of a large, fresh lemon, and 1 wineglassful of olive oil; place round the margin of the dish an onion cut in exceedingly thin slices, and small bunches of any fresh, green salad leaves.

CAULIFLOWER.—Boil a cauliflower in salted water till tender; when cold, cut it up neatly in small sprigs; beat together 3 tablespoonfuls of oil and 1 teaspoonful of tarragon vinegar; pepper and salt to taste; rub the dish very lightly with garlic; arrange the pieces of cauliflower on it; strew over them some capers, a little tarragon, chervil and parsley, all finely minced, and the least bit of dried thyme and marjoram;

pour the oil and vinegar over all, and serve.

CELERY.—Take the inner and tenderest heads of 3 stalks of celery; cut them into strips 1 in. long and about the thickness of young French beans; rub the salad bowl lightly with shallot; mix the yolks of 2 hard boiled eggs with 3 tablespoonfuls of salad oil, 1 of tarragon vinegar and a little flour of mustard; pepper and salt to taste; add the celery to this sauce; turn it well over; garnish with the hard boiled whites of eggs.

CHICKEN. — 1. Take the meat from a pair of boiled chickens; chicken, as well as celery, should be cut as large as a cranberry; have equal quantities of chopped chicken and celery; take a level teaspoonful of dry mustard and rub it very smooth with the yolks of 4 hard boiled eggs, and the yolks of 2 raw eggs; pour on very slowly ½ of a large bottle of salad oil, alternating with the juice of 1 large lemon, or 2 smaller ones; stir all the time; add a large tablespoonful of salt and 2 or 3 tablespoonfuls of rich cream; just before serving, mix the chicken well through the dressing; then add the celery.—2. One chicken chopped fine; 4 eggs, boiled hard and chopped or mashed fine; 2 tablespoons mixed mustard; ½ teaspoon cayenne pepper; ½ spoon salt; ½ teacup melted butter; ½ tumbler of vinegar; 1 teacup cabbage; and ½ cup celery chopped fine; mix well together.

CHICKEN MAYONNAISE.—Cut up some chickens and fry them nicely in butter; let them get cold; then trim into good shape; put them in a covered dish with salt, pepper, oil and vinegar as for salad; add a few pieces of onion and a little parsley; let them stand thus 2 or 3 hours; then drain the pieces of chicken; place them on the lettuce in your salad dish; spread a nice mayonnaise dressing over all.

CUCUMBER.—Peel and slice the cucumbers as thin as possible; put the slices in salted water 5 minutes; draw off the water; cover them with vinegar; a little pepper and salt if necessary.

FISH.- This consists of cold fish of any kind, mixed with well dried salad, pickled gherkins or any other green pickle; oysters or shrimps may be added to the other fish, which should be separated neatly into flakes, and the whole should be moistened with a salad cream; garnish with slices of lemon and some parsley.

FRENCH.—Any cold meat—veal, ham, beef or mutton; cut into small morsels, with an equal quantity of cold boiled potatoes, chopped or sliced; lettuce in proportion; dress with whites of 3 raw eggs, beaten stiff; mustard, oil or cream, well mixed with yolks of 3 eggs; add a little sugar, salt, pepper and vinegar carefully.

HAM.—Take the fragments of cold boiled ham left after slicing; remove all the dark and dry portions, also all the fat; mince evenly and fine; take enough rich, sweet cream to set the mince; a saltspoon of strong ground mustard; the same of fine sugar and a good pinch of cayenne pepper; mix thoroughly with the meat; garnish with sprigs of parsley.

HERRING.—Soak 4 Holland herrings in water or milk for 3 hours; then cut them up into neat, square pieces and set them aside; cut up into slices nearly 3 qts. of boiled potatoes while they are hot; pour over them Rhine wine enough to moisten them; cover close; when cold add the herrings and the yolks of 4 hard boiled eggs chopped fine; crush 1 doz. whole peppers in a napkin; add to the salad and mix.

LETTUCE.—Take a good sized head of lettuce and pull the leaves apart; wash them a moment in a little water; shake off the water and dry the leaves in a napkin by taking hold of the four corners and shaking it; examine them carefully; wipe off all grit; reject all bruised leaves; place them in a salad bowl large enough to dress them in nicely without scattering a part of them over the table; mix 1 saltspoonful of salt, 1 saltspoonful of fresh ground pepper, and a dust of cayenne with 1 tablespoonful of oil in a salad spoon; pour this over the lettuce; add 2 more tablespoonfuls of oil; next toss the salad lightly with a salad spoon and fork; add 1 tablespoonful of vinegar; toss it gently once or twice, and send to table; eat at once.

LOBSTER.—1. Plunge into boiling water 2 live lobsters; allow them to boil, say at least 30 minutes, according to their size; take the hearts of 6 heads of lettuce; boil 3 eggs hard; stone 24 olives; cut some beets into nice, even shapes; break off the shells of the lobsters; take out the solid flesh and cut into cubes; place in a deep dish and season with salt, pepper, oil and vinegar; wash the lettuce well; put it into a salad bowl; turn in the lobster; cover it with mayonnaise dressing, as directed for chicken salad.—2. Have the bowl half filled with any kind of salad herb desired; break a lobster in two; open the tail; extract the meat in one piece; break the claws; cut the meat of both in small slices, about ½ in. thick; arrange these tastefully on the salad; next take out all the soft part from the belly; mix it in a basin with 1 teaspoonful of salt, ½ do. of pepper, 4 do. of vinegar, and 4 do. of oil; stir these well together; pour the mixture on the salad; cover it with 2 hard eggs, cut into slices, and a few slices of cucumber.

ORANGE.—Oranges, thinly sliced and freed from seeds, dressed with lemon juice and salad oil—¼ of lemon juice to ¾ of oil, with a dust of cayenne pepper, make a good salad.

OYSTER.—Cut the oysters into thirds; pull the hearts out of nice lettuce heads, and shred up ½ as much as there are oysters; make a dressing in the proportion of 2 tablespoonfuls of best oil to 4 of vinegar; 1 teaspoonful of salt and the same of sugar; half as much pepper and made mustard; stir all up well, and pour over oysters and lettuce just before serving.

PARTRIDGE.—Carve a cold roasted partridge; place the members in a dish; add lettuce hearts in quarters, pickles, pieces of clear jelly, hard boiled yolks of eggs in slices, celery, tomatoes, or anything likely to give effect to the dish; pour over it a mayonnaise sauce, or add a salad dressing at table.

PEA.—Mix well together in the salad bowl 1 cup of shred lettuce, ½ cup tender shelled green peas, half grown, and 1 tablespoonful of finely cut nasturtium stems; with a silver spoon cut up ½ cup of rather ripe strawberries; mix well

with ½ cup of strawberry juice; pour it over the salad in the bowl; let it stand 15 minutes and serve.

POTATO.—Cut up 3 qts. of boiled potatoes, while hot, into neat pieces; add to them 1 tablespoonful of chopped parsley, 1 tablespoonful of chopped onion, 1 teaspoonful of pepper, and 1 of salt; add 1 cupful of oil, and mix; add 1 cupful of warm stock, 1 wineglassful of vinegar (from the mixed pickle bottle); mix the ingredients together carefully; do not break the potato any more than is absolutely necessary; set it in the ice box; when cold serve by placing a leaf of lettuce on a side dish; put 2 spoonfuls of the salad upon the lettuce.

RADISHES.—Let them lie in cold water before serving; cut off all their leaves, and almost all their stalk; serve them in glasses ½ full of water on a plate.

RUSSIAN.—Cut up raw apples and every kind of available vegetables into small slices; lay them into a shallow dish with salt, a little vinegar and pepper and the best oil; let the dressing thoroughly saturate the mixture for at least 12 hours.

SALMON.—If canned salmon be used, drain it dry and pick it into flakes with a silver fork; mince some celery and boiled beet root together in equal quantities; mix with salad dressing 1 hour before required; cut a crisp lettuce finely; add it the last thing; garnish with slices of hard boiled eggs.

SPINACH.—Take an equal quantity of young tender spinach and of lettuce leaves and chop 2 hard boiled eggs with them; dress with oil, vinegar, salt and pepper.

STRAWBERRY.—Pick, wash, drain and toss crisp, tender lettuce leaves; shred them up fine in a salad bowl; pour over them some strawberry juice and serve at once.

TOMATO.—1 can of tomatoes; same quantity of chopped celery; 3 eggs beaten light; season with salt and pepper; boil tomatoes and celery together until they are thick; take off the fire and stir in the eggs; when nearly cold add 1 tablespoonful of mixed English mustard.

TURNIP TOP.—Place a bushel of turnips in a dark, warm cellar to sprout; when the sprouts are 3 or 4 in. long cut them off; pick the leaves from the stems; pour hot water over them; let them remain in the hot water a moment; plunge them into cold water; place the sprouts in the colander to drain off all the water; send to table with a plain dressing or bacon dressing poured over them

VEAL.—Boil a nice lean piece of veal with a chicken or turkey; save the water in which they are boiled to make a soup; serve the fowl for dinner with egg or oyster sauce; when cold cut it up into neat strips; mix it with celery or lettuce; pour mayonnaise over it and serve.

WATER-CRESS.—1. Serve the cress with a sauce of lemon juice and olive oil poured over it in a salad bowl.—2. Pick out a quantity of nice sprigs of water-cress; turn them over in a mixture of 3 parts olive oil and 2 parts tarragon vinegar with salt, and serve in a bowl.

SOUPS.

REMARKS.—All soups are better made with fresh uncooked meat, as that which has been cooked once has lost much of its flavor and nearly all of its juices. The fat does not impart much flavor, and is not palatable. Soup may be kept until the next day; before it is heated over again skim off the cake of fat which congeals at the top. Soft water should always be used in making soups. To get the full value out of bones that are boiled for soup, break them into small pieces, roughly bruise, place them in an earthenware pot and cover with hot water. Boil the vegetables separately from the meat; strain both meat and vegetable water, and mince the vegetables before putting them with the strained liquors.

ASPARAGUS.—Take 50 stalks of asparagus; throw away the hard, woody part; boil the remainder in a saucepan with 3 pts. of stock free from fat; when done remove the asparagus; pound it in a mortar and pass it through a sieve; melt about 1½ oz. of butter in a saucepan on the fire; mix with it 2 tablespoonfuls of flour; add a little sugar, pepper, salt, the asparagus pulp, and all the stock in which the asparagus was boiled; let the whole boil up; add as much more stock as will make the soup of the right consistency; put in a little spinach greening, and a small pat of fresh butter, or stir in ½ gill of cream.

BARLEY.—Wash and steep 4 oz. of barley in 1 pt. of water, in which a little soda has been dissolved, for about 12 hours; when ready to prepare the soup, pour off all the water; place in a soup pot; add 3 qts. boiling water, 1 oz. of grated stale bread, ½ oz. salt, and 2 tablespoonfuls of chopped parsley; set the pot on the fire and boil it gently for 4 hours; keep it closely covered; when about to serve add a tablespoonful of good butter.

BEAN.—1 pt. of beans put to soak over night; in the morning put in a pot with 4 qts. of water, 3 lbs. of beef, 2 onions, 2 carrots, some parsley and celery tops; let it cook slowly all day, and stand over night to get cool; in the morning take off the fat and strain through a colander; put a pinch of cayenne pepper and salt, 2 hard boiled eggs chopped fine, a glass of sherry wine, ½ doz. forcemeat balls the size of a hickory nut, and a lemon cut thin, in the soup tureen; make the soup boiling hot; pour into the tureen and serve immediately.

BEEF.—Boil shank 4 or 5 hours in water enough to cover it; ½ hour before the soup is put on the table, take up the meat; thicken the soup with scorched flour, mixed with cold water; season with salt, pepper, cloves, mace, and a little walnut or tomato catsup; put in sweet herbs, or herb spirit if liked; make forcemeat balls of part of the beef and pork; season them with mace, cloves, pepper and salt; boil them in the soup 15 minutes.

BOUILLON.—Take a soup pot that will hold about 3 pts. of water; put in a fowl of about 4 lbs., a knuckle of veal, 3 lbs. of lean beef, any roast beef or beefsteak bone you may have; put it on the range; let it come to boiling very slowly; skim all the rising matter; add a carrot, 2 leeks, some celery, a few corns of white pepper, and some salt; move the pot where it will only cook very slowly, but steady, for 6 hours; strain it into a stone pot; let it cool; next day take off all the fat; heat the soup shortly before you want it; serve in cups with a slice of dry toast.

BROWN.—Take cold roast beef or fowl; cover it with cold water; let this simmer for 2 hours; take out the meat and strain the liquid; have chopped fine equal parts of celery root and cabbage; add to each quart of liquid 1 cupful, 2 tablespoonfuls of pearl barley, 1 tablespoonful of chopped parsley, 1 small carrot cut fine, 2 small potatoes sliced thin; let this boil ½ hour; add 1 well beaten egg and 2 tablespoonfuls of sweet milk thickened with browned flour; make this into small dumplings and drop in; boil 5 minutes more; when ready to serve, add 1 onion fried brown in butter, and 2 tablespoonfuls of tomato catsup.

CALF'S HEAD.—Parboil a calf's head; take off the skin and cut it into pieces of about 1½ in. square; mince the fleshy part into smaller pieces; take out the back part of the eyes, and cut the remainder into rings; skin the tongue; cut it into slices; turn the whole into 3 qts. of good stock; season with cayenne pepper, 2 or 3 blades of mace, and salt; add the peel of ½ lemon, ½ pt. white wine, and 1 doz. forcemeat balls; stew the whole for 1½ hours; rub down 2 tablespoonfuls of flour with a little cold water; mix it well with ½ pt. of the soup; then stir it into the pot; add the juice of ½ lemon and the yolks of 8 eggs hard boiled; let it simmer for 10 minutes, and serve in a turcen.

CELERY.—9 heads of celery; 1 teaspoonful of salt; nutmeg to taste; 1 lump of sugar; ½ pt. of strong stock; 1 pt. of cream; 2 qts. of boiling water; cut the celery into small pieces; throw it into the water; season with the nutmeg, salt and sugar; boil it till sufficiently tender; pass it through a sieve; add the stock and simmer it for ½ hour; put in the cream; bring it to the boiling point, and serve immediately.

CHICKEN.—Take a fowl and, having drawn it, scald the legs and remove the tough skin from them; cut up the fowl into small pieces, bones and all; put them into a saucepan with about 1 qt. water, 2 teaspoonfuls rice, a blade of mace, and pepper and salt to taste; boil very gently for 1 hour; remove all scum as it rises; take out the white meat; simmer the rest for 3 or 4 hours more; strain the liquor through a napkin; free it from fat, and serve.

CLAM.—To the liquor of 50 clams allow 3 qts. of water; put it on with a knuckle of veal, the bone chopped; simmer 3 hours; put in a bunch of sweet herbs, nutmeg, mace, and 1 tablespoonful of whole pepper; stew 1 hour longer; then strain, and add 4 oz. of butter rubbed in flour, and the clams chopped in pieces; boil ¼ hour, and serve.

CLEAR.—Put in a large saucepan 4 oz. of butter; when melted place in it 3 lbs. of lean, fresh beef and 3 lbs. of veal, cut in pieces, with the bones broken; cover the pan tightly and set over a quick fire; when the meat begins to stick to the pan turn it, and when a brown glaze begins to form cover the meat just evenly with cold water; watch carefully; when it is just coming to a boil, pour in 1 pt. of water and skim; add another pint of water and skim again; be careful not to stir up the soup; put in the soup, cut in small pieces, 4 large white onions, 2 large turnips, 2 good sized carrots, 3 heads of celery; add 2 qts. of water; place it where it will simmer steadily for 4 hours; then strain through a linen bag; do not put the meat and vegetables in, nor stir it; if not quite clear, beat up the whites of 2 fresh eggs; stir into it; return it to the fire until it just comes to a boil; then strain again.

CONSOMME.—6 lbs. of lean beef; an old fowl, with the giblets, and any pieces of bone that you may have; 2 large carrots, 2 large onions, 2 leeks, 1 turnip, 3 cloves; make a bouquet of parsley, celery and a very little bay leaf, thyme and hyssop, tied together with a thread; put the beef, fowl, etc., on the fire, in cold water, with a little salt; do not let it boil hard at any time, but be particularly careful that it does not boil much until it has been well skimmed, which must be done 2 or 3 times before it will be quite clear; boil slowly; keep the kettle covered from 6 to 8 hours; put the vegetables in as soon as it has been thoroughly skimmed; strain the soup and remove the grease; then serve.

CORN.—Cover the trimmings and bones from the shoulder of veal with 1 quart of cold water; add an onion, sliced, a small carrot or part of one, and some parsley; simmer for 2 hours and strain; boil very slowly a can of corn in a qt. of water; wash through a fine colander that will not allow the skins of the kernels to pass through; return the saucepan to the fire; melt in it a large tablespoonful of butter; and mix with 2 tablespoonfuls of flour; add, gradually stirring meanwhile, the corn pulp and then the veal stock; draw to the back of the range for fifteen minutes; first add a teaspoonful of finely minced parsley; put a small teacupful of hot milk or cream in the butter and pour in the soup.

COTTAGE.—Take 2 lbs. of lean beef, cut into small pieces, with ¼ lb. of bacon, 2 lbs. of mealy potatoes, 3 oz. rice, carrots, turnips and onions sliced, or leeks and cabbage; fry the meat, cabbage and onions in butter or dripping; put them in a gallon of water; stew gently over a slow fire for 3 hours; put in the carrots at the same time; add the turnips and rice only in time to allow of their being well done; mash the potatoes; pass them through a colander; season only with pepper and salt; keep the vessel closely covered.

CREAM OF BARLEY, A la Jardiniere.—Rub in the hands and wash a lb. of barley until the water comes clear; parboil, drain and put in a saucepan with 2 qts. of veal broth; boil, cover and simmer 4 hours; rub through a fine sieve; return to the saucepan; dilute to about 3 qts.

with more broth ; boil again ; skim ; put in a little sugar and a cup of cream ; tint slightly with 3 oz. of butter mingled with a little spinach green ; add cooked carrots, turnips, small flowers of cauliflowers and ½ pt. green peas ; boil no more, and serve.

CREAM OF RICE.—Have 1 qt. of rice ; wash it well ; put into a stewpan with 1 oz. of butter, a little salt and 2 qts. of boiled milk; grate in some nutmeg; set on the fire; heat slowly; stir occasionally ; when it boils, cover it; let it simmer gently for an hour; when done, pass through a fine wire sieve by rubbing vigorously with a wooden spoon; if the soup is not rich enough, put the residue back into the saucepan with a ladle of soup, and after standing some time steam again ; finish with ½ pt. of boiling cream, and 2 oz. of table butter; season ; serve with it fine lozenge shaped pieces of bread, fried in clarified butter.

CREAM.—Take a qt. of good mutton or veal stock ; cut an onion in quarters ; slice 3 potatoes very thin and put them into the stock, with a small piece of mace; boil gently for an hour, then strain ; add 1 pt. of rich milk with enough corn starch in it to make the soup almost as thick as cream; add also a piece of nice fresh butter ; just before serving add a little finely chopped parsley.

CURRY.—Cut the meat from an ox cheek; soak it well ; put it in a stewpan, with 4 onions cut in slices, and a bunch of pot-herbs; add 3 qts. of water; remove the scum frequently; strain ; add also ½ lb. of soaked rice; 1 teaspoonful of curry powder; a little pepper and salt ; stew 4 hours.

DAUPHINE. — Take ½ pt. of strong *consommé* of fowl; pour it gradually into a stewpan containing 8 yolks of eggs beaten up with a little salt, nutmeg and pepper; when the egg is well mixed with the *consommé*, strain it through a sieve into a round plain mould previously buttered carefully for that purpose; put the mold holding the preparation into a large stewpan containing water to the depth of about an inch ; cover the stewpan with the lid; let the water in it simmer, or gently boil on the corner of the stove fire; when the custard is set, take it out of the water; allow it time to cool; cut it into shapes resembling thick wafers; put these into 2 qts. strong *consommé* of fowl, together with 1 pt. of green asparagus heads, previously boiled for that purpose, a small piece of sugar, and a few tarragon leaves; allow the soup to boil very gently by the side of the stove fire for about 3 minutes, and then send to the table.

EEL.—Take any number of pounds of eels according to the quantity required; add two-thirds water; if about 3 or 4 pounds of eels, add 1 onion, a small quantity of mace, a little pepper whole, sweet herbs, a crust of the top side of bread; cover down close; stew till the fish separates; then strain; toast slices of bread deep brown, but not to burn ; cut into triangular pieces or squares a piece of carrot two inches long, cut into 4 slices lengthways ; put into a tureen with the toast, and pour the soup on; add boiling cream thickened with a little flour.

EGG BALLS, For Soup.—Boil 4 eggs 10 minutes ; drop into cold water; when cool remove the yolks; pound these in a mortar until reduced to a paste; then beat them with a teaspoonful of salt, a speck of pepper and the white of one raw egg; form in balls about the size of a walnut; roll in flour; fry in butter or chicken fat, being careful not to burn.

EGG.—The yolks of 2 eggs, a pt. of water, ½ oz. or so of butter, and sugar to taste; beat up together over a slow fire; add the water gradually ; when it begins to boil, pour backward and forward between the jug and saucepan till quite smooth and frothy.

FORCEMEAT BALLS, For Soup.—Soak the crumbs of ½ French roll in milk; squeeze it as dry as possible; put it into a stewpan with a piece of butter the size of a walnut; work it over the fire until it becomes stiff paste; add an egg, and continue stirring the paste until it is again dry; take it off the fire and thoroughly incorporate with it 2 oz. of pounded, potted or sausage meat; add a pinch of parsley, chopped very fine, and a few leaves of thyme; taste to see if it is highly seasoned; set aside until cold; flour your hands, and roll up as directed for egg balls; fry them quickly in a little butter until light brown.

FRENCH.—Clean nicely a sheep's head; put it in 4 quarts of boiling water, which reduce to 2 quarts; add 1 small cup of pearl barley, 6 large onions cut up fine, 1 sliced carrot, 1 sliced turnip, a few cloves, 1 bunch of sweet herbs, pepper, salt, a little catchup of any kind; cook one hour longer after adding these ingredients; strain all off; cut the head into pieces and serve in the soup.

GAME.—Break the bones of cold cooked game; cut the meat in pieces; boil the bones and meat in broth for an hour or more; thicken the soup with the yolks of eggs and with boiled cream ; season according to taste.

GRAHAM.—Three onions, 3 carrots, 3 turnips, 1 small cabbage; 1 bunch of celery ; and 1 pt. of stewed tomatoes; chop all the vegetables very finely ; set over the fire in 4 or 5 qts. of water; when thoroughly boiled, strain and add to the soup about 2 teaspoons of Graham flour wet in cold water ; a small piece of butter, pepper and salt; boil again about 20 minutes.

GROUSE.—In some good well seasoned stock, stew a brace of grouse until they are tender; take them up ; cut off the primest flesh ; beat this in a mortar until it is a smooth paste ; press it through a sieve ; simmer down the bones in the stock until the latter is well reduced; strain it into another saucepan; add the *purée*; give all a good warm up, but do not allow it to reach boiling point; serve it in a tureen into which you have put 2 glasses of port wine and 1 dessert-spoonful of beaten loaf sugar.

GUMBO, or OKRA.—One chicken, 2 slices of cooked ham, 3 large onions ; cut the chicken in pieces; slice the onions and put them and the ham into a skillet ; fry in a tablespoon of butter until brown; boil ½ gal. young okra and 1 qt. ripe tomatoes; put these in 3 qts. of water ; add ham, chicken and onions ; boil 4 hours ; season with pepper and salt.

HERB.—Slice 3 large but young cucumbers; a handful of spring onions and six lettuces; cut the last small; put into a stewpan 8 oz. of butter, and with it the above vegetables; when the butter has melted, cover; let it stand over a slow fire 1 hour and 20 minutes; add as much stock as may be required for the quantity of soup intended to be served; let it boil and simmer for 1 hour; thicken with flour and butter, or 3 tablespoonfuls of cream.

JULIENNE.—½ pt. each of carrots, turnips and onions; 2 or 3 leeks; ½ head of celery; 1 lettuce; a little sorrel and chervil; 2 oz. butter; 2 qts. of medium stock; cut the vegetables into strips about 1¼ in. long; be particular they are all the same size; cut the lettuce, sorrel and chervil into larger pieces; fry the carrots in the butter; pour the stock boiling to them; when this is done, add all the other vegetables; stew gently for nearly an hour; skim off all the fat; pour the soup over thin slices of bread cut round, about the size of a shilling, and serve.

LENTIL.—Take ½ lb. of lentils; pick, wash and set on the fire with cold water, just enough to cover; do not cook in an earthen pot, as they will not get soft; clean a head of celery and cut in quarters; cut up an onion very fine; put in both with the lentils; take 1½ lbs. of pork; ½ lb. of beef and 1 onion; have this chopped fine; put in a dish with 1 egg and some pepper and salt; mix this thoroughly and make a dumpling of it; put in the lentils and fill up with as much boiling water as you want soup; cut up a leek and some sprigs of celery; put in at the same time with the dumpling; after ½ hour put in 6 potatoes, peeled and cut in quarters; whenever the lentils get dry add boiling water; do not salt till they are soft; cook lentils 3 hours, dumpling 1 hour.

LOBSTER.—Parboil 2 lobsters; remove the flesh; skim the water carefully and keep it; when you have removed your lobsters, allow the water to remain on the fire so as to reduce it; take the lobsters and chop them fine; bray them in a mortar; put all back into the water save 2 tablespoonfuls, which retain for the making of balls; in the water and lobster place an onion, salt to taste, and white pepper with a bouquet of herbs and a teaspoonful of anchovy paste, or 1 anchovy beaten with the lobster will do; when the water is reduced somewhat, add to it 1 qt. of cream; stir frequently; remove the onion and bouquet of herbs, which make into balls with crumbs of stale bread, the yolk of 1 egg, your chopped lobster and mace; salt and pepper and a little flour; 5 minutes before serving put in the balls; serve very hot.

MACARONI. or VERMICELLI.—Throw 4 oz. of fine, fresh, mellow macaroni (or vermicelli) into a pan of fast boiling water, with about 1 oz. of fresh butter, and a small onion stuck with 3 or 4 cloves; when it has swelled to its full size, and become tender, drain it well; cut it into 2 in. lengths; slip it into 2 qts. of clear gravy soup; let it simmer for a few minutes, when it will be ready for table; serve with grated Parmesan cheese.

MILK.—Wash, pare, slice and parboil 1 lb. of potatoes; pour away the water; skin and scald 2 onions; chop them; place the potatoes, onions, 1 teaspoonful of salt, and ½ teaspoonful of pepper in a stewpan, with 1 qt. of cold water; bring to a boil, and boil till quite soft; crush the potatoes and onions with a spoon till smooth; add 1 qt. of new milk and 1 oz. of crushed sago; stir continually till it boils; then boil for ten minutes; add the beaten yolks of 2 eggs, gradually.

MOCK TURTLE.—1. Take ½ a calf's head, ¼ lb. of butter, ¼ lb. of lean ham, 2 tablespoonfuls of minced parsley, a little minced lemon thyme, a little sweet marjoram and basil, 2 onions, a few chopped mushrooms, 2 shallots, 2 tablespoonfuls of flour, 1½ dozen of forcemeat balls about the size of a nutmeg, and cayenne and salt to suit your taste; the juice of 1 lemon, a Seville orange, 1 dessertspoonful of pounded sugar, and 3 qts. of best stock.—2. Take some stock made from bones or the liquor in which meat has been boiled; boil it with fresh vegetables, herbs and spices till it is pleasantly flavored, and strain carefully; procure a tin of mock turtle soup; boil this up with a little more than an equal quantity of the flavored stock; when it is quite hot throw a claretglassful of Madeira or good sherry into it, and serve very hot with 1 or 2 cut lemons on a dish; the mixture of the stock made from fresh vegetables, with the preserved soup, will correct the slight taste of the tin, which is the only objection which can be urged against it; and when a small quantity only of soup is required it will save time, trouble and expense to make it in this way, rather than to prepare it at home; when there is no stock in the house, the vegetables and seasoning may be boiled in water, but of course the soup will not be so good as if stock were used; time, 1 hour to flavor the stock.

MUTTON.—Take a shoulder of good heavy mutton, weighing about 4 lbs.; remove the skin and fat; put it in about 4 qts. of cold water; let it simmer for 2 hours; boil 1 yellow turnip, and 1 medium sized carrot 1 hour; also 4 potatoes, 2 bulbs of soup celery, ½ hour; when cooked put them in cold water; peel and chop fine; remove the meat; add the vegetables and 1 cup of boiled rice or barley; let the soup simmer 10 minutes more; add 1 tablespoonful of chopped onion and 1 of parsley; let it cook 10 minutes more.

NOODLE.—Break 2 eggs into a bowl; beat until light; add a pinch of salt; work in flour with the hand until you have a very stiff dough; turn it out on the molding board; work until it is smooth as glass; pinch off a piece the size of a walnut; roll it as thin as paper; with a sharp knife cut off very narrow strips; proceed in the same way until all the dough is cut; have prepared some good veal, chicken, or any other kind of broth, well seasoned, ½ hour before dinner is served; drop in the noodles; be sure the soup is boiling; add a little parsley.

ONION.—Take 3 large onions; slice them very thin; fry to a light brown in a large spoonful of either butter or stock fat, the latter answering equally as well; when brown, add ½ teacupful of flour; stir constantly until red; pour in slowly 1 pt. of boiling water; stir steadily until it is all

in; boil and mash 4 fine large potatoes; stir into 1 qt. of boiling milk; take care that there are no lumps; add this to the fried onions, with 1 teaspoonful of salt and ½ teaspoonful of white pepper; let all boil for 5 minutes; then serve with toasted or fried bread.

OX TAIL.—3 ox tails; cut them through the joints; wash carefully and dry with a towel; heat 2 oz. of clarified drippings and brown the ox tails with a finely chopped onion; add 1 heaping tablespoonful of flour; rub gradually in through the sifter and brown; put the ox tail, onion and browned flour with 3 qts. of cold water in the soup pot; 1 carrot cut in inch slices; 1 turnip cut in the same way; 2 or 3 pieces of celery cut up; 4 bay leaves; the same of sage, and 1 sprig of thyme; ½ doz. allspice; 4 cloves; 1 tablespoonful of salt; a pinch of cayenne pepper, and ½ saltspoonful of white pepper; let it come to a boil; put the pot back; cover it on the stove to simmer steadily for 3 hours; just before serving, add 1 tablespoonful of finely chopped parsley, and take out the herbs and spices.

OYSTER.—Strain the liquor from 2 qts. of oysters; put the liquor on the back of the stove in a farina kettle; pick over the oysters carefully; remove every particle of shell; if possible, do this without washing them; heat 3 pts. of rich milk, or, if you have it, half that quantity of milk, the other half rich cream; season with salt, pepper and, if liked, a little mace; rub together 3 oz. of butter with 1½ oz. of flour, corn starch or farina; stir this into the milk when scalding hot; as soon as it begins to thicken add the liquor from the oysters, which must not boil; stir well and add the drained oysters; as soon as they puff out and the edges are "curled" or "ruffled" they are done.

PEA.—Wash well 1 qt. of good split peas; float off such as remain on the surface of the water; soak them for 1 night; boil them with a bit of soda the size of a filbert, in just sufficient water to allow them to break to a mash; put them into from 3 to 4 qts. of good beef broth; stew them in it gently for 1 hour; work the whole through a sieve; heat afresh as much as may be required for table; season it with salt, cayenne or common pepper; clear it perfectly from scum; send it to table with fried or toasted bread; add celery sliced and stewed in it.

PEPPER POT.—Put 4 cows' feet and 4 lbs. of tripe to boil with water to cover them, and a little salt; when simmered to pieces take them out and skim and strain the liquor; cut up the tripe; put it in the pot and pour the liquor over it; add sliced onions and potatoes and herbs, also small dumplings made with flour and butter; season with pepper and salt; add a little butter rolled in flour; when done, serve in a tureen.

POTATO.—Pare and chop fine 6 good sized potatoes; put them into a soup "digester" or kettle with 3 pts. of water; boil until just tender, not soft; season with pepper and salt; just before ready to serve break into the soup 3 or 4 raw eggs; stir briskly to break the eggs before they are cooked; serve hot and immediately after the eggs are well stirred in.

PUMPKIN.—For 6 persons use 3 lbs. of pumpkin; take off the rind; cut it in pieces and put it in a saucepan with a little salt and cover with water; let it boil until it is soft; pass through a colander; it must have no water in it; put about 3 pts. of milk in a casserole; add the strained pumpkin and let it come to a boil; add a very little white sugar, some salt and pepper.

RABBIT.—Take 2 full grown or 3 young rabbits; cut them into joints; flour and fry them lightly; add to them 3 onions of moderate size, also fried to a clear brown; on these pour gradually 7 pts. of boiling water; throw in 1 large teaspoonful of salt; clear off all the scum carefully as it rises; put to the soup a bunch of parsley, 4 medium sized carrots, and 1 small teaspoonful of peppercorns; boil the whole very gently for 5 or 5½ hours; add more salt if needed; strain off the soup; let it cool sufficiently for the fat to be skimmed clear from it; heat it afresh; send it to table with sippets of fried bread; add a thickening of rice flour or of wheaten flour browned in the oven and mixed with a spoonful or two of ketchup.

RICE.—Pick and wash a handful of rice; boil in salt water till the grains just burst; drain the water off; leave the saucepan at the side of the fire; cover with a damp cloth; at the time of serving, put as much rice as is wanted into the saucepan in which the soup is being made hot; as soon as it boils send it up to table.

SAGO.—Take 3 lbs. of lean beef, and a slice of lean ham; lay in a stewpan with a lump of butter; draw the gravy gently; add 2 qts. of water, and a sliced onion which has been browned by frying in fresh butter; also add a bunch of sweet herbs, 6 cloves, 1 blade of mace, 1 teaspoonful of allspice, and 1 of black pepper whole; stew until the soup is rich and brown; remove the meat, and strain the soup clear; put it into a clean stewpan; thicken it to a good consistency with sago.

SCOTCH.—Take 4 lbs. of mutton; add 1 gal. of water, 1 teacupful of pearl barley, 2 carrots sliced, 2 turnips sliced, 2 onions cut small, 3 carrots grated, the white part of a large cabbage chopped very small, and a small quantity of parsley; season with salt and pepper; let this boil very gently for 3½ hours.

SCOTCH SAGO CREAM.—Make a strong stock by boiling an old fowl till all the strength is taken from the meat; while boiling, add some whole white pepper and a small piece of mace; strain and skim the stock; set it away to cool; when quite cold remove every particle of fat that has risen and hardened on top; for every 2 qts. of stock take 3 oz. sago or tapioca; wash in hot water; boil it in the stock 1 hour; break the yolks of 2 eggs in a basin; add to them ½ pt. of cream or milk; beat them together; while beating pour in gradually a little of the hot stock; turn all back into the stock or soup; let it heat after putting in the cold milk till just up to the boiling point; take care it does not boil, lest the soup curdle; dish and send to table.

STOCK.—In making soups from raw meats break the bones apart; place them in a pot; cover them with cold water; boil slowly for 5 or 6 hours; add salt to quicken the rising of the

scum, **which should be thoroughly** removed; cut up 3 carrots, 3 turnips, 2 heads of celery, and 2 onions; add to the stock, together with 6 or 8 cloves, a bouquet of herbs, and a teaspoonful of whole peppers; strain into a deep saucepan; clarify with white of egg.

TOMATO.— 1 qt. tomatoes; 3 pts. of boiling water; 1 even teaspoonful soda; pepper and salt; butter the size of an egg; 1 small onion, minced; 1 qt. of milk; put the tomatoes and onion over the fire with the hot water; strain and rub through a colander; boil the milk; stir in soda and butter; after one boil keep hot; put pepper and salt with the tomatoes; simmer 5 minutes; then stir in milk; serve at once.

TURKEY.—Put all the bones, the scraps of meat, and the dressing of the turkey in a kettle with enough water to cover them; let it boil for 2 hours; when nearly done add the tops of some celery chopped fine, and a teaspoonful of curry powder; when it is done strain and set on the table hot.

TURTLE.—3 or 4 green onions, a bunch of seasoning herbs, a sprig of basil, cayenne pepper and salt, 1 qt. very strong veal broth, 1 lb. of butter, flour, lemon juice, and Madeira wine; cut up the entrails; let the bones and other parts intended for the soup stew 6 hours with the onions and seasoning, chopped small; pepper, salt and cayenne to taste, and water enough; add the liquor in which the fins are boiled tender to the veal broth; put in the butter, rubbed down with as much flour as will sufficiently thicken the soup; stir it over the fire for ten minutes; add lemon juice and Madeira according to quantity; cut the green fat into pieces an inch and a half square and simmer in the soup one hour; serve forcemeat balls and the eggs in the soup; make these of the vealy part of the turtle minced fine with ½ a beaten anchovy, a piece of celery boiled tender, and the yolk of a hard-boiled egg; mix them well up with 2 tablespoonfuls of bread crumbs; season with cayenne pepper, more salt and white pepper; moisten with a little oyster liquor, a lump of butter warmed, and well beaten egg; roll them into balls and fry in butter.

VEGETABLE.—3 onions, 3 carrots, 3 turnips, 1 small cabbage, 1 pt. of tomatoes; chop all the vegetables, except the tomatoes, very fine; have ready in a porcelain kettle 3 qts. of boiling water; put in all except the cabbage and tomatoes; simmer for ½ hour; add the chopped cabbage and the stewed tomatoes; also a bunch of sweet herbs; let the soup boil for 20 minutes; strain through a sieve; rub all the vegetables through; take 2 tablespoonfuls of best butter and one of flour; beat them to cream; salt and pepper your soup to taste; add a teaspoonful of white sugar, and ½ cup cream if you have it; lastly, stir in the butter and flour; let it boil up, and it is ready for the table; serve with fried bread chips.

VENISON.—3 lbs. venison; 1 lb. corned ham or salt pork; 1 onion; 1 head of celery; cut up the meat; chop the vegetables and put on with just enough water to cover them; keep on the lid of the pot all the while; stew slowly for 1 hour; add 2 qts. of boiling water, with a few blades of mace and a doz. whole peppers; or, should you prefer, a little cayenne; boil 2 hours longer; salt and strain; return the liquor to the pot; stir in a tablespoonful of butter; thicken with a tablespoonful of browned flour wet into a smooth thin paste with cold water; add a tablespoonful of walnut or mushroom catsup, a tablespoonful of Worcestershire sauce, and a generous glass of Madeira or brown sherry.

VEGETABLES.

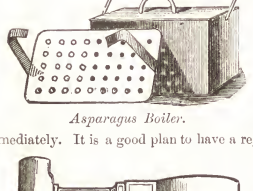
REMARKS.—Green vegetables should be thoroughly washed in cold water, and then dropped into water which has been salted and is beginning to boil. Use a tablespoonful salt for every 2 qts. of water. A great deal depends on the time vegetables are allowed to boil, and this depends upon the age of the vegetables. The following is a good table: Potatoes, boil, 30 minutes; bake, 45 minutes. Sweet potatoes, boil, 46 minutes; bake, 60 minutes. Squash, boil, 25 minutes; bake, 45 minutes. Green peas, boil, from 20 to 45 minutes. Shelled beans, boil, 60 minutes. String beans, boil, 1 to 2 hours. Asparagus, 15 to 30 minutes. Tomatoes, fresh, 1 hour; canned, ½ hour. Cabbage, ¾ to 2 hours. Beet greens, 1 hour. Onions, 1 to 2 hours. Beets, 1 to 2 hours. Turnips, white, 45 to 60 minutes; yellow, 1½ to 2 hours. Parsnips, 1 to 2 hours. Carrots, 1 to 2 hours. Nearly all these vegetables are dressed with salt, pepper and butter, but sometimes a small piece of lean pork boiled with them seasons them sufficiently. Put a lump of charcoal in the pot when either cabbage, onions or strongly flavored meat is being boiled, to prevent the scent from penetrating the house.

ARTICHOKES. Boiled.—1. Parboil the artichokes; remove the middle leaves; pare the choke; stuff the centre with forcemeat; put them in an oven until the meat is well done; serve up with melted butter.—2. Peel the artichokes; throw each root into cold water and vinegar immediately, to preserve the color; put them into boiling water, with a little salt, until sufficiently tender for a fork to pass through them easily; pile them on a dish; serve as hot as possible with melted butter or white sauce poured over.

ARTICHOKES, Fried.—Take boiled artichokes; when they are almost cold, dip them into beaten egg; roll them in sifted bread crumbs; fry them in plenty of butter till they are a nice brown; serve decorated with parsley.

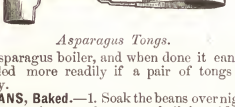
ASPARAGUS.—Scrape the lower part of the stalks; cut them of equal length; tie in small bunches, arranging the heads all one way; put these into boiling water with a little salt; use only sufficient water to cover; boil rapidly until tender; moisten some thin slices of toast in the asparagus liquor; butter and arrange them on a hot platter; over these put the asparagus, re-

move the strings and sprinkle the top with pepper; pour some melted butter over all and serve



Asparagus Boiler.

immediately. It is a good plan to have a regular asparagus boiler, and when done it can be handled more readily if a pair of tongs are handy.



Asparagus Tongs.

BEANS, Baked.—1. Soak the beans over night; in the morning put them on to boil in cold water, having first strained them; when boiled tender skim them out into your baking dish; stir in butter the size of an egg, a little salt and a tablespoonful of molasses; turn a cupful of rich milk over them, or enough to cover them. 2. Wash 1 qt. of beans thoroughly; cover them with cold water; let them soak over night; change the water in the morning once or twice; put them in a pot and simmer slowly for 3 hours, until they begin to crack open; pour them into a colander to drain off all the water; heat an earthen bean pot with hot water; wipe it dry; place a small piece of pork on the bottom of the pot and pour in the beans; cut the rind of another piece of pork into strips; sink it into the beans; leave only the rind of the pork exposed at the top; dissolve 1 tablespoonful of New Orleans molasses with 1 teaspoonful of salt in a pint of warm water; add it to the pot; set it in the oven and bake slowly for 3 or 4 hours; or place the pot in a baker's oven over night, instructing the baker to add a little water to the pot should the beans become dry.

BEANS, LIMA.—1. Boil in water in which a lump of butter has been placed; preserve them as white as you can; chop a few sweet herbs with some parsley very fine; stew them in a pint of the water in which the leaves have been boiled; to which add ½ pt. of cream; stew until quite tender; add the beans; stew 5 minutes, thickening with butter and flour.—2. 1 peck of beans; ½ gal. of water; 1 large spoonful of salt; shell the beans; put them into a saucepan of boiling salt and water; boil them quickly as above directed; when done, drain them; serve with parsley and butter in a separate tureen.

BEANS, String.—Cut off the tops and bottoms of the beans; remove the strings from each side; divide each bean into 3 or 4 pieces, cutting them lengthwise; as they are cut put them into cold water with a little salt; drain the beans; put them into a saucepan of boiling water; boil quickly with the saucepan uncovered; as soon as they are done drain them into a colander; dish and serve with a small piece of butter stirred into them.

BEETS, Boiled.—Wash, but do not cut them; put them on to boil in a sufficiency of water; let them boil from 2 to 3 hours, or until they are perfectly tender; take them up; peel and slice them; pour vinegar or melted butter over them.

BEETS, Stewed.—Wash 2 or 3 large beets without breaking the skin or removing the top-stalks or roots; boil them an hour in boiling water and salt; peel and slice them; stew them an hour in the following sauce: Mix together in a saucepan over the fire 1 tablespoonful each of butter, flour and vinegar; gradually stir in a pt. of boiling water; season the sauce with a saltspoonful of salt and ½ saltspoonful of pepper.

BEET TOPS.—Treat in the same way as spinach, but boil for ½ hour instead of 10 minutes; garnish with slices cut from the roots of large red and white beets, and season plentifully with pepper.

BROCCOLI.—2 or 3 heads of broccoli; 2 qts. of water; a little salt; strip off the dead outside leaves; cut the inside ones even with the flower; cut off the stalk close; put them into cold salt and water for an hour to cleanse from insects; put them into a large saucepan of boiling salt and water; boil quickly with the saucepan uncovered; when tender, take them carefully out; drain them dry; serve them with a little melted butter poured over them, and some in a separate tureen.

BRUSSELS SPROUTS.—Trim neatly and wash them; put them to boil in plenty of salted water; when almost done, strain them and dry them in a cloth; put them in a saucepan with a large piece of butter, pepper, salt and grated nutmeg to taste; toss them gently on the fire until they are quite cooked.

CABBAGE, Baked.—Boil a firm white cabbage for 15 minutes; change the water for more that is boiling; boil until tender; drain and set aside until cold; chop fine and add salt and pepper; 1 tablespoonful of butter; 2 eggs well beaten; 3 tablespoonfuls of rich milk or cream; mix well; bake in a buttered pudding dish in a moderate oven till brown; serve hot.

CABBAGE, Boiled.—Strip off the outside leaves; cut in quarters; lay for 1 hour in cold water; cover with boiling water and cook 15 minutes; turn off the water; cover with fresh boiling water; cook till tender, perhaps 1 hour; drain well; chop and stir in a tablespoonful of butter, pepper and salt; serve hot.

CABBAGE, Stuffed.—Take a large, fresh cabbage and cut out the heart; fill the place with stuffings made of cooked chickens or veal, chopped very fine and highly seasoned, rolled into balls with yolk of egg; tie the cabbage firmly together and boil in a covered kettle for 2 hours.

CARROT FRITTERS.—Beat 2 small boiled carrots to a pulp with a spoon; add 3 or 4 eggs and ½ handful of flour; moisten with cream, milk or a little white wine; sweeten to taste; beat all well together; fry in boiling lard; when

of a good color, take them off and serve; squeeze over them the juice of an orange, and strew them over with finely sifted sugar.

CARROTS, Mashed.—Wash, scrape and soak them in cold water for 1 hour; cook tender in boiling salted water; drain, mash and beat in a generous piece of butter; season to taste with salt; arrange them in a dish; sprinkle pepper over the top and serve hot.

CARROTS, Stewed.—Scrape and wash them thoroughly; boil in water which has a little salt in it, until they are quite tender; take them out and drain them over a hair sieve or colander; dissolve ½ lb. butter in a saucepan; add to it ½ teacupful of veal stock, and the same quantity of cream; stir in by degrees a tablespoonful of fine flour, seasoned with cayenne pepper and salt; stir these ingredients around to keep the flour from forming into lumps; put the carrots into this sauce; let them stew in it, at the side of the fire, from 7 to 10 minutes; serve in a vegetable dish.

CARROTS, With Cream.—Take a quantity of the smallest new carrots that can be obtained; boil them in salted water; when done, drain off the water; melt 1 oz. of butter in a saucepan; add to it a dessertspoonful of flour, pepper, salt, grated nutmeg, a pinch of powdered sugar and a small quantity of cream; put in the carrots; simmer gently a few minutes and serve.

CAULIFLOWER, Boiled.—Cut the stalk close to the bottom; pare away the tops of the leaves, leaving a circle of shortened leaf-stalks all around; put the cauliflower head downwards into a little vinegar and water for ½ hour; put it into a pan of boiling water or milk and water, with a tablespoonful of salt in it; remove the scum carefully as it rises or the cauliflower will be discolored; boil till tender; drain and serve; put a lump of butter the size of an egg into a saucepan with a cupful of cold water; add gradually 1 teaspoonful of flour; mix smoothly; boil and strain over the vegetable.

CAULIFLOWER, Scalloped.—Boil until tender; clip into neat clusters; pack the stem downward into a buttered puading dish; beat up a cupful of bread crumbs to a soft paste with 2 tablespoonfuls of melted butter and 6 of cream; season with pepper and salt; bind with a beaten egg; with this cover the cauliflower; cover the dish closely; bake 6 minutes in a quick oven; brown in 5 more; serve very hot in the dish in which they were baked.

CELERY FRITTERS.—Boil some thick but tender stalks of celery in salted water; when done dry them in a cloth; cut them in equal lengths about 1½ in.; dip them in a batter; fry to a golden color; sprinkle fine salt well over and serve.

CELERY, Stewed.—Break apart and wash very carefully 3 heads of good celery; cut off the green portions and leave the outside stalks to season soups; cut the celery into pieces 1 in. long; put just enough boiling water on to cover them; add salt to the water before putting in the celery; boil slowly; when tender, drain and place neatly on a vegetable dish; sprinkle over it some black pepper; pour off part of the water, but save it, in case of need, till the stew is completed; wet into a smooth paste a teaspoonful of corn starch; add the same quantity of flour, 2 tablespoonfuls of butter and the same of rich cream; stir this into the water, over the fire, till it thickens; then pour over the celery; if too thick add some of the water left over; if too thin use more corn starch, after making it into a thin paste.

COLCANNON.—Chop fine a whole cold boiled cabbage; mix it up thoroughly with 1 qt. well boiled potatoes; have a pan hot and put in it a tablespoonful of butter or good drippings; then put in the cabbage and potatoes, a saltspoonful of black pepper and a light pinch of cayenne.

CORN, Boiled.—Strip the ears; pick off the silk; put them in a pot of water with a little salt; boil ½ an hour; when done, cut off the corn from the cob, season it with butter, pepper and more salt if necessary, or serve on the ear.

CORN FRITTERS.—To the beaten yolks of 3 eggs add a teacup of milk; 1 pt. of boiled green corn grated; a little salt and as much flour as will form a batter thick enough to drop from a spoon; beat the whole very hard; stir in the beaten whites of the egg; drop the batter a spoonful at a time into hot lard.

CORN OYSTERS.—6 ears of sweet corn; with a sharp knife split each row of the corn in the centre of the kernel lengthwise; scrape out all the pulp and add to it 1 egg, well beaten, a little salt, 1 tablespoonful of sweet milk and flour enough to make a pretty stiff batter; drop in hot lard; fry a delicate brown; if the corn is quite young, omit the milk; use as little flour as possible.

CORN, Stewed.—Stew 1 qt. of canned corn in its own liquor; set the vessel containing it in an outer one of hot water; should the corn be very dry, add a little cold water; when tender, pour in enough milk to cover the corn; bring to a boil; put in a tablespoonful of butter rolled in flour; salt to taste; stew gently; stir well 3 or 4 minutes; turn into a deep dish; keep the vessel containing the corn closely covered while cooking.

CUCUMBERS, Fried.—Pare the cucumber; lay in ice ½ hour; cut it lengthwise and lay in ice water a few minutes longer; wipe it dry; sprinkle with pepper and salt; dredge it with flour; fry in lard to a light brown.

CUCUMBERS, Stewed.—Peel and quarter 2 cucumbers lengthwise; put them in a saucepan; add 1 teaspoonful of salt and 1 doz. whole peppers; when tender take them out; place them on toast, the edges of which have been dipped in water used in stewing; pour drawn butter over them, well seasoned with cayenne pepper, and serve.

DANDELION. — Gather a quantity of fresh dandelion; pick off all the withered tips and hard parts; shred them into strips; wash them free from grit; put the dandelion into a stewpan with a strip of bacon; add 1 tablespoonful of vinegar; cover it with a small quantity of boiling water; stew until tender; mash with a wooden spoon; stir in a lump of butter; flavor with pepper and salt; serve like spinach; or, it may be garnished either with hard-boiled eggs, sippets of fried bread, or slices of boiled carrot.

EGG-PLANT, Baked.—Boil a large egg-plant in plenty of water until it is perfectly tender, trying it with a straw; let it stand in the colander to drain until cold; then peel; cut it open, and take out the seed; mash carefully with a gill of milk, 2 eggs, a dessertspoonful of salt, a salt-poonful of white pepper, ½ grated nutmeg, a heaping tablespoonful of butter, and 2 table-poonfuls of very fine bread crumbs; bake ¾ hour in a quick oven; a slow oven spoils it.

EGG-PLANT, Fried.—Peel carefully; cut in slices ½ of an inch thick; put the slices in lightly-salted water; allow to remain for 2 hours; dry perfectly before cooking; take 2 eggs and mix cold in a pint of milk; have dried bread crumbs or powdered crackers; dip the egg-plant in the milk and egg; then into the bread or cracker crumbs; have in your frying-pan a piece of butter; when it is very hot, put in your slices and cook thoroughly.

EGG-PLANT, Stuffed.—Cut 2 egg plants in two lengthwise; slash the inner surfaces with the point of a knife, making a shallow incision; fry till they are soft, and drain on a cloth; prepare in a saucepan 2 oz. of butter, 2 oz. of fat salt pork chopped fine and 2 or 3 chopped shallots; cook a few minutes; add a pint of mushrooms, a little parsley, and 3 anchovies, all chopped fine; mix the fleshy parts of the egg plant with this; season to taste; put the stuffing thus made, back into the plants, with bread and cheese crumbs and little pieces of butter strewed on the top, and bake 20 minutes.

HORSERADISH, Boiled.—Cut each root into pieces 2 in. in length; then each piece into quarters; boil in water containing a little salt and 1 tablespoonful of vinegar; when tender, drain; place the strips on a napkin; send to table with drawn butter.

LEEKS, Boiled.—Wash them carefully; cut away all the green; slit each almost in two; tie them in bunches; boil them for 20 minutes in salted water; drain them, and serve upon moistened toast, and with any sauce preferred.

LEEKS, Fried.—Wash them thoroughly; cut away all the green; slice the white tender part as thin as possible; make a good deal of butter hot in a frying pan; put in the leeks; continue stirring till they are nicely browned; drain off the superfluous fat; add rasped bread crumbs, and serve.

LEEKS, Hashed.—After boiling, chop them up; toss them in some butter in a stewpan; add enough rich gravy; simmer till this is pretty thick; serve surrounded with sippets.

LENTILS, Boiled.—Wash 1 lb. or 1 full pt. of lentils well in cold water; put them over the fire, in 3 qts. of cold water, with 1 oz. of drippings, 1 tablespoonful of salt, and a saltspoonful of pepper; boil slowly until tender, that is about 3 hours; drain off the little water which remains; add to the lentils 1 oz. of butter, 1 tablespoonful of chopped parsley, a teaspoonful of sugar, and a little more salt and pepper, if required; serve hot.

LENTILS, Fried.—Fry 1 oz. of chopped onion brown in 2 oz. of drippings; add 1 pt. of plain boiled lentils; see if they are properly seasoned: brown them well; serve to the table hot.

LENTILS, Stewed.—Put 1 pt. of plain boiled lentils into a saucepan; cover them with any kind of pot liquor; add 1 oz. chopped onion; 2 oz. drippings; ½ oz. of chopped parsley; stew gently for 20 minutes; serve hot.

LETTUCE, Fried.—Chop lettuce very fine; if liked, the tops of 2 or 3 young onions; add 2 well beaten eggs and a little salt; put a piece of butter the size of an egg into a frying pan; when melted pour in the mixture; turn when a light brown and serve with or without vinegar.

LETTUCE, Stewed.—After washing and parboiling the lettuces, slightly toss them in fresh butter; finish by stewing them gently in thick cream; serve all together.

MUSHROOMS, Baked.—Place under a glass or basin on toast, along with scalded or clotted cream, or a little melted butter, with 1 clove, salt, pepper, etc., to taste; when they are taken up, do not remove the glass for a few minutes, by which time the vapor will have become condensed and gone into the bread.

MUSHROOMS, Broiled.—Choose them rather large; cut out the stalks and soak the mushrooms in a marinade of olive oil seasoned with a bruised clove of garlic, salt and pepper; let them stay in this 1 hour or so; place them on a gridiron, the stalk side downwards; before they begin to render any juice, turn them; place a small piece of butter in each, and when they look done, carefully, without upsetting them, place them in a dish.

MUSHROOMS, Stewed.—Put the mushrooms into a porcelain lined saucepan; add a little pepper, salt, a squeeze of lemon and a small piece of butter; cover the pan and let them stew for ½ hour; add flour enough to thicken them to the thickness of good cream; rub the flour in milk; remove any particles of butter floating on the top; add a little grated nutmeg; let them gently simmer until tender; serve in a vegetable dish.

OKRA, or GUMBO.—Cut off the hard stalk ends of the young pods; put them into boiling water; boil ½ hour until the seeds are red; strain off the water; add a little butter, black pepper, salt, and lemon juice.

ONIONS, Baked.—Boil in milk and water until just done; drain and place the onions in a buttered baking pan; put a bit of butter and some pepper and salt over each one; add a little of the water in which they were boiled; brown them quickly on the grating of the oven and serve hot.

ONIONS, Boiled.—Skin and trim the ends nicely; lay in cold water 1 hour or 2 before wanted; cover well with boiling water, which change once during the process of cooking; when thoroughly tender, drain carefully; butter and season; when in the dish for table use, pour over them drawn butter.

ONIONS, Fricasseed.—Peel 2 or 3 dozen of the very small, round, white onions; sprinkle them with salt; let them remain for ½ hour; roll them upon a cloth to dry them slightly; dredge with flour; throw them into a stewpan in which you have melted 2 oz. of fresh butter; toss them over a gentle fire for 5 minutes; drain the fat from

them; add 1 pt. of rich milk, minced lemon peel, white pepper, salt, and butter; simmer for 10 minutes and serve in the sauce.

ONIONS, Scalloped.—Boil till tender 6 large onions; separate them with a large spoon; place a layer of onions and a layer of grated bread crumbs alternately in a pudding dish; season with pepper and salt to taste; moisten with milk; put in the oven to brown.

ONIONS, Stewed.—Trim some small onions, such as are used for pickling; put them into a well buttered saucepan; sprinkle them freely with powdered loaf sugar; shake the pan gently; as soon as they begin to color moisten with a little stock; add salt; let them stew gently till well colored; shake the pan now and then, but carefully, lest the onions break.

ONION TURNOVERS.—Chop 6 or 8 onions into dice; boil for a few minutes in salt and water; drain and toss in butter until of a light brown; beat up 3 or 4 eggs and add them to the onions; just as they are going to set lay them on a piece of puff paste; pinch the edges together as in making an apple turnover and bake to a nice color.

OYSTER PLANT or SALSIFY, Boiled.—Scrape the roots lightly; either cut them into 3 in. lengths, or leave them whole; throw them into water with a little lemon till wanted; put them into boiling salt water; keep them boiling quickly till tender; drain them; arrange on toast upon a hot dish; pour over them good melted butter, white sauce, or sauce *maître d'hotel*.

OYSTER PLANT or SALSIFY CROQUETTES.—Wash, scrape and boil the oyster plant till tender; rub it through a colander; mix with the pulp a little butter, cream, salt, cayenne and lemon juice; mix the ingredients thoroughly together to a smooth paste; set the dish in the ice-box to get cold; shape it into small cones; dip them in beaten egg and roll in crumbs; fry crisp and brown.

OYSTER PLANT or SALSIFY FRITTERS.—Cook until soft enough to mash; add 2 eggs, 1 pt. milk, flour to make a batter, and salt; fry well brown in hot lard and butter.

PARSNIPS, Boiled.—Wash and brush them very carefully; either peel and quarter them or do them whole as they are, and peel afterwards; have plenty of water; send them to table simply quartered or sliced, or mashed and tossed in enough butter.

PARSNIPS, Fried.—Boil the parsnips until they are half done; lift them out; let them cool; slice them rather thickly; sprinkle with salt and pepper; fry them a pale brown in good butter; serve them with roast meat, and dish them under it.

PARSNIPS, Scalloped.—Mash 1 pt. of boiled parsnips; add 2 tablespoonfuls of butter; 1 teaspoonful of salt; a little pepper; 2 tablespoonfuls of cream or milk; mix the ingredients; stir on the fire until the mixture bubbles; turn into a buttered dish; cover with crumbs; dot with butter, and brown in the oven.

PEAS, Dried, Stewed.—Stew in meat liquor; allow 1 qt. of the latter to each ½ pt. peas; flavor to taste; thicken with yolks of eggs; add powdered dried mint as for pea soup; introduce small pieces of broiled bacon as a garnish.

PEAS, Green, Boiled.—Boil the peas in plenty of salted water, which should be boiling rapidly when they are put in; when tender, but not broken, drain off a part of it; throw into the remainder a sprig of mint, and butter and pepper to taste; add a little milk.

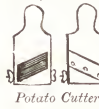
PEAS, Green, Stewed.—Put your peas into a stewpan; toss them into a little butter; when hot add sufficient veal or chicken stock to moisten them with; simmer slowly; thicken slightly with flour and butter; place fried sippets round a dish, and serve the peas in the middle.

POTATOES, Baked.—1. Choose large potatoes of uniform size; wash them well in lukewarm water, and scrub the skins with a soft brush; put them in the oven, or in a Dutch oven, and bake until done enough; do not let them remain in the oven after they are cooked, or they will become hard and shrivelled; serve, neatly folded, on a hot napkin, and send pats of butter to table with them.—2. Pare and slice, very thin, potatoes to almost fill a 2 qt. dish; sprinkle on a large spoonful of salt and a little pepper; then turn on sweet milk until the dish is a little more than half full, that will wash the pepper and salt among the potatoes; cut 5 slices of pork; lay them around on the top of the potatoes; set it in the oven and bake 2 hours.

POTATOES, Boiled.—1. Choose potatoes of uniform size; wash them well, and scrub them with a soft brush, but do not touch them at all with a knife, even to remove the specks; put them in a saucepan; barely cover them with cold water; throw in a spoonful of salt, and let them simmer gently until they are done enough; then let them boil quickly for 2 or 3 minutes; drain the water from them; leave them in the saucepan by the side of the fire, partially covered, and let them remain until they are quite dry; then peel them quickly, and serve at once; leave the cover of the tureen a little on one side, that the steam may escape and not descend upon the potatoes.—2. Take 20 middle sized potatoes; peel, wash and drain them; put them into a 2 qt. stewpan with 1 qt. of water and a little salt; when they have boiled 15 minutes throw off the water; cover closely, and let them steam till done, which will be in about 5 minutes more.

Potato Peeler.

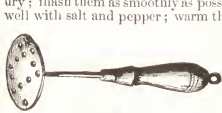
POTATOES, Fried.—1. (*Saratoga Chips.*) Wash and peel some potatoes, and cut them from the breadth (not the length) in slices as thin as a shilling; as they are sliced throw them into cold water, and keep them there until wanted; when they are to be dressed, dry them carefully in a napkin and throw them, a few at a time, into as much boiling fat as will cover them entirely; the fat may be known to be boiling when it ceases to hiss, and is still; move the potatoes about in the fat that they may be equally cooked, and when they are brightly browned on both sides and crisp, put them on a cloth or brown paper before the fire to drain the grease from them; sprinkle a little salt over them and serve very hot.—2. Peel some raw po-



Potato Cutter.

tatoes, and cut them in thin slices; fry them in butter over a hot fire, continually turning them, until they become sufficiently brown; let them drain; then arrange them on a hot dish; sprinkle salt over them and serve to the table as hot as possible.

POTATO BALLS. — Boil some potatoes very dry; mash them as smoothly as possible; season well with salt and pepper; warm them, with 1 oz. of butter to every lb. of potatoes, and a few spoonfuls of good cream; let them cool a little; roll them into balls; sprinkle over them some crushed vermicelli or macaroni; fry them a light brown.



Potato Masher.

POTATO CONES. — Take mashed potatoes; season with pepper and salt and a little minced shallot; beat into it a sufficient quantity of butter to bind it; divide and form into cones or croquettes; place them with roast beef or mutton to brown; sprinkle them slightly with the gravy.

POTATO CROQUETTES.—Take 6 boiled potatoes; pass them through a sieve; add 3 tablespoons of grated or finely minced ham; season with pepper and salt and chopped parsley; work into this mixture the yolks of 4 eggs; make with the hands into balls; roll in bread crumbs; fry in hot lard; serve with fried parsley.

Potato Croquettes.

POTATO CUTLETS.—Cut some small slices of cold mutton; spread mashed potatoes, nicely flavored with pepper and salt, on each side of them; fry a nice light brown; take some ripe tomatoes; remove their skins by plunging into boiling water; stew the tomatoes in a small saucepan; break into them 1 or 2 eggs; stir the mixture well, until it is of the consistency of scrambled eggs; pile up the tomatoes in the centre of the dish; arrange the potato cutlets round it.

POTATO DUMPLINGS.—Boil 5 or 6 good sized potatoes; let them get cold; peel and grate into a large dish; do not crush or mash them together; keep them light and flaky; peel about the same quantity of raw potatoes; grate and put into a cloth; press out all the water; put the potatoes in a dish; cut up an onion very fine; put in 2 or 3 eggs and a small handful of salt; cut some stale bread into small squares; fry in hot lard or butter until they are brown and crisp; thoroughly mix the raw potatoes, onions, eggs and salt; put in the bread, and lastly the boiled potatoes; handle as little as possible; roll the mixture into balls; put them in a pot of boiling water, into which you have thrown a handful of salt.

POTATOES, Gravy for. — Put a spoonful or more of butter, according to the quantity of potatoes you have, into a frying pan; set over the fire until brown, being careful not to scorch it; mix a spoonful of flour in a cup of thin sweet cream, or milk if one has no cream; pour into the browned butter; boil up; season with pepper and a little salt if necessary; turn over the boiled potatoes.

POTATOES, Mashed.—Peel 2 qts. potatoes; when they are cooked turn off every drop of water; put in a little salt, pepper and butter; take a carving fork and break them up a little; add a little more butter, and nearly a cup of nice milk or cream; take a silver fork; beat them briskly 5 minutes, or until light and creamy; carry immediately to the table.

POTATO PUFFS.—Take mashed potatoes and make them into a paste, with 1 or 2 eggs; roll it out with a dust of flour; cut round with a saucer; have ready some cold roast meat, free from gristle, and chop fine; season with salt, pepper, thyme, or pickles cut up fine; place them on the potato and fold it over like a puff; pinch it neatly around, and bake for a few minutes.

POTATO SNOW.—Peel and boil in a saucepan 6 large, mealy white potatoes; add a little salt to the water; take them out one by one; leave the saucepan on the fire; rub through a sieve into a deep dish, letting it fall in a mound.

PUMPKIN. Boiled.—Make a good syrup of brown sugar and water; strain it; peel and cut in thin slices some pumpkin; put in the syrup, and add grated lemon peel and juice; cook until nearly candied; use mace or spices instead of lemon if preferred; eat this hot with the meats; or it is equally as nice cold.

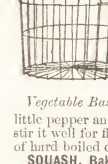
PUMPKIN. Fried. — Peel and slice a young pumpkin in pieces 2 or 3 inches square and ½ in. thick; let it stand for 1 hour in a deep earthen dish with a light sprinkling of salt between each layer; wipe the slices; pepper them; roll them in flour, or in a batter made with flour, milk, 1 egg and a little salt; fry them brown in smoking hot fat, enough to cover them; lay them for a moment on brown paper to free them from fat, and serve them hot.

RHUBARB, or PIE PLANT.—Wash; cut up into small pieces; boil in clear water until done; just before removing it from the fire, sweeten it to taste.

SALMAGUNDI.—Take an equal quantity of carrots and turnips; cut them the size of almonds; 12 small white onions; put all in a saucepan with a lump of butter; let them brown gently; add a little gravy and some mushrooms, French peas, haricots, tops of cauliflower, salt and pepper, and a teaspoonful of sugar; let them all boil gently; just before serving, thicken the sauce with a little flour.

SEA KALE.—Clean it thoroughly; tie it in medium sized bunches; cook exactly as you would asparagus; serve it masked with white sauce, or placed simply on moistened toast; or enveloped in a warm damask napkin.

SPINACH.—Take 2 pailfuls of spinach, young and freshly gathered; pick away the stalks; wash the leaves in several waters; lift them out with the hands that the sand or grit may remain at the bottom; drain them on a sieve or in a



Vegetable Basket.

wire vegetable basket; put them into a saucepan with as much boiling water, slightly salted, as will keep them from burning; let them boil until tender; take the spinach up; drain it; press it well; chop it small; put it into a clean saucepan with a little pepper and salt, and a slice of fresh butter; stir it well for five minutes; serve with the yolk of hard boiled egg.

SQUASH. Baked.—Cut in half; clean inside nicely; put into oven flesh side up, 1 hour before dinner; serve hot, with butter, pepper and salt.

SQUASH. Fried.—Slice them as you would cucumbers; dip in dry flour; fry to a brown, and imagine that you are eating fried oysters.

SQUASH. Scalloped. — Boil and mash the squash in the customary way, and let it cool; beat the yolks of 2 eggs, and when the squash is nearly cold whip these into it, with 3 tablespoonfuls of milk, 1 of butter rolled in flour, and melted into the milk; pepper and salt to taste; pour into a buttered bake dish; cover with fine crumbs; bake to a light brown in a quick oven; eat hot.

SQUASH, Stuffed. — Select a squash with a moderately hard shell; cut out a piece from the top large enough to insert the hand; clean out the seeds; place the squash and the piece in a moderately hot oven; boil onions, Brussels sprouts and potatoes; let these vegetables be cooked till each is done, lacking 10 minutes; make a stuffing of rice, or bread crumbs and tomatoes, having 1 part rice or 2 parts bread crumbs to 4 parts tomatoes; season to taste with finely minced chopped onion; cook the rice 40 minutes, the bread crumbs 10 minutes; have all ready and hot at the same time; take the half cooked squash from the oven; put in the stuffing and the vegetables in layers, not filling quite full; replace the piece cut out of the top; tie a string around the whole and return to the oven; bake until the squash is tender, but not broken down; serve hot, cutting the shell, if possible, with a sharp knife.

SUCCOTASH.—1. Take 1 qt. lima beans; ½ lb. pork; 1½ doz. ears sweet corn (green); boil the pork 1½ hours in 3 qts. of water, putting in the beans when the pork has boiled ½ hour; cut the corn off; put it in one dish; into another scrape the milk from the cobs; when the beans are nearly done put in the corn, and boil 15 minutes; add the milk from the cobs, boiling all 10 minutes longer; stir all the time after adding the milk, or it will burn.—2. Take 2 qts. of beans; string; cut fine; boil 2 hours with water enough to cover without boiling dry; cut the corn from 6 ears; boil with beans 20 minutes; season with butter, pepper and salt; just before dishing up, add 1 tablespoonful of flour; moisten with ½ cup of sweet milk; let it boil 10 minutes.

SWEET POTATOES. Baked.—1. Boil your potatoes until tender; slice several times the long way of the potato; place a layer of the slices on the bottom of an earthen dish; sprinkle lightly with white sugar, and heavily with lumps of butter; then another layer of potatoes, and so on, until you have the sugar and butter for a top layer; bake 30 or 40 minutes.—2. Wash; put in a hot oven; bake until well done.

SWEET POTATOES. Boiled. — Wash; peel; place in boiling water; let them boil until thoroughly done.

SWEET POTATOES, Fried.—1. Boil the potatoes; carefully mash them; boil 1 pt. of milk; put in some lemon peel, 2 small lumps of sugar, and a little salt; when the milk boils take it off the fire and add the potatoes, so as to form a paste, or, rather, a tolerably thick mush; when cool, make it into balls; cover these with crumbs of bread and yolk of egg; fry to a nice brown color, and serve with sugar strewed over them.—2. Boil, and, when cold, scrape off the skins; slice lengthwise and fry to a light brown in nice dripping or butter; drain, salt, pepper and serve hot.

TOMATOES, Baked.— 6 medium sized tomatoes sliced; 1 large onion sliced; 2 slices of bread cut into small pieces; cover the bottom of the pan with pieces of the bread; above this put a layer of the tomatoes and a few slices of onion; then again bread, tomatoes and onion, until all the material is used; over all spread 2 tablespoonfuls of butter and sprinkle salt and pepper; just before setting in oven add ½ cupful of boiling water; bake in a brisk oven 1 hour.

TOMATOES. Deviled.— 1 pt. tomatoes; 1 hard boiled egg, the yolk only; 2 tablespoonfuls melted butter; 1½ tablespoonfuls vinegar; 1 raw egg whipped light; 1 teaspoonful powdered sugar; salt, mustard and pepper; pound the boiled yolk; rub in butter and seasoning; beat light; add the vinegar; heat almost to a boil; stir in the beaten egg until the mixture thickens; set in hot water while you cut the tomatoes in thick slices; broil over a clear fire; lay on a hot chafing dish, and pour the hot sauce over them.

TOMATOES. Fried.—Take large green tomatoes; cut off both ends; then cut up in 3 slices; have some butter in the frying pan; let it get hot; roll the tomatoes in flour and lay them in the pan; salt, pepper, and sprinkle a little sugar on while frying; cook till they are done nice and brown, and you will have a most delicious article for breakfast.

TOMATOES, Roasted.—Select them nearly of the same size; roast them gently in a Dutch oven, or place them at the edge of the dripping pan; take care that no fat from the joint shall fall upon them; keep them turned, that they may be equally done.

TOMATOES, Scalloped.—Stew and season 1 qt. of tomatoes to your taste; add butter, a little chopped onion, and salt and pepper to the taste; then grated bread crumbs till a stiff butter; pour into a buttered pudding dish; strew the top thickly with crumbs, and bake 20 minutes.

TOMATOES. Stewed.—Wash ½ peck of tomatoes; put them in a saucepan with ½ pt. of boiling water; cover closely; put on the stove to boil; as soon as the water boils set the saucepan back to simmer for ½ hour; with the potato masher, pass the tomatoes through the colander; leave the skins and any unripe, lumpy parts; season with 1 dessertspoonful of salt, 1 saltspoon-

ful of white pepper, as much cayenne as you can take on the end of a penknife, finely chopped parsley, and 1 tablespoonful of butter.

TURNIPS. Boiled.—Serve the turnips whole, when they are very young, and then cover with white sauce; when they have reached any size, mash them; pare the turnips; wash them; if very young, a little of the green top may be left on; if very large, they should be divided into halves or even quarters; throw them into slightly salted water; let them boil gently till tender; drain and serve them.

TURNIPS. Stewed.—Pare and wash 6 white turnips; cut them in dice ½ in. square; lay them in cold water as they are cut; meantime heat 1 pt. of any kind of cold gravy; when all the turnips are cut put them into the gravy with 1 teaspoonful of sugar, and sufficient pepper and salt to make them palatable; stew gently for about 1 hour; serve hot in the gravy.

WATER-CRESS. Stewed.—Pick them over and wash them carefully; blanch them in boiling water; drain and press them; stew in either gravy or cream; thicken the sauce with yolks of eggs; garnish the dish with slices of orange.

COOKING FOR THE SICK.

REMARKS.—Endeavor to tempt the appetite of the patient by attention to little things. Give the distasteful food the semblance of something that is particularly palatable. Cover the tray in a dainty manner with the freshest of cloths; render it bright by a vase of flowers. Do not set a plate before an invalid containing the exact quantity of meat, fish or pudding you want him to eat. Serve every thing on small dishes, and allow the patient to help himself. Very often the effort to lift the head, even if persons are not dangerously ill, disinclines them to take refreshing or nourishing drink. Do not disturb such sufferers by propping them up with pillows and making them lift their heads and change their position. Secure a bent glass tube, and the patient need not be disturbed, in a sick headache or extreme fatigue, but can take the beverage provided without a change of position. As the system feels the need of the very thing that the taste demands, satisfy that desire as far as possible; but the greatest care is necessary with regard to the food; therefore give no new article of diet without the express permission of the doctor.

ABERNETHY BISCUITS.—(See same in BISCUITS, CRACKERS, ETC.)

AERATED BREAD.—(See same in BREAD.)

ALUM WHEY.—Boil together 1 teaspoonful of powdered alum and 1 pt. of sweet milk; strain to separate the curd.

APPLE TEA.—Roast 8 fine apples in the oven or before the fire; put them in a jug with 2 spoonfuls of sugar; pour over them 1 qt. of boiling water; let the whole stand 1 hour near the fire.

ARROWROOT GRUEL.—Mix 1 dessertspoonful of arrowroot with sufficient cold water to form a soft paste; rub it till quite smooth; add ½ pt. of boiling water; stir it briskly; boil it for a minute or two; when removed from the fire add 1 teaspoonful of sherry or other white wine with a little grated nutmeg or lemon peel, and sugar to the taste. For children use milk instead of water, omitting the wine and lemon or nutmeg.

ASSES' MILK. Imitation of.—Eringo root, pearl barley, sago, rice, of each 1 oz.; wash them with cold water; boil them with 3 pts. of water to 1½ pts., and strain; put 1 teaspoonful to 1 cup of boiling water, and sweeten to the taste.

AUSTRALIAN MOSS.—Soak ½ oz. of the moss in water for 1 or 2 hours; pour away the water; boil the moss in 1 qt. of fresh water until dissolved; strain through a hair sieve; sweeten and flavor to the taste.

BARLEY WATER.—Boil 2 oz. of barley in 2 qts. of water till soft; pearl barley is the best, but the common barley answers very well; when soft, strain and mix it with a little currant jelly, to give it a pleasant, acid taste; if the jelly is not liked turn it, when boiled soft, on to 2 oz. of figs or raisins; boil it again until reduced to 1 qt.; then strain it for use.

BARLEY WINE.—To 1 pt. of boiled barley water, nicely flavored, put ½ pt. sherry; boil it down till reduced one half; 1 wineglassful of this taken 3 or 4 times a day is both strengthening and nourishing to delicate people, or after an illness.

BEEF TEA.—Take 1 lb. of lean, fleshy beef; put it into a basin containing 1 qt. of cold water, first cutting it into very small bits; let it soak in this water an hour or more; then put both water and beef into a clean saucepan, and bring it to a boil; put in a little salt, and take off the scum as it appears; simmer very gently, and strain for use in little less than an hour. When warmed up again it should not be put into a saucepan, but heated by setting the cup of tea into boiling water.

BEEF TOAST.—Cut ½ lb. lean, juicy beef from the round into slices over ½ in. thick; lay them for a moment upon a very hot frying pan, which is perfectly free from grease; turn them quickly; when they are heated through, salt them and squeeze the juice from them in a lemon squeezer—those made of iron are the best; have a piece of toast, made from baker's bread, placed upon a very hot plate; pour the beef juice upon it and serve instantly; do not butter the toast, and add a dash of peppe , if not condemned by the physician.

BRANDY, EGG AND MILK.—Take a fresh egg; break it; separate the yolk from the white; whip each with a fork until it becomes a froth; thoroughly mix them together; add enough good milk or ordinary cream, well sweetened with finely ground loaf sugar, to make a tumblerful; pour in 1 tablespoonful of good brandy; if this is not convenient, a proportionate quantity of the best whisky may be used instead; mix with a fork, when it will be ready for the sick person.

CAUDLE.—Beat up 1 egg to a froth; add 1 wineglassful of sherry and ½ pt. of gruel; flavor with lemon peel and nutmeg, and sweeten to taste.

CEYLON MOSS.—Boil Ceylon moss, ½ oz., in water, 1 qt., till the liquid jellies on cooling; strain and flavor.

CHEESE WHEY.—Put the milk, fresh from the cow, into the churn; let it stand for 10 minutes, then begin churning; as soon as the flakes of the butter begin to float and the milk looks thin and blue, strain it off; repeat this twice a day.

CHICKEN BROTH.—The best parts of a young fowl use for a fricassee or a grill, and the inferior parts for the broth; or if it is an old fowl stew it till all the bones are bare in 1 qt. of water, and add a little more liquid if necessary; season the broth with salt, pepper, mace or onion, according to the taste and the appetite of the invalid. When the fowl has simmered until it has parted with all its nutriment, strain the liquid through a sieve; cool it, and remove the fat before it is warmed for use.

CHICKEN PANADA. — Clean and cut up a chicken; boil it slowly, bones and all, in 1 qt. of water till nearly done; take off the skin; cut off the white meat; remove the fat if there is any; pound it to a smooth paste with some of the water it was boiled in; when quite smooth, flavor it with a little salt, and the least bit of grated nutmeg and fresh lemon peel; boil it again gently for a few minutes; make it the consistency you like by adding more or less of the water it was boiled in; stir all the time.

COD LIVER SAUCE.—Add ½ lb. of cod liver, previously boiled, and cut into large dice, to a little anchovy sauce and ½ pt. of melted butter.

COD ROE AND LIVER.—Take a cod's roe; cut open the skin which surrounds it; put the eggs in a basin; pour water over them; mash with the hand, to separate them; throw away the water; add ½ lb. salt and 1 teaspoonful of pepper; let them soak all night; wash well 2 or 3 times, leaving about 1 gill in the bottom; put over it now 2 lbs. of the liver, in 6 or 8 pieces; put the stewpan on a very slow fire or in an oven for 1 hour; then take out the liver, which serve; add about 1 gill of melted butter to the roe.

COFFEE AND EGG.—Make a strong cup of coffee; add boiling milk as usual; sweeten; take an egg; beat yolk and white together thoroughly; boil the coffee, milk and sugar together; pour it over the beaten egg in the cup you are going to serve it in.

CREAM BISCUIT.—Put a cracker of the large thin kind, called ship biscuit, in the oven till it is thoroughly dry and crisp; lay it upon a soup plate and pour salted boiling water upon it; let it stand for a few minutes; keep it warm in the oven or on the back of the stove; pour off the water; take care not to break the shape of the cracker; lay a few slices of canned peaches upon it; slightly sweeten a cup of milk and cream, previously warmed but not scalded; pour over the cracker; put a little whipped cream in the centre to partially cover the fruit. If bananas are in season, and are allowed by the physician, slice one over the cracker instead of the canned fruit; add 1 spoonful of wine, fine brandy, or of the juice from fresh or canned pine-apples.

CRUMB JELLY.—Take a small roll; pare off the crust; cut the crumb into thin slices; toast them lightly on both sides; put them in 1 qt. of spring water; let it simmer gently over the fire until the liquid becomes a jelly; strain it through a thin cloth; flavor it with a little lemon juice, and sugar added when hot.

CUSTARD POWDER.—Rub up together gum tragacanth, 2 oz., potato starch, 1 lb., powdered tumeric, 2½ dr., with oil of bitter almonds, ½ dr., and essence of lemons, 1 dr.; put up into 1 oz. packets; from 1 pt. of new milk take 2 tablespoonfuls to work up with the powder; boil the remaining milk with 2 oz. of lump sugar; pour it, while boiling, into the basin; stir quickly until thoroughly mixed; bake as a custard.

DYSPEPTIC BREAD.—(See *Brown* and *Graham Breads* in BREAD.)

EGG AND MILK.—Beat up 1 egg very well, say for 20 minutes; add fresh milk, 1 pt., water, 1 pt., sugar to make it palatable; boil, and let it cool; drink when cold.

EGG ROTH.—Put 1 egg in the refrigerator long enough before it is wanted to have it become ice cold; separate the white from the yolk; into the latter stir 1 tablespoonful of cream (also ice cold), and 2 teaspoonfuls of white sugar; whip them together with a fork until they are quite frothy; add 1 teaspoonful of brandy; beat the white of the egg to a stiff froth; mix all together as lightly as possible and pour into a tumbler. If liquor is not allowed, substitute a small teaspoonful of lemon juice; first make it thick with sugar.

EGG WINE.—Beat an egg up well in a tumbler with a wineglass of cold water, and a glass of sherry; add sifted sugar to your taste; drink when all is thoroughly beaten up and frothy.

FLAXSEED LEMONADE.—4 tablespoonfuls of flaxseed; 1 qt. boiling water; juice of 2 lemons; pour the boiling water upon the flaxseed; steep 3 hours in a covered vessel; sweeten to taste; if too thick, add cold water with the lemon juice; ice for drinking.

FRUIT DRINK.—Put a large dessertspoonful of black currant jelly or preserved tamarinds into a tumbler; fill it up with boiling water; when cold, it is fit to drink; if too sweet, add a large quantity of water.

GLUTEN BREAD. — Fresh moist gluten, 24 oz.; bicarbonate of ammonia, 3¼ drs.; common salt, 1½ drs.; powdered caraway, 48 grs.; wheaten flour, 4½ oz.; powdered bran, 1½ oz.; salt butter, 4 oz.

GRUEL. — 1. Mix 2 tablespoonfuls of corn meal with 1 of wheat flour, or oat meal alone, and sufficient cold water to make a thick batter if the gruel is liked thick, stir it into 1 pt. of boiling water; if liked thin, add more water or milk; season the gruel with salt, and let it boil 6 or 8 minutes; stir frequently; take it from the fire; put in a piece of butter the size of a walnut, and pepper to the taste; turn it on toasted bread, cut in small pieces, or serve in a breakfast cup. — 2. Take a large tablespoonful of rice flour and mix to a stiff paste, with cold water; then stir it into the remainder of a pt. of boiling water, and let it boil for 15 minutes

with a stick of cinnamon, and a little rasped dried orange peel; strain it off, sweeten with loaf sugar, and add ½ glass or more of brandy.

ICELAND MOSS.—Iceland moss, 2 oz.; soak for 1 or 2 days in cold water; boil for 1 hour in water, q. s. to yield a strong solution; strain, decant the clear after repose, and apply heat; dissolve in it 1 dr. of isinglass; evaporate the whole to a proper consistence; put it into pots, and set them in a cool place.

IRISH MOSS.—(See same in MISCELLANEOUS DESSERTS.)

LEMON AND EGG. — Equal parts of sugared water and lemon juice into which the beaten whites of 2 or 3 eggs have been stirred.

LEMON SPONGE.—Dissolve ½ oz. gelatine and ½ lb. sugar, with the juice of 1 large lemon, in ½ pt. water; stir into this the whites of 2 eggs beaten to a stiff froth; let it come not quite to a boil and put it to cool in the dish in which it is to be served.

LEMON WHEY. — Pour into boiling milk as much lemon juice as will make a small quantity quite clear; dilute with hot water to an agreeable smart acid; put in a bit or two of sugar.

MUSTARD WHEY.—Mustard seed, bruised, 1½ oz.; milk, 1 pt.; water, 1 pt.; sugar, either loaf or moist, 2 oz.; boil the milk; throw in the seed; let it continue to boil till the curd completely separates; strain, and add the water, which should be in a boiling state; sweeten, and boil up the whole together.

OATMEAL AND BEEF TEA. — Take 2 tablespoonfuls of fine oatmeal and make it perfectly smooth in 2 spoonfuls of cold water; pour into this 1 pt. of strong beef tea; boil it 8 minutes; stir it all the time; it should be very smooth; if lumpy pass through a sieve.

ORANGE WHEY.—Put the juice of an orange, with a portion of the peel, in 1 pt. of boiled sweet milk; let it stand till it forms a curd, and strain.

OYSTER SOUP.—Procure the largest oysters; remove 6 from the can, 1 at a time, to a plate; insert a fork into the solid flesh; with a sharp knife make a slit up and down and across the abdominal cavity; slip the point of the knife under the dark mass thus exposed and thoroughly remove it, being as nice about it as you would in dressing any other fish; put into stew-pan; pour out proper share of liquor, 1 pt. of water and ½ gill of cream; add salt; pepper, if there be no fever; 1 teaspoonful of lemon juice or 2 of pure cider vinegar; bring just to the boil and pour into a dish; break in cracker or nicely toasted thin slice of light bread; a little fresh butter makes it richer.

PANADA.—Take a slice of wheat bread; break into fragments; sprinkle over it 1 teaspoonful of ground cinnamon; put into a cup; pour on it 1 pt. of boiling water; boil a few minutes until well mixed; add some sugar with a little grated nutmeg; if desired a piece of butter may be put in, and also some wine or brandy.

RACAHOUT. — Chocolate, in powder, 1 oz.; rice flour, 3 oz.; potato arrowroot, 3 oz.; white sugar, 9 oz.; vanilla (pulverized with a part of the sugar), 1 dr.

RASPBERRY VINEGAR. — Pour 1 qt. of pure cider vinegar over 3 qts. of ripe raspberries in a dish; let it stand 24 hours; strain it; pour the liquor over 3 qts. of fresh raspberries; let it infuse again for a day and night; strain again, and add 1 lb. white sugar to each pt. of juice; boil 20 minutes; skim it well; bottle and seal when cold.

RENNET WHEY. — Heat 1 qt. of new milk; add a large tablespoonful of rennet; boil until the curd separates, which must be removed.

RENNET WINE.—Take the fresh rennet bag of a calf; cut off and throw away 3 in. of the upper or cardiac extremity; slit the rest longitudinally; wipe gently with a dry napkin; do not remove the clean mucus; cut it into small pieces, and put into a common wine bottle filled up with good sherry; let it remain corked for 3 weeks.

RICE CAKE. — Beat the yolks of 15 eggs for nearly ½ an hour with a whisk; mix with them well 10 oz. of finely sifted white sugar; put in ½ lb. ground rice, a little orange flower water or brandy, and the rinds of 2 lemons grated; add the whites of 7 eggs, well beaten up; stir the whole for ½ hour; put into a hoop and bake for ½ hour in a quick oven.

SAGO. — Wash 1 oz. of pearl sago in cold water; boil it very gently in 1 pt. of fresh water; stir it frequently till dissolved; flavor with wine, spices and sugar; for children and for consumptive and debilitated persons, substitute milk for water.

SAGO or TAPIOCA MILK.—Take 1 oz. of either of these; soak it in 1 pt. of cold water for 1 hour; pour off this water; add 1½ pts. of good milk; boil slowly until well incorporated.

SAGO POSSET.—Macerate a tablespoonful of sago in 1 pt. of water for 2 hours on the hob of a stove; boil for 15 minutes, assiduously stirring; add sugar with an aromatic, such as ginger or nutmeg, and a tablespoonful or more of white wine; if wine is not permitted, flavor with lemon juice.

TAPIOCA.—1. Boil ½ lb. of tapioca till soft in 2 qts. of water; drain in a colander; put it back in the pan; season with salt and pepper; add ½ pt. of milk; put over 1 lb. of fresh cod-liver, cut in 8 pieces; set the pan near the fire to simmer slowly for ½ an hour, or a little more, till the liver is quite cooked; press on it with a spoon to squeeze out the oil; take away the liver, and mix the tapioca; if too thick, add a little milk; boil for a few minutes; add a little more salt and pepper, and serve.—2. Put a large tablespoonful to soak overnight; boil 1 pt. of new milk the next morning; sweeten it; add the tapioca and the yolks of 2 eggs well beaten; flavor with extract of vanilla; put in a dish to cool; cover the top with the whites of the eggs beaten stiff with a little sugar and vanilla; place in the oven to brown slightly.

TOMATO SYRUP.—Express the juice of tomatoes and add 1 lb. sugar to each qt. juice and bottle; when needed, mix with enough water to make a pleasant drink.

VINEGAR WHEY.—Milk, 1 pt; vinegar ½ oz.; boil for a few minutes; separate the curd.

WHITE WINE WHEY.—Boil ½ pt. new milk; as soon as it boils up, pour in as much white wine as will turn and make it look clear; boil it

up; set the saucepan aside till the curd subsides, and do not stir it; pour the whey off; add to it ½ pt. of boiling water and a bit of white sugar.

MARKETING.

BUTTER.—A smooth unctuous feeling in rubbing a little between the finger and thumb, expresses its rich quality; a nutty smell and rich aroma indicate a similar taste; and a bright, golden, glittering, cream-colored surface shows its high state of cleanliness. It may be necessary to use the trier, until you become an expert in testing by taste, smell and rubbing. To test butter more thoroughly melt and render it free from all salt and water by filtration. Then put 10 gr. into a test tube and liquefy by placing the tube in hot water at 150° Fahr.; remove the tube when ready and add 30 minims of carbolic acid; shake the mixture and place it in the water bath until it is transparent. Set the tube aside for a time, and if the sample is pure the solution will be perfectly clear. If beef, mutton, or pork fat be in it, the mixture will resolve itself into 2 solutions of different densities, with a clear line of demarkation. Oleomargarine is detected by heating the sample, which will turn from clear yellow fat to black, and emit an odor of fat.

COFFEE.—Ground coffee is frequently adulterated with roasted grains, roots, acorns, sawdust, burnt sugar, and baked horses' and bullocks' livers. Roasted coffee is imitated by chicory molded into the form of coffee-berries. The presence of caramel or chicory in ground coffee may easily be detected as follows: Place a spoonful of coffee gently on the surface of a glass of cold water; if the coffee is pure it will float for some time and scarcely color the liquid; if the contrary is the case, it will rapidly absorb the water and sink to the bottom of the glass, communicating a deep reddish brown tint as it falls.—2. Shake a spoonful of coffee with a wineglassful of cold water, and then place the glass on the table; if it is pure it will rise to the surface and scarcely color the liquid, but if not it will sink to the bottom, and the water will be tinged red as before.

EGGS.—Hens' eggs are the best; but for some purposes those of turkey and pea-hens are desirable; those of ducks and geese are coarse and inferior. To test whether the eggs are fresh or not, the following are good methods: 1. Dissolve 120 grammes of common salt in a liter of water; put an egg in this solution on the day it is laid and it will sink to the bottom; 1 day old will not reach quite to the bottom of the vessel; one three days old will swim in the liquid; while one more than 3 days' old will swim on the surface.—2. With the hands or a piece of paper rolled in a funnel shape, hold an egg toward the light; if the egg is clear and golden in appearance, it is good; if it is dark or spotted, it is bad.—3. Make an egg tester by fitting a looking-glass in the bottom of a cigar box; cut round holes in the cover, just large enough for the eggs to fit in nicely and not drop through when set in large end downward; make a slit near the end of the cover, 1x2 in. to look through; with the eggs in place, hold the box in any strong light; peep down into the glass, and the fertile eggs will be dark and opaque, and the unfertile ones transparent.—4. When eggs shake they are stale.

FISH.—The finest flavored fish are sea fish, and those which live in both salt and fresh water, such as salmon, shad and smelts; in the choice of every kind of fish, the chief characteristics to be observed are stiffness, fullness of the eyeballs, brightness of the eyes, redness of the gills, and little or no permanent impression should be made by the ordinary pressure of the finger. Fresh fish, also, always lie in a curled position.

FLOUR.—This is easily tested as follows: 1. Squeeze a little in the hand, and if it is good it will hold together in a mass and show the impression of the fingers; if it works soft and sticky when kneaded between the fingers, it is poor.—2. Throw a little against a dry perpendicular surface and if it falls like powder it is bad.—3. It should have a white, yellowish colored tint.—4. Mix with the flour some juice of lemon or good vinegar; if the flour be pure, they will remain together at rest; if there be a mixture of whitening or chalk, a fermentation, or working like yeast, will ensue.—5. Dip the ends of the forefinger and thumb in sweet oil; take up a small quantity of flour between them; if it be pure it will turn nearly black; if whitening be in it, it will not change color.

FRUIT.—All fruit should be bought ripe and sound; it is poor economy to buy imperfect or decayed kinds, as they are neither satisfactory nor healthy eating; while the mature, full flavored sorts are invaluable as food.

GAME.—When hares and rabbits are young and fresh, the cleft in the lip is narrow, the body stiff, the ears tear easily, and the claws are smooth and sharp; the greater the depth of fat upon a haunch of venison the better the quality of the meat will be, if it is a clear white and the lean of a dark hue.

GAME BIRDS.—Fine game birds are always heavy for their size; the flesh of the breast is firm and plump, and the skin clear; if a few feathers be plucked from the inside of the leg and around the vent, the flesh of freshly killed birds will be fat and fresh colored; if it is dark, and discolored, the game has been hung a long time; the wings of good ducks, geese, pheasants, and woodcock are tender to the touch; the tips of the long wing feathers of partridges are pointed in young birds, and round in old ones; yellow legs and a dark bill are signs by which a young bird may be known, and a rigid vent when fresh; when this part is green the bird is stale; pigeons, when fresh, have supple feet, and the vent will be firm; if discolored and supple, they are stale; plovers, when fat, have hard

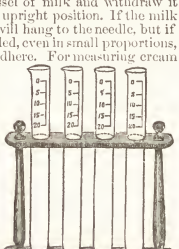
vents; but, like almost all other birds, may be chosen by the above rules; quail, snipe and small birds should have full, tender breasts; woodcock and snipe, when old, have the feet thick and hard; when these are soft and tender they are both young and fresh killed; when their bills become moist, and their throats muddy, they have been too long killed.

MEAT.—For the different parts of meat see SLAUGHTERING of the animals in LIVE-STOCK. The muscular part of beef, that is most used, while it is toughest, gives the most nourishment; but it needs to be cooked differently from the tender parts. When buying meat, remember that the tenderest parts come from that part of the animal where there is least muscular exertion. The tough parts of the meat, which would be unpalatable if broiled or roasted, may be with profit stewed, braised or made into soup. The pieces of beef generally used for roasting, some of them also being used for steaks, are the thirteen ribs, the hip and thick sirloin, the middle cut sirloin, the cross-rib pieces, the rump, the first cut of the round, and occasionally the tenderloin. The piece most prized is the third, fourth and fifth ribs, coming from the sirloin toward the neck; the next best piece is the first and second ribs; then the sixth and seventh, the eighth and ninth, etc. Some prefer the sirloin to the ribs, which is only a matter of taste. Steaks are cut from the following pieces: Tenderloin, sirloin, chuck, cross-rib, rump and neck. Butchers generally cut the steaks too thin. A steak should never be less than three-quarters of an inch in thickness. In selecting beef to roast, have some of the bone removed, then make the butcher skewer the beef. The best beef steak for broiling is porter-house. The best beef for *à la mode* is the round; have the bone removed and trim off all the gristle; for corned beef the round is also the best. For a mutton roast choose the shoulder, the saddle or the loin and haunch. The leg should be boiled. Small rib chops are best for broiling; those cut from the leg are generally tough. Mutton cutlets to bake are taken from the neck. For roast veal the loin, breast, or shoulder is good. Veal chops are best for frying; cutlets are apt to be tough. Never select a ham which is too lean. The joint should be well rounded and plump, and the skin thin and pliable. The color of any kind of meat should not be either a pale pink or a deep purple. It should have a marked appearance from the ramifications of little veins of fat among the muscles. It should have little or no odor. The smell of the knife is a good guide in testing meat by its odor, especially hams. Bacon should have a thin rind and the fat be firm and tinged red by curing; the flesh should be a clear red and firmly adhere to the bone. Liver, kidneys, etc., may be safely bought if they show a bright even color and are free from marks of bruises. The best kind of pork is fresh and pinkish in color, and the fat is firm and white. The second quality has rather hard, red flesh, and yellowish fat. The poorest kind has dark, coarse grained meat, soft fat, and discolored kidneys. The flesh of stale pork is moist and clammy, and its smell betrays its condition. Measly pork has little kernels in the fat, and is unhealthy and dangerous food. Prime veal has a light flesh color and an abundance of hard, semi-transparent fat.

MILK.—The removal of the cream and the addition of water are the commonest frauds practised by the milk dealer; potato starch is occasionally added to both milk and cream, to give them a richer appearance, and to increase their quantity. Sometimes milk is unwholesome, because the cow from which it was taken was unhealthy. Sometimes it is very injurious, because the vessels into which it was milked were rinsed with impure water. The purity of the milk may be tested by a lactometer, which consists of a glass tube with a bulb at its lower extremity, in which is a little mercury so adjusted as to make a mark on the scale float exactly level with the surface of the distilled water. When the jar accompanying it is nearly filled with the milk to be examined (taking care to shake up the cream just before doing this), the instrument rises in proportion to the density, and by casting the eye along the surface of the milk the number on the scale on a level with it will indicate the exact specific gravity. A polished knitting needle makes a good lactometer. Dip the needle into the vessel of milk and withdraw it immediately in an upright position. If the milk is pure some of it will hang to the needle, but if water has been added, even in small proportions, the fluid will not adhere.

Lactometer.

For measuring cream the best instrument is a creamometer, which consists of 3 or 4 glass tubes divided into 100 parts and graduated near their upper ends; these tubes are supported in a wooden stand. The cream is placed in these, and after standing 12 hours the cream will have risen to the surface, and the figure opposite its lower edge will mark the percentage of cream to milk. The presence of potato starch may be determined by boiling some of the milk with a little vinegar; after separating the coagulum by a strainer, and allowing the liquid to become cold, testing it with solution or tincture of iodine; if it turns blue, starch, flour, or some other amylaceous substance, has been used to adulterate it. A simple method of determining the quantity of cream in any sample of milk consists in agitating the milk in a graduated glass tube with its bulk of ether for 4 or 5 minutes; add alcohol in volume equal to that of the milk, and shake for 5 minutes; place the tube vertically and allow it to rest for a brief period, when



Creamometer.

the oily matter will rise to the surface, so that its amount may be read off on the scale and the percentage easily computed.

POULTRY.—Fresh poultry have full, bright eyes, pliable feet, and soft moist skin; the best is plump, fat, and nearly white, and the grain of the flesh is fine. The feet and neck of a young fowl are large in proportion to its size, and the tip of the breast bone is soft and easily bent between the fingers. The young cock has a smooth leg and a short spur; when fresh the vent is close and dark. Hens, when young, have smooth legs and combs; when old, these will be rough; a good capon has a thick belly and large rump, a poll comb, and a swelling breast. Young ducks and geese are plump, with light, semi-transparent fat, soft breast bone, tender flesh, leg joints which will break by the weight of the bird, fresh colored and brittle beaks, and windpipes that break when pressed between the thumb and forefinger. In selecting a goose or duck, take hold of the toes and pull them apart; if the web separates easily it is young. Young pigeons have light red flesh upon the breast and full, fresh colored legs; when the legs are thin, and the breast is very dark, the birds are old. Turkeys are good when white and plump, have full breasts and smooth legs, generally black, with soft loose spurs; hen turkeys are smaller, fatter and plumper, but of inferior flavor to gobblers; old turkeys have long hairs, and the flesh is purplish where it shows under the skin on the legs and back. Fresh killed, the eyes are full and clear, and the feet moist When they have been kept too long, the parts about the vent begin to wear a greenish discolored appearance.

SUGAR.—Sugar of the inferior kinds is sometimes adulterated with flour, gum, etc.; it is, however, more frequently impure than intentionally adulterated; sugar is frequently adulterated with glucose; its presence can be discovered as follows: Take a handful of the mixture and drop it into a glass of cold water; stir it a few minutes; the cane sugar will entirely dissolve, leaving the grape sugar undissolved at the bottom of the glass in the form of a white, sticky substance not at all unlike starch in looks, and quite bitter to taste; the impurities and adulterations may also be detected by the appearance; a pure sugar being light colored, highly crystalline and very dry; impure sugars are dark colored, imperfectly crystalline, small grained, often presenting an earthy appearance, damp and heavy; they may also be tested by the touch; a good sugar should be perfectly dry to the touch, and should not feel in the least sticky or clammy when pressed between the fingers; on the other hand, a bad sugar, when treated in the same way, feels moist and sticky.

TEA.—The only adulteration of tea which is practiced to any great extent, is that of mixing it with exhausted leaves which have been redried, gummed, curled and faced with coloring matters; the leaves of the sloe tree, ash tree, elder bush and white thorn, are often sold as tea; it is a practice among some grocers to give what they call "a bloom" to green teas, by shaking them up with a little calcined magnesia or finely powdered French chalk; black teas are faced in a similar manner with finely powdered black-lead; many of these substances may be detected by simply stirring the tea in a little cold water, when they will become detached, and either make the water turbid or sink to the bottom.

VEGETABLES. — In buying these, particular attention must be given to their appearance; even this is often deceiving, as the dealer will brighten up the stale vegetables by the use of water; if the out end of asparagus is brown and dry and the heads bent on one side, the asparagus is stale; to be sure that the mushrooms are genuine, sprinkle a little salt on the spongy part or gills of the sample to be tried; if they turn yellow they are poisonous; if black they are wholesome; allow the salt to act before you decide on the question; false mushrooms have a warty cap, or else fragments of membrane, adhering to the upper surface they are also heavy, and emerge from a vulva or bag; they grow in tufts or clusters in woods, on the stumps of trees, etc., whereas the true mushrooms grow in pastures; false mushrooms have an astringent, styptic and disagreeable taste; when cut they turn blue; they are moist on the surface, and generally a rose or orange color; the gills of the true mushroom are of a pinkish color; the flesh is white and the stem is white, solid and cylindrical; when peas are young the shells are green; when newly gathered they are crisp; when old they look yellow; and when plump the peas are fine and large. To test a potato take a sound one, paying no attention to its outward appearance and divide it into two pieces; then examine the exposed surfaces; if there is much water it will be soggy when boiled; in regard to color, a yellowish white indicates a good potato; if it is a deep yellow, it will not cook well; rub the 2 pieces together and a white froth will appear around the edges and upon the 2 surfaces; this signifies the presence of starch, and the more starch the better the potato; test the strength of the starchy element by releasing the hold upon one piece after rubbing it against the other; if it clings to the other it is a good sign. When watermelons are to be bought, look for small specks, scales or blisters on the outer cuticle or rind; these are multiplied and enlarged as the fruit matures; a ripe melon will show them thick over the surface; a partial development only indicates half ripened fruit; a full crop of blisters reveals its perfect ripeness.

VINEGAR. — This article is often adulterated by water, burnt sugar, sulphuric acid, chillies, etc.; that which is used for pickles is frequently contaminated with copper; this is caused by the imprudent use of copper vessels; in order to detect the presence of copper in the vinegar, put a few drops of nitric acid into the suspected fluid, and then place in it a piece of polished iron or steel; if copper be present it will at the end of 24 hours be deposited on the iron.

PRESERVING.

CANNED FRUIT.

REMARKS.—In canning, glass jars are in every way preferable, and, in the end, cheaper than tin cans, either for fruit or vegetables. With care they will last many years, though new rubber bands will be needed now and then. The fruit used for canning should be of the best quality and as freshly picked as possible. It is best to select well ripened fruit; not, however, dead ripe and soft. Coarse-grained varieties seldom can so well as the more highly flavored kinds. When the fruit has been peeled and pitted, place it in a preserving kettle and cook it properly; while it is still boiling hot, fill the cans full to the very brim, put on elastics, wipe the jar, screw the top down at once and tighten it several times afterwards. As simply pouring boiling water over fruit does not expel the air, fruit treated in this way will spoil. Partly filled jars will also spoil. If it is desired to cook berries in the jars in which they are to be canned, fill the jars with the fruit and set them in a wash boiler on wooden slats, so as not to touch the bottom. Pour in cold water until it reaches the rims of the jars and heat until the fruit is well cooked. The syrup in which all canned fruits are cooked should be composed of water and sugar, in the proportion of 4 oz. sugar to 1 pt. water. For a highly flavored syrup, express the juice by means of a press, freeing the fruit from the seeds, into bottles of convenient size, which cork, when filled, and set aside on ice till wanted. All fruits do not require the same degree or the same continued application of heat. Fruits of delicate texture, such as berries, should not be brought quite to the boiling point; while orchard fruits may be boiled, but not so rapidly as to soften or macerate them. The preservation of canned fruit depends a great deal on the place in which they are stored, and upon the manner in which they are made air tight. If you put them in a cellar, unless it is unexceptionally dry, they will gather mold and lose all the fine, fresh flavor it is so desirable to retain. If kept in too warm a spot, they will ferment and burst the cans. Severe cold does not injure them unless the weather is below zero; but a double walled closet in a fireless room on the second floor is one of the best places for storing canned fruit in winter; and in summer a cool milk room will be found safe. Metal covers should never be used on cans or jars. They must be sealed tightly to exclude the air. For sealing wax for fruit cans see *Sealing Wax* in CEMENTS, GLUES AND PASTES. For preserving dried fruits, etc., see same in CURING AND STORING.

APPLES.—Take 10 lbs. apples after they have been sliced, pared and cored, 5 lbs. sugar, 1 pt. vinegar, and spices to suit the taste; steam the apples till they are soft; put them in the sugar, vinegar and spices; let them cook a few minutes, and then seal them in jars.

APRICOTS.—Take 4 lbs. of fine apricots which are not fully ripe; let them be gathered, if possible, in the morning, when the sun is on them,

Family Paring, Slicing and Coring Machine.

as the flavor is then much the best; make a small slit with a knife at the end where the stalk has been, and push the stone gently out; if they are to be preserved in halves, the stone can be easily removed; throw them into cold water, and simmer them gently until they feel soft when a pin is pushed through them; take them out and put them in fresh cold water; put into a preserving pan 1 qt. of water and 4 lbs. of loaf sugar; put it on a moderate fire, and stir it until the sugar is dissolved; when it boils, put in 1 tablespoonful of cold water; when it boils up again, take it off the fire and let it stand for a few minutes to settle; take off the scum, and boil it again; drain the fruit, and put it into the syrup; let it boil up 4 or 5 times, every time taking it off to cool, when it must be well skimmed; the last time, let it remain until the fruit is quite clear, which will be in about 10 minutes; just before it is taken from the fire, blanch and slice a few of the kernels and add them to it; or they may be blanched and put into a little spirit until the jars are ready to be tied up, and then a few strewn at the top of each.

CRAB APPLES.—To 5 lbs. apples take 3 lbs. sugar; make a syrup; when boiling put in apples; boil until soft; seal immediately in heated cans. The apples must not be pared.

GRAPES.—Take the clusters of grapes; look them over carefully; cut out all the imperfect ones with a pair of scissors; lay them as closely as possible, without crushing, into the cans; take the wash boiler, lay a folded towel on the bottom, set the cans in, in water, as closely as they will stand; set the boiler on the stove; let it heat slowly; allow it to boil 20 minutes, then set it off; have boiling syrup of sugar and water ready; fill up the cans and seal them.

PEACHES.—Always use twice as much water as sugar; make the syrup; and at the same time peel, halve and drop the peaches into boil-

ng water; let them simmer until a silver fork can be passed through them easily; then lift each half out separately with a wire spoon and fill the can; pour in all the boiling syrup which the jar will hold; leave it a moment for the fruit to shrink while filling the next jar; add as much more boiling syrup as the jar will hold; cover and screw down tightly immediately; continue in this way, preparing and sealing only one jar at a time, until all is done.

PEARS.—Allow a pt. of water and ¼ lb. of sugar to a qt. of fruit; drop each pear, after it is pared, into a pan of clear water; when the syrup has come to a fast boil, put in the pears carefully, not to bruise them; boil them until they look clear and can be easily pierced with a fork; have the cans rolled in hot water; pack them with the pears and fill to overflowing with the scalding syrup, which must be kept on the fire until wanted, and seal.

PLUMS.—To 1 lb. of fruit, allow ½ lb. of sugar and 1½ gills of water; prick each end of the plums quite through with a darning needle; wash, and put them in a stone jar; make the syrup; skim and pour boiling over the plums; turn a plate over them to keep the plums under the syrup; let stand until the next day; pour the syrup from the plums and let boil again; then return to the plums; repeat this process 3 days; then put the syrup over the fire; when it comes to a boil add the plums; let it cook slowly ¼ of an hour; fill the cans as quickly as possible.

QUINCES.—Cut the quinces into thin slices like apples for pies; to a 1 qt. jarful of quinces take 1½ coffee-saucers of sugar and a coffee-cup of water; put the sugar and water on the fire; when boiling put in the quinces; have ready the jars with their fastenings; stand the jars in a pan of boiling water on the stove; when the quince is clear and tender put rapidly into the jars, fruit and syrup together; fill the jars so that the syrup overflows, and fasten up tight as quickly as possible.

STRAWBERRIES.—For every 2 boxes of fresh strawberries, take 1 coffeecupful of white sugar, add a tablespoonful or two of water to the fruit if there is no juice in the bottom, to prevent burning before the heat brings out the juice; as soon as the fruit boils, add the sugar; stir gently for a few minutes until it boils up again, and can immediately.

Canned Vegetables.

BEANS.—Prepare the beans as if for immediate use; put them on in a kettle of cold water; boil until tender; have ready the tin cans and the tea-kettle of boiling water; dip the beans out into the cans and fill up with the boiling water from the teakettle; seal immediately.

CORN.—Fill the cans with fresh corn, husked and cut from the cob; fasten them up; set them in a boiler containing enough water to cover, and surround them with straw to prevent their striking together; heat the water by degrees and allow it to boil 1½ hours; make a small opening in the top of the can for the escape of the gas and then seal immediately.

PUMPKIN.—Cut up the pumpkins; cook them thoroughly and strain the same as for immediate use; return the mass to the kettle; let it get hot; can it the same as any vegetable; pack down well, so there are no air bubbles.

RHUBARB or PIE PLANT.—Cut fresh rhubarb into inch pieces; place a layer in a large earthen dish; sprinkle liberally with sugar; when the dish is filled, turn a large dinner plate over it; place in the oven and bake until done; have the canning jars heated; fill at once, and screw on the covers; tighten them every ½ hour until they are absolutely air tight.

TOMATOES. — Select nice large fruit; pare carefully, without scalding; cut away all defective parts; place in a preserving kettle over a hot fire; have the cans thoroughly cleansed and rinsed; as soon as the tomatoes come to a boil, fill the cans, being careful to keep the fruit as whole as possible; press the fruit into the can; when full, put in hot juice until it will hold no more; seal; wipe off the can and set aside.

Jams.

REMARKS. — Let the jam be made on a dry day; wipe the fruit clean, but do not wash it; peel off the skin and coarse fibers; slice the fruit thin; to each lb. thus prepared allow 1 lb. of fine sugar in fine powder; put the fruit in a pan; strew a quarter of the sugar amongst it and over it; let it stand until the sugar is dissolved; boil it slowly to a smooth pulp; take it from the fire; stir in the remainder of the sugar by degrees; when it is dissolved, boil the preserve quickly until it becomes very thick, and leaves the bottom of the pan visible when stirred; the time required for jams depends on the kind of fruit used, and the time of year it is made; it will vary from 1 hour to 2½; the juice should be slowly drawn from it first.

APPLE BUTTER.—Boil 40 gal. cider just from the press; when boiled away ½ to ⅔, add 7 or 8 wooden pails of nicely prepared quarters of sweet apples; stir constantly until boiled down to 15 gal.; when almost done throw in pulverized allspice.

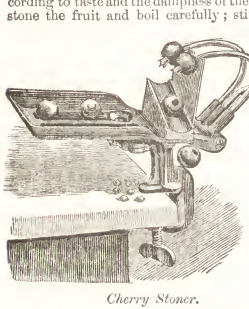
APPLE JAM. — Peel and core the apples; cut them in thin slices; then put them into a preserving pan or enameled saucepan; to every lb. of fruit add ¾ lbs. of white sugar, broken small; and put in tied up in coarse muslin, with a few cloves, a small piece of ginger and a rind of a lemon very thin; stir with a wooden spoon on a quick fire for 20 minutes or longer; when sufficiently boiled, the jam will cling to the spoon; remove the cloves, etc.; put the jam in-

to jam pots; when quite cold, tie them down with thick paper or bladder.

APRICOT JAM.—Pare the apricots as thinly as possible; break them in half; remove the stones; weigh the fruit; to every lb. allow the same proportion of loaf sugar; roll the sugar fine; strew it over the apricots, which should be placed on dishes; let them remain 12 hours; put the sugar and fruit into a preserving pan; let them simmer very gently until clear; take out the pieces of apricots singly as they become clear; as fast as the scum arises carefully remove it; put the apricots in small jars; pour over them the syrup; cover the jam with pieces of paper dipped in the purest salad oil; stretch over the top of the jars tissue paper cut about 2 in. larger and brushed over with the white of 1 egg; when dry it will be perfectly hard and air tight.

BLACKBERRY JAM. — Dry the berries with a towel if they are not picked in dry weather; to every lb. of fruit add ½ lb. of sugar; cook for 1 hour; stir all the time; no water; put in patent glass jars.

CHERRY JAM.—Take picked and stoned cherries; to every lb. allow ½ to ¾ lb. of sugar, according to taste and the dampness of the season; stone the fruit and boil carefully; stir for ½



Cherry Stoner.

hour; add the sugar; boil and skim for another ½ hour; just before it is done add some of the blanched and split kernels or a few drops of rutafia.

CURRANT JAM.—To every lb. of fruit allow 1 lb. of sugar; gather the currants on a fine day; pick them from the stalks; put them into a preserving pan with the sugar broken into small pieces; bring it gradually to a boil; then let it simmer; remove the scum as it rises, and stir the jam constantly; when done, put it into pots with brandy paper, or paper steeped in starch, over them; tie them down closely.

ELDERBERRY BUTTER. — 1 gal. of elderberries; 2 qts. of sugar and 1 pt. of vinegar; boil for 5 hours, stirring often.

GOOSEBERRY JAM.—Equal weights of fruit and sugar; top and tail the not very ripe gooseberries; simmer them in a syrup made by boiling ½ pt. of water with every lb. of sugar for ¼ hour; carefully skim till clear and firm; try a little of the juice on a plate; if it jellies when cold, it is done; pour it into pots; when cold, cover and set in a dry place.

GRAPE BUTTER.—Cook grapes until the skins are tender; rub through a colander fine enough to retain the seeds; to each pt. of pulp add ½ lb. of sugar, or more, if the butter is desired firmer and richer; boil down with great care to prevent burning, to the desired consistency; add spices, if liked.

GRAPE JAM.—Pinch the pulp from the grapes; lay the skins on one side; put the pulp over the fire with very little water; boil 20 minutes and then strain it through a sieve; put it back over the fire and add sugar and spices to taste; ½ cup of sugar to 1 lb. of the pulp will be enough; when it boils drop in the skins; boil 10 minutes; if it seems too thin, boil another 10 minutes.

LEMON BUTTER.—1 lb. of white sugar; ½ lb. of fresh butter; 6 eggs; juice and grated rind of 3 lemons; take out all the seeds; boil all together a few minutes, till thick as honey; stir constantly; put in small jars or tumblers, covered with paper dipped in white of egg.

PEACH BUTTER.—Pare ripe peaches and put them in a preserving kettle; use sufficient water to boil them soft; sift through a colander; remove the stone; to each qt. of peach put 1½ lbs. sugar; boil very slowly one hour; stir often and do not let them burn; put in stone or glass jars and keep in a cool place.

PLUM BUTTER.—Look over the plums carefully; discard any specked one; put into sufficient hot water to cover them; add 1 teaspoonful of soda to every ½ bu. of plums; boil until the skins crack; drain and rub through a colander; take pint for pint of the pulp and granulated sugar; heat in a porcelain kettle slowly 20 minutes; stir to keep from burning; store in a crock in any cool place.

RASPBERRY JAM.—Clean and crush the fruit thoroughly; boil 15 minutes before adding sugar; ¾ lb. sugar to 1 lb. fruit; then boil 30 minutes longer; stir constantly; for this purpose a small wooden paddle 6 in. wide, the lower end rounded to fit the bottom of the kettle, full of holes, and tapered to the handle, to which it is attached by a mortise and tenon at right angles, is a convenient article; the handle should be 1 yd. long.

RHUBARB, or PIE PLANT JAM.—Cut the plant into pieces about an inch long; to 1 lb. of rhubarb put 1 lb. of yellow sugar; cut it up the afternoon before it is to be cooked; scatter the sugar over it and let it stand all night; in the morning drain off the syrup which has formed; boil it until it thickens; add the rhubarb and a twig of green ginger sliced fine; boil it until it is perfectly tender.

STRAWBERRY JAM.—Same weights of strawberries and pounded white loaf sugar; mash up the berries well in preserving pan first; add sugar afterward; boil for 20 minutes; stir well and skim.

TOMATO JAM.—To 1 lb. of peeled and cut tomatoes allow ½ lb. of sugar; put together over

night in a stone jar; in the morning take off juice; strain, boil and skim it; put in the tomatoes with a handful of best stick cinnamon tied in a cloth; stir constantly, and boil until the jelly will not separate; about 10 minutes before removing from the fire take out the cinnamon; add 1 teacupful of good vinegar to each gallon of jam, seal.

JELLIES.

REMARKS.—Cook the fruit in a porcelain kettle, with or without water, according to its nature, until it is well softened; strain through a flannel bag previously rinsed in hot water; to every pint of juice allow 1 full rounded pint of sugar; boil the juice for 20 minutes, noting time from the instant it begins to boil; heat the sugar by placing in an oven on platters; after the juice has boiled 20 minutes skim and add the sugar; when this is dissolved and the juice is still boiling, pour it into the glasses. Add the beaten white of an egg to the juice to clarify it.

Jelly Mold.

ALMOND.—Rich almond milk, ½ pt.; thick hartshorn jelly, ½ pt.; sugar, 2 oz.; 2 or 3 bitter almonds, and a little lemon peel to flavor; heat together; strain and mold.

APPLE.—20 large, juicy apples; pare and chop; put into a jar with the rind of 4 large lemons, pared thin and cut in bits; cover the jar closely, and set it in a pot of boiling water; keep water boiling hard all around it until the apples are dissolved; strain through a jelly bag, and mix with the liquid the juice of the 4 lemons; put 1 pt. of mixed juice to every lb. of sugar in the kettle; when the sugar is melted set it on the fire; boil and skim about 20 minutes, or until it is thick, fine jelly.

BARBERRY.—Take some very ripe barberries; pick them from their stalks and weigh them; to every pound of fruit take ¾ lb. of loaf sugar; add sufficient water to make it into a syrup; put in the barberries; boil them until the syrup comes to the pearl; take off any scum which may rise; throw them into a fine hair or lawn sieve; press the berries with a spoon to extract as much juice as possible from them; receive the syrup and juice in a pan; put it again on the fire, and finish as apple jelly.

BLACKBERRY.—Gather the fruit when perfectly ripe, and in very dry weather; put the blackberries into a jar, and place the jar in hot water; keep it boiling until the juice is extracted from the fruit; pass it through a fine sieve or jelly bag without much pressure; for every pint of juice add 14 oz. of sugar; boil in a clean preserving pan about 25 minutes; carefully take off the scum as it rises to the surface; place it hot in small jars and cover it with thin tissue paper, dipped in brandy, and brown paper over it; keep in a cool, dry place.

CALF'S FOOT.—Wash and prepare 1 set of feet; place them in 4 qts. of water, and let them simmer gently 5 hours; at the expiration of this time, take them out and pour the liquid into a vessel to cool; when cold, remove every particle of fat; replace the jelly in the preserving kettle; add 1 lb. of loaf sugar, the rind and juice of 2 lemons; when the sugar has dissolved, beat 2 eggs with their shells in 1 gill of water; pour this into the kettle and boil until perfectly clear; add 1 gill of Madeira wine and strain through a flannel bag into any form desired.

CHAMPAGNE.—Take 2 oz. of good gelatine; dissolve it in 1 qt. of water; put this in a saucepan with the juice of 2 lemons and 3 oranges, 2 whole eggs, 2 whites of eggs, a few egg shells and ¾ lb. of sugar; mix well and add another quart of water; put the saucepan on the fire; stir occasionally to make clear; when it boils, put the pan on the side of the stove; let it remain without boiling for 15 minutes; remove it and run the jelly twice through a flannel strainer; add to it 1 pt. of champagne; pour into one or more molds and set on the ice to harden; turn out of the molds and serve on cold plates.

CHERRY.—Take the stalks and stones from 2 lbs. of dark red, fleshy cherries; put them in a basin; pound the kernels; squeeze the juice of 4 lemons through a tammy; mash the cherries; put first in ½ pot of currant jelly; then the kernels; lastly the lemon juice; mix these well together; boil and skim 1 pt. of clarified sugar and isinglass; put the cherries into a jelly bag; pour the sugar, etc., over them; run it through till quite clear; if not sufficiently sweet add more sugar; if the contrary, add more lemon juice; wet the mold; set in ice, and fill it with the jelly, but do not turn it out till the last minute.

CIDER.—Soak ½ box or 1 oz. of gelatine in 1 qt. of sweet cider for 10 minutes, and a small cupful quince or crab-apple jelly; chop fine; place the pan over the fire until all is dissolved; add a small cupful white sugar while hot; strain into metal molds, previously oiled to prevent its sticking.

CRAB APPLE.—Cut out the blossom ends and quarter the apples, but do not peel or core them; put into a stone jar; cover well, and set in a kettle of tepid water, with a block or small tin in the bottom; let it boil thus nearly all day; leave it in the covered jar until next morning; sift through a colander, and afterwards strain through a jelly bag; allow 1 lb. of sugar for 1 pt. of juice; boil the juice 20 minutes; add the hot sugar; stir well; let all boil up together 2 or 3 minutes.

CRANBERRY.—1 qt. cranberries and ½ lb. sugar; wash the berries and cut each in two; put on the fire with just enough water to cling to them; stir in the sugar gradually; when the sugar melts, let all simmer slowly 2 hours; stir

occasionally, and strain into molds that have been dipped in ice water.

CURRANT.—Use red currants fully ripe; put them into a preserving pan; mash them up; place them on the fire to get scalding hot; stir them all the time with a wooden spatula; remove from the fire; when cold enough, strain them through a coarse crash towel till all the juice has been extracted; measure the juice into a clean copper or porcelain pan; place it upon the fire and let it boil 5 minutes; add 1 lb. pulverized sugar to every pint of juice; stir constantly from the bottom while adding the sugar; continue to do so until the sugar is dissolved; remove scum and fill jelly glasses immediately.

GELATINE.—Obtain as good a quality of gelatine as possible, and do not use a larger quantity than is necessary for the firmness of the dish; soak the gelatine in water until it swells; this will be in about 1 hour; dissolve it in a little boiling water for a few minutes; add wine, lemon juice, sugar and flavoring according to taste, and pour into a damp mold; keep it in a cool place until firmly set; if very stiff, it may be turned out more easily if dipped in boiling water for a moment.

GOOSEBERRY.—Boil 6 lbs. of green, unripe gooseberries in 6 pts. of water; pour them into a basin; let them stand covered with a cloth for 24 hours; strain through a jelly bag, and to every pint of juice add 1 lb. of sugar; boil it for 1 hour; then skim it, and boil it for ½ hour longer with a sprig of vanilla.

GRAPE.—Put the fruit into a stone jar; set this in a kettle of tepid water and put on the fire; let it boil, closely covered, until the fruit is broken to pieces; strain; to each pint of juice allow 1 lb. of sugar; set the juice on alone to boil; while it is warming divide the sugar into several different portions and put into shallow pans that will fit in the ovens; heat in these; open the ovens now and then to stir and prevent burning; boil the juice just 20 minutes from the moment it begins fairly to boil; throw the sugar into the boiling juice; stir rapidly all the while; withdraw the spoon when it is dissolved; let the jelly just come to a boil; take the kettle instantly from the fire; roll the glasses or cups in hot water and fill with the scalding liquid.

ISINGLASS.—2 oz. of isinglass to 1 qt. of water; boil till it is dissolved; strain it into a basin upon a slice of lemon peel pared very thin, 6 cloves and 3 or 4 lumps of sugar; let this stand by the fire for 1 hour; take out the lemon and cloves; then add 4 tablespoonfuls of brandy.

JELLY STRAINERS. To Make. — 1. Nail pieces of lath together as indicated in the illustration; make the bag of white flannel and tie it to the corners, or fasten rings on the strings to go over the posts; after use, wash and dry the bag at once.—2. Make a conical bag of good white flannel, about 20 in. long and 15 in. broad at the top, when spread on a flat surface; sew to it four pieces of white tape at the large end and at equal distances, so that 2 sticks may be run into them; fasten ropes to the top stick at intervals, by which the bag is to be hung up.

Jelly Strainer.

LEMON.—Dissolve 1 box of gelatine in nearly 1 qt. of boiling water; add the juice of 5 lemons, and enough sugar to sweeten to taste; strain and set aside until nearly cool; beat the whites of 5 eggs and whip into the jelly; turn into a dish and let it set until cold; after it becomes solid decorate with pieces of red jelly.

Jelly Strainer.

ORANGE.—Whites of 2 eggs; 8 sweet oranges; 2 lemons; ¾ lb. sugar; 1 oz. gelatine and 1 gill cold water; grate the rinds of the oranges and lemons; melt the sugar in a small saucepan with ½ gill cold water; when melted, add the juice and rinds of the oranges and lemons; soak the gelatine for 10 minutes with ½ gill cold water; add to the other ingredients; whip the whites of eggs slightly and pour them into the saucepan; whisk all together until it boils; put on the lid of the saucepan and allow it to simmer for 20 minutes; pour through a flannel bag and then pour it into the molds.

PINE-APPLE. — Chop up 2 canfuls of fresh pine-apple; pour on it 2 qts. of boiling water; add 4 teacupfuls of white sugar and juice of 2 lemons; add a box of gelatine to every 3 qts. of water; strain through a flannel bag, and pour into jelly molds.

PLUM. — Boil the plums until soft in enough water to cover them; pour into a jelly bag, and drain over night; strain through a flannel bag; boil this juice 20 minutes; skim well; take off; measure it; to each pt. of juice add 1½ pts. of white sugar; boil 1 pt. of juice at a time 7 minutes; pour into cups; when cold paste paper over, and brush all over with white of egg.

PUNCH. — Isinglass, 2 oz.; sugar, 1¾ lbs.; water, 1 pt.; dissolve; add of lemon juice, ½ pt., the peels of 2 lemons, also of 2 oranges, and rum and brandy of each ½ pt.; keep it in a covered vessel until cold; liquefy it by a very gentle heat; strain and pour into molds.

QUINCE. — Pare and slice the quinces; add for every 5 lbs. of fruit 1 cupful water; put peelings, cores and all into a stone jar; set the jar into a pot of boiling water; let it boil until the fruit is soft and broken; strain through a stout, coarse bag or cloth; to each pt. of juice allow 1 lb. of white sugar; set the juice on alone to boil; while it is warming place the sugar on flat dishes to heat in the oven; have the sugar hot; do not let it burn; boil the juice just 20 minutes from the time it begins to boil; throw in the hot sugar; stir quickly all the time; as soon as the sugar is dissolved remove the kettle at once from the fire; fill your glasses with the scalding liquid.

RASPBERRY.—Take ripe raspberries, 3 parts, and ripe currants, 1 part; press out the juice and filter; to 1 pt. juice add 1 lb. loaf sugar;

finish in the same manner as other jellies.

RUM.—To 1 qt. bottle of common white wine, add 1 lb. of lump sugar reduced to syrup and clarified; take 1 oz. isinglass; dissolve it thoroughly; strain it through a sieve; mix it with the syrup milk warm; when this mixture is nearly cold, pour it into the white wine; mix it by stirring it well; add a spoonful, or more if desired of old Jamaica rum; stir it and pour it into molds or glasses.

STRAWBERRY. — Take the berries when ripe and in their prime; mash them; let them drain through a flannel bag, without squeezing it; to each pt. juice put 1 lb. of white sugar, and the beaten white of an egg to 3 lbs. of the sugar; set it on the fire; when it boils up well, take it from the fire; skim it clear; set it back on the fire; if any more scum rises, take it from the fire and skim it clear; boil it till it becomes a jelly.

WINE.—½ pt. sherry wine; ½ pt. cold water; ½ package gelatine; juice of 2 lemons and grated peel of 1; 1 orange and 1 pt. boiling water; soak gelatine in cold water ½ hour; add to this sugar to taste, and the lemons; pour over all the boiling water; stir until the gelatine is dissolved; put in the wine; strain through flannel bag into molds; peel and slice an orange, and drop slices into the mold also.

MARMALADES.

REMARKS.—Marmalades are made either by pounding the pulped fruit in a mortar with an equal or a rather larger quantity of powdered white sugar, or by mixing them together by heat, passing them through a hair sieve whilst hot, and then putting them into pots or glasses; when heat is employed in mixing the ingredients, the evaporation should be continued until the marmalade jellies on cooling.

APPLE. — Peel and core 2 lbs. of apples and put them into an enameled saucepan with ½ pt; of white wine and 1 lb. of powdered loaf sugar; stew them over a slow fire until the fruit is very soft; then squeeze it through a hair sieve; if not sufficiently sweetened add sugar to taste and put away in jars.

APRICOT. — Prepare the fruit by blanching and greening; when they are green, pulp them by rubbing them through a coarse hair sieve or colander; for each lb. of pulp clarify and boil to the blow 1 lb. of loaf sugar; mix it with the pulp and boil it until it will jelly; take off any scum which may arise with a skimmer.

BARBERRY.—Pick from their stalks 2 lbs. of the finest ripe barberries; put them into an enameled saucepan with 1 pt. of water; boil them for a few minutes; pour them out; mash them well, and strain the pulp through a sieve; place them upon the fire; slowly reduce it; when it is pretty stiff add sugar in the proportion of weight for weight of the fruit before being dressed; simmer it for a short time; put it by in glasses when it has grown sufficiently cool.

CHERRY.—Choose the finest ripe red cherries you can get; stone them; strew sugar over them; mash them well; pass them through a tammy; simmer them down with an equal weight of fine beaten and sifted loaf sugar; cook them over a slow fire; stir them constantly; when a beautiful stiff pulp is formed, turn it into glasses; keep them carefully covered.

CRAB APPLE. — When ripe, pare, core and quarter the crab apples; slice each quarter as thinly as possible; spread the apple slices upon a cloth, so as to shrivel them slightly; melt down ¾ their weight of clarified sugar; when this is boiling hot, add the apples; withdraw the saucepan from the fire; let it stand till its contents are cold; place it over the fire again; simmer very gently, but do not stir the apples; when they look nicely clear, pour them into pots, and cover as usual when the preserve is cold.

CRANBERRY.—Stew sweet and insipid apples and mix them with stewed cranberries, in the proportion of 1 part cranberries to 2 parts apples; strain through a colander and mix evenly.

GOOSEBERRY. — Pick the fruit clean; cook thoroughly; pass through a sieve; add equal weights of sugar and water, so that when the marmalade has been cooked for 1 hour and is cold it will spread as thinly as honey.

LEMON. — Have ready a quantity of lemons; take off the peel in quarters and remove the white skin and pips from the pulp; slice the fruit; cut the peel as thin as possible, but do not remove the white part; to every lb. of fruit after it is sliced, add 2 pts. of filtered water; leave it to steep for 24 hours; tie up the pips and the skin from the pulp in muslin; put it with the fruit and boil slowly for two hours or more until quite tender, without sugar; take out the muslin bag; weigh the fruit; to every lb. or pt. of boiled fruit add 1¼ lbs. of sugar; boil all for two hours or until perfectly clear.

NECTARINE.—Let the fruit be the best and ripest that can be obtained; with a very sharp knife halve the fruit; remove the stones; slice the nectarines (skins and all) as thin as possible; sprinkle with loaf-sugar, beaten and sifted; 12 hours later drain the juice rendered by the fruit, with 12 oz. of sugar to 1 lb. of nectarines; put it into a preserving pan; when the sugar is about boiling hot, add the sliced fruit; withdraw it from the fire; when cold simmer it for 10 minutes without stirring it, and put it into small jars for keeping.

ORANGES.—Boil the peels of the oranges in syrup until soft, pulping them through a sieve; add as much white sugar, and boil them with the former syrup and the juice of the fruit to a proper consistence.

PEACH.—Allow ¾ of a lb. of sugar to 1 lb. of fruit; cut the fruit in pieces and put in the preserving kettle, with layers of sugar, placing fruit at the bottom to prevent scorching of sugar; if the fruit is not very juicy, add a little water; let all boil slowly together for about 1½ hours, or until the whole begins to look clear and becomes thick by cooling a portion on a plate; when it is done put into jars or bowls.

PEAR.—To 6 lbs. of small pears, take 4 lbs. of sugar; put the pears into a saucepan with a little cold water; cover it and set it over the fire until the fruit becomes soft; put them into cold water; pare, quarter and core them; put to them 3 teacups of water; set them over the fire; boil the sugar fine; mash the fruit fine and smooth; stir it well together until it is thick like jelly; put it in tumblers or jars; when cold, secure it as jelly.

PINE-APPLE.—Select a ripe, sound pine-apple; halve it and scrape the flesh off it with a knife until it is quite a pulp; weigh this, and to each ½ lb. add the strained juice of a lemon and 6 oz. of loaf sugar, beaten and sifted; put all together into an enameled saucepan; stir it over a clear but not fierce fire; when it is well-stiffened, pour it into sweetmeat glasses for serving.

PLUM.—When the plums are thoroughly ripe, proceed to take off the skins; weigh and boil them quickly, without sugar, for 50 minutes; keep them well stirred; to every 4 pounds add 3 of good sugar reduced quite to powder; boil the preserve from 5 to 8 minutes longer; clear off the scum perfectly before it is poured to be put in the jars; when the flesh of the fruit will not separate easily from the stones, weigh and throw the plums whole into the preserving pan; boil them to a pulp; pass through a sieve; deduct the weight of the stones from them when apportioning the sugar to the jam.

QUINCE.—Pare, core and slice the quinces; stew skins, cores and seeds in a vessel by themselves, with just water enough to cover them; when this has simmered long enough to extract all the flavor, and the parings are broken to pieces, strain off the water through a thick cloth; put the quinces into the preserving kettle when this water is almost cold; pour it over them and boil; stir and mash the fruit with a wooden spoon as it becomes soft; when the whole is reduced to a smooth paste, stir in ¾ lb. of sugar for every lb. of fruit; boil 10 minutes more; stir constantly; take off, and when cool, put into small jars with brandied paper over them.

PICKLES.

REMARKS.—Pickles are divided into two varieties, the true or sour pickle, which is usually a vegetable preserved in salt and vinegar, and the sweet pickle, a sort of hybrid between a pickle and a preserve. A good quality of vegetables or fruit should be selected and either pure cider or wine vinegar should be used. Before using a brass kettle for pickling, see that it is carefully cleaned with salt and hot vinegar; rub it all over the inside, over the rim, and around the ears, where the handles fit in, till every part shines like pure gold; immediately after it used and taken from the fire, remove all the contents. After a kettle is thoroughly cleaned no harm comes from its use so long as it is kept over the fire; the mischief arises from letting anything stand in it and cool. In scalding any kind of pickle, as soon as that work is done, empty the contents into a wooden or earthen bowl, and immediately proceed to scour the kettle again, even though the same articles are to be returned to it as soon as changed into another water or more vinegar. Keep pickles in glass jars if possible; if not, in unglazed stone jars. Glazed jars are poisonous. Having once bought the glass or stone jars, never allow them to be used for anything else. As soon as one is emptied, wash, scald, set in the sun till well sweetened, then cover up and set away carefully for another year, saving all the covers and corks. If all kinds of pickles are not kept well covered with vinegar they will soon turn soft and mold and be ruined. If in a stone pot turn a saucer bottom up over them and then cover closely. If in glass have covers tightly screwed on. Examine the pickles every few weeks to see if they are keeping well, and if there is the least uncertainty pour out the vinegar, scald, skim, add a little sugar, then pour on the pickles again hot and cover closely. To color the pickles, dissolve 5 gr. saffron in ½ oz. distilled water; in another vessel dissolve 4 gr. indigo carmine in ½ oz. distilled water; shake each up thoroughly and allow to stand about 24 hours. Then mix them together and a mixture is obtained which will color 5 lbs. sugar.

SOUR PICKLES.

BEANS.—Procure young string beans, wash and boil them in slightly salted water till tender; drain through a colander or sieve; dry them with a cloth; pour boiling vinegar, spiced to taste, over them; repeat this two or three days, or till they are green.

BEETS.—Take beets while young and sweet and not too large; boil and slice them while they are hot; have ready a pan of hot vinegar, into which put the slices; cover them a few moments until thoroughly hot; then with a spoon place them carefully and closely in a glass can; fill up with vinegar and seal; if the slices are too large cut them in two.

BUTTERNUTS.—When a pin will go through them easily, they are young enough to pickle; soak them in salt and water a week; drain it off; rub them with a cloth to get off the roughness; to a gallon of vinegar put a teacup of salt, a tablespoonful of powdered cloves and mace, mixed together; ½ oz. allspice and peppercorns; boil the vinegar and spices; turn it while hot on to the nuts; in the course of a week scald the vinegar; turn it back on them while hot; they will be ready to eat in the course of a fortnight.

CABBAGE.—Shred or chop six or seven heads of white cabbage and five or six red peppers; pack in jar and pour over them a boiling brine made of a heaping tablespoonful of salt to 2 qts. water; after 24 hours drain off the brine and pour on boiling vinegar; if very sour it may be made half water; the next day pour into a colander; wash out the jars; repack the cabbage

with a little whole mustard seed; cover with cold vinegar; turn a plate over them. Black pepper and cloves added to this pickle spoil its bright clear color.

CATSNY.—To ½ pk. of ripe tomatoes, 3 green and 3 red peppers, and a large bunch of celery, all cut fine, add 3 pts. of vinegar, 1 teacup of salt, 1 teacup mustard seed, 1 teacup grated horseradish and 2 tablespoonfuls of black pepper; mix well and bottle.

CAULIFLOWER. — Cut a large cauliflower in branches; soak it for an hour in cold water enough to cover it, with a handful of salt added to the water for the purpose of removing all insects; then drain it; throw it into well-salted boiling water; boil it until just tender enough to be easily pierced with a sharp knife; drain, cool and place it in glass jars; beat 4 eggs smooth, but not to a froth; mix them with 1 pt. of vinegar; stir the mixture with a wooden spoon over the fire until it begins to thicken; remove it from the fire at once lest it curdle; stir for 2 minutes; next stir in 1 tablespoonful each of curry powder and ground mustard, 1 teaspoonful each of white pepper and salt, and 1 gill of good salad oil; pour this dressing over the cauliflower and seal the jars containing it.

CHICKEN.—Boil 2 chickens until the meat will fall from the bones; remove the meat as whole as possible and put into a stone jar; add to a pt. of the water in which they were boiled, enough vinegar to cover the meat; season with cloves, allspice, pepper and salt, and pour hot over the chicken.

CHOW CHOW. — This is also called higdon, mixed, and chopped pickles. 2 large cauliflowers, 2 qts. green peppers, 3 qts. green tomatoes, 3 qts. green cucumbers, and 3 qts. small onions; slice about ½ in. thick; sprinkle with salt; alternate with layers of tomatoes, onions and cucumbers; boil the cauliflower about 5 minutes; set over night; then strain all well and free from water; after this place in jars and make the seasoning as follows: 1 lb. mustard, ½ lb. mustard seed, ½ lb. whole allspice, ½ lb. whole black pepper, 1 pt. beef brine, 1 gal. vinegar, ½ stick curry powder; boil hard for 15 minutes; pour over the vegetables; if too thick add vinegar; mix the mustard with the vinegar; put the spices in a bag closely tied.

CUCUMBERS. — 1. Wipe small cucumbers clean with a dry cloth; put them into a jar; add boiling vinegar, containing a handful of salt; boil up the vinegar every 3 days; pour it on them until they become green; add ginger and pepper, and tie them up close for use.—2. 2 doz. large cucumbers, sliced and boiled, in vinegar enough to cover them, 1 hour; set aside in the hot vinegar; to each gallon of cold vinegar allow 1 lb. sugar, 1 tablespoonful of cinnamon, 1 tablespoonful ginger, 1 tablespoonful black pepper, 1 tablespoonful celery seed, 1 teaspoonful mace, 1 teaspoonful allspice, 1 teaspoonful cloves, 1 tablespoonful turmeric, 1 tablespoonful scraped horse-radish, 1 tablespoonful sliced garlic, and ½ teaspoonful Cayenne pepper; put in the cucumbers and stew 2 hours.—3. Take good-sized cucumbers; slice quite thin and pour a weak brine, boiling hot, over them; let it stand 24 hours; then to 1 gal. of vinegar add 1 oz. white mustard seed, 1 of celery seed, and ½ teaspoonful of pulverized alum; boil and turn over the pickles; put in pickle bottles and seal, or in a jar with a cloth cover, rinsing the cloth occasionally.

EELS.—Skin some eels; slit them up the middle; take out the bones; rub the flesh over with salt; let them lie 3 days; turn them every day; take them out of the brine; wash them in water; wipe them dry with a cloth; season them with nutmeg, cloves, mace, and a bay leaf; roll them up; tie them tightly in a cloth; boil them in an equal quantity of white wine and vinegar; when they are tender take them out of the liquor and set them to cool; when quite cold put them into the same liquor again; if there is not sufficient liquor, boil some more vinegar, white wine and spices; put by in jars.

EGGS.—Use a moderate size wide-mouthed earthen jar, sufficient to hold 1 doz. eggs; let the latter be boiled quite hard; when fully done place the same, after taking them up, into a pan of cold water; remove the shells from them; deposit them carefully in the jar; have on the fire 1 qt. or more of good white wine vinegar, into which put 1 oz. of raw ginger, 2 or 3 blades of sweet mace, 1 oz. of allspice, ½ oz. of whole black pepper and salt, ½ oz. of mustard seed, with 4 cloves of garlic; when it has simmered down, take it up and pour the contents into the jar; take care that the eggs are wholly covered; when quite cold, stopper it down for use.

GREEN GINGER.—Put ¼ lb. of salt, 2 tablespoonfuls of cayenne pepper, 1 oz. ginger, 1 oz. white pepper and 2 oz. shallots into 2 qts. of best cider vinegar; boil it a short time; cool, and then pour over any freshly gathered vegetables or fruits desired; cover closely, and set in a cool, dark place.

HORSERADISH. — To each coffeecupful of horseradish allow 1 tablespoonful of white sugar and 1½ pts. of good vinegar; bottle and seal.

LEMONS.—Wipe 6 lemons; cut each into 8 pieces; put on them 1 lb. of salt, 6 large cloves of garlic, 2 oz. of horseradish sliced thin, likewise of cloves, mace, nutmeg and cayenne ¼ oz. each, and 2 oz. of flour of mustard; to these add 2 qts. of vinegar; boil ½ hour, either in a well tinned saucepan or in a strong jar, in a kettle of boiling water; set the jar by; stir it daily for 6 weeks; keep the jar closely covered; then put it into small bottles.

LIMES.—Select small limes, with thin rinds; rub them with pieces of flannel; slit them half down in four quarters, but not through to the pulp; fill the slits with salt, hard pressed in; set them upright in a pan for 4 or 5 days until the salt melts; turn them 2 times a day in their own liquor until tender; make a sufficient quantity of pickle to cover them, of vinegar, the brine of the lemons, pepper and ginger; boil and skim it; when cold put it to the lemons, with 2 oz. of mustard seed, and 2 cloves of garlic to every 6 lemons.

MANGOES.—Large bell peppers or small green muskmelons are the best for stuffing; take a melon that is not quite ripe; cut off a slice from

the top, and carefully pick out all the seeds; shred finely 1 oz. of garlic; mix it with 2 oz. of mustard seed, and the seeds of the melon; now put this back as a stuffing; place the top on, and bind it down; boil in 2 qts. of best vinegar, 1 oz. of Jamaica peppers, 1 oz. of whole allspice, 1 oz. of bruised ginger, and 1 teaspoonful of salt; when boiling, pour it over the melon; the same vinegar must be put into a saucepan, boiled up again, and thrown over the melon for 3 successive days, or more if possible; then tie down with bladder to exclude the air.

MUSHROOMS.—To preserve the flavor, rub the buttons with a piece of flannel and salt; from the larger ones take out the red inside; throw a little salt over them; then put them into a stewpan with some mace and white pepper; as the liquor comes out, shake them well; simmer them over a gentle fire till all of it is dried into them again; put as much vinegar into the pan as will cover them; make it warm, and put all into glass jars or bottles, and tie down with a bladder.

NASTURTIUMS.—As soon as nasturtiums are gathered throw them into strong brine; let them remain for 2 days; boil together vinegar, whole pepper, whole cloves, salt and a small piece of ginger root; when boiling, pour this over the nasturtiums; drain them well; cover closely for 1 week, when they will be fit for use.

ONIONS.—Scald 1 gal. of small onions in salt water of the strength to bear an egg; just let them boil; strain them off; peel them after they are scalded; place them in a jar; cover them with the best cold vinegar; the next day pour the vinegar off; add 2 oz. of bruised ginger, 1 oz. of white pepper, 2 oz. of flour of mustard seed, ½ oz. chillies; boil them 20 minutes; turn all together, boiling hot, on the onions; let them remain 10 days; turn the vinegar out again; boil as before, and turn them hot on the onions again.

OYSTERS.—Take the oysters from the liquor; strain and boil it; rinse the oysters, if there are any bits of the shells attached to them; put them into the liquor while boiling; boil them 1 minute; then take them out of it; add to the liquor a few peppercorns, cloves, and a blade or two of mace; add a little salt, and the same quantity of vinegar as oyster juice; let the whole boil 15 minutes; then turn it on to the oysters.

PICCALILLI.—1 peck of green tomatoes, seeded; 2 large heads of cabbage; 3 green peppers; 1 small teacup of salt; chop and mix well; put in a colander to drain over night; in the morning cover it with good cider vinegar; let it boil until soft; drain off that vinegar and put in 1 tablespoonful of mustard, 1 of allspice, 1 of cloves ground, 2 lbs. of sugar, and about ½ teacup of horseradish, and 3 onions if you like; cover nicely with cider vinegar; let it boil a few minutes; put into a stone jar, and lay on the top a thin white cloth; put an old plate on to keep it under the vinegar.

SOUR-KROUT.—Take a large, strong wooden vessel, or cask resembling a salt beef cask, and capable of holding as much as is sufficient for the winter's consumption of a family; gradually break down or chop the cabbages in very small pieces; begin with one or two cabbages at the bottom of the cask; add others at intervals; press them by means of a wooden spade against the side of the cask, until it is full; then place a heavy weight upon the top of it, and allow it to stand near a warm place for from 4 to 5 days; then place the cask in a cool situation; keep it always covered up; strew anise seeds among the layers of the cabbages during its preparation.

TOMATO.—1 peck of green tomatoes sliced and sprinkled with 1 teacupful of salt; cover with cold water; let it stand over night; rinse in fresh water; put 3 onions and 3 green peppers to the tomatoes; hop all fine; scald in weak vinegar and drain; add 1 cupful of grated horseradish, 1 pt. of white mustard seed whole, 2 teaspoonfuls of ground cloves, 1 of good cinnamon, and 1 teacupful of brown sugar; pack in jars, after mixing the mass thoroughly; cover with cold, strong vinegar.

WALNUT.—Select full grown green walnuts or butternuts when they are soft enough to be pierced through with a needle; prick 100 nuts well through; lay them into a brine made of 4 lbs. of salt to each gallon of vinegar; let them remain 9 days; at the end of the third and sixth days change the brine for fresh; on the ninth day lay them in the sun; after they are well drained place them in the sun till they turn black; let them remain several days; boil 1 gal. of vinegar, 2 oz. of black pepper, ½ oz. of cloves, 1 oz. of mace, 1 oz. of allspice, and 1 oz. of root ginger sliced, 10 minutes; pour it over the walnuts, which have been packed in jars ¾ full; when the vinegar cools cover them up tight; they will be ready to use in 1 month.

Sweet Pickles.

APPLE.—Wash the apples and put them unpared into a steamer over a kettle of boiling water; cover it tightly; put them in not more than 2 deep; let them steam until you can stick a fork in them easily; while they are cooking, boil 1 qt. good vinegar, not too sharp, with 2 cups of sugar or good sorghum syrup; when it boils put in the apples from the steamer; let them boil 10 or 15 minutes; take them up in a pitcher or a stone jar and pour the vinegar hot over them.

BLACKBERRIES. Spiced.—To 5 lbs. of berries add 2 lbs. of sugar, 1 pt. of vinegar, 2 tablespoonfuls of cinnamon, 2 of cloves, and the same of allspice; heat all well together; skim out the fruit and boil 1 hour; return the fruit; boil 15 minutes; then put in jars and cover tight.

CHERRIES.—To 1 qt. of cherries allow 1 coffeecupful of vinegar, 2 tablespoonfuls of sugar, 1 doz. cloves, and ½ doz. blades of mace; boil these together for 5 minutes; turn into a covered stoneware vessel; fill small jars ¾ full with the fruit; strain the spices from the cold vinegar; pour it over them; then cover them tightly.

CHERRIES. Brandied.—Choose firm, fine fruit; wash; pick the stems off; stick the cherries in 2 or 3 places with a needle; pour over them a syr-

up made by boiling 1 lb. of sugar to every lb. of cherries in 1 gill of water; add 1 pt. of brandy for every 4 lbs. of sugar; pour the syrup hot over the cherries; cork and tie up carefully when cold; they will be ready for use in 1 week.

CITRON MELON. Spiced.—Prepare the fruit, cover with vinegar and let it stand over night; in the morning pour the vinegar off, and to every 7 lbs. of fruit allow 3½ lbs. of white sugar and 1 pt. of vinegar; tie in a muslin bag 1 tablespoonful of each of the different spices; make a syrup of the sugar; put in the fruit; cook for ½ hour; when all the fruit is done add the vinegar; let the syrup boil thick; pour it over the fruit hot and let it get cold before sealing up the jars.

CRAB APPLES.—Pick the apples with the stems on; look them over carefully; cut off the spots of black fungus and other imperfections; wash thoroughly; scald in a weak brine, and then drain quite dry. For 1 peck of apples take 1 gal. of sharp vinegar, 1 lb. of sugar, 1 teaspoonful each of cinnamon, allspice, cloves and black pepper, and 1 tablespoonful of ground mustard; tie them loosely in a thin cloth or bag; put them with the vinegar and sugar in the preserving kettle; bring it to a boil; put in half the apples; let them boil till the skins begin to crack; skim them out into the jar in which they are to remain; put in the rest of the apples and serve in the same; turn the spiced vinegar over them; when cool, cover with grape leaves, and put a cloth on the jar, under the cover.

CUCUMBER.—Take a small crock of pickled cucumbers; make a good, rich syrup of molasses, pure cider vinegar and whole cloves; heat together, and turn it over the cucumbers; they will be ready in 2 days.

CURRANTS. Spiced.—Take 5 qts. of currants, picked from the stems; add to them, the night previous to cooking them, 6 lbs. of coffee crushed sugar, ½ teaspoonful of salt, 2 tablespoonfuls of ground cloves, 3 tablespoonfuls of ground cinnamon, and ½ pt. of vinegar; put the mixture into a preserving kettle; cook slowly for 1 hour and carefully remove all the scum which arises.

DAMSON.— 7 lbs. of damsons, 3 lbs. of brown sugar, 1 oz. of cloves, 1 oz. of cinnamon and 1 qt. of vinegar; pierce each damson through with a large needle, to prevent bursting; fill a stone jar with them; put alternately a layer of damsons and one of spices, not powdered; boil the sugar and vinegar together; pour it over the fruit; the next day boil all together; then put it away for use in a dry, airy closet.

GOOSEBERRIES. Spiced.— 6 qts. of gooseberries, 9 lbs. of sugar and 1 pt. of vinegar; if the vinegar is very strong dilute it with water; 1 tablespoonful each of cloves, allspice and cinnamon; after looking the berries over carefully and picking off the blow, put them in the porcelain kettle with a little water and part of the sugar; boil for 1½ hours; when almost done add the rest of the sugar and the spice and vinegar; put this into cans while hot and seal up, or in jelly tumblers and bowls; if in the latter, cut pieces of writing paper the size of the top of the bowl; dip them in alcohol; then tie or paste stout paper over the top

GRAPES.—Take ripe grapes; remove all imperfect and broken ones; divide the large bunches, as they will pack more closely; put in an earthen jar a layer of grapes and then one of grape leaves; to 4 qts. of vinegar take 2 pts. of white sugar; boil a few minutes and when quite cold pour it over the grapes.

GRAPES, Spiced. — To 8 lbs. fruit use 4 lbs. sugar and 1 qt. of vinegar; place the fruit in jars; boil and skim the syrup; pour over the grapes boiling hot; repeat this process 3 or 4 days; seal up and set in a cool, dry place; boil any kind of spices in the syrup that suits the taste.

PEACHES.—Take to 1 gal. of good cider vinegar 8 lbs. of cut sugar; let it dissolve in a large jar; stick a clove into each peach; put over the fire about 1 qt. of the vinegar with the sugar dissolved; drop in while cold 16 peaches, sufficient to fill a qt. jar; allow the peaches to boil slowly until a fork will stick easily through them; first put in a stick of cinnamon and a little allspice and cloves tied up in a rag; take out the peaches and carefully place them in a jar, 1 by 1; fill with the liquid and screw on the top.

PEACHES. Brandied.—Dip the peaches in hot lye, and rub the fur off with a cloth or pare them nicely; allow to 1 lb. of fruit ¾ of a lb. of sugar; add as much water as will make syrup enough to cover the fruit; boil awhile; put in the peaches; scald until they become tender, lay them on dishes to cool; continue to boil the syrup until it is rich and thick; when it is quite done, and has cooled a little, add pale peach or apple brandy; put the fruit in jars, and pour on the syrup.

PEARS. — 10 lbs. of pears; 3 lbs. of light brown sugar; 1 qt. vinegar; 1 oz. cinnamon and 1 oz. ground cloves; put all together and boil till the pears are tender; skim the pears out; let the syrup boil ½ hour longer.

PEARS, Brandied.—4 lbs. fruit; 4 lbs. sugar; 1 pt. best white brandy; make a syrup of the sugar and enough water to dissolve it; let this come to a boil; put the fruit in and boil 5 minutes; remove the fruit carefully; reboil the syrup until it thickens well; add the brandy; take the kettle at once from the fire; pour the hot syrup over the fruit and seal; if, after the fruit is taken from the fire, a reddish liquor oozes from it, drain this off before adding the clear syrup; put up in glass jars.

PEARS, Spiced.— To every 10 lbs. of good flavored pears take 5 lbs. of white sugar, 1 qt. of strong cider vinegar, 1 oz. of stick cinnamon and 1 oz. whole allspice; boil the sugar and vinegar; skim thoroughly; add the spices and the pears; let the latter boil slowly until tender.

PLUMS.—7 lbs. fruit, pared; 4 lbs. white sugar; 1 pt. strong vinegar; mace, cinnamon and cloves; pare peaches and pears; prick plums and damsons, tomatoes, "globes" or husk tomatoes; put into the kettle with alternate layers of sugar; heat slowly to a boil; add the vinegar and spice; boil 5 minutes; take out the fruit with a perforated skimmer; spread upon dishes to cool; boil the syrup thick; pack the fruit in glass jars; pour the syrup on boiling hot; examine every few days for the first month; should it show signs of fermenting set the jars

uncovered in a kettle of water; heat until the contents are scalding.

TOMATOES.—Gather large well-grown tomatoes that have turned white, but none that are beginning to soften or turn red; slice through the middle and put into a weak brine; let them lie in this over night; take out, rinse in cold water, and steam a few moments; put into clear cold vinegar, and cook till tender; drain and put into a pickle jar; throw out the vinegar in which the tomatoes have been cooked; take enough fresh to cover them; then add sugar; boil and turn hot over the fruit.

WATERMELON.—10 lbs. of pared rinds boiled in water till tender; make a syrup of 2 lbs. sugar and 1 qt. vinegar; ½ oz. cloves and 1 oz. cinnamon; pour this over the rinds boiling hot, three days in succession.

PRESERVES.

REMARKS.—Most of the fruits, to make preserves of them, should first be boiled in water; then drained and put into boiling syrup, where they should be left 1 day; then pour off the syrup and add more sugar to it; reboil and pour hot over the fruit; continue this until it is fully saturated with sugar, which may be known by the syrup being no longer weakened with the juice of the fruit; keep them in a dry but not warm place, as too much heat will cause them to ferment, more especially if they are not incorporated with sugar; nor in a damp place, or they will become moldy; when done, drain and put the fruit into jars; reboil the syrup and then pour it over the fruit; seal down the top with pasted paper, first putting a piece of paper soaked in brandy over the fruit; paper steeped in a solution of salicylic acid and tied over the mouths of the jars, will keep the preserves sweet and free from mold.

ANGELICA. — Cut some stalks of fine, tender angelica into small pieces; put them into a pan of water on the fire until they are soft, then put them into cold water; draw off the skin and strings with a knife; put them into cold water again, and boil them until they look whitish; let them cool; drain them from the water; put them in an earthen pan; pour boiling syrup over them till they float; the next day drain it off, without disturbing the angelica; boil with more sugar, if required; take off any scum which may rise; pour it over the stalks while it is hot; repeat this for 7 or 8 days.

APPLES. — Weigh equal quantities of good brown sugar and of apples; peel, core and mince the apples small; boil the sugar, allowing to every 3 lbs. a pt. of water; skim it well and boil it pretty thick; add the apples, the grated peel of 1 or 2 lemons, and 2 or 3 pieces of white ginger; boil till the apples fall and look clear and yellow.

APRICOTS. — Take the largest and cleanest apricots to be got; pick out the stones with a silver skewer; slit them down the sides with a silver knife; take nearly their weight in good lump sugar; dip each lump in water and put over the fire; let it just boil; skim and put by till cold; pour it over the fruit in the preserving pan; warm very gently; allow them to simmer only; put them by till next day; warm them again, continuing this till they look clear; then take the fruit from the syrup.

BARBERRIES. — Put into a *bain-marie* an equal weight of sugar and barberries picked from their stalks; when the fruit is soft enough, put them aside till the following day; simmer them in a preserving pan for a quarter of an hour and keep in small jars till wanted.

CHERRIES. — Stone the cherries; preserve every drop of juice; weigh them; allow 1 lb. sugar to every lb. fruit; put a layer of fruit for 1 of sugar until all is used up; pour over the juice and boil gently until the syrup begins to thicken.

CITRON MELON. — Pare and remove the seeds; reject all but the solid part of the melon; cut in such pieces as you choose; weigh the pieces; boil in water until they can be easily cut; remove the fruit; add sugar to make the syrup; allow 1 lb. sugar to each lb. of fruit; when it boils put in the fruit; boil slowly 1 hour; when cold add sliced lemon; allow 1 lemon for 2 lbs. of citron; 1 large teacup of water is sufficient for 1 lb. of fruit.

CRAB APPLE. — Take off the stems; core them with a sharp knife without cutting them open; weigh 1 lb. of white sugar for each lb. of apples; put a teacup of water to each lb. of sugar; put it over a slow fire; when the sugar is dissolved and hot, put the apples in; let them boil gently until they are clear; skim them; cut and spread them on flat dishes; boil the syrup until it is thick; put the syrup in whatever they are to be kept; when the syrup is cold and settled, pour it carefully over the fruit.

CUCUMBER. — Gather young cucumbers, about the length of the middle finger; lay in strong brine 1 week; wash and soak them a day and night in fair water, changing this 4 times; wipe, and with a small knife slit them down one side; dig out the seeds, stuff with a mixture of chopped raisins and citron; sew up the slit with a fine thread; weigh them and make a syrup, allowing 1 lb. of sugar to 1 lb. cucumber, and 1 pt. water; heat to a boil, skim, and drop in the fruit; simmer ½ hour; take them out and spread upon a dish in the sun, while syrup is being boiled down, with a few slices of ginger root added; when thick put in the cucumbers again; simmer 5 minutes, and put up in glass jars; tie them up when cold.

CURRANTS. — Take the currants when ripe and in their prime; let them remain on the stalks; pick off the bad ones; make a syrup of sugar and very little water; allow 1 lb. of sugar to 1 lb. of currants; clarify it; put in the currants and let them boil a few minutes; in the course of a few days turn the syrup from them, scald it, and turn it back, while hot, on to the currants.

DEWBERRIES. — Pick the berries early in the morning; weigh them; then spread them on

dishes; sprinkle them with sugar, lb. for lb.; when the juice settles from them in the dishes, pour it off; with it moisten the remainder of the sugar; simmer this over a slow fire; while simmering, drop in a portion of the berries; let them become clear; then return them to the dishes to cool while the remainder takes their place in the kettle; when all are clear, and the syrup is boiled down to a rich consistency, pour it over them; when cool enough transfer them to glass jars.

FRUIT. Frosted. — Select perfect fruit of any small variety, such as plums, cherries, grapes or small pears, leaving the stems on; dip them one by one in a beaten white of an egg or in a solution of gum Arabic, and from that into a cup of finely pulverized sugar; cover the bottom of the pan with a sheet of fine white paper; place the fruit in it; set in a stove or oven that is cooling; when the frosting on the fruit becomes firm, heap them on a dish and set in a cool place.

GINGER. — Take the root of green ginger and pare neatly with a sharp knife; throw it in a pan of cold water; boil till tender through, changing the water three times, each time putting in cold water; when boiled perfectly tender throw again in cold water, and let it lie an hour or more; for every 6 lbs. of ginger allow 8 lbs. of loaf sugar; add ½ pt. of water to each lb. of sugar; stir gradually the beaten whites of 4 eggs into it; boil and skim well; drain the ginger from the water, and when the syrup is cold pour over it; cover it; let it stand 2 days; then, having strained the syrup from the ginger, boil it again and pour cold over the ginger; let it stand three days; afterward boil the syrup and pour hot over the ginger; repeat the pouring of the hot syrup over the ginger until the syrup has thoroughly penetrated it; this can be learned by tasting it, by its appearance when cut, and by the syrup becoming very rich and thick.

GOOSEBERRIES. — Choose the large and unripe gooseberries; pick off the black eyes, but leave the stalks; put them into a cold syrup of sugar and water; let them slowly come to a boil; when tender enough, take them out; reduce the syrup until it is very stiff again; put the fruit into it, and do it gently until the syrup is quite ropy; keep them carefully covered from the air; instead of water being employed to form the syrup, a jelly may be made by boiling down some green gooseberries, and straining the liquor from them.

GRAPES. — Take out the stones from the grapes with a pin; break them as little as possible; boil some clarified sugar nearly to candy height; put in sufficient grapes to cover the bottom of the preserving-pan, without laying them on each other, and boil for 5 minutes, merely to extract all the juice; lay them in an earthen pan and pour the syrup over them; cover with paper; the next day boil the syrup, skimming it well for 5 minutes; put in the grapes; let them boil a minute or two; put them in pots, and pour the syrup over them, after which tie down.

GREEN GAGES. — Let the fruit be not quite ripe but sound; prick them with a fork or needle; throw them into cold water; scald and green them; when they are of a fine green, increase the heat; take them out with a skimmer when they swim, and throw them into cold water; drain them on sieves; put them in syrup that is boiling; give them two or three boils in it; pour them into an earthen pan; drain the syrup from them the next day; add more sugar and boil to the thread; take off any scum which may arise; pour the syrup over them boiling hot; repeat this for 5 or 6 days, and finish as for green apricots.

LEMON. — 1 lb. of pounded loaf sugar; ¾ lb. of butter; 6 eggs and the whites of 4 well beaten; the rind of 2 lemons grated, and the juice of 3; mix well together and let it simmer till of the consistency of honey; be careful to stir all the time or it will burn.

MULBERRIES. — Put into a preserving-pan sufficient mulberries to yield a pt. of juice; strain it; add to 3 lbs. of refined loaf-sugar in powder; boil and skim it; put into it 2 lbs. of first rate mulberries; when the syrup is nearly cold put it again upon the fire; bring it slowly to a boil; pour it over the fruit; let it stand till the next day, and again slowly boil it until it will stand in round drops, and the mulberries look beautifully clear; when cold put them into small pots for use.

ORANGE. — Take any number of oranges, with rather more than their weight in white sugar; slightly grate the oranges and score them round and round with a knife, but not cut very deep; put them in cold water for 3 days, changing the water 2 or 3 times a day; tie them up in a cloth; boil them until they are soft enough for the head of a pin to penetrate the skin; while they are boiling, place the sugar on the fire, with rather more than ½ pt. of water to each lb.; let it boil for a minute or two, then strain it through muslin; put the oranges into the syrup till it jellies and is of a yellow color; try the syrup by putting some to cool.

PEACH. — Weigh the fruit after it is pared and the stones extracted, and allow 1 lb. of sugar to every lb. of peaches; crack 1 qt. of the stones; extract the kernels; break them to pieces; boil in just enough water to cover them until soft; set aside to steep in a covered vessel; put a layer at the bottom of the kettle, then one of fruit, and so on till all of both have been used up; set it where it will warm slowly until the sugar is melted and the fruit hot through; strain the kernel water and add it; boil steadily until the peaches are tender and clear; take them out with a perforated skimmer and lay upon large flat dishes, crowding as little as possible; boil the syrup almost to a jelly; skim off the scum; fill your jars ⅞ full of the peaches; pour on the boiling syrup; when cold cover with brandy tissue paper, then with cloth, lastly with thick paper tied tightly over them.

PEARS. — Take some good baking or other pears; pare and cut them in half; take out the cores with a little scoop for the purpose; if they are first blanched a little they can be pared easier and better; boil them in water, with sugar sufficient to make it only just sweet, a little lemon juice, and a few allspice or cloves; put a

piece of pewter, or a pewter spoon, in the bottom of the pan, and boil them until they are quite tender and of a fine red; or prepared cochineal may be added instead, using sufficient to give the desired tint; take out the fruit and add enough sugar to the water they were boiled in to make a syrup; boil to the large thread; put in the pears and give them 2 or 3 boils in it; skim and put them in an earthen pan; boil the syrup twice more; pour it on them, raising it to the degree of the large pearl; keep them in dry pans for use.

PINE-APPLE.—Slice the pine-apple rather thinner to preserve than to eat; take 1 lb. loaf sugar to 1 lb. of fruit; powder the sugar, and place in the kettle alternately a layer of sugar and a layer of fruit; to each pound of sugar put 3 table-spoonfuls of water; let it remain over a slow fire until the sugar is all melted; boil it slowly until the fruit looks clear; take out the fruit piece by piece and lay them on a dish, until the syrup is boiled nearly to a jelly; put the fruit in jars; pour on the syrup hot; cover the jars carefully with paper, which has previously been dipped on both sides in white of egg.

PLUMS.—Plums should be wiped with a soft cloth or dusted, never washed; have the syrup all ready; prick each plum with a silver fork to prevent the skin from bursting; put them into the syrup; boil from 8 to 10 minutes, according to the size of the fruit; dip carefully into the hot jars; fill full, and screw on the cover immediately.

PUMPKIN.—Take 7 lbs. of pumpkin, 5 lbs. of sugar, 4 lemons and 2 oz. of green ginger root; cut the pumpkin in slices ½ in. thick in any desired form, square, round or diamond shape; boil in the syrup till tender; take up the pieces; slice the lemon and ginger root very thin and scald them in a little clear water, after which add them to the syrup; boil the latter down until it is clear enough to keep without fermenting; then add the pumpkin to it.

QUINCES.—Weigh your quinces after washing them and cutting out any imperfections; take 1 pt. of water to every pound of fruit; let the quinces boil in this water until they can be easily pierced with a fork; drop them in cold water; as soon as cold enough to handle, peel carefully, cut in two, cut out the cores, put the skins and ¼ the seeds back in the water the quinces were boiled in, and let them boil rapidly for ½ hour; then strain through a jelly bag; take ½ pt. of this water to 1 lb. of lump sugar and 1 lb. of fruit; let it all boil slowly together until the quinces are a bright pink, semi-transparent and perfectly tender; take each piece out carefully; put on a platter, and keep them in the sun while the syrup boils ½ hour longer; pour the hot syrup over the quinces and let them stand uncovered till quite cold; put in jars; over each one put a piece of letter paper dipped in whisky; cork tightly and keep in a cool place.

RASPBERRIES.—Strain equal quantities of ripe currants and raspberries to make a syrup to preserve the raspberries in; dissolve white sugar in the syrup by a gentle heat, using 1 lb. of sugar to each pound of syrup and raspberries; when the sugar has dissolved, set the syrup where it will boil about 10 minutes; then put it in the raspberries and let them boil 5 minutes; in the course of 4 or 5 days turn the syrup from the raspberries; boil it away, so that there will be just enough of it to cover the berries; turn it on them while hot; keep them in wide mouthed bottles, corked and sealed up tight.

STRAWBERRIES.—To 2 lbs. of fine, large strawberries add 2 lbs. of powdered sugar; put them in a preserving kettle over a slow fire till the sugar is melted; boil them precisely 20 minutes as fast as possible; have ready a number of small jars; put the fruit in boiling hot; cork and seal the jars immediately; keep them through the summer in a cool, dry place.

WATERMELON.—Cut a watermelon in two; take out all the soft inside, leaving only the firm white rind; scrape off the green outside; cut into any fancy shape desired; boil these bits in water enough to cover them, with fresh lemon skins to color them yellow; when the pieces are tender, take them out in dishes to cool; make a syrup of 1 lb. of sugar and a teacup of water to each pound of melon; when the sugar is dissolved, clarify the syrup with the white of an egg; put the watermelon into this; simmer it till done through and transparent; take out the melon and drain; reboil the syrup with the addition of a little sugar if necessary; put the fruit in jars and pour the syrup over it; then seal immediately.

WHORTLEBERRIES.—To 4 qts. of fruit allow 2 lbs. of sugar and ½ oz. of powdered cinnamon; moisten the sugar with wine and boil well; when the sugar boils in transparent bubbles throw in the fruit, and keep stirring till it is of a smooth consistency and no more thin juice collects on the top; sprinkle in the cinnamon just before it is done.

LIQUIDS.

CIDER.

REMARKS.—Cider apples may, for convenience, be classed under three heads—bitter, sweet, and sour. The first are the best; years of experience teaches that; their juice has the greatest specific gravity, is the richest in sugar, it ferments most freely, it clarifies spontaneously quickest, and it keeps the best of all after fermentation. They contain a minute quantity of extractive matter not present in other apples. The juice of sweet apples ferments tumultously, clears with difficulty, and cider does not keep so well as that produced from the first

variety. The juice of sour apples contains less sugar and more acid than the other two and produces the worst cider; it, however, fines well, although it stores. It is always better to core apples before grinding, as the cider will not only taste and look better, but keep better. The expression of the juice is the next step in the process. The apples are crushed or ground in mills. Next sprinkle the pulp with $\frac{1}{4}$ to $\frac{1}{3}$ its weight of spring or river water; then allow it to remain in tubs or wooden cisterns 12 or 14 hours, during which time fermentation com-

Cider Mill.

mences, breaking up the cells of the membrane, by which subsequent separation of the juice is facilitated. The pulp is now placed on a kind of wicker frame, or in hair-cloth or coarse canvas bags, and, after draining into suitable receivers, is subjected to pressure in the cider press. The liquor which runs off first, is the best, and is kept separate; while that which follows, especially the portion obtained by much pressure, tastes of the pips and skins. The expressed juice is next put into casks with large bung-holes, and freely exposed to the air and the shade, where they are placed on "stillions," with flat tubs under them to catch the waste. They are constantly attended to and kept full, in order that the yeast, as it forms, may froth over and be carried off from the surface. After 2 or 3 days for weak, and 8 or 10 days for strong cider, or as soon as the sediment has subsided, the liquor is racked off into clean casks, previously sulphured with a cooper's match. The casks containing the racked cider are stored in a cellar, or other cool place, where a regular temperature can be insured, and are left to mature. By spring the cider is fit for use, and may be re-racked for sale.

ARTIFICIAL.—1. Sugar, 1 lb.; tartaric acid, $\frac{1}{2}$ oz.; good yeast, 2 tablespoonfuls; water, 1 gal.; agitate to effect solution, and allow to ferment 12 hours or more. — 2. 18 gals. water; enough sulphuric acid to give the water an agreeable tartness; 25 lbs. sugar; 2 oz. alum; $2\frac{1}{2}$ oz. ginger; $2\frac{1}{2}$ oz. cloves; 3 oz. bitter almonds. Boil the last 4 ingredients in 1 gal. of the water for 2 hours; strain, and add it to the remaining water. If whisky be added, it will give more body. — 3. Put in a cask 5 gals. hot water; 15 lbs. brown sugar; 1 gal. molasses; $\frac{1}{2}$ gal. hop or brewer's yeast; good vinegar, 6 qts.; stir well; add 25 gals. cold water, and ferment. — 4. (*For Bottling.*) Put in a barrel 5 gals. hot water; 30 lbs. common sugar; $\frac{3}{4}$ lb. tartaric acid; 25 gals. cold water; 3 pts. hop or brewer's yeast, worked into a paste with 1 pt. water and 1 lb. flour. Let it work in the barrel 48 hours, the yeast running out of the bung-hole all the time, putting in a little sweetened water occasionally to keep it full; then bottle, putting in 3 or 4 broken raisins to each bottle, and it will nearly equal champagne.

CANNED.—Cider may be preserved for years by putting up in air-tight cans, after the manner of preserving fruit. The liquid should be first settled and racked off from the dregs, but fermentation should not be allowed to commence before canning.

CHAMPAGNE.—Cider, 18 gals.; spirit, 3 pts.; sugar, 5 lbs. Mix, and let them rest for a fortnight; then fine with skimmed milk, 1 pt.; bottle in champagne bottles; when opened, it will be found to approach near to champagne.

CHERRY.—30 gals. apple cider; 8 qts. dried black cherries; 2 qts. dried blueberries; 1 qt. elderberries; 75 lbs. brown sugar. To make smaller quantities use less of the ingredients.

CLEARING.—To clear and improve cider, take 4 pts. ground horseradish and nearly 1 lb. thick gray filtering paper to the barrel; shake or stir until the paper has separated into shreds, and let it stand 24 hours; then draw off with a siphon.

PRESERVING. — 1. Fermentation may be largely prevented by filtration of the juice when first expressed, by which much of the material on which fermentation works is removed. — 2. When the cider in the barrel is in lively fermentation, add white sugar equal to $\frac{1}{4}$ or $\frac{3}{4}$ lb. to each gal. of cider (according as the apples are sweet or sour; let the fermentation proceed until the liquid has the taste to suit; then add $\frac{1}{4}$ oz. sulphite (not sulphate) of lime to each gal. cider; shake well, and let it stand 3 days, and bottle for use. The sulphite should first be dissolved in 1 qt. or so of cider before introducing it into the barrel of cider. — 3. Cider may be kept good in large quantities, if 1 qt. pure refined linseed or olive oil be poured in at the bung. This, spreading over the top of the cider, will prevent the air from coming in contact with it, and keep it sweet. After the cider has mostly been drawn, the oil may be saved for another year, or used for other purposes. — 4. Scald, and just before the boiling point is reached, remove the scum that rises by skimming. By this means the fine tissues of the apple contained in the juice are brought to the surface, which is the most active cause of fermentation. Cider, so treated, will keep through winter and not become hard, without the addition of any hurtful drugs. — 5. For 40 gals. take 1 qt. alcohol, and add to it $\frac{1}{2}$ oz., each, oils of wintergreen, sassafras and cinnamon; shake up and pour into the

cider; bung, and shake the barrel gently, and let it stand to cure. Age adds to its quality. — 6. Take about 2 tablespoonfuls yellow mustard seed and place in a white linen bag, securely fastened, and then suspend in the barrel of cider. It will keep it sweet for a long time. — 7. Salicylic acid has been extensively used, and samples of cider that have been kept 6 months to 1 year, still have the peculiar flavor of sweet cider, and are sweet cider; 1 oz. is sufficient for 1 barrel of 32 gals. Put the acid in the cider, and mix it well; then bung. It will not ferment.

SOUR. To Sweeten. — If cider is long made, or souring when you get it, about 1 qt. hickory ashes (or a little more of other hard wood ashes) stirred into each barrel will sweeten and clarify; but if it is not rectified, it must be racked off to get clear of the pomace, as with this in it it will sour. Oil or whisky barrels are best to put cider in, or ½ pt. sweet oil to 1 barrel, or 1 gal. whisky to 1 barrel, or both, may be added with decidedly good effects; isinglass, 4 oz. to 1 barrel, helps to clarify and settle cider that is not to be rectified.

VINEGAR.

REMARKS. — Vinegar is made from cider, malt, wine, sugar, molasses, etc. Cider made late in the season, of mature apples, rich in sugar, yields a better article of vinegar than that produced earlier in the season. Filtering through animal charcoal will leave the vinegar nearly clear. The barrels in which the cider is placed, require attention. Cider tainted from impure or musty vessels, will not produce a first-class vinegar. Iron-bound whisky casks, well painted on the outside, are preferred. In manufacturing large quantities of vinegar, the barrels may be stored in an outhouse warmed by the sun, or placed in lofts of any outhouse. When stored for the winter in cellars, the barrels must be rolled out in the spring and placed under a shed with the open bungs exposed to the sun's rays, but the casks shaded. A large handful of sugar placed in vinegar will hasten the souring and improve the sharpness.

BEET. — 1 bush. sugar beets, mixed with 9 bush. apples, makes a cider richer than that made from apples alone. Sugar beet juice can be converted into vinegar, the same as cider; it makes a stronger article, equally good, but of a different flavor. 1 acre of beets will yield 5,000 gals. vinegar.

CELERY. — ½ lb. celery seed; 1 qt. best cider vinegar; 1 teaspoonful salt; 1 tablespoonful white sugar; pour the seed into a jar; scald the salt and vinegar, and pour over the celery seed; set to cool; cover tightly; let it stand 1 week, after which strain into small flasks for use. This will be nice for use when celery is out of season.

CHILI.—Take 50 peppers, cut or bruised, to 1 pt. best vinegar; let it stand 14 days; strain and keep in pt. bottles.

CIDER. — When cider has done fermenting, fill into a keg; then take strips of straw paper, and dip them into West India molasses and put them into the keg of cider; set in a warm place near the stove, and in a few weeks the contents will have turned to sharp vinegar. If desired in a shorter time, pour into the keg 1 pt. of the molasses, and 1 teacupful yeast for every gal. cider; fill a jug with the mixture and let it stand uncorked, back of the cook stove. In 24 hours it will commence fermenting, and not take over 2 weeks to make splendid vinegar. Then draw off into bottles and cork tight. The straw paper acts like mother, to which in a few days it bears a close resemblance.

CLOVER BLOSSOM. — To 1 gal. clear clover blossoms, add 1 qt. molasses and ½ lb. sugar; pour over these 1 gal. boiling water; when cold, add ½ pt. good yeast. If more water is needed, add as you please. It makes strong vinegar.

CORN. — Steep 1 pt. good, firm corn in 2½ gals. cold water, 2 or 3 hours, and then put it on the fire and boil until the corn shows signs of bursting; take it off before the grains burst, and strain the liquid, adding ½ lb. sugar to each gal.; place the jug containing it in the sun, and in 3 weeks or more the liquid will be good vinegar.

COWSLIP.—4 gals. water, with the chill taken off; 6 lbs. brown sugar; ½ pk. cowslips, flowers and stalks; put all in a cask with 3 tablespoonfuls yeast; lay a piece of glass or slate over the bung-hole, and set in a warm place till the vinegar grows sour; then fasten the bung down. This makes excellent vinegar. If kept in a warm place, the vinegar will be ready in 6 months; ¼ oz. isinglass will make it clear sooner.

ECONOMICAL.—A good article of vinegar is often made in a small barrel (with a faucet and bung-hole), placed in some warm spot in the kitchen; there should be strong stock to begin with in the form of good, sharp cider vinegar; to this is added from time to time as needed, a few gals. hard cider; or the parings and cores of sound fruit may be placed in a stone jar, covered with soft warm water and set in the sun or other warm place for 1 fortnight, when it can be strained and added to the stock in the barrel. The addition of molasses or sugar (1 tablespoonful of the former to 1 gal. of juice) is thought to expedite the conversion. Where much fruit is used, the refuse portions will make enough vinegar for a large family, free from the poisonous acids too often present in vinegar of commerce.

GERMAN. — Soft water, 7½ gals.; honey, or brown sugar, 2 lbs.; cream of tartar, 2 oz.; corn spirit, or whisky, 1 gal.

GOOSEBERRY.—To every gal. water put 1 qt. ripe gooseberries; boil the water first, and let it stand till cold; then crush the fruit with a wooden spoon, and add it to the water; let it stand covered 5 days, in a cool place, stirring it twice every day; strain through a hair sieve into a cask and to every gal. add 1½ lbs. moist sugar; when it has stood 6 months, bottle it.

GRAPE. — 1. Vinegar from grapes may be made as follows: The wine is stirred into a large tun which contains lees, and, when mixed, is squeezed through cloth sacks into an iron-

bound vat, whence, after standing some hours, it is drawn off into casks for fermenting. These casks have only a small opening at the top, and are kept at 77° to 86° Fahr. After 14 or more days, the vinegar is drawn off cautiously into barrels which contain birchwood chips. This clarifies it, and after standing a few days it may be siphoned off into casks. The residue, containing mother, is employed to ferment all the subsequent liquor, by simply pouring the latter into the cask used previously. — 2. Take full grown green grapes before they turn sweet; put them in a porcelain lined kettle, with water to cover them, and stew until tender; then pour into a hair sieve, and let it stand to drain, pressing slightly. Then sweeten slightly, and heat the juice to the boiling point, and can in bottles or vials. This will spoil if not canned in a little longer time than common stewed fruit; but it will not produce mother, nor breed vinegar eels. It can be used to acidify cabbage, and in place of lemon or lime juice. The strained grapes may be returned to the kettle and sweetened, and, with the addition of water, will prove sour enough for sauce.

GROCERS'.—1. Take 3 barrels; let one of them be a vinegar barrel; fill this last up before it is quite empty, with molasses, 2 gals.; soft water, 11 gals.; yeast, 1 qt.; keeping these proportions in filling up the whole 3 barrels; sell the vinegar out of your old vinegar barrel as soon as it is ready, which will be in a short time. When nearly empty, fill it up with the fluid as before, and pass on to sell out the next barrel. By the time it is disposed of, go on to the last; then go back to the first, filling up your barrels in every case when nearly empty, and you will always keep a stock of good vinegar on hand, unless your sales are large; in which case, follow the next process. Have the bung-holes open in the barrels to admit air. The free admission of warm air hastens the process. — 2. Take a quantity of maple, beech, or basswood chips, and soak them in good vinegar for 2 or 3 days; with these chips fill a barrel which has been pierced with a large number of inch holes all around the sides for the free admission of air among the chips; cut another barrel in halves; place ½ below the barrel with the chips, and the other ½ above it; pierce the bottom of the top tub with a number of gimlet holes, and place in the holes several threads of twine, to make the vinegar flow evenly over the chips. The liquid drains down slowly through the chips and out of a faucet near the bottom of the barrel into the lower tub. It should run through every 4 hours, and then be baled or pumped back. Leach any of the following preparations through the shavings: 1½ lbs. sugar to each gal. water; 2 lbs. dregs molasses barrels to each gal. water; reduce small beer, lager beer, ale etc., with water (small beer needs little water, lager beer as much water as beer); add ½ gal. water to 2 gals. cider. Use soft water, and use 2 qts. yeast to every barrel. This vinegar can be made in 3 days, and the process should be attended to during warm weather, or in a room where a high temperature is kept up.

MINT. — Procure fresh mint; pick the leaves from the stalk and fill a jar with them; add vinegar until the jar is full; cover to exclude the air, and let it infuse a fortnight; strain the liquor and put it into small bottles for use, of which the corks should be sealed.

MOTHER, To Prevent.—This is a thick, shiny substance, concreted in liquor, particularly in vinegar. To prevent this, add a few drops of sulphuric acid to each gal. vinegar, and it will thoroughly arrest vegetation of this kind.

RAISIN.—Made from the mare left from making raisin wine; 1 cwt. to every 12 or 15 gals. water, with a little yeast.

RHUBARB. — Drain off the first water from rhubarb, when it has stewed 5 minutes; evaporate it to the requisite sourness, and use it instead of vinegar for the table and cooking. It is an agreeable acid, and in many cases it can be used instead of lemon. It is a natural acid, and more wholesome than vinegar formed by the decay of sweets. It may be evaporated by a gentle heat to an intense degree of sourness, and kept in cans or in bottles for use, and reduced with water when wanted.

ROSE. — This is made by pouring the best white wine vinegar into a jar loosely filled with rose leaves, to the height first occupied by the leaves; after the mixture has thus remained 2 or 3 weeks in the sun or a warm situation, it may be strained; if not sufficiently fine for bottling, fine in the usual way, either with isinglass or a little alum water. It is best to keep the vinegar in large bottles, tightly corked, and put into each bottle 1 lump of refined sugar.

SUGAR.—To every qt. spring water put ½ lb. coarse sugar; boil them together, and skim the liquor as long as scum rises. After pouring it into a tub or vessel, let it stand until cool enough to work; then place in it a toast spread with yeast, of a size proportioned to the quantity made; let it ferment a day or two; then beat the yeast into it; put it into a keg or barrel, with a flat stone over the bung hole, and place it in a situation where it may receive the warmth of the sun. Make this vinegar in March or April, and it will be fit for use in July or August. If it is to be bottled, it should be previously drawn carefully from the first cask into another, and 1 handful of shred isinglass thrown into 1 barrel of vinegar, or less, in proportion to the quantity of liquid; then let it stand a few days to clear.

TARRAGON.—Gather full-grown shoots of tarragon the day before they are wanted; fill ½ gal. jar with as many as it will hold without pressing down; add 3 cloves and the thin rind of 1 lemon, and fill up the jar with white wine vinegar; leave it tightly corked, exposed to the sun for 2 or 3 weeks; then strain off the vinegar, wringing the tarragon in a cloth; filter through paper, and bottle.

TESTING. — 1. A method of testing vinegar, to ascertain whether it has been adulterated with sulphuric acid, consists in covering a vessel of boiling water with a wide saucer, placing a layer of a solution of sugar upon this, and after this has evaporated to dryness, and is still hot, laying upon the sugar a drop of the vinegar to be tested. Pure vinegar does not produce

blackening of sugar; but this result takes place if it has been fulsified with sulphuric acid. To determine the presence of a trifling percentage of sulphuric acid in any liquid, a similar experiment may be employed. A drop of water, hanging to a glass tube, which contains not over an 80.1000th part sulphuric acid, will produce action upon the heated layer of sugar. In this case there is no blackening, but the change is to green. Other acids, such as phosphoric acid, hydrochloric acid, nitric acid, etc., do not produce this alteration of sugar. — 2. Paper written on or smeared with pure vinegar; is not charred when strongly warmed before the fire; if it is, the sample contains fully 2 per cent. of oil of vitriol.

WHITE WINE.—Mash up 20 lbs. raisins; add 10 gals. water; let it stand in a warm place for 1 month, and you will have pure white wine vinegar. The raisins may be used a second time.

BEVERAGES.

AMBROSIAL, or NECTAR CREAM SODA.—Take 2 oz. tartaric acid; 2 oz. cream of tartar; 2½ lbs. white sugar; 1 qt. water; whites of 4 eggs, well beaten; 2 tablespoonfuls wheat flour; put all in a tin dish, and heat (but not to boiling point); add 2 drops fine oil of lemon, or other flavoring preferred, and that will complete the syrup. When ready to use, pour 3 tablespoonfuls of the syrup into a tumbler ⅔ full of water; add as much soda as can be held on a dime, and drink immediately. A cool, refreshing summer beverage.

ANTI-FERMENT.—A substance sold in the cider districts for the purpose of arresting fermentation.—1. It generally consists of sulphite of lime in powder, or a mixture of equal parts of the sulphite and powdered mustard. — 2. Mix together 14 lb. of mustard seed with 1 lb. cloves, and bruise them well without drying. Use.—A portion of either of the above added to cider or perry tends to allay the fermentation, when it has been renewed. The second may be used for wine and beer as well as cider. Caution.—In the above, the sulphite must be employed, not the sulphate, which is quite a different article.

BEER TONIC.— Plain syrup, 22° Baume, 5 gal.; oil of wintergreen, 2 dr.; oil of sassafras, 2 dr.; oil of allspice, ½ dr.; oil of sweet orange, 2 dr.; mix the oil with 12 oz. of alcohol, and add to the plain syrup; then add 35 gal. of water, at blood heat, and ferment with sufficient yeast; to this add 1 dr. of salicylic acid, dissolved with 1 dr. of baking soda in small glass water; after it has ceased effervescing, add to the fermenting beer. The object of using this minute quantity is to prevent putrefactive fermentation. The natural vinous ferments will not be obstructed by it.

BOMBA, An Italian Drink.—Blanch and pound 4 oz. of sweet almonds to a smooth paste, adding a few drops of fresh lemon juice during the process, to prevent their oiling, and an equal weight of fine white sugar; when perfectly smooth, add (very gradually) 2 qt. of warm water, stirring briskly all the time, and, when cold, strain carefully and use.

BOTTLED SODA WATER (Without Machine.)—In each gal. of water to be used, dissolve ¾ lb. crushed sugar and 1 oz. supercarbonate of soda; then fill pint bottles with this water; drop into each bottle ½ dr.; pulverized citric acid; immediately cork and tie down; handle the bottles carefully, and keep cool. More sugar may be added, if desired.

CENTENNIAL MEAD.—Mix 1 qt. boiling water with 2½ lb. brown sugar, 2 oz. tartaric acid, and ½ pt. mollasses; when cool, add ½ oz. any flavoring extract. Two fingers of this syrup in a glass of ice-water makes a refreshing summer drink; serve each glass with ¼ teaspoonful bicarbonate of soda.

CHAMPAGNE A LA MINUTE. — Put into a pitcher or bowl 2 teaspoonfuls of carbonate of soda and about 2 oz. of finely powdered sugar; pour upon these 1 qt. of sharp cider, and you have a very pleasant imitation of champagne.

CHERRY BOUNCE.—Crush 4 lb., each, sour and sweet cherries in a stone jar, breaking all the stones; add 2½ lb. white sugar, and 1 gal. best whisky; put into a jug, and shake every day for 1 month; then let it stand quiet another month; strain off and bottle.

CHOCOLATE SYRUP.—Selected chocolate, 1 lb.; water, 4 pt.; have the chocolate rubbed well to powder, or by means of a Keystone beater, or other suitable apparatus, thoroughly incorporate, adding 4 lb. sugar; bring to boiling point with constant stirring; remove from the source of heat; continue the use of the mechanical stirrer for 20 minutes; when cold, add extract vanilla, 1 oz.; essence cinnamon, ½ oz.; and enough thin sirup to make 1 gal. Much depends upon the selection of the chocolate. Avoid scorching, and this means constant attention and stirring.

CINNAMON SIRUP.—Oil of cinnamon, 8 min.; tincture of capsicum, 2 dr.; dissolve and add to a solution of sugar, 7 lb., in boiled water, 1 gal.

COCOANUT BEVERAGE.—To 2 grated cocoanuts with their milk, add 2 qt. pure water; place over the fire, and boil for 5 or 6 minutes, stirring constantly with a wooden spatula; then strain through a hair sieve. Add to the liquid 12 oz. of pulverized sugar; mix well together and ice. This is a delightfully cooling beverage.

COFFEE BEVERAGE, Iced.—Make 1 qt. of strong coffee, to which add 1 pt. of simple syrup; mix well and put into a freezer, and freeze just sufficiently to admit of its being poured into glasses for use.

COOLING FEVER DRINK.—Vinegar, 1 lb.; honey, 2 lb.; water, 6 lb.; mix.

CREAM-OF-TARTAR DRINK.—Put into a large pitcher, 1 oz. of cream of tartar; the rind and

juice of 2 large, fresh lemons; 4 oz. of loaf sugar; pour over these ingredients 2 qts. of boiling water; stir until the sugar dissolves; leave until quite cold; then stir again, strain and serve.

CURRANT ICE WATER.—Press the juice from ripe currants; strain it, and put 1 lb. sugar to each pt. juice; bottle, cork and seal, and keep in a cool, dry place. When wanted, mix with ice-water; or put water into it, make it very sweet, and freeze.

EFFERVESCING JELLY DRINK.—When jams or jellies are too old for table use, mix them with good vinegar, and use them with soda or saleratus.

EGG NOG.—1. (*For 20.*) Take 18 or 20 egg yolks; 15 tablespoonfuls pulverized sugar; beat together, and grate into them 1 nutmeg; add 1 pt. best brandy or Jamaica rum, and 3 or 4 glasses fine sherry; beat to a froth whites of the eggs; whip all together, and add 5 pts. rich milk. A pleasant and nutritious drink; sherry wine may be substituted for the stronger liquors, should they be objected to.—2. Mix yolks 12 eggs; 2 qts. brandy; 1 pt. Santa Cruz rum; 2 gal. milk; 1½ lb. white sugar; beat well; put the whites of the eggs on the top for ornament, first beating them to a stiff froth; serve cold.—3. Eggs, 5; sugar, 5 tablespoonfuls; milk, 1 qt.; best brandy, ½ pt.; nutmeg; stir the sugar and yolks of eggs together; add milk; then brandy; and, lastly, stir in the whites of 3 eggs, whipped up stiff. Flavor to taste.

FRUIT DRINKS.—These are delicious and extremely refreshing, and can be very easily manufactured. Put 3 large tablespoonfuls of any favorite preserve into a pitcher, pour over it a quart of boiling water; leave until cold; then strain and use. Those preserves with a tart flavor, such as black currant, quince, barberry, damson, etc., are the most suitable for this purpose.

GINGER BEER.—1. Put into a large earthenware pan the thin yellow rind and strained juice of 6 lemons, 3 oz. of bruised ginger, 3 lbs. of loaf sugar, and 1 oz. cream of tartar; pour over 3 gals. of boiling water, and when just warm, add 3 tablespoonfuls of fresh brewer's yeast; stir the preparation for a few minutes, and then leave it to ferment until next day; skim the yeast very carefully from the surface, strain the beer gently from the sediment at the bottom, and put it into proper bottles. Cork with perfectly sound corks, which should be dipped in boiling water immediately before using; secure tightly with wire, and store for 3 or 4 days previous to drinking.—2. Brown sugar, 2 lbs.; boiling water, 2 gals.; cream of tartar, 1 oz.; bruised ginger root, 2 oz.; infuse the ginger in the boiling water; add your sugar and cream of tartar; when lukewarm, strain; then add ½ pt. good yeast. Let it stand all night, then bottle; if you desire, you can add 1 lemon and the white of an egg to fine it.—3. (*English.*) 3 gals. water; 6 oz. pulverized ginger; 4 lb. sugar; 4 oz. cream tartar; boil, and when cold add 2 tablespoonfuls of yeast. Allow it to stand over night, then filter and bottle. A most pleasing beverage.

GINGER BEER POWDERS.—1. Ginger, bruised, ½ oz.; cream of tartar, ¾ oz.; essence of lemon, 4 drops; mix. Some sugar may be added, if it be thought desirable to make the packet look bigger. For use, this powder is to be added to 1 gal. of boiling water, in which dissolve 1 lb. of lump sugar; and when the mixture is nearly cool, 2 or 3 tablespoonfuls of yeast are to be added. The mixture should be set aside to work for 4 days, when it may be strained and bottled.—2. Jamaica ginger, powdered, 1 oz.; sodium bicarbonate, 7 oz.; sugar, 1¾ lb.; 1 fl. dr. oil of lemon. Make into powders.

GINGER LEMONADE.—½ cupful vinegar; 1 cupful sugar; 2 teaspoonfuls ginger; stir well; put in a qt. pitcher, and fill with ice-water. If wanted sweeter or sourer, more of the needed ingredients may be put in. It is almost as good as lemonade.

GINGER MEAD.—1 gal. water; 1 lb. loaf sugar; ½ oz. race ginger; 1 lemon, sliced, without seeds; 1 teacupful yeast; let it stand over night to ferment; then pour off without stirring; add to each bottle 1 raisin; cork tight.

GINGER POP.—1. 1 oz. tartaric acid; white sugar, 5 lbs.; 1½ lb. bruised ginger (root); 12 gal. of water; whites of 6 eggs, beaten to a froth; oil of lemon, 2 dr. The ginger root should be boiled for ½ hour in 2 gals. water; strain carefully and add the oil. After 24 hours, strain and bottle.—2. 5 lbs. of loaf sugar to 5 gals. of cold water, 4 lemons, 2 oz. white root ginger, 4 oz. cream tartar; boil the sugar and ginger (previously pound the latter); when it has boiled 15 minutes, strain it through a flannel cloth into a large crock; put in the cream tartar; slice also the lemon into it; let it stand until milk warm, then add a teacup of yeast; let it stand a little, then bottle it tightly in stone bottles; in three days it will be fit for use.—3. 5 lbs. of cream tartar; ginger, 8 oz.; sugar, 35 lbs.; essence of lemon, 5 dr.; water, 30 gals.; yeast, 2 qt.—4. Take 5½ gals. water; ginger root (bruised), ¾ lb.; tartaric acid, ¾ oz.; white sugar, 24 lbs.; whites of 3 eggs, well beaten; 1 small tenspoonful lemon oil; 1 gill yeast; boil the root for 30 minutes in 1 gal. water; strain, and put the oil in while hot; mix. Make overnight; in the morning skim and bottle.—5. (*Royal.*) To 3 gals. of water add ½ lb. cream tartar, ¾ oz. ginger, 3½ lb. white sugar, ½ dr. essence of lemon, ½ pt. yeast. The corks should be tied down.

GRAPE JUICE, Home-Made.—1. 1 qt. grape juice; 3 qts. water; 2½ lbs. brown sugar; keep in an open barrel 9 days, covering only with muslin, to exclude insects; then put in a close cask; fasten the bung, and set aside till spring; then rack off and bottle.—2. Let the grapes gathered be rather ripe, with all decayed ones removed; mash, strain and measure; to each gal. juice add 1 lb. white sugar; let stand for 2 or 3 days; skim, strain and measure as before, and to each gal. add 1 lb. sugar; let it stand again for 2 or 3 days; and add 1 lb. of sugar to each gal.; cork and put away. Do not add a drop of water to the juice if you want rich wine.—3. Stem, and press through a coarse cloth, 2 lbs. catawba grapes; add 3 tablespoonfuls loaf

sugar; when dissolved, add 1 cupful cold water; cool with ice, and drink.

HOME-MADE SODA.—40 gr., each, carbonate soda and fine loaf sugar; 50 gr. lemon or tartaric acid; mix these in 4 glasses water; stir, and drink. If a sliced lemon be substituted for the acid, this drink will be found more delicious; it is refreshing in hot weather or when one is feverish.

HOP BEER.—Water, 5 qts.; hops, 6 oz.; boil 3 hours; strain the liquor; add water, 5 qts.; bruised ginger, 4 oz.; and boil a little longer; strain, and add 4 lbs. sugar; and when milk warm, 1 pt. of yeast. Let it ferment; in 24 hours it is ready for bottling.

IMPERIAL BEVERAGE.—1. Pare off the yellow rind or zest from 1 fresh lemon; add it to 1 qt. of cream. Place upon the fire and bring it to the boiling point, stirring continually; now remove, and continue to stir until quite cold. Sweeten with powdered sugar to your taste. Strain the juice of 4 lemons into a china bowl; pour the cream slowly upon the juice, holding the vessel containing it 2 feet above the bowl; stir well together, and let it stand 2 hours before using it.—2. Cream of tartar, ½ oz.; fresh orange or lemon peel, 3 oz.; lump sugar, 4 oz.; boiling water, 3 pts.; digest in a close vessel until cold, then pour off the clear.—3. (*Collier.*) To the last add cream of tartar, ½ oz., and sweeten to palate. Refrigerant; a common drink in fevers and in hot weather.

IMPERIAL CREAM NECTAR SODA.—*Part 1st.* Water, 1 gal.; loaf sugar, 6 lbs.; tartaric acid, 6 oz.; gum Arabic, 1 oz. *Part 2d.* Flour, 4 teaspoonfuls; whites of 5 eggs, beat finely together; add ½ pt. water. When the first part is blood warm, put in the second; boil 3 minutes, and it is done; 3 tablespoonfuls of syrup to ⅜ glass of water; add ½ teaspoonful carbonate of soda, made fine; stir well and drink at leisure.

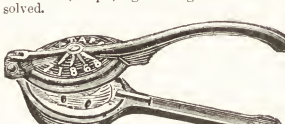
IMPERIAL POP.—Cream of tartar, 3 oz.; ginger, 1 oz.; white sugar, 24 oz.; lemon juice, 1 oz.; boiling water, 1½ gal.; when cool, strain and ferment with 1 oz. yeast, and bottle.

KING'S CUP.—Yellow peel of 1 lemon; lump sugar, 1½ oz.; cold water, 1 pt.; infuse 8 or 10 hours, and strain. The addition of 1 teaspoonful of orange flower water is an improvement. Used as a diluent in cases where acid liquors are inadmissible.

KOUMISS.—1. Into 1 qt. new milk put 1 gill fresh buttermilk and 3 or 4 lumps white sugar; mix well, and see that the sugar dissolves. Put in a warm place to stand 10 hours, when it will be thick. Pour from 1 vessel to another, until it becomes smooth and uniform in consistency; bottle and keep in a warm place 24 hours; it may take 36 in winter. The bottle must be tightly corked and the corks tied down. Shake well 5 minutes before opening.—2. Fill a qt. champagne bottle up to the neck with pure milk; add 2 tablespoonfuls of white sugar, after dissolving the same in a little water over a hot fire; add also ½ of a 2 cent cake of compressed yeast. Then tie the cork on the bottle securely, and shake the mixture well; place it in a room of the temperature of 50° to 95° Fahr. for 6 hours, and finally in the ice-box over night. Drink in such quantities as the stomach may require. Be sure that the milk is pure; that the bottle is sound; that the yeast is fresh; to open the mixture in the morning with great care, on account of its effervescing properties; not to drink it at all if there is any curdle or thickening part resembling cheese, as this indicates that the fermentation has been prolonged beyond the proper time.—3. To a qt. of new milk add a sixth part of water; and to this mixture add, as a ferment, an eighth part of the sourest buttermilk that can be got. In future preparations, a similar quantity of old koumiss will better answer the purpose of a ferment. Cover the vessel with a cloth, and stand in a place of moderate warmth for 24 hours, when a thick substance will be found collected at the top. Stir well until this substance is thoroughly mixed with liquid portion beneath, and stand for 24 hours more, when, having filled a bottle two-thirds full, and again thoroughly mixed by shaking, the preparation, now called koumiss, may be used at once, or the bottle tightly corked and kept in a cool place for future use. Always shake the bottle well before using.—4. Dilute the milk with one-sixth part of hot water, and, while still tepid, add one-eighth of very sour (but otherwise good) buttermilk; put it into a wide jug, cover with a clean cloth, and let it stand in a warmish place (about 75° Far.) for 24 hours; stir up well, and leave for another 24 hours; then beat thoroughly together, and pour from jug to jug till perfectly smooth and creamy. It is now koumiss, and may be drunk at once. To make it sparkling, which is generally preferred, put it into champagne or soda-water bottles; do not quite fill them, well secure the corks, and lay down in a cool cellar. It will then keep for 6 or 8 weeks, though it becomes increasingly acid. To mature some for drinking quickly, it is as well to keep a bottle or two to start with in some warmer place, and from time to time shake vigorously. With this treatment it should, in about 3 days, become sufficiently effervescent to spurt freely through a champagne tap, which must be used for drawing it off as required. Later on, when very frothy and acid, it is more pleasant to drink if a little sweetened water (or milk and water) is first put into the glass. Shake the bottle, and hold it inverted well into the tumbler before turning the tap. Having made one lot of koumiss as above, you can use some of that instead of buttermilk as a ferment for a second lot, and so on 5 or 6 times in succession; after which it will be found advisable to begin again as at first. Mare's milk is the best for koumiss; then ass' milk. Cow's milk may be made more like them by adding a little sugar of milk (or even loaf sugar) with the hot water before fermenting. But perhaps the chief drawback to cow's milk is that the cream separates permanently, whereas that of mare's milk will remix. Hence use partially skimmed milk, for if there is much cream it only forms little lumps of butter, which are apt to clog the tap, or are left behind in the bottle.

LEMONADE.—1. Peel off the yellow rinds from 1 dozen bright, fresh lemons, taking care

that none of the rind is detached but the yellow zest—that portion in which the cells are placed containing the essential oil of the fruit. Put these rinds into an earthen vessel, pour over them 1 pt. of boiling water, and set aside in a warm situation to infuse; express the juice from 2 dozen lemons; strain it into a porcelain bowl, and add 2 lbs. of fine white sugar, 3 qts. water, and the infusion from the peels; stir all well together, until the sugar is well dissolved; now sample, and if required add more acid or more sugar; take care not to have it too watery; make it rich with plenty of fruit juice and sugar.—2. To the juice of 6 lemons and the yellow rind of 2 lemons, add ½ lb. sugar and 1 qt. water; ice the lemonade. Water may be added according to taste afterward. —3. Take 2 lemons, divide them, and put each half into a lemon-squeezer; when all the juice is extracted, put the remainder of the lemons into a pitcher and pour boiling water on them; after they have stood a little, squeeze all the goodness from them; add the juice to some loaf sugar, to sweeten pleasantly; then pour on enough cold water to make the strength required. Ice must be added.—4. Citric acid, 1 to 1½ dr.; essence lemon, 10 drops; sugar, 2 oz.; cold water, 1 pt.; agitate together until dissolved.



Lemon Squeezer.

LEMONADE, Aerated.—Into each bottle put lemon syrup, 1 to 1½ oz; essence lemon, 3 drops; sesquicarbonate of soda, ½ dr.; water, q. s. to nearly fill the bottle; have the cork fitted and ready at hand; then add of tartaric acid, 1 dr.; instantly close the bottle, and wire down the cork; it should be kept inverted, in a cool place, and, preferably, immersed in a vessel of ice-cold water.

LEMONADE, Antimoniated.—Add tartar emetic, 1 gr., to each pt. of ordinary lemonade.

LEMONADE, Aperient.—Sugar, 1 oz.; lemon juice, ¾ fl. oz.; sulphate of soda, 3 dr.; water, 8 fl. oz.; put them into a soda-water bottle without shaking; have the cork ready fitted; add of sesquicarbonate of soda, ½ dr., and instantly cork the bottle; wire it down and keep in a cool place, inverted.

LEMONADE, Artificial.—Loaf sugar, 2 lbs.; tartaric acid, ½ oz.; essence of lemon, 30 drops; essence of almonds, 20 drops; dissolve the tartaric acid in 2 pts. hot water, add the sugar, and lastly the lemon and almond; stir well; cover with a cloth, and leave until cold; put 2 tablespoonfuls into a tumbler, and fill up with cold water. This drink, it is said, will be found much more refreshing and more palatable than either ginger beer or lemonade, and costs only 30 cents for 10 pts. The addition of a very little bicarbonate of potash to each tumblerful just before drinking will give a wholesome effervescing drink.

LEMONADE, Lactic.—Lactic acid, 1 to 4 dr.; syrup, 2 oz.; water, 1 pt.; mix.

LEMONADE, Milk.—Dissolve ¾ lb. loaf sugar in 1 pt. boiling water, and mix with 1 gill lemon juice and 1 gill sherry; then add 3 gills cold milk; stir the whole well together, and then strain it.—2. Take 4 lemons, pare the rind as thin as possible; squeeze them into 1 qt. water; add ½ lb. fine sugar; let it stand 2 or 3 hours, and pass it through a jelly bag.—3. (*Effervescing, without a Machine.*) Put into each bottle 2 dr. sugar, 2 drops essence lemon, ½ dr. bicarbonate potash, and water to fill the bottle; then drop in 35 or 40 gr. of citric or tartaric acid in crystals, and cork immediately, placing the bottles in a cool place, or preferably, in iced water.—4. 2 scruples sesquicarbonate of soda, 2 dr. sugar, 4 drops essence of lemon, and ½ pt. water; lastly, 8 dr. tartaric acid in crystals. Care must be taken to avoid accidents from the bursting of bottles.—5. Into a soda-water bottle, nearly filled with water, put 1 oz. sugar, 2 drops essence of lemon (dropped on the sugar), 20 gr. bicarbonate of potash in crystals; and, lastly, 30 to 40 gr. of citric acid, also in crystals. Cork immediately.

LEMONADE, Portable.—Mix strained lemon juice with loaf sugar, in the proportion of 4 large lemons to 1 lb.; grate the rind of the lemons into this, and preserve the mixture in a jar. If too sweet, add a little citric acid. Use 1 tablespoonful to a tumbler of water.

LEMONADE POWDERS.—1. Powdered citric or tartaric acid, 12 gr.; powdered white sugar, ½ oz.; essence of lemon, 1 drop (or a little of the yellow peel of a lemon rubbed off on a piece of sugar); mix. For 1 glass.—2. White sugar, 4 lb.; citric or tartaric acid, 1½ oz.; essence of lemon, ½ oz.; mix well, and preserve it in a bottle for use. 1 to 2 dessertspoonfuls make a glass of lemonade. It is also put up in papers containing about 2½ dr. each.—3. Take 1 oz. crystalized citric acid, rub in fine, and mix thoroughly with 1 lb. dry pulverized white sugar; put in a single drop of oil of lemon peel to flavor it, and mix well; preserve in bottles for future use. In place of citric acid, you may take tartaric acid.

LEMON BEER.—1. Boiling water, 1 gal.; lemon, sliced, 1; bruised ginger, 1 oz.; yeast, 1 teacupful; sugar, 1 lb.; let it stand 12 to 20 hours, and it is ready to bottled.—2. Put in a keg 1 gal. water; 1 sliced lemon; 1 tablespoonful ginger; 1 pt. syrup; ½ pt. yeast. Ready for use in 24 hours; if bottled, tie down the corks.

LEMON JUICE, Artificial.—1. Citric or tartaric acid, 2½ oz., gum, ½ oz.; pieces of fresh lemon peel, ¼ oz.; loaf sugar, 2 oz.; boiling water, 1 qt.; macerate, with occasional agitation, till cold, and strain. Excellent.—2. Water, 1 pt.; sugar, 1 oz.; essence of lemon, 30 drops; pure acetic acid to acidulate. Inferior. Both are used to make lemonade.

LEMON SUGAR.—Sugar, 4 lbs.; tartaric acid, 3 oz.; essence of lemon, ¼ oz. Used to make lemonade, etc.

LEMON SYRUP.—Rub the rind off 6 large, fresh lemons with 1 lb. of fine loaf sugar, broken into small pieces; moisten these with as much water as they will absorb; put them into a preserving pan and boil to a clear syrup; then add the strained juice of 12 fresh lemons; stir well—off the fire—for 5 minutes; then pour into small, perfectly dry bottles, and when quite cool cork, seal and store in the usual manner. A small quantity of this syrup put into a glass of pure filtered water immediately transforms the latter into the most delicious lemonade. Orange syrup is prepared exactly as described above, only substituting oranges for the lemons, and using a smaller proportion of sugar.

LIME-FRUIT SYRUP.—A very pleasant and cooling drink is made of citric acid, 3 oz.; sugar, 7 lbs.; boiling water, 1 gal.; coloring, q. s.; dissolve.

MAPLE BEER.—1. To 4 gals. boiling water, add 1 qt. maple syrup; ½ oz. of essence of spruce; add 1 pt. of yeast, and proceed as with ginger pop.—2. To 4 gals. of boiling water, add 1 qt. of maple syrup, ½ oz. of essence of spruce, and 1 pt. of yeast; let it ferment for 24 hours, and then strain and bottle it. In a week or more it will be ready for use.

MEAD.—Mead is an old-fashioned beverage, but a very pleasant one, if care be taken in making it. It is generally made over strong, too much honey being used to the proportion of water. The following is a good recipe: 1. On 30 lbs. honey (clarified) pour 13 gals. soft water, boiling hot; clarify with the whites of eggs, well beaten; boil again; remove all scum as it rises; add 1 oz. of best hops, and boil for 10 minutes; then pour the liquor into a tub to cool, spreading a slice of toast on both sides with yeast, and putting it into the tub when the liquor is nearly cold. The tub should stand in a warm room. When fermentation has thoroughly begun, pour the mixture into a cask, and as it works off, fill up the cask, keeping back some of the liquor for this purpose. Bung down closely when fermentation has ceased, leaving a peg hole, which can be closed up in a few days. Let it remain a year in the cask before bottling off.—2. To 15 lbs. honey add 6 gals. of water; clarify the honey with whites of eggs; boil for 10 minutes, and keep thoroughly skimmed; add a handful of mixed herbs, thyme, rosemary tops and bay leaves; boil for ½ hour more; strain the mixture into a tub, upon 5 pts. ground malt; stir well together, and, when lukewarm, strain through a cloth into another tub; work it with yeast, and when fermentation is set up, pour it into a cask; suspend in the cask a muslin bag containing sliced ginger, ½ oz.; ¼ oz., each, of cloves, nutmeg and mace, well bruised; bung up tightly when it has ceased working, letting the bag of spices remain. It should stand in the wood for a year, and then be bottled off.

METHEGLIN MEAD.—1. 50 lbs. clear honey; boiling water to fill a 16 gals. cask; stir them well for a day or two; add yeast, and ferment.—2. From honey, 1 cwt.; warm water, 24 gals.; stir well until dissolved; the next day add of yeast, 1 pt.; hops, 1 lb.; previously boiled in water, 1 gal., along with water, q. s. to make the whole measure 1 barrel; mix well, and ferment the whole with the usual precautions adopted for other liquors. It contains on the average from 7 to 8 per cent alcohol.

NECTAR.—This is a simple, pleasant drink, and, generally speaking, extremely popular. Dissolve 2 lbs. loaf sugar in 3 qts. boiling water, and when cool, add ½ oz. of tartaric or citric acid and the strained juice of 6 lemons; color according to fancy with cochineal, saffron or burnt sugar; strain and bottle. This beverage will keep good for 3 or 4 weeks, and should always be made a few days previous to being required.

OATMEAL WATER.—The method of manufacture is simple. Put a liberal lump of ice into a pail with a few handfuls of oatmeal; fill up with water; add the juice of a lemon and a little sugar, only just enough to give interest; and the result is a drink that any man will be grateful for on a sweltering dog day.

ORANGEADE.—1. Juice of 4 oranges; thin peel of 1 orange; lump sugar, 4 oz.; boiling water, 3 pt.—2. Juice and peel of 1 large orange; citric acid, 15 grains; sugar, 3 oz.; boiling water, 1 qt.—3. Pare off the thin, yellow rind of 4 oranges, and infuse in ½ pt. boiling water, express the juice of 12 Florida oranges, and strain through a hair sieve; add to this ¾ lb. fine white sugar, the infusion from the rinds and 1 qt. of water. Ice the orangeade.—4. Slice crosswise 4 oranges and 1 lemon; put them into an earthen jug, with 4 oz. loaf sugar; pour upon these 1 qt. of boiling water, and allow to stand covered for 1 hour. Decant and ice.—5. Simple syrup, ½ fl. oz.; tincture of orange peel, ½ dr.; citric acid, 1 sc.; fill the bottle with aerated water.—6. (*Effervescing or Aerated, or Sherbet.*) Mix 1 lb. syrup of orange peel, 1 gal. of water, and 1 oz. citric acid; charge strongly with carbonic acid gas, with a machine.—7. Syrup orange juice, ¾ oz.; aerated water, ½ pt.

ORANGEADE POWDERS.—Powdered sugar, 14½ oz.; powdered orange peel, 12 gr.; oil of orange peel, 60 drops; essence of cedrat, 12 drops; bicarbonate of soda, 3½ oz.; mix and put 145 gr. in each blue paper. In the white paper put 32 gr. tartaric acid, or 30 gr. citric acid. Or the alkaline and acid powders may be put into separate bottles, with a measure holding the proper proportions of each. The orange peel may be omitted.

ORGEAT BEVERAGE.—Blanch 1 lb. sweet and 1 oz. bitter almonds; put them into a stone mortar and pound them to a fine paste, with 1 wineglassful of orange flower water; then add and rub in by degrees, ½ pt. rose water and 1½ pt. pure water; strain through a hair sieve and add it to 3 pts. simple syrup; place it upon the fire and boil up for 1 minute; remove and bottle. A tablespoonful of this added to tumbler of ice-water, soda or seltzer, is a very pleasant and refreshing drink.

OXYMEL.—An acidulous syrup made of honey and vinegar. Clarified honey, 0·32 oz. (avoirdupois); acetic acid, 4 fl. oz.; distilled water, 4 fl. oz. Liquefy by heat (Br. Ph.).

PERRY.—A fermented liquid, prepared from pears, in the same way as cider is from apples. The reduced pulp must not be allowed to remain long without being pressed. In the cask, perry does not bear changes of temperature so well as cider. It is therefore advisable, if at the end of the succeeding summer it be in sound condition, to bottle it, when it will keep perfectly well. The red, rough tasted sorts of pears are principally used for making perry. They should be quite ripe, without, however, approaching to mellowness or decay. The best perry contains about 9 per cent of absolute alcohol; ordinary perry from 5 to 7 per cent. Perry is a very pleasant tasting and wholesome liquid. When bottled champagne fashion, it is said to frequently pass for champagne without the fraud being suspected.

PERUVIAN BEER.—(*Carbonated.*) To ½ gal. of syrup add 1 oz. of extract of cinchona or Peruvian bark. This may be flavored with 1 oz. essence sarsaparilla or root beer.

PHILADELPHIA SHERBET.—Boil in 6 pt. water, 10 to 12 stalks green rhubarb and 8 oz. raisins or figs. When the water has boiled ½ hour, strain, and mix it with 1 teaspoonful rosewater, and vanilla, orange or lemon syrup to suit taste. Drink it iced.

RASPBERRY VINEGAR.—The following makes a delicious summer drink by stirring 2 or 3 tablespoonfuls of it into a tumbler of ice-water: Fill a stone jar with ripe berries, and cover with pure, strong cider vinegar; let it stand 5 days; then strain through a sieve, pressing out all the juice; allow 1½ lb. white sugar to each pint of this juice, and boil until the sugar is dissolved, removing any scum that may arise; take from the fire; bottle and seal.

RHUBARB SHERBET.—Boil in 3 pts. water, 6 or 8 stalks green rhubarb and 4 oz. raisins or figs; when the water has boiled ½ hour, strain, and mix it with 1 teaspoonful rose water, and orange or lemon syrup to taste. Drink it cold.

ROOT BEER.—1. Take 3 gals. molasses; add 10 gals. water at 60° Fahr.; let this stand 2 hours; then pour into a barrel, and add powdered sassafras and wintergreen bark, each, ½ lb.; bruised sarsaparilla root, ½ lb.; yeast, 1 pt.; water to fill the barrel; ferment 12 hours, and bottle.—2. For 10 gals. beer, take 3 lbs. common burdock root, or 1 oz. essence of sassafras; ½ lb. good hops; 1 pt. corn, roasted brown; boil in 6 gals. pure water, till the strength is obtained; strain while hot into a keg, adding cold water to make 10 gals. When nearly cold, add molasses or syrup until palatable; add also as much fresh yeast as will raise a batch of 8 loaves of bread; place the keg in a cool place, and in 48 hours it will be first-rate root beer.—3. For each gal. water used, take hops, burdock, yellow dock, sarsaparilla, dandelion and spikenard roots (all bruised), of each, ½ oz.; boil 20 minutes; strain while hot; add 8 or 10 drops of oils of spruce and sassafras, mixed in equal proportions; when cool enough, put in 2 or 3 tablespoonfuls yeast; molasses, ⅔ pt., or white sugar, ½ lb., gives the right sweetness.

SARSAPARILLA BEER.—Sarsaparilla (sliced), 1 lb.; guaiacum bark (bruised small), ¼ lb.; guaiacum wood (rasped) and licorice root (sliced), of each, 4 oz.; aniseed (bruised), 1½ oz.; mezereon root bark, 1 oz.; cloves (cut small), ½ oz.; moist sugar, 3½ lbs.; hot water (not boiling), 9 qts.; mix in a clean stone jar; keep in a moderately warm room, shaking 2 or 3 times daily, until fermentation sets in; then let it repose a week, when it will be fit for use.

SARSAPARILLA MEAD.—1 lb. Spanish sarsaparilla; boil 5 hours, so as to strain off 2 gals.; add 16 lbs. sugar and 10 oz. tartaric acid; ½ wineglass of syrup to ½ pt. tumbler water, ½ teaspoonful soda powder, is a fair proportion for a drink.

SARATOGA PUNCH.—Grate the rind of 3 and squeeze the juice of 6 lemons; add water the same as for lemonade; sweeten to taste; then add 6 eggs, yolks and whites, beat separately, and serve. This makes a delicate frothy drink.

SASSAFRAS MEAD.—3½ lbs. nice brown sugar; 1½ pt. good molasses; 3 qts. boiling water; ½ qt. tartaric acid. When cool, strain into a jug, and mix with this ½ oz. essence of sassafras. Put in bottles, cork tight, and keep in a cool place. For a drink, put 2 spoonfuls of this syrup into ⅔ glass ice-water, and then add ½ teaspoonful soda.

SHERBET.—8 oz. carbonate of soda; 6 oz. tartaric acid; 2 lbs. powdered loaf sugar; 3 dr. essence lemon; mix thoroughly; keep corked and dry; stir in 2 teaspoonfuls to 1 pt. cold water, and drink.

SODA POWDERS.—1. Tartaric acid, 1 oz.; bicarbonate soda, 1 oz., 54 gr.; or bicarbonate of potassa, 1 oz., 2 dr., 40 gr.; reduce the acid and either bicarbonate separately to fine powder; divide each of these into 16 powders, and preserve the acid and alkaline powders in separate papers of different colors.—2. Citric acid, 9 dr.; bicarbonate of soda, 11 dr.; or bicarbonate of potassa, 13 dr.; proceed as last, dividing each into 18 parts.—3. Tartaric acid (in crystals), 10 dr.; bicarbonate of soda, 11 dr.; or bicarbonate of potassa, 13 dr. Reduce them to powder, and divide into 18 parts.

SOUR DRINK.—1 gal. water; 1 pt. cider vinegar; 1 lb. sugar; 2 spoonfuls ginger; stir well together, and add a lump of ice. A trifle of soda stirred into each glass will make it foam and sparkle.

SPANISH BEVERAGE.—1. To ¾ lb. sugar and 6 oz. pounded almonds, as for orgeat, add 1 pt. grape juice and 3 pts. water; mix well together and filter. It should then be iced.—2. To 3 pts. rich lemonade, add 1 bottle of claret and ½ a nutmeg, grated.

SPRUCE BEER.—1. Essence of spruce, ½ pt.; pimento and ginger (bruised), of each, 5 oz.; hops, ½ lb.; water, 3 gals.; boil the whole for 10 minutes; then add of moist sugar, 12 lbs.; warm water, 11 gals.; mix well, and when only lukewarm, further add of yeast, 1 pt.; after the liquid has fermented for 24 hours, bottle.—2. Cold water, 10 gals.; boiling water, 11 gals.; mix in a barrel; add molasses, 30 lbs., or brown sugar, 24 lbs.; oil of spruce, or any oil you wish, 1 oz.; add 1 pt. yeast; ferment; bottle in 2 or 3 days. If you wish white spruce beer, use lump sugar; for ginger flavor, use 17 oz. ginger root,

bruised, and a few hops; boil for 30 minutes in 3 gals. water; strain and mix well; let it stand 2 hours and bottle, using yeast.—3. Boil 1 handful hops and 2 handfuls of chips of sassafras root, in 10 gals. water; strain, and turn on, while hot, 1 gal. molasses, 2 spoonfuls essence spruce, 2 spoonfuls ginger, and 1 spoonful pounded allspice; put into a cask, and, when cold enough, add ½ pt. good yeast; stir well; stop it close; when clear, bottle and cork.

STRAWBERRY WATER.—Bruise 1 lb. of fresh strawberries with ½ lb. of finely sifted sugar and ½ pt. of cold spring water; filter this slowly through very fine muslin; add 1 qt. of cold water and the strained juice of a large lemon, and serve. Raspberry, currant or pineapple water may be prepared in the same manner, and will be found most delicious, especially if a small quantity of carbonate of soda and tartaric acid be stirred into each glass immediately before drinking, in order to make it effervesce.

STRAWBERRY SHERBET.—Crush 1 qt. ripe berries; add juice of 1 lemon, 2 teaspoonfuls of orange flower water, and 3 pts. water; let them stand several hours; then strain over ¾ lb. sugar; set in ice an hour or two before using.

TABLE BEER.—The same proportions will answer for a greater or less quantity, only proportioning the materials and utensils. Take 1 peck of good malt, ground; 1 lb. of hops; put them in 20 gals. of water, and boil them for ½ hour; then run them into a hair-cloth bag or sieve, so as to keep back the hops and malt from the wort, which, when cooled down to 60° by Fahrenheit's thermometer, add to it 2 gals. of molasses, with 1 pt., or a little less, of good yeast; mix these with your wort, and put the whole into a clean barrel, and fill it up with cold water to within 6 inches of the bung-hole (this space is requisite to leave room for fermentation), bung down tight. If brewed for family use, would recommend putting in the cock at the same time, as it will prevent the necessity of disturbing the cask afterward. In one fortnight this beer may be drawn, and will be found to improve.

MEDICINAL LIQUORS.

CORDIALS.

ALKERMES.—1. Bay leaves and mace, each, 1 lb.; nutmegs and cinnamon, each, 2 oz.; cloves, 1 oz. (all bruised); cognac brandy, 3½ gals.; macerate 3 weeks, frequently shaking; then distil over 3 gals.; and add clarified spirit of kermes, 18 lbs.; orange flower water, 1 pt.; mix well, and bottle.—2. Spice as last; British brandy, 4 gals.; water, 1 gal.; macerate as before, and draw over 4 gals., to which add of capillaire, 2 gals., and sweet spirit of nitre, ¼ pt. Inferior to the last.

ANISEED.—1. Aniseed, 2 oz. (or essential oil, 1½ dr.); sugar, 3 lbs. per gal.—2. Aniseed, 4 oz.; coriander and sweet fennel seeds (bruised), each, 1 oz.; rectified spirit, 1 gal.; water, 3 qts.; macerate 5 or 6 days; draw over 7 pts.; and add lump sugar, 2½ lbs.—3. Oil of aniseed, 15 drops; oils of cassia and caraway, each, 6 drops; rub them with a little sugar; then dissolve in spirit, 3 qts., by shaking together; filter and dissolve in the liquor, sugar, 1½ lb.

BALM OF MOLUCCA.—Mace, 1 dr.; cloves, ½ oz.; clean spirit, 1 gal.; infuse 1 week in a well-corked carboy, frequently shaking; color with burnt sugar; to the clear tincture add lump sugar, 4½ lbs., dissolved in pure soft water, ½ gal.

BLACKBERRY.—Wash and pick over the berries; mash with a wooden spoon in a preserving kettle; let them come to a boil; strain; to every pt. juice, add ½ pt. water; 1 lb. loaf sugar; 1 oz., each of cloves, mace and cinnamon; 1 grated nutmeg; 1 oz. pounded green ginger; boil ½ hour; strain; and, when cold, add to each pt. 1 gill brandy. To be kept in a cool, dry place.

CARAWAY.—Generally from the essential oil, with 2½ lbs. sugar per gal.; 1 fl. dr. of the oil is reckoned equal to ½ lb. seed. A little oil of cassia, and essence lemon or orange, improves it.—2. 8 gals spirit, 50 per cent.; 1 oz. oil of caraway; dissolve in 95 per cent spirit; 8 lbs., each, sugar and water; dissolve the sugar in the water; mix, stir, and filter.

CEDRAT.—Essence cedrat, ½ oz.; pure spirit (at proof), 1 gal.; dissolve; add water, 3 pts.; agitate well; distil 3 qts., and add an equal measure of clarified syrup.

CHERRY.—Macerate 30 lbs. red sour cherries, made into a pulp, with 4½ gals. 95 per cent alcohol; press, and add syrup of 42 lbs. sugar and 3½ gals. water; filter.

CINNAMON.—Seldom made with cinnamon (owing to its high price), but with essential oil or bark of cassia, with 2 lbs. sugar to gal. It is preferred colored, and may be prepared by simple digestion. The addition of 5 or 6 drops, each, essence of lemon and orange peel; with a spoonful essence of cardamoms, per gal., improves it. 1 oz. oil of cassia is considered equal to 8 lbs. buds or bark; 1 fl. dr. of oil is enough for 2½ gals. Color with burnt sugar.

CITRON.—Oil or peel, with 3 lbs. sugar per gal.

CITRONELLE.—1. Fresh orange peel, 2 oz.; fresh lemon peel, 4 oz.; cloves, ½ dr.; coriander and cinnamon, each, 1 dr.; proof spirit, 4 pts.; digest 10 days; add water, 1 qt., and distil ½ gal.; to the distilled essence add white sugar, 2 lbs., dissolved in water, 1 qt.—2. Ess. of orange, ½ dr.; essence of lemon, 1 dr.; oils of cloves and cassia, each, 10 drops; oil of coriander, 20 drops; spirit, 5 pts.; agitate until dissolved; then add distilled water, 3 pts.; mix and filter; lastly, add sufficient dissolved sugar.

CLAIRET.—Aniseed, fennel, coriander, caraway, dill and candy carrot seeds, each (bruised) 1 oz.; proof spirit, ½ gal.; digest a week; strain

and add loaf sugar, 1 lb., dissolved in water, q.s.

CLOVE.—Put into a stone jar, ½ lb. cloves; ½ oz., each, cinnamon, nutmeg and coriander seeds, ½ lb. red currant jelly; 10 oz. sugar candy; 1 oz., each, candied citron, orange and lemon peel sliced; 1½ oz. isinglass; 3 oz. preserved ginger sliced; 2 oz. sweet and 1 oz. bitter almonds, blanched and pounded; 9 oz. powdered loaf sugar; 1 pt. red cordial water; 1 gal. proof spirit of wine; stop up the jar, and shake well daily for 1 month; then put it away in a dry room and let stand 12 months; strain and filter into bottles; cork and seal them. Fit for use in 2 months; age will improve it.

CORIANDER.—To ½ gal. spirits, put ½ lb. coriander seeds, ¼ lb. caraway seeds, ½ lb. sugar, and 1 drop oil of orange; make up to 3 qts. with water. The coriander must be bruised and steeped in the spirit 10 or 12 days, and stirred 2 or 3 times a day.

CURACOA.—Curacoa orange peel, 2 lbs.; ½ lb. Ceylon cinnamon; soak in water; boil 5 minutes with juice of 32 oranges and 14 gals. plain white syrup; add 6 gals. alcohol, 95 per cent.; strain; filter; color dark yellow with sugar coloring.

GINGER.—1 lb. raisins; rind of 1 lemon; ¾ oz. bruised ginger; steepin 1 qt. best brandy; strain, and add 1 lb. powdered loaf sugar to every qt.

GODFREY.—1. Opium (sliced), ¼ oz.; sassafras chips, 1 oz.; brandy, 1 qt.; macerate 4 or 5 days; add water, 1 qt.; molasses, 3½ lbs.; simmer the whole a few minutes; next day decant the clear portion. — 2. Aniseed, caraways and corianders, each, bruised, 1 oz.; sassafras chips, 9 oz.; water, 6 pts.; simmer until reduced to 4 pts.; then add molasses, 6 lbs.; when nearly cold, add tinct. opium, 3 fl. oz.

GOLD.—Angelica root (sliced), 1 lb.; raisins, ½ lb.; coriander seeds, 2 oz.; caraway seeds and cassia, each, 1½ oz.; cloves, ½ oz.; figs and sliced liquorice root, each 4 oz.; proof spirit, 3 gals.; water, 1 gal.; digest 2 days, and distil 3 gals. by a gentle heat; add, sugar, 9 lbs., dissolved in rose water and clean soft water, each 1 qt.; lastly, color by steeping in it hay saffron, 1½ oz.

GRAPE.—Purple grapes, sugar, water; wash and bruise the fruit; add a little water, and let it stand over night; strain; and to each gal. juice add 2 lbs. sugar; let it stand a week; drain off and bottle. A very acceptable drink for invalids, with a little water.

LEMON.—Digest fresh and dried lemon peel, each, 2 oz., and fresh orange peel, 1 oz., in proof spirit, 1 gal., for a week; strain with expression; add clear soft water, q. s., to reduce it to desired strength, and lump sugar, 3 lbs. to the gal.; a little orange flower or rose water improves it.

LOVAGE.—Fresh roots lovage, 1 oz. per gal. ¼ this quantity fresh roots celery and sweet fennel are commonly added; sometimes a little fresh valerian root and oil of savine are added before distillation.

NECTAR.—Chopped raisins, 2 lbs.; loaf sugar, 4 lbs.; boiling water, 2 gals.; mix, and stir frequently until cold; add 2 lemons, sliced; proof spirit (brandy or rum), 3 pts.; macerate in a covered vessel, 6 or 7 days, occasionally shaking; strain with pressure, and let the liquid stand in a cold place a week to clear; decant the clear portion, and bottle it. — 2. Red ratafia, 3 gals.; oils cassia and caraway, each, 25 drops, dissolved in brandy, ½ pt.; orange wine, 1 gal.; 6 sliced oranges; lump sugar, 2 lbs.; macerate a week; decant and bottle.

PEACH.—Make a rich syrup of 1 qt. peach juice and 1 lb. white sugar; when cold, add ½ pt. best brandy; for a drink, dilute with water.

PEPPERMINT.—1. Pour 1 qt. boiling water upon ½ lb. loaf sugar; stir till sugar dissolves; add 24 drops oil peppermint; bottle while warm. — 2. Good whisky and water, each, 10 gals.; white sugar, 10 lbs.; oil peppermint, 1 oz., in 1 pt. alcohol; 1 lb. flour well worked in the fluid; ½ lb. burnt sugar to color; mix, and let it stand 1 week before using.

QUINCE. — Take the parings and cores of quinces, when preserving; cover with water, and boil 1 gal. down to ½ gal.; when reduced to a thick mucilage, add 2 lbs. white sugar; stir until dissolved; add 2 qts. best white brandy; pour into clean wine bottles, and into each bottle put 4 or 5 blanched bitter almonds; shake each bottle well, and cork tightly; in 1 week it is fit for use.

RASPBERRY. — Raspberry brandy, capillaire and water, equal parts.

ROYAL.—Take a stone bottle, and put into it 2 qts. best brandy; add 2 dr. angelica seeds, 1 oz. coriander seeds; 1 teaspoonful, each, fennel and anise seeds, previously bruised in a mortar; squeeze into the mixture the juice of 2 fresh lemons, putting in the rinds cut small; add 1 lb. loaf sugar, and, agitating the jug from time to time, let the whole infuse 5 days; after this pass it through filtering paper, and bottle it, corking tightly. 2 tablespoonfuls to a small wineglassful is taken.

SIGHS OF LOVE.—Sugar, 6 lbs.; soft water, q. s. to produce 1 gal. syrup; add eau de rose, 1 pt.; proof spirit, 7 pts. It is stained pale pink by powdered cochineal. A pleasant cordial. A drop or two of essence of ambergris or vanilla improves it.

STRAWBERRY. — 1 qt. strawberries, fully ripe; 1 lemon; 1 orange; 3 pts. water; 1 lb. sifted sugar. Mash the strawberries through a sieve; add juice of lemon and orange and the water, and work together; let stand 2 hours. Put the sugar into a bowl and strain the juice over it, stirring till sugar is dissolved. Stand on ice before serving. A delicious drink.

TENT.—Plain spirit and port wine, each, 1 qt.; sherry and soft water, each, 1 pt.; orange flower water and lemon juice, each, ¼ pt.; essence ambergris, 2 drops; sugar, 2 lbs.

MINERAL WATERS.

AERATED.—Sulphate of iron, 1 gr.; carbonate of soda, 4 gr.; water deprived of air, and charged with carbonic acid gas, 1 pt.

AIX-LA-CHAPELLE.—Bicarbonate of soda, 12 gr.; chloride of sodium, 25 gr.; chloride of calcium, 3 gr.; sulphate of soda, 8 gr.; simple sulphuretted water, 2½ oz.; water, slightly carbonated, 17½ oz.

BADEN.—Chloride of magnesium, 2 gr.; chlo

ride of calcium, 40 gr.; perchloride of iron, ¼ gr.; chloride of sodium, 30 gr.; sulphate of soda, 10 gr.; carbonate of soda, 1 gr.; water, 1 pt.; carbonic acid gas, 5 volumes.

BAREGES. — Crystallized hydrosulphate of soda, crystallized carbonate of soda, and chloride of sodium, each, 2 oz.; water, 10 oz.; dissolve. Add to a common bath at the time of using.

CARLSBAD. — Chloride of calcium, 8 gr.; tincture of chloride of iron, 1 drop; sulphate of soda, 50 gr.; carbonate of soda, 60 gr.; chloride of sodium, 8 gr.; carbonated water, 1 pt.

CHALYBEATE. — Water, freed from air by boiling, 1 pt.; sulphate of iron, ½ gr.

CITRATE OF MAGNESIUM. — Citric acid, 16 oz.; carbonate of magnesium, 16 oz.; essence of lemon, 8 oz. Dissolve the acid in 4 pts. hot water; add the magnesia; when effervescence ceases add the lemon, and make up sufficient to measure 1 gal.; charge with 9 gals. water.

CONGRESS. — Bicarbonate of soda, 314 gr.; precipitated chalk, 85 gr.; calcined magnesia, 24 gr.; nitrate of strontia, 1 gr.; sulphate of manganese, 2 gr.; sulphate of iron, 1 gr.; sulphate of potassium, 1½ gr.; nitric acid, 1 gr.; carbonate of potassium, 18 gr.; chloride of sodium, 44 gr.; bromide of sodium, 2 gr.; iodide of sodium, 3 gr.; alum, 2½ gr.; carbonate of lithia, 8 gr.; solution of silicate of soda, 3 gr.; muriatic acid and carbonic acid water, sufficient. As magnesia or the carbonate, as well as carbonate of lime, are nearly insoluble in carbonic acid water as found in commerce, they should be freshly precipitated, when they will dissolve by it. This is accomplished by dissolving in sufficient muriatic acid, thereby forming chlorides of magnesium and calcium. The 314 gr. of bicarbonate of soda having been dissolved in 12 fluid oz. water, is added to the solution of the chlorides, when freshly precipitated carbonates are formed. To this mixture is added sufficient carbonic acid water to make a clear solution, which would therefore contain both bicarbonate of magnesia and of lime, and chloride of sodium formed by double decomposition. It will be observed that there are 44 more gr. of chloride of sodium called for by the receipt.

HARROWGATE.—Chloride of sodium, 100 gr.; chloride of calcium, 10 gr.; chloride of magnesium, 6 gr.; bicarbonate of soda, 2 gr.; water, 18½ oz.; dissolve, and add simple sulphuretted water, 1½ oz., to the foregoing prepared solution.

HUNYADI JANOS.—Sulphate of lime, 1½ oz.; Glauber salts, 23 oz.; Epsom salts, 28 oz.; sulphate of potassium, 1 dr.; water, 10 gals.; mix, and charge with gas.

KISSENGEN. For Fountains.—Bicarbonate of soda, 1 dr.; carbonate of lime, 2 dr. and 2 sc.; precipitate carbonate of lime, 2 sc.; common salt, 8 oz.; muriate of ammonia, 4 gr.; sulphate of soda, 2 dr. and 2 sc.; sulphate of magnesia, 2 oz.; phosphate of soda, 13 gr.; phosphate of lime, 2 dr. and 2 sc. Mix; add water, ¾ gal.; let it stand 6 hours; filter; add carbonate magnesia, 3 dr. and 1 sc., and then charge with 10 gals. water.

MARIENBAD.—Carbonate of soda, 2 sc.; sulphate of soda, 96 gr.; sulphate of magnesia, 8 gr.; chloride of sodium, 15 gr.; chloride of calcium, 10 gr.; to this add carbonated water, 1 pt.

PULLNA.—Sulphate of soda, 4 dr.; sulphate of magnesia, 4 dr.; chloride of calcium, 15 gr.; chloride of magnesium, 1 sc.; chloride of sodium, 1 sc.; bicarbonate of soda, 10 gr.; water, slightly carbonated, 1 pt. One of the most active of the purgative saline waters.

PYRMONT. — Sulphate of magnesia, 20 gr.; chloride of magnesium, 4 gr.; chloride of sodium, 2 gr.; bicarbonate of soda, 16 gr.; sulphate of iron, 2 gr.; Carrara water, 1 pt.

SEIDLITZ.—Fill soda water bottles with clear water; add to each as below; cork and wire immediately; Rochelle salts, 3 drops; bicarbonate of soda, 35 gr.; sulphuric acid, 11 drops.

SEIDSCHUTZ.—Sulphate of magnesia, 3 dr.; chloride of calcium, nitrate of lime, bicarbonate of soda, each, 8 gr.; sulphate of potash, 5 gr.; aerated water, 1 pt.

SELTZER.—Chloride of calcium and chloride of magnesium, each, 4 gr.; dissolve these in a small quantity of water, and add to it a similar solution of 8 gr. bicarbonate of soda, 20 gr. chloride of sodium, and 2 gr. phosphate of soda; mix, and add a solution of ¼ gr. sulphate of iron; put the mixed solution into a 20 oz. bottle, and fill up with aerated water.

TUNBRIDGE WELLS.—Chloride of sodium, 5 grains; tinct. steel, 20 drops; distilled water, 1½ pts.

VICHY. — Bicarbonate of soda, 1 dr.; chloride of sodium, 2 gr.; sulphate of soda, 8 gr.; sulphate of magnesia, 3 gr.; tincture chloride of iron, 2 drops; aerated water, 1 pt.

—o—

SYRUPS.

ACID FRUIT.—The juice of any acid fruit may be made into syrup by using 1 lb. white sugar for each pt. juice, and adding some peel; boil 10 minutes; strain, and cork.

AMBROSIA.—1. A mixture of equal parts vanilla and strawberry syrup. — 2. Raspberry syrup, 2 pts.; vanilla syrup, 2 pts.; hock wine, 3 oz.

APPLE. — Boil in clarified syrup an equal quantity of fruit, cut in small squares, but not washed or broken. The syrup extracts the flavor, and may be poured off, leaving the apples, which may afterwards be used as common preserve.

ARRACK PUNCH.—53⅓ lbs. sugar; 3⅓ gals. water; boil well; add 1⅔ gals. lemon juice to the boiling sugar, and stir till clear; pour in a clean tub, and, when nearly cool, add 5 gals. Batavia arrack; then filter.

BANANA.—Oil of banana, 2 dr.; tartaric acid, 1 dr.; simple syrup, 6 pts.

BLACKBERRY. — Make simple syrup of a lb. of sugar to each pt. of water; boil until thick;

add as many pts. of the expressed juice of ripe blackberries as there are lbs. of sugar; put ½ nutmeg grated to each qt. of syrup; boil 15 or 20 minutes; then add to it ½ gill fourth proof brandy for each qt. syrup; set it by to become cold; then bottle for use.

CANDYING, To Prevent. — The candying, or crystallization of syrup, unless it be over saturated with sugar, may be prevented by the addition of a little acetic or citric acid (2 or 3 dr. per gal.); confectioners add a little cream of tartar to the sugar to prevent granulation.

CATAWBA. — Simple syrup, 1 pt.; catawba wine, 1 pt.

CAYENNE.—Tincture of capsicum, 2 oz.; simple syrup, 1 gal.; mix; color pink with carmine.

CHAMPAGNE.—Rhine wine, 2 pts.; brandy, 2 oz.; sherry, 1 oz.; granulated sugar, 3 lbs.; dissolve the sugar without heat.

CHERRY.—Take sour cherries (a convenient quantity), bruise them in a mortar, to break the stones; express the juice; set aside 3 days to ferment, and proceed according to directions given for strawberry syrup.

CHOCOLATE.—Chocolate, 8 oz.; syrup sufficient; water, ½ pt.; white of 1 egg; grate the chocolate, and rub in a mortar with the egg; when mixed, add water gradually, and triturate till a uniform mixture is obtained; add syrup to 4 pts. and strain.

CINNAMON.—Oil of cinnamon, 30 min.; carbonate of magnesia, 60 gr.; water, 2 pts.; sugar, granulated, 56 oz.; rub the oil first with the carbonate of magnesia, then with the water gradually added, and filter through paper. In the filtrate dissolve the sugar without heat.

COFFEE.—Pure coffee, roasted and ground, ½ lb., is infused in boiling water, ½ gal.; enough is filtered to make ½ gal. infusion, in which dissolve 7 lbs. granulated sugar. The best utensil for making the coffee infusion is the French style of coffee pot, having a receptacle above for the ground coffee, upon which boiling water is poured, extracting the flavor without the bitter. This infusion drains through a sieve bottom into the lower half of the coffee pot. With care, however, a fair infusion of coffee may be made in any utensil, but continued boiling develops the bitter.

COFFEE CREAM.—Coffee syrup, 2 pts.; cream, 1 pt.

CREAM.—Fresh cream, 1 pt.; fresh milk, 1 pt.; powdered sugar, 1 lb.; mix by shaking, and keep in a cool place. The addition of a few gr. bicarbonate of soda will retard souring.

EXCELSIOR.—Simple syrup, 1 pt.; syrup of wild cherry bark, 4 oz.; port wine, 4 oz.

GINGER.—(See same in MEDICAL PREPARATIONS.)

GRAPE.—Brandy, ½ pt.; spirits of lemon, ½ oz.; tincture of red sanders, 2 oz.; simple syrup, 1 gal.

LEMON.—1. Havana sugar, 1 lb.; boil in water down to 1 qt.; drop in the white of 1 egg.; strain it.; add ½ oz. tartaric acid; let it stand 2 days; shake often; 12 drops essence of lemon will improve it.—2. Dissolve 6 dr. tartaric acid and 1 oz. gum Arabic, in pieces, in 1 gal. simple syrup; then add 1½ fl. dr. best oil of lemon.

MAPLE. — Dissolve 3½ lbs. maple sugar in 1 qt. water.

MULBERRY.—Mulberries, not entirely ripe, 6 lbs.; sugar powdered, 6 lbs.; place in a kettle, and boil, stirring, until the boiling syrup marks 30° Baume; throw on a strainer, and allow the marc to drain thoroughly.

NECTAR. — Vanilla syrup, 5 pts.; pine-apple syrup, 1 pt.; strawberry, raspberry, or lemon syrup, 2 pts.

ORANGE FLOWER.—Orange flower water, 1 pt.; granulated sugar, 28 oz.; dissolve without heat.

ORANGE.—Oil of orange, 30 drops; tartaric acid, 4 dr.; simple syrup, 1 gal.; rub the oil with the acid, and mix.

ORGEAL. — Cream syrup and vanilla syrup, each, 1 pt.; oil of bitter almonds, 4 mins.

RASPBERRY.—1. Raspberry juice, 1 pt.; simple syrup, 2 pts.; solution of citric acid, 2 dr. — 2. First make a syrup with 36 lbs. white sugar and 10 gals. water, and put it into a clean barrel; dissolve ¼ lb. tartaric acid in 1 qt. cold water, and add to the syrup; take ½ lb. orris root, and pour over it ½ gal. boiling water; let it infuse until cold; then filter, and put it into the barrel, stirring it well.

SARSAPARILLA. — Oils of wintergreen, anise and sassafras, each, 10 drops; fluid extract of sarsaparilla, 2 oz.; simple syrup, 5 pts.; powdered extract of liquorice, ½ oz.

SHERBET.—Mix equal parts of orange, pine-apple and vanilla.

SHERRY COBBLER.—Sherry wine, 1 pt.; simple syrup, 1 pt.; 1 lemon, cut in thin slices; macerate 12 hours, and strain.

STRAWBERRY.—1. Use strawberries of good flavor to obtain a syrup of fine flavor. Mash the fruit in a suitable vessel, and leave the pulp 12 or 24 hours at a temperature between 70° and 80°; stir occasionally; press; set the juice aside for 1 night; add for every lb. avoirdupois of juice, 1 oz. avoirdupois of cologne spirit, or deodorized alcohol; mix; set aside for a night, and filter. For 1 lb. filtered juice, take 10 lbs. sugar, and heat to the boiling point, taking care to remove from the fire as soon as the mixture begins to boil; remove scum; bottle in clean bottles, rinsed with cologne spirit. This syrup, as well as those made by the same process, is strong enough to be mixed with 2 or 3 times its weight of simple syrup for the soda fountain. — 2. Strawberry juice, 1 pt.; simple syrup, 3 pts.; solution of citric acid, 2 dr.

VANILLA CREAM.—1. Fluid extract vanilla, 1 oz.; simple syrup, 3 pts.; cream (or condensed milk), 1 pt. Color with carmine. — 2. Cream syrup, 1 pt.; vanilla syrup, 1 pt.; oil of bitter almonds, 4 drops.

VANILLA.—Fluid extract vanilla, 1 oz.; citric acid, ½ oz.; simple syrup, 1 gal.; rub the acid with some of the syrup; add the extract of vanilla, and mix.

WALNUT CREAM.—1 lb. hickory nuts or walnuts; remove the skin, which would give a bitter taste; pound the kernels in a mortar, adding from time to time a drop of lemon juice, not to flavor, but to prevent the nuts becoming oily; as fast as the nuts are reduced, put them in a

linen cloth, gathered around them, so that they may be squeezed through. Whatever is left in the cloth return to the mortar and pulverize. The result of this process is to be added to 2 qts. of the cream, and used in lieu of syrup in dispensing the soda.

ALMOND.—Blanch and peel 1 lb. Jordan almonds and ½ oz. of bitter almonds, and steep them in cold water for 4 hours. Pound the almonds to a smooth paste in a mortar, adding ½ lb. pounded sugar and moistening by degrees with 1 qt. water; press the almonds through a wet broth napkin, straining the almond milk into a basin. Boil 2 lbs. sugar to the ball; take it off the fire, and when it is nearly cold, add to it the almond oil and a tablespoonful of orange flower water; shake the sugar boiler, to mix the whole together; cover it up and put it by until the sugar is quite melted. Pour the syrup into bottles; cork them carefully, and keep them in a cool place. As almonds can be obtained all the year round, it will be better to prepare only small quantities of the syrup at a time.

ASPARAGUS.—Cut 3 lbs. of the green and tender part of some asparagus, and boil it in 2 qts. water until the water is reduced to 1 qt. Pour the whole through a filtering bag, and add 4 lbs. loaf sugar, broken in pieces, to the asparagus water. Boil the syrup in a covered vessel au bain marie—that is, by placing the vessel containing the syrup in a stew-pan half filled with boiling water—until it registers 32° on the saccharometer. When cold, bottle the syrup and keep it in a cool place.

CAPSICUM.—Tincture of capsicum, 1 oz.; simple syrup, 2 pts.; heat the syrup; add the tincture, and when the alcohol has evaporated, mix immediately.

EGG PHOSPHATE.—Lemon syrup, 2 pts.; orange syrup, 2 pts.; eggs, 32; phosphoric acid (U. S. P.), 1 to 2 fl. oz. Thoroughly incorporate this with a Keystone beater; draw 1½ to 2 fl. oz. in large tumbler, and fill with carbonated water.

FANCY.—Vanilla syrup, 2 pts.; pineapple syrup, 8 oz.; raspberry syrup, 8 oz.

FRAMBOISE.—Raspberry syrup, 1 pt.; currant syrup, 2 pts. The mixtures of the various fruit syrups give rise to many other names. We will not formulate them here.

FRUIT SYRUP, For Lemonade.—Raspberries, 1,000 grm.; blackberries, 500 grm.; bilberries, 500 grm.; lemon, 3 fruits; mash in stone mortar; add of cold water, 1,500 grm.; let it stand for 3 days, or until fermentation has finished. Express and filter. In every 2,500 grm. dissolve citric acid, 40 grm., and sugar, 4,500 grm.; boil up once in a copper kettle.

LICORICE.—To 45 parts water, add 7½ parts licorice root, cut in pieces; boil for 15 minutes; pour the liquid off and evaporate to 26 parts; add 30 parts white sugar, and 30 parts purified honey; boil up once.

MANNA.— 1. 4 parts white sugar; 1 part picked manna. Dissolve in boiling water, and let it boil up.—2. 12 parts mulberries, not quite ripe; 12 parts granulated sugar; boil, stirring constantly, until the juice shows 30° Baume. Strain.

MILK PUNCH.—1. Simple syrup, 1 pt.; brandy, 8 oz.; Jamaica rum, 8 oz.; cream, 1 pt.—2. To 1 pt. heavy syrup, add ½ pt., each, of brandy and Jamaica rum; flavor with 2 teaspoonfuls of an extract prepared by macerating 2 oz. of ground nutmegs in 8 oz. of alcohol. The syrup is first to be poured into the glass in the proper quantity; and ordinary cream syrup added before drawing the soda-water.

ROSE.—1 gal. simple syrup; 1 oz. essence rose; color pink with prepared cochineal, and acidulate lightly with a solution of citric acid. Very satisfactory.

SYRUP OF FIGS.—Senna leaves, 2 Tr. oz.; buckhorn bark, 128 gr.; jalap, 384 gr.; rhubarb, 256 gr.; cinnamon, 30 gr.; cloves, 30 gr.; nutmeg, 15 gr.; oil of peppermint, 20 min.; sugar, 12 Tr. oz.; diluted alcohol, enough for 16 fl. oz. Reduce the drugs to a moderately fine (No. 50) powder; add to it the oil of peppermint, and percolate it, in the usual manner, with diluted alcohol. Remove the first 8 fl. oz. of the percolate and dissolve in this the sugar, with the aid of a gentle heat, if necessary, but avoiding loss of alcohol by evaporation. Allow the solution to cool, collect a further portion of percolate and add it to the syrup, so as to make 16 fl. oz. This is excellent.

WILD CHERRY.—Wild cherry bark (in course powder), 5 oz.; moisten the bark with water, and let it stand 24 hours in a close vessel; then pack firmly in a percolator, and pour water upon it until 1 pt. fluid is obtained; add of sugar, 28 oz.

WINTERGREEN. — Oil of wintergreen, 25 drops; simple syrup, 5 pts.; add burnt sugar to color.

SERVING.

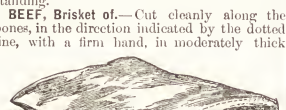
—o—

CARVING.

REMARKS.—The carving knife should be light, of middling size, and well sharpened. A long, thin blade is very necessary for large joints, for ham or turkey; a short, narrow, thin pointed knife should be used for chickens or wild fowl; let each one choose such as he can use with the best effect. Strength is less required than skill in the manner of using it; to facilitate this the butcher should be directed to divide the joints of the bones of all carcass joints of mutton, lamb and veal, such as neck, breast and loin, which then may easily be cut into thin slices.

If the whole of the meat belonging to each bone should be too thick, a small slice may be taken off between every two bones. If the carver is tall, or the chair at the head of the table is quite high, it is a more graceful and quiet way to keep seated while carving; but where there is a large piece of beef or mutton, a ham or turkey, or several chickens to be served, it is easier and more graceful to carve standing. One has freer movements of the arms, and therefore more strength and elasticity in their use. To serve out the meat carved before taking the seat is more expeditious, and in both operations one is less liable to soil the tablecloth around the platter if he serves out the various portions while standing.

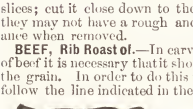
BEEF, Brisket of.—Cut cleanly along the bones, in the direction indicated by the dotted line, with a firm hand, in moderately thick



Brisket of Beef.

slices; cut it close down to the bones, so that they may not have a rough and jagged appearance when removed.

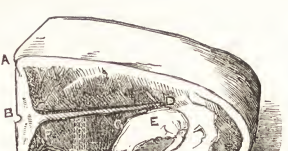
BEEF, Rib Roast of.—In carving the rib roast of beef it is necessary that it should be cut across the grain. In order to do this the knife should follow the line indicated in the illustration. It should be cut in slices of a medium thickness, and very evenly; the lean and the fat in one slice, and if more fat is desired it should be taken horizontally from the side. Before proceeding to serve, a slice of about ¼ in. in thickness should be cut from the top, so that the juicy part of the meat may be obtained at once.



Rib Roast of Beef.

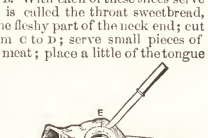
BEEF, Round of.—Cut in thin slices the entire size of the meat; a little of the fat cut thicker, and a trifle on the slant, is placed on each slice of the lean.

BEEF, Sirloin of.—Cut with one good firm stroke from end to end of the joint, at the upper portion, making the cut very clean and even from A to C; then disengage it from the bone by a horizontal cut exactly to the bone, B to D, using the tip of the knife; every slice should be clean and even, and the sirloin should be cut fairly to the very end. Many persons cut the under side whilst hot, not reckoning it so good cold. To carve this part, remove the fat E, which chops up well to make puddings, if not eaten at table; then the under part can be cut from end to end, F to G, or downwards, as shown by the marks at H.



Sirloin of Beef.

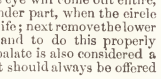
CALF'S HEAD.—Commence by making long slices from end to end of the cheek, cutting quite through to the bone, according to the dotted lines from A to B. With each of these slices serve a cut of what is called the throat sweetbread, which lies at the fleshy part of the neck end; cut also slices from C to D; serve small pieces of these with the meat; place a little of the tongue and a spoonful of the brains on each plate. Some persons prefer the eye; remove it by a circular cut marked by dotted lines at E; put the knife in slanting at F, inserting the point at the part of the dotted line, and driving it into the centre under the eye; then turn the hand round, keeping the circle of the dotted line with the blade of the knife, the point still in the centre; the eye will come out entire, cone shaped at the under part, when the circle is completed by the knife; next remove the lower jaw, beginning at G; and to do this properly turn the dish. The palate is also considered a dainty, and a little of it should always be offered to each guest.



Calf's Head.

CHICKEN.—(See *Fowl.*)

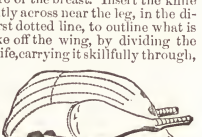
COD'S HEAD.—First cut slices across the marked *a b* and *c d*. Then sever the slices completely by a transverse stroke from *b* to *d*.



Cod's Head.

DUCK.—(See *Fowl.*)

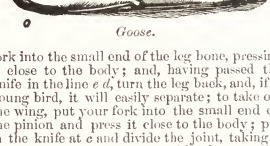
FOWL.—Hold the bird down firmly with the fork in the centre of the breast. Insert the knife and draw it lightly across near the leg, in the direction of the first dotted line, to outline what is being done; take off the wing, by dividing the joint with the knife, carrying it skillfully through, giving a slight jerk with the wrist, and at the same time turning the blade. Next slip the knife between the leg



Turkey.

and body and cut downwards, as indicated by the dotted line; then with the fork turn the leg back and the joint will separate; turn the fowl and take off the other wing and leg in the same manner. Next take off the merrythought; to do this, insert the knife in a straight line at that point and bend it back. The neck bones must be next divided from the part that adheres to the breast without breaking them; do this by putting the prongs of the fork through each and wrenching it up carefully. The next thing is to divide the breast from the back by cutting through the carcass, close to the breast, right down to the tail; then turn the back up and divide it by a straight line across the middle. The side bones are then readily separated from the rump. The thigh may be divided from the drumsticks by inserting the knife at the joint.

GOOSE.—Turn the neck end of the goose toward you; cut the whole breast in slices on each side of the bird, but only remove them as you help each person, unless the company is so large as to require the legs likewise; turn the goose on one side; then take off the leg by putting the



Goose.

fork into the small end of the leg bone, pressing it close to the body; and, having passed the knife in the line *e d*, turn the leg back, and, if a young bird, it will easily separate; to take off the wing, put your fork into the small end of the pinion and press it close to the body; put in the knife at *c* and divide the joint, taking it down in the direction *c d*; nothing but practice will enable people to hit the joint exactly at the first trial; when the leg and wing of one side are done go on to the other; cut off the apron in the line *f e g*, then take off the merrythought in the line *o i*; the neck bones are next to be separated as in a fowl, and all other parts divide the same.

HAM.—Commence cutting beyond the knuckle; cut it in the direction A B, leaning downwards; it may be carved also after 2 or 3 cuts have been made as above, by cutting the slices lengthwise.

Ham.

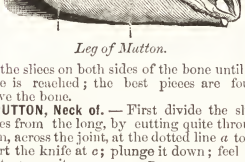
LAMB. Fore Quarter of.—Separate the shoulder from the breast and ribs by passing the knife under; keep it toward you horizontally to prevent cutting the meat too much off the bones; squeeze the juice of a lemon on the piece left and sprinkle it with pepper and salt; then separate the gristly part from the ribs and help to each person the portion preferred.

MUTTON. Haunch of.—Cut through the flesh between the leg and loin and then run the knife from this to the lower end of the loin, cutting

Fore Quarter of Lamb.

parallel slices in that direction; make these cuts in one sweep; carry the knife directly from the outside of the leg to the end of the loin, and thus get a beautiful long slice of lean, with the fat at the end; there is, also, a delicious mine of kidney fat in the loin of mutton, under the flank.

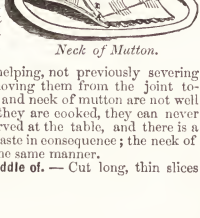
MUTTON. Leg of. — Lay it back down; cut the first slice across the lower part about ¼ of the distance between the knuckle and cramp bone;



Leg of Mutton.

cut the slices on both sides of the bone until the bone is reached; the best pieces are found above the bone.

MUTTON, Neck of. — First divide the short bones from the long, by cutting quite through them, across the joint, at the dotted line *a* to *b*; insert the knife at *c*; plunge it down; feel the joint; press it in; turn it over as you do the leg of a fowl, to snap it; then cut the chop off; cut one of the small bones and serve with each chop; it is usual to cut two chops, and add two small bones to each helping, not previously severing them, but removing them from the joint together; if loin and neck of mutton are not well jointed before they are cooked, they can never be properly carved at the table, and there is a great deal of waste in consequence; the neck of veal is cut in the same manner.



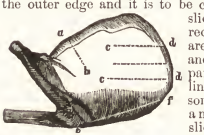
Neck of Mutton.

MUTTON, Saddle of. — Cut long, thin slices

Saddle of Mutton.

from the tail to the end, viz.; from *a* to *b*, beginning close to the back bone; if a large joint, the slice may be divided; cut some fat from the sides.

MUTTON, Shoulder of. — Cut in the hollow part, in the direction *a*, *b*,; then pass the knife deep to the bone; the best part of the fat lies on the outer edge and it is to be cut out in thin slices, in the direction *f*; if many are at the table, and the hollow part cut on the line *a*, *b*, is eaten, some very good and delicate slices may be cut out in each side of the ridge of the blade bone, in the direction of *c*, *d*; the line between these two dotted lines is that in the direction of which the edge or ridge of the blade bone lies, and cannot be cut across.



Shoulder of Mutton.

PARTRIDGE.—If very large this may be carved like a fowl; serve the merrythought with the breast, and the wing with a leg; when very small, divide the bird into two parts by cutting quite through from the breast to the tail.

PIGEON. — Divide the pigeon in half when laid flat on its back upon the dish by going boldly quite through the breast with sufficient weight of hand to divide the bones at once, or by cutting in the direction of the dotted lines *c*, *a*, *b*.

Pigeon.

PIG, Sucking. — Separate the shoulder from the carcass on one side, and then the leg, according to the direction given by the dotted line; then divide the ribs in about two helpings, and

Sucking Pig.

an ear or jaw presented with them, and plenty of sauce; the joints may either be divided into two each, or pieces may be cut from them; the ribs are reckoned the finest part, but some people prefer the neck and between the shoulders.

RABBIT. — Place the knife under the shoulders; cut clear down to the rump on the side of the back bone; the same on the other side; sever the head from the body by a circu-

Rabbit.

lar cut; then cut the back into four parts; the shoulder take off in a circular line; if the rabbit is an old one, place the knife between the leg and back giving it a little turn inwards near the joint, which endeavor to hit; then cut, and with fork turn completely back; both legs being off, divide the back into as many parts as necessary; hares are carved in the same way.

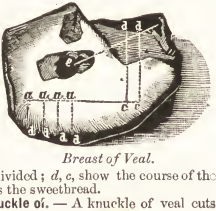
SPARERIB—Cut out first a slice from the fleshy portion, following the line *a*, *b*; this will give a due proportion of fat and lean; after this part is taken away, the bone lying in the direction *d*, *b*, *c*, should be separated, breaking it off at the joint *c*.

Spareribs.

TONGUE.—Cut a tongue across, not length wise; the middle and thick parts are the best; that near the tip is hard.

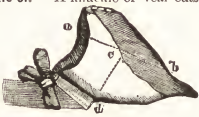
TURKEY.—(See *Fowl.*)

VEAL, Breast of.—Cut to the left on the first line *d*, *c*; then cross from *c* to the most distant *a*; the line *a*, *d*, *a*, *d*, etc., represent the directions in which the brisket or gristly part should be divided; *d*, *c*, show the course of the ribs, and *e* is the sweetbread.



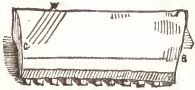
Breast of Veal.

VEAL, Knuckle of. — A knuckle of veal cuts in neat slices only in one direction, viz: from *a* to *b*; the line *d*, *c*, divides two bones, which it is necessary to separate in order to get at the best marrowy fat portion; also cut asunder the knuckle bones.



Knuckle of Veal.

VEAL, Loin of.—With a loin of veal a slice of toast is sent to table, on a small dish; turn over the loin, and cut out the kidney, with the surrounding fat, and place it on the dish upon the toast; turn back the veal to its former position and cut off slices from D to C.

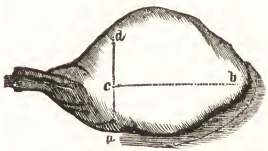


Loin of Veal.

VEAL, Neck of.—(See *Mutton, Neck of.*)

VEAL, Shoulder of.—This is carved like the shoulder of mutton by some; but the best plan is to begin on the under side, and cut slices from the thick edge opposite the bone and parallel with it. When stuffed, a portion of the forcemeat must be served on each plate.

VENISON, Haunch of. — First cut it down to the bone in the line *d, c, a*; then turn the dish with the end *a* towards you; put in the point of the knife at *c* and cut it down as deep as you can in the direction *c, b*; thus cut, you may take



Haunch of Venison.

out as many slices as you please, on right or left; as the fat lies deeper on the left, between *b* and *a*, to those who are fond of fat, as most venison eaters are, the best flavored and fattest slices will be found on the left of the line *c, b*, supposing the end a turned toward you; slices of venison should not be cut too thick nor too thin, and plenty of gravy given with them.

TABLE ARRANGEMENTS.

FLORAL DECORATIONS.—The ornamentation or decoration of the dinner table is a matter which should not be left to the servants; it should be the special business of the lady of the house; nothing imparts such a bright, pleasant appearance to a table as plenty of fresh flowers. When flowers can be readily obtained, not only should the centre ornaments be filled with them, but a small bouquet, also, should be placed before each guest. The best ornament for the centre of the table is a glass stand in which flowers and foliage are disposed on a foundation of clay and sand; or have a group of plants in a basket, the mold neatly covered with moss. In the disposition of the centre-piece care must be taken that it does not occupy too much space nor be too high. If the size of the table will allow, a couple of smaller baskets or glass stands may be added. Elaborate and costly epergnes are sold for this purpose. They are usually made either of silver, glass or alabaster, and some of them are exceedingly beautiful. Various designs in frosted silver, with glass vases and dishes attached, for the reception of fruit and flowers, are amongst the most elegant. Occasionally a plateau of looking-glass is annexed, which has a very good effect. Whatever the ornaments may be, place the largest one in the centre, and the smaller ones, of which there should be duplicates, at either side of it, with a greater or less distance between them. In arranging flowers and fruit, the color should be taken into account. Systematic coloring is rarely satisfactory; for even if good of its kind, it must fail because it will weary. Good mixtures should be the aim, but there must be symmetry in some sort, and the colors should have the relief of a sufficient amount of green. Bits of lycopodium and maiden-hair fern are sure to be appropriate. Small leaves of many kinds may be used with advantage. Variegated leaves are frequently useful, but beware of such as are coarse, or which have a sepulchral air by gaslight, as may happen with leaves of begonia, cissus, amaranthus and coleus.

Epergne.

GARNISHING.—The art of garnishing dishes is the art of ornamenting them, and making them look elegant, and thus satisfying the eye as well as the palate. Various materials are used for this purpose. Among the most popular are cocks' combs, plovers' and hens' eggs boiled hard, prawns and small crayfish, button mushrooms glazed, stamped pieces of vegetables, such as carrot, turnip, parsnip, beet root and truffles, stoned olives, gherkins, fried croûtons of bread, aspic jelly, horse radish, cut lemon and parsley. Everything depends upon the artistic arrangement of the ornamentation, determined by the taste of the garnisher. Where the taste has been cultivated, or where there is a natural faculty for decoration, the task of garnishing dishes effectively is an easy one. Where culture and natural taste are absent, observe and imitate the ways of others. A great deal depends upon the pleasing contrast of colors. Be particular not to overdo the work of decorating. A simple garnish adds

much to the appearance of a dish, but too much decoration injures it. Garnishes should be so arranged as not to interfere with serving. Potato balls and thin fried potatoes make a nice garnish for all kinds of fried and broiled meats, and fish. Whipped cream is a delicate garnish for all Bavarian creams, blanc manges, frozen puddings and ice creams. Arrange around jellies or creams a border of any kind of delicate green, like smilax or parsley, or of rose leaves, and dot it with bright colors, pinks, geraniums, verbenas or roses. Remember that the green should be dark and the flowers small and bright. A bunch of artificial rose leaves, for decorating dishes of fruit at evening parties, lasts for years. Natural leaves are preferable when they can be obtained. Wild roses, buttercups and nasturtiums, if not used too freely, are suitable for garnishing a salad. It is well to pour the sauce for cold puddings around the pudding, especially if there will be a contrast in color.

MENUS, or BILLS OF FARE.—These are generally placed by the side of each individual, so that he may know at once what is to be set before him, and may partake of that which he most approves. A small menu stand, containing the bill of fare, may be placed before each guest, and most beautiful and artistic cards are sold upon which the order of the dinner can be written. The task of drawing up the bill of fare is generally undertaken by the mistress of the house or by the experienced cook to whom she intrusts the execution of her orders. Knowledge, taste and judgment are called for in its accomplishment, and the crowning honor of a successful banquet certainly belongs to the person who conceived the idea of it. The order in which the viands are to be served is placed upon these, commencing with the lightest and advancing to the heaviest, then gradually ending with lighter articles of food. The order followed in general is as follows: Oysters, if eaten on the shell; soup; fish; entrees; meats, naming with each meat the accompanying vegetable; game; vegetables, if not mentioned in connection with the meats; salads, and desserts, ending after the fruits and nuts with the serving of tea or coffee, wines or liquors. Menus may be made as souvenirs by the hostess, being either hand-painted or embroidered.

MENU, Banquet.—

Soup.
Green Turtle. Sherry Wine.
Fish.
Salmon, Lobster Sauce, Iced Cucumbers,
Haut Bareac.
Roast.
Spring Lamb, Mint Sauce.
Fillet de Beuf, with Mushrooms.
Geisler Blue Seal Champagne.
Vegetables.
Potatoes. Peas. Tomatoes. Cauliflowers.
Entrees.
Sweetbreads and Peas. Chicken Croquettes.
Salad.
Lobster.
Dessert.

Lamb Chops and Potatoes.
Chicken Salad.
Dried Beef, dressed with Cream.
Light Pudding and Charlotte Russe.

MENU, Holiday Dinner.—The following will be seen to be very elaborate; but selections can be made from the different parts to form a smaller menu.

Oysters on Shell.

Soup.

Mock Turtle. Tomato. Fish Chowder.

Fish.

Boiled Cod's Head and Oysters.
Fried Sea Trout with Rashers of Pork.
Baked Striped Bass, Stuffed, Claret Sauce.

Removes.

Roast Turkey. Boiled Turkey and Oyster Sauce.
Roast Tenderloin of Beef.
Boiled Capons and Pork, Celery Sauce.
Roast Geese.
Boiled Leg of Mutton, Caper Sauce.
Roast Ham, Champagne Sauce.

Cold Ornamental Dishes.

Calf's Head, boiled, decorated.
Lobster Salad, garnished in Jelly.
Gelatine of Turkey with Truffles.
Quail with Plumage, on Form.
Boned Chicken with Truffles. Smothered Liver.
Oysters, Fricasseed.

Entrees.

Macaroni *à la Creme.* Mutton Cutlets, breaded.
Venison Steak, Jelly Sauce. Veal Patties.
Partridge Croquettes.
Terrapin Stewed, Port Wine Sauce,
Roasted Grouse, with Truffles.
Sweetbreads, larded, with Green Peas.
Veal Cutlets, larded, Tomato Sauce.
Mutton Kidneys, Champagne Sauce.
Fillet of Beef with Mushrooms.
Fillets of Chicken. Calf's Head, Turtle Sauce.
Oysters fried in Crumbs.
Tripe Lyonnaise.

Game.

Gray Ducks. Canvas-Back Ducks.
Black Ducks. Partridge. Prairie Grouse.
Quail. Teal.

Dessert.

Meringue Baskets. Omelet Souffle.
Blanc Mange. Pastry. Creams. Confectionery.
Wine Jelly. Charlotte Russe. Ambrosia. Nuts.
Oranges with Jelly. Apples and Nuts.
Lemon Snow. Grape Pyramid.
Plum Pudding. Fried Bananas.
Roman Punch. Coffee and Wines.

SETTING THE TABLE.—Much of the general comfort of a meal depends upon the neatness and taste with which it is served. The actual laying out of the table must depend upon circumstances, the viands to be served, and the means of the host. The bread should be cut in thin, square slices. To prevent waste by the constant leaving of slices of bread, use a wooden

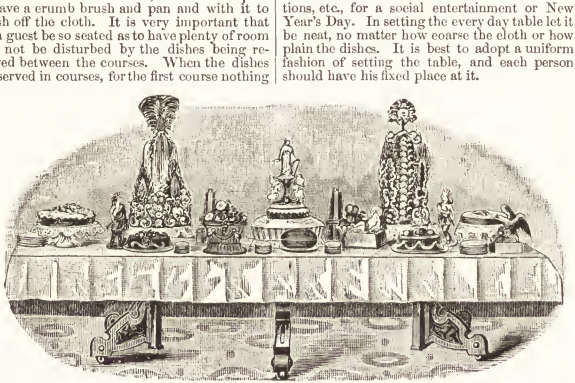
Wooden Bread Plate.

bread plate, upon which the loaf is placed to be cut as needed. When the napkins are used for the first time fold them in some fancy form, inclose the bread in them, and place one by the

side of the plate of each sitter. There are innumerable ways of folding the napkin according to the caprice of fashion; but any unique form may be adopted by the one who does the folding. The napkins may be folded neatly and placed in rings, or in the goblet of each sitter. Water caraffes, salt cellars, pepper and mustard stands, and individual butter plates should be abundantly supplied. In arranging the plates on the table place them face downward; arrange the napkin with the knife and fork on the right hand. Have the centre piece placed in position first, and then the smaller ornamental pieces. From these the dishes must radiate. The meats should be arranged with a view to convenience of carving and serving; the vegetables, by their bulk, shape and color, should be utilized for effect of appearance, and the *tout ensemble* plainly saying to the guests, "Please make yourselves at home." It is best to serve the dishes in courses, where the number of the different dishes is likely to cause confusion in the appearance of the table and discomfiture to the guest. After each course, the dishes should be quickly removed, clean plates, etc., brought, and in some cases the table-cloth changed; but as this causes some trouble, it is a better plan to have a crumb brush and pan and with it to brush off the cloth. It is very important that each guest be so seated as to have plenty of room and not be disturbed by the dishes being removed between the courses. When the dishes are served in courses, for the first course nothing should be on the table save the decorations, soup

Crumb Brush and Pan.

plates and spoons, napkins, etc. When the first course is removed, the plates should be placed at the side of the carver, if the meat is carved at the table. Vegetables, when possible, should be served in individual dishes. The general cloth in use is the white, but when a change is made during the meal a colored one is used when fruits are found among the desserts. For a light tea, breakfast or lunch, the colored cloth is also appropriate. The napkins should correspond with the cloth used. When the table is laid for a large party, at which the guests are not expected to sit, but sit around the room, the table should be arranged to present artistic arrangement rather than comfort. Our illustration shows a table well decorated with confections, etc., for a social entertainment or New Year's Day. In setting the every day table let it be neat, no matter how coarse the cloth or how plain the dishes. It is best to adopt a uniform fashion of setting the table, and each person should have his fixed place at it.



Ready for the Guests.

"HOME, SWEET HOME!"

THE HOUSEHOLD.

REMARKS.—It should be the constant object and aim to render home attractive. Let the boys and girls have a pleasant, sunny room to themselves. If each one cannot have a separate apartment, let him have his own drawers, and a specified portion of closet room. See that they are kept in order. Let the room be just as warm, bright and cheerful as motherly love and sisterly ingenuity can make it. Mothers should learn to cook well and there will be no spoiled bread, cakes, puddings and unsavory dishes, with their manifold perplexities. Ignorance makes a poor mechanic or wife, and saddens life, unless the possessor is so great a fool as to be unconscious of the torture inflicted upon others, and of his own littleness. Allow nothing to be wasted in the kitchen. Require the servants or help to follow your rules. Do it quietly and kindly, but firmly. Never relax and never make a fuss. Help that can not be controlled into the observance of order by such means, had better be got rid of. Judicious praise of good work is a duty, and it will pay double in the faithful service returned. If a good servant happens to be irritable and "crusty" sometimes, remember that servants have feelings as keen as your own; pass a casual offense of temper for the time, and recall it kindly when the offender has grown cool. If there is no penitence, a discharge is the alternative.

CHILDREN.

CHILDHOOD has been divided into two distinct periods by medical writers; 1st, that of *infancy*, which extends to the end of the 2nd year; and 2nd, *childhood proper*, which ends when maturity has been reached. The rules governing the care of both periods are different in almost all respects.

INFANCY.

REMARKS.—As the infant, in its helplessness, is unable to make known its wants other than by its cry, there is no part of a mother's duty to her child more essential than an early study of the meaning of this cry. This is by no means difficult; a close attention to its tone, and the expression of the babe's features, are the important points, and the key to both she quickly finds in her heart and in the knowledge of her success in the comfort of her child. It is the duty of both mother and nurse, as well as of the woman expecting to become a mother, to acquaint themselves with the wants of children, and with the proper means for caring for and supplying them. The first want of a child is plenty of air, and this want never ceases while life lasts. The common practice of having night lights in the bedrooms of children should be deprecated. It has a most injurious effect upon the nervous system of young children, besides injuring their eyes, which are attracted to constantly gaze on anything bright.

BATHING.—The morning hours are the proper time for bathing children. Take care that you have a spot in a warm room free from draughts; let all baby's clothes hang ready and warm to put on; the towels must also be warmed. Adorn yourself with two flannel aprons, and see that the water is warm; also that you have everything in readiness for the tiny toilet—needles threaded and all handy. Take a flat piece of fine, soft sponge; use castile soap; soap the tender head all over as the baby lies on your knee, continuing as well all over the body, paying extra care to the armpits and all crannies and creases; with the left hand and arm firmly held under the head and back, lay the baby in the bath, and sponge the face and head thoroughly well and carefully, so as to eliminate every sign of soap; but beware of relaxing the hold till the back is sponged. Take it quietly out, and with a soft, dry or warmed towel, begin at the face and gently dry the entire surface of the body. Do not scour the skin with a single fold of the towel, but have it doubled. Dress the child as soon as possible, and be careful not to move it about the room too much before it is clothed.

Sometimes a physician orders a salt or hot water bath to be given the child. If the former, it should be given as an ordinary bath, only adding as much common salt to the water as may be necessary. Have the water warmer before the salt goes in than you wish the bath to be after the salt dissolves. If the hot bath is ordered, take an ordinary hand basin, or, if it is not large enough, use a small wooden tub; stand it in front of a fire until the inside becomes quite warm; pour into it the water, which should be as hot as the child can bear without inconvenience. See that every door and window has been closed; let no one come into the room until the

Infancy.

child has been bathed and dressed. Stand it in the tub, and with a towel, which has been dipped into the water of the tub, wash its limbs and the lower part of the body. The child should now be made to sit down in the water; then with the towel wash the other parts of the body, neck and face, which are not under the water. Do it quickly, but never forget to be gentle. A little Castile soap may be also used. The length of time which the child should remain in the bath must, as in other cases, be left a great deal to the intelligence of the mother; but usually it should not exceed two minutes. A good general rule, in the absence of a better one, is to take it out as soon as the perspiration breaks out on the skin. For babies for whom soft towels are necessary, and whose tender skins will not bear hard rubbing, use finely powdered white starch or fuller's earth, and where there is soreness in the little fat creases of the limbs, a slight dusting of pulverized nutmeg added to the starch, and rubbed on softly or sprinkled in with the fingers, will soon heal it. The following is also a good powder: Take 1 oz. of pulverized hemlock bark, 1 oz. of magnesia, and 1 oz. of laundry starch; pulverize finely by laying upon a platter and grinding with a knife; sift through a hair sieve.

BEDS.—Hard beds should never be given to little children, unless, perhaps, in hot weather. If the bed is not kept sweet and clean by daily airings and frequent beating, whether it is soft or hard, it is injurious.

CLOTHING.— Good sense requires infants' dresses to be made with long sleeves and high in the neck. Woolens should encase the whole body next the skin, with the exception of the head and hands. In the first stage of infancy, warmth depends on clothing alone, for there is little muscular movement. Avoid a degree of warmth which produces sensible perspiration. Dress the child loosely, and fasten with strings, not with pins. The umbilical cord, navel and belly band require much attention. Avoid keeping the child's head too warm, or its feet too cold. Avoid chilling the child, or taking it abroad in cold weather. Attend to the form and size of the child's shoes, so that the feet shall not be cramped. Quite as much attention should be paid to keeping the child cool in summer as to keeping it warm in winter. Overheating is a source of sickness then. Tight dressing causes permanent distortion and interferes with the regular course of the blood and action of the various organs. Heavy diapers have a tendency to deform the lower limbs of the infant. Their use need not be prolonged beyond a very few months of infancy. When used, let them be loosely fitted. The substitution of short for long dresses may take place when the child is about 4 months old. At this time it should be watched carefully and protected against cold. Whatever the season, let it wear woolen socks at first.

EXERCISE.—Very little motion, and that of the gentlest and most careful kind, is all the infant should have for a considerable time after birth. Avoid the upright posture as much as possible. Avoid all sudden and violent jerking, and long continued positions. Allow the child to move its limbs freely, on the floor or in bed. Avoid sympathizing too strongly with a child when hurt. Assist quietly, and show how the accident happened. Children who are angry when hurt should see that you do not sympathize with their rage, although you do with their sufferings. Abjure all leading strings and go-carts, or other artificial means of teaching the

child to walk. Never drag the child by one hand, or lift it by either one or both arms. The mother should have her eye both on child and its attendant out of doors, and be as much as she can in her child's company. It is injudicious to take an infant out during the hottest part of the day in summer; such a proceeding tends to enervate and depress, rather than to strengthen. Whenever it goes out its head should be protected from the direct rays of the sun. During other periods of the day, the weather being favorable, an infant cannot be too much out of doors, especially during teething. Infants of 3 or 4 months old may, under certain precautions, be sent out into the open air during sunny winter days. They must be wrapped up. As it advances in age and strength, the time of keeping it out should be gradually prolonged, until, during pleasant weather, it lives most of the day in the open air. The position of the child should be frequently changed while being carried, and, until able to sit up, its head and back should be carefully supported. Care should be had in tossing children about, lest in the as yet imperfectly united condition of the bones fracture may be produced.

FOOD. — A mother's milk is the most appropriate food for an infant, and the breast should be given within twelve or eighteen hours after birth, at least. Foment the breast with warm water if the milk does not flow; avoid rubbing the breasts with spirits. If there be too much milk, drink little, and take cathartic medicine. It should be the only food given until the first teeth are being cut, or until the infant is at least three or four months old. For the first month an infant should be put to the breast every two hours, and after this the interval should be increased by a quarter of an hour every week, until at length it has it about every four hours. Feed the baby regularly and do not give him the bosom every time he cries. Let him go without a meal, put him into a warm bath, and give him a little cold water if thirsty. When the infant is three or four months old, occasionally even before then, artificial food may be necessary. If a good wet nurse cannot be found, cow's milk, condensed milk, goat's milk, ass's milk, etc., may be given. Cow's milk should be pure and fresh, and taken from one healthy cow, if possible. It should be prepared thus: Dissolve a lump or two of white sugar and a pinch of salt in a pint of warm water, and add to this a pint of fresh unboiled milk. This food is to be given night and morning, but not oftener when the baby is being suckled as well. As the child gets older, diminish the water. If the above food disagrees, as it sometimes will, omit the sugar, or change the proportions to two parts of water and one of milk. If the milk purge violently or cause offensive motions, boil it, or put one or two tablespoonfuls of lime water into each bottle of food. In the case of delicate infants, add a tablespoonful of cream to each pint of milk. The most convenient way of feeding the infant with artificial food is with a feeding bottle, with *black*, pure rubber nipple. Great care is necessary in using it, as it soon turns sour; immediately, therefore, the child is fed, the teat should be thrown into a tumbler about half full of cold water, and it should remain in the glass until it is again required. The bottle itself should be attended to with the most scrupulous attention; it should be rinsed out every time it has been fed from, and the food should not be suffered to remain in it and again offered to the child. Avoid the use of pure starch food, like arrowroot; it does not sufficiently nourish the bones and nerves. When the infant begins to cut his teeth it is unadvisable to give him any farinaceous food. It may then have beef or mutton soup at least once a day, and when 10 months old a crust of bread and a piece of rare beef to suck. All sweets should be carefully guarded against. The following are good substitutes for the milk, when that does not agree with a child: 1. Boil the crumbs of bread for 2 hours in water, taking care it does not burn; add a lump of sugar, a pinch of salt, and pour a little new milk on it while boiling hot. —2. Bake some biscuit flour in a slow oven until it is of a light fawn color; reduce it with a rolling pin to a fine powder, and keep it in a tin ready for use; 2 tablespoonfuls to ½ pt. of milk, boiled and sweetened.—3. Boil 1 teaspoonful of powdered barley with a little salt in ½ pt. of water for 15 minutes; strain, mix with half as much boiled milk, and add a lump of sugar.—4. Scotch oatmeal; prepare in the same way as flour.—5. Dissolve 1 teaspoonful of cocoa essence in ½ pt. boiling water; strain and add new milk and sugar. These are all to be given lukewarm through a nursing bottle.

NURSES.—The wet nurse acts as a substitute for the mother or aids her when there is a deficiency in the maternal supply of milk. She should be near the age of the mother, strong in constitution, with perfect teeth. The milk drawn into a spoon should be white with a slight bluish tint, its taste saccharine, and its consistence not too thick. Her temper, disposition and morals have much to do with the healthy nurture of the child, for it is well known that these are apt to affect the child. Temperance in eating and drinking is another important qualification, the latter especially. A wet nurse should be used only when a positive necessity exists. The suckling of the child is the natural office of the mother, and is of the greatest benefit to the infant. The child will naturally place its affections where it receives its sustenance. The dry nurse is a person who brings up a child by hand when the mother is incapable of suckling her child, and a wet nurse cannot be substituted. A sensible, kind and patient person, who possesses some knowledge of the nature and habits of children is indispensable; and the person most likely to possess these qualities, is one who has had children of her own. A nurse-maid is one who assists the mother in her care of infants; she should love children, be of good disposition and morals and obey the mother's directions.

SLEEP. — Allow the child plenty of sleep without disturbance. Avoid accustoming the child to sleep on the lap; it will then not sleep in bed. Establish times for regular sleeping. As soon as the infant begins to take notice, the nurse should endeavor to form the habit of

sleeping more during the night than day. Keep the hands and feet comfortably warm; blankets are better than sheets. Avoid laying the child in the same bed with an adult. An unspoiled child does not need rocking, fondling, walking about or trotting on the knee to put it to sleep. It may be put on its bed or crib, wide awake, and left. When quiet can not be secured, and baby is worried out and can't go to sleep, and nobody knows what is the matter, in hot weather, a soft napkin or fine towel wet in warm water and folded over the top of its head, eyes and ears, will often act like a charm, and it will drop off into a refreshing sleep in a few minutes.

WEANING.—The exact time when this should be done must depend on the strength or weakness of the child, and the health and capability of the mother for the duty of a wet nurse, and to some extent the season of the year. When mother and child are both in a fair condition of health, the best time for weaning the infant is generally between the ninth and twelfth month; as a general rule, the child should not be weaned during the heat of summer; the spring and autumn are the better periods. Should the child, however, be very backward with its teeth, the time of weaning should be postponed for a few weeks or months. As a general rule, when the child has a sufficient number of teeth to enable it to mumble the soft food on which it is fed, the time has arrived to wean it. Gradually prepare the infants for the change, by beginning to feed them once, twice and finally three times a day for some weeks before absolute weaning, at the same time reducing the number of times of daily suckling; by this means the weaning is made easy and gradual, and the children are in a great measure spared the distress consequent upon an abrupt change. The mother can take for herself a cooling purgative and refrain from fluids and stimulating diet. A good application to the breast is 3 oz. compound soap liniment, 3 dr. laudanum, 1 dr. camphor liniment. If this be too irritating, foment with warm water, or poppyheads and chamomile flowers boiled together in water. Avoid tightness or pressure from the dress, and all roughness, for fear of abscess. Avoid drawing the breasts and exposure to cold.

CHILDHOOD.

BATHING.—The daily bath of a child should be considered a necessity and not a luxury. Some children have a horror of cold baths and enjoy a tepid one; others seem to enjoy a cold bath. In either case it is safe to consult the child's wish; but they must be thoroughly bathed from head to foot, at least once a week in winter and oftener in summer, in cold or tepid water. It is not necessary to use much soap every time a bath is given, but it is best to use a little. When used, it should be a good Castile soap. Care must be taken that the child is wiped dry with gentle friction. The greatest attention should be paid to the care of the teeth. Until a child is old enough to use a brush they should be washed with a soft rag dipped in cold water at least twice a day. The hair should be well brushed, but never touched with a fine comb, which causes disease of the scalp. Cleanse the hair by occasionally washing in warm water to which a little borax is added, and by thoroughly rinsing with clear water. If it splits at the ends it is owing to a deficiency of natural oil and may be remedied by using a little glycerine.

CLOTHING.—Children should be warmly dressed, particularly when going into the open air, and every part of the body should have equal protection; but care must be taken not to overload them with clothing. The sweat glands are very active in youth, and if over stimulated by heat become inflamed, producing a rash. Light woolen materials should be used in winter, and colors selected that will wash when necessary. It is better that childrens' clothing, as far as possible, should be fastened with tapes, or hooks, or buttons, avoiding pins on account of the danger of their being pricked by them. Where pins are absolutely necessary, nursery pins should be used. All little boys should be provided with thick woolen drawers, a little shorter than their trousers, to wear in all except the hottest weather. For children of both sexes, combined waist and drawers is the most convenient fashion for under garments. In summer it is more convenient to have them made in two parts, buttoning together around the waist. For girls, provide long sleeved, high necked, thick cotton waists for the spring and fall and cool summer days, and other thinner ones with low neck and short sleeves for hot weather. It is best to take off all the clothing worn during the day at night and air it for morning. As the children grow up avoid the use of corsets and tight belts as much as possible. In place of the loose night dress, a pair of drawers, with a body reaching up to the neck and legs long enough to cover the feet, is a good substitute. It can be opened in the back or front, and the material depends on the season. In selecting a child's wardrobe, have everything as good and pleasing as means will permit.

FOOD.—Children require plenty of healthful, substantial, nourishing food; they not only have to repair the daily waste of the system, but also create new bone and muscle every day. Their food may be varied by hominy, boiled rice, or porridge of corn meal. Better than all are cracked wheat and oatmeal, which so well feed their bones and nerves and assist in forming sound teeth. Soft boiled eggs are also good. Tender, juicy, broiled beefsteak, and roast beef or roast mutton are better than lamb or veal, as they contain more nutriment. Well made soups and broths are never out of place. Simple puddings should be substituted for pastry. Tea and coffee had better be dispensed with until 18 or 20. The good effect of going without them will be seen in a healthy nervous system. When cow's milk is found to disagree with the partaker, it may be rendered entirely wholesome by adding to it a small portion of table salt, just enough to be perceptible to the taste. The ordinary simple vegetables may generally be used if well cooked, except cabbage, green corn and beans, whether green or dry. The vegeta-

bles which are eaten uncooked should be avoided. Most nuts and dried fruit are injurious; boiled chestnuts ought to be prohibited. Sugar at meal times and in moderate quantities does no harm, but candies must be ate in moderation. A white potato roasted, not boiled, is the first vegetable to give the child. Regular meals should be insisted upon. Children may eat oftener than grown folks, but it must be at regular, appointed periods.

SLEEP.—Children require more sleep than adults, and to rouse any child in the morning who has been up late the night before is cruel. Have a regular early hour for their retiring, and they will have had sufficient sleep by early morning. For young children 9 or 10 hours is necessary. For school children in their teens, 8 hours of quiet sleep is generally enough, but do not restrict them.

SPORTS AND EXERCISES.—Healthy children require a great deal of exercise, and should not be discouraged from playing vigorously and shouting lustily. If perfectly well, they should be sent out in all good weather. In bad weather they should have on part of their out-door clothing, be sent into a room where the windows are open, and made to play tag, puss-in-the-corner, or any active indoor game, for ½ hour or more. Find amusements for the children while in the house. Costly toys amuse for the moment, but home-made ones, which can be pulled around and be none the worse for bad treatment, are always a source of enjoyment. At Christmas give the children as much pleasure as your means will allow. Give them a tree, or let them hang up their stockings. At Easter give them pleasure by hiding their Easter eggs and letting them hunt for them.

TRAINING, Mental.—Endeavor to always talk your best before children. They hunger perpetually for new ideas. They learn with pleasure from the lips of parents what they dream is drudgery to learn from books, and even if they have to be deprived of any educational advantages, they enjoy in childhood the privilege of listening daily to the conversation of intelligent people. One of the first things necessary in the education of a child intended for a farmer is the cultivation of the habit of observation. With this habit once formed he never becomes stupid, because he is busy seeing things and reflecting over what he has observed. This faculty is especially necessary while preparing the soil and watching the growth of crops. A child seeks for information about physical science very early. The first teaching it wants is an object lesson of one sort or another; and as soon as it is fit for systematic instruction of any kind, it is fit for a modicum of science. Be careful that when he learns he knows of his own knowledge. Don't be satisfied with telling him that a magnet attracts iron. Let him see that it does; let him feel the pull of the one upon the other for himself. A judicious mother will so manage her daughters that even at the early age of 13 they can, in an emergency, prepare a meal. A thorough domestic training is very useful to a girl. Girls left to their own devices waste a great deal of time which might be utilized to their advantage. A girl who can climb trees, who can dance hours without fatigue, jump rope or take long walks, skate and row, can also sweep, and scrub, and make bread and wash and iron, if she is encouraged to do so. The latter accomplishments she must possess in order to make a happy home, though she may have half a dozen servants at her call. Give the proper encouragement and the means, and many boys whose mechanical aptness is allowed to run to waste, or is diverted from its course, would become good workmen. The mechanical boy ought to have a shop of his own. Let it be the attic, or an unused room or a place in the barn or the woodshed. Give him a place and tools. Let him have a good pocket knife, gimlets, chisels, gouges, planes, cutting nippers, saws, a foot rule, and material to work. If he is a mechanic it will come out, and he will do himself credit. If he fails, he is to follow some calling that does not demand mechanical skill.

TRAINING, Moral.—Moderate any propensity of a child, as anger, violence, greediness for food, cunning, etc., which appears too active. Show him no example of these. Let the mother be, and let her select her servants like she wishes the child to be. The youngest child is affected by the conduct of those in whose arms he lives. Cultivate and express benevolence and cheerfulness. Let a mother feel as she ought, and she will look as she feels. Much of a child's earliest moral training is by looks and gestures. When necessary exhibit firmness and authority, always with perfect temper, composure and self-possession. When the child is most violent, the mother should be most calm and silent. Out-screaming a screaming child is as useless as it is mischievous. Steady denial of the object screamed for is the best cure for screaming. In such contests, witnesses should withdraw, and leave the mother and child alone. A child is very ready to look round and attract the aid of foreign sympathy in its little rebellions. Never promise to give when the child leaves off crying. Let the crying be the reason for not giving. Never strike a child, and never teach it to strike again. Never tell a child to beat or threaten any animal or object. Teach your children the evil of secret vice, and the consequences of using tobacco and spirituous liquors; teach them to be temperate, orderly, punctual, truthful, neat, faithful and honest. Teach them to always pay debts promptly; to never shirk a duty; to do an equal share, and to always live up to an agreement. Teach your children to confide in you, by conference together. Tell them your plans, and sometimes ask their advice; they will thus open their hearts to you, and will ask your advice. The girl who tells all her heart to her mother has a shield and a protection about her which can come only with a mother's advice and counsel. From their earliest infancy, teach them instant obedience. Never under any circumstances tease or allow a child to be teased. It makes them cross, irritable and impudent, and they will imitate you in all things. Never allow talebearing. Teach them self-denial, not self-indulgence of an angry and resentful spirit.

TRAINING. For Work.—One of the greatest defects in the education of children is the neglecting to accustom them to work. A certain amount of work is necessary to the education of children; their future independence and comfort depend on their being accustomed to provide for the thousand recurring wants that nature entails on them. No man or woman is thoroughly educated if not required to labor. Whatever accomplishments they possess, they require more practical knowledge and experience derived from accustoming themselves to useful labor of some sort. Their physical strength also depends on the exercise they have. (See *Sports and Exercises.*)

CLEANING.

HOUSEHOLD.

Too much care can not be bestowed on keeping house implements clean. Keep each to its own special use. The scrubbing brush needs attention, and unless kept clean will smell. Have it well rinsed, and all hair and pieces of flannel fluff picked out of it after using. Cloths and washing flannels must be thoroughly rinsed in separate waters, and hung out in the open air to dry.

ALABASTER. To Clean. — 1. If much discolored, make a paste with quicklime and water; cover the article well with it, and let it remain all day; wash off with soap and water, rubbing hard the stains.—2. Put 2 oz. of aquafortis into pure, cold water; dip a clean small brush into this liquid and wash the alabaster with it for 5 minutes or more; then rinse with clear cold water, and set it in the sun for 2 or 3 hours to dry.

BARRELS, To Clean.—1. First scald well with boiling water (letting the water stand in them till cold); fill them with cold water, and throw in a large quantity of live coals from a wood fire, leaving the cask uncovered. By repeating this, the casks may be made perfectly sweet, provided they have at no time contained fish.—2. Fill with meal or bran and water till fermentation takes place. It will entirely cleanse them, and the mixture will afterwards do for food for swine.

BLEACHING JUTE.—To bleach jute, the yarn is first placed in a weak and slightly warm soap bath for 10 minutes, and then transferred to a chloride of lime bath of 1.0035 specific gravity; after the lapse of 40 minutes the yarn is taken out; sometimes it may be necessary to repeat the operation; finally the yarn is washed in warm and then in cold water and dried in the open air.

BLEACHING WOOL.—In bleaching raw wool it is first deprived of the yolk or peculiar natural varnish with which it is covered. For this purpose it is steeped and stirred for about 20 minutes in rather warm water, either with or without the addition of ¼ part of stale urine; after which it is placed in baskets to drain, and soon afterwards thoroughly rinsed in a stream of water, when it is again allowed to drain, and it is hung up to dry. The further operations depend on circumstances, wool being sometimes whitened in the fleece, or in the yarn, but still more frequently and extensively not till woven. When it is intended to send it in the first two forms white to market it is hung up or spread out while still wet, and sulphured; after which it is either at once rinsed for some time in cold water, or is previously treated with a very weak bath of soft soap. (See *Bleaching Yarn.*)

BLEACHING YARN.—Scour well the yarn; when dry get a barrel with the head out; put in an iron vessel 2 or 3 oz. of lac-sulphur, and set this in the bottom of the barrel; throw in coals enough to make a smoke; put some sticks across the barrel for the yarn to rest on; lay the yarn on the sticks and cover up the barrel with a cloth to keep the smoke from escaping. An ounce of sulphur to the cut is the allowance. This will bleach yarn as white as snow, and renders home-made yarn beautiful for knitting hoods and comforts.

BOTTLES. To Clean.—1. Put ashes into each one, and immerse them in a pot of cold water; then heat the water gradually until it boils. When they have boiled in it 1 hour, take it from the fire and let them remain in it till cold; then wash them in soap-suds, and rinse them in pure water till clean.—2. Dissolve 1 oz. of chloride of lime in 1 qt. of water, and fill the bottles with the liquid; set them aside for several days and rinse them well with water. The water of chloride of lime can be used several times.—3. A concentrated solution of permanganate of potassium, to which a few drops of hydrochloric acid are added, will remove fatty substances.—4. Simply shaking ashes in a little water in a bottle, will clean it.

BRASS, To Clean.—1. Brass may be cleaned with pumice stone and water, applied with a brush, polishing with dry pumice stone and woolen cloths.—2. Rub the surface of the metal with rotten stone and sweet oil, then rub off with a piece of cotton flannel, and polish with soft leather.—3. A solution of oxalic acid rubbed over tarnished brass soon removes the tarnish, rendering the metal bright. The acid must be washed off with water, and the brass rubbed with whiting and soft leather.—4. Immerse or wash it several times in sour milk or whey. This will brighten it without scouring. Then scour with a woolen cloth dipped in fine, soft ashes.—5. Mix some cream of tartar with warm water to a thick paste; rub this well into the brass with a flannel and brush; afterward rinse off the water under a stream of cold water, and dry with a soft cloth in front of the fire, polish-

ing with a dry leather.—6. Brass inlaid work may be cleaned with tripoli and linseed oil, applied by a rubber of felt or leather; the whole being afterwards thoroughly rubbed off, and then finished with clean soft leather.—7. A fine color may be given to brass ornaments, when not gilt or lacquered, with a little sal-ammoniac in fine powder, moistened with soft water. The articles must be afterwards rubbed dry with bran and whiting.

BRASS, Powders for Polishing.— 1. Rotten stone, 7 oz.; powdered oxalic acid, 1 oz. Used with a little water.—2. Rotten stone, 3 oz.; powdered soap, 1 oz.

BRASS or COPPER KETTLES, To Clean.— A brass, bell-metal, or copper kettle should be cleaned immediately after it is used. Even when not used it will require occasional cleaning, otherwise it will collect rust or verdigris, which is a strong poison. After washing the kettle with warm water, put into it a teacupful of vinegar and a tablespoonful of salt; place it over the fire; when hot, rub the kettle thoroughly with a cloth, taking care that the salt and vinegar shall touch every part; then wash with warm water; next take some wood ashes, or fine sand, and scour well; afterward wash with hot soap-suds, and finish by rinsing in cold water and wiping dry.

BRITTANIA, To Clean.—To clean Brittania metal, use finely powdered whiting, sweet oil and yellow soap; mix with spirits of wine to a cream; rub on with a sponge; wipe off with a soft cloth and polish with a chamois skin.

BRONZE, To Clean.—The following mixture will remove fly specks from bronze: Lavender oil, 1 dr.; alcohol, 1 oz.; water, 1½ oz.; use a soft sponge and proceed as quickly as possible, with little rubbing.

BRUSHES, To Clean.—1. These may be best washed in a moderately cold weak solution of borax.—2. A few drops of hartshorn put into a little water will clean a hair brush, and does the brush no harm; if very dirty, rub a little soap on; after cleansing, rinse it in clear water; do not let the bristles rest on any hard substance while wet; tie a string around the handle and hang it up.—3. Dissolve soda in cold water. Soda, having an affinity for grease, cleans the brush with very little friction.

CARPETS, To Clean.—1. Shake and beat well; lay upon the floor and tack down firmly; then, with a clean flannel, wash over with 1 qt. of bullock's gall, mixed with 3 qts. of soft cold water, and rub it off with a clean flannel or house cloth. Any particular dirty spot should be rubbed with pure gall.—2. If the carpets are so much soiled as to require cleaning all over, after the dirt has been shaken out spread them on a clean floor and rub on them, with a new broom, grated raw potatoes. Let the carpets remain till dry before walking on them.—3. ½ bar white Castile soap, 2 oz. borax, 2 oz. washing soda; boil in ½ gal. of water till dissolved; then add 2 gals. tepid water and boil 10 minutes; when cold, add ½ pt. alcohol; rub on with a clean flannel.

CARPETS, To Remove Grease from.—1. Aqua-ammonia, 2 oz.; soft water, 1 qt.; saltpeter, 1 teaspoonful; shaving soap, 1 oz., finely scraped; mix well, shake and let it stand a few hours or days, before using, to dissolve the soap. When used pour on enough to cover any grease or oil that has been spilled, sponging and rubbing well and applying again if necessary; then wash off with clean cold water.—2. Sprinkle powdered magnesia, fuller's earth, buckwheat or pipe clay on the spot and let lie until the grease is absorbed; renew the powder until all the grease is removed. 3. A handful of crushed soap bark to a pail of water will also remove grease and restore colors. Scrub the spots and sponge the carpet all over.

CARPETS, To Remove Ink from. — As soon as the ink has been spilled, take up as much as you can with a sponge, and then pour on cold water repeatedly, still taking up the liquid; next rub the place with a little oxalic acid dissolved in cold water; then rub on some hartshorn.

CARPETS, To Remove Soot from. — Soot falling on the carpets from chimneys or from stove pipe carelessly handled, if covered over thickly with salt may be swept up without disfiguring or damaging the carpet.

CARPETS, To Sweep. — 1. Always sweep velvet carpets the way of the pile. Before proceeding to sweep a carpet, a few handfuls of waste tea leaves may be sprinkled over it. A stiff hair broom or brush should be employed unless the carpet be very dirty, when a whisk or carpet-broom should be used first, followed by another made of hair, to take off the loose dust. The frequent use of a stiff carpet-broom soon wears off the beauty of the best carpet.—2. Sprinkle salt over the surface and sweep well. This makes carpets look very clean and bright.

CEILINGS.—(See *Wall Paper, To Clean.*)

CHAIRS, Cane-Bottom, To Clean. — Turn up the chair bottom, and with hot water and soap sponge the cane; work well until completely soaked. Let it dry in the open air.

CHAMOIS, To Clean. — Wash in cold water with plenty of soap, and rinse well in clear cold water.

COFFEE POTS, To Clean. — Wash the coffee pot thoroughly every day, and once a week boil borax water in it for 15 minutes.

COPPER UTENSILS, To Clean.—Use a coarse cloth; have a pail of very hot water; soak the cloth a little; sprinkle on plenty of pulverized borax, and rub the boiler well; rinse off with hot water; and dry with a soft cloth. A boiler can be brightened in this way as quickly as with acid. If acid is used, see *Brass or Copper Kettles, to Clean.*

DECANTERS, To Clean. — The best way to clean decanters after port wine has stood in them is to wash them out with a little pearlash and warm water, adding a spoonful or two of fresh slaked lime, if necessary. To facilitate the action of the fluid against the sides of the glass, coal ashes or pieces of raw potato may be used. A spoonful of strong oil of vitriol will also rapidly remove any kind of dirt from glass. Decanters which have become furred by holding hard water may be cleaned with a spoonful of hydrochloric acid diluted with 3 or 4 times its weight of water.

DISHES, To Wash. — Dishes should be rinsed in clear, hot water after having been washed in soap suds. It is necessary from a sanitary point of view; the caustic alkali is corrosive and unwholesome, and the grease often impure. A rack made of narrow strips of ½ in. board is a device frequently used for draining dishes, thus saving the trouble of wiping them. This rack placed on a shelf inclining towards and adjoining the sink holds the dishes securely while they are drying. Milk is a substitute for soap in the kitchen. A little put into hot water will soften it, give the dishes a fine gloss, and will not injure the hands. China and glass (when very dirty) are best cleaned with finely powdered fuller's-earth and warm water, afterwards rinsing it well in clean water. All china that has any gilding upon it may on no account be rubbed with a cloth of any kind, but merely rinsed, first in hot and afterwards in cold water, and then left to drain till dry. Cups and saucers which have become stained with coffee or tea can be easily cleaned by scouring them with baking soda.

DRAINS, To Clean. — Dissolve 4 or 5 lbs. of washing soda in boiling water and throw down the kitchen sink to prevent the pipes stopping up with grease, etc. Do this every few weeks. Clean lead pipes leading from wash bowls by pouring down them a strong solution of potash dissolved in hot water. Don't get the mixture on the hands or clothing. It destroys all animal matter, hair, etc., and saves employing a plumber.

DUSTING. — Very frequently the dust of an apartment is not removed, but merely disturbed or driven from one place to settle down on another. It should always as much as possible be got rid of by means of a duster or a brush and dust pan. As the dust will adhere to the former, this should from time to time be taken out into the open air and shaken. During the time a room is being dusted the furniture should be collected in as small a space as possible, and enveloped in the dusting sheet. The dusting sheet on its removal should be carefully folded together, taken into the air and shaken. The furniture may then be dusted and returned to the proper places. A duster should never be rubbed over furniture standing close to a wall; or a dirty mark on the wall paper will be the result. The same caution applies to mantel pieces where contact with the duster should be avoided.

ENGRAVINGS, To Clean.— 1. Accumulated dust should first be taken off with a light feather duster; then, further, by a light rubbing, by hand, with bread crumbs, frequently renewed. —2. Immerse the print in oxygenated muriatic acid, letting the engraving remain in the acid a shorter or longer time, according to the strength of the acid. This may be tested by first immersing a leaf of an old book.—3. Provide two soft sponges, and then select a flat surface, a table, or, if available, a marble slab; place thereon a sheet of white paper, larger than the print about to be treated; take the engraving and carefully damp it on both sides with the wet sponge; fill a pint measure with cold water, and in this put some chloride of lime and some oxalic acid in nearly equal proportions; but it will be seen when the mixture is right, from the fact of the liquid turning magenta color. With this mixture well saturate the injured engraving, continuing the application until every mark or stain is removed, and then sponge off freely with pure, cold water.

FEATHER BEDS, To Clean.—To renovate old feather beds, when no steam apparatus is convenient, put them out doors during a heavy rain. Let them dry in the sun, beating them occasionally with sticks to loosen the feathers. They should be turned over several times, and thoroughly dried.

FEATHERS, To Clean.—1. Goose feathers for beds are generally purified by simply exposing them to the sun or in the oven until perfectly dry, and then beating them to remove loose dirt. —2. When carelessly collected and dirty, they are sometimes first cleansed with lime water, or, better still, with a weak solution of carbonate of soda, or water to which a little solution of chloride of lime has been added; after which they are rinsed in clean water and dried or stoved as before. Old feathers are cleansed or purified in same way. —3. Take for every gallon of clear water 1 lb. of quick lime; mix them well together, and when the undissolved lime is precipitated in fine powder, pour off the clear lime water for use at the time it is wanted; put the feathers to be cleaned in another tub, and add to them a sufficient quantity of clear lime water to cover the feathers about 3 in. when well immersed and stirred therein. The feathers, when thoroughly moistened, will sink down, and should remain in lime water 3 or 4 days; after which the foul liquor should be separated from the feathers by laying them on a sieve. The feathers should afterward be well washed in clean water and dried on nets, the meshes being about the same firmness as those of cabbage nets. The feathers must from time to time be shaken on the nets, and as they dry they will fall through the meshes, and are to be collected for use. The admission of air will be serviceable in the drying, and the whole process may be completed in about three weeks. The feathers, after being thus prepared, will want nothing more than beating, for use either as beds, bolsters, pillows or cushions.

FLOORS, To Clean.—Should the floor not be very dirty, ordinary soap rubbed on the brush will be sufficient; but if a great cleaning is required use soft soap on the brush instead, or else take soda and warm water; take the flannel to rinse off the soap, wringing it each time to dry the floor. Change the water two or three times in a small room, and more frequently in a large one. Soft soap is apt to leave an offensively "washy" smell. This will soon pass if the windows are opened and a free current of air admitted. Leave no spot untouched, and clean straight up and down, not crossing from board to board; then dry with clean cloths, rubbed hard, up and down in the same way. Boards may be rendered white and clean by scrubbing them, instead of with soap, with a mixture composed of 1 part of freshly slacked lime and 3 parts of white sand.

FURNITURE, To Clean.—1. To improve the appearance of furniture, take a soft sponge wet with clean cold water and wash over the article; then take a soft chamois skin and wipe clean; dry the skin as well as you can by wringing it in your hands, and wipe the water off the furniture, being careful to wipe only one way. Never use a dry chamois on varnish work. In deeply carved work the dust cannot be removed with a sponge; use a stiff-haired paint brush instead of a sponge. For unpolished furniture linseed oil is the best; rub in thoroughly.—2. Kerosene is excellent for cleaning furniture, either walnut or oak.

FURNITURE, Polishes for.—1. An excellent furniture polish is made with 1 pt. of linseed oil and about ½ gill of alcohol, stirred well together and applied to the furniture with a linen rag; rub dry with a soft cotton cloth and finish with an old piece of silk.—2. Equal parts of boiled linseed oil and kerosene; apply it with a flannel, and keep always ready for use.—3. Black walnut, rosewood, mahogany, oak and chestnut furniture can be cleaned with furniture polish, made by mixing 1 coffeecupful of cold drawn linseed oil, 1 of turpentine and 1 of vinegar, to which 2 tablespoonfuls of alcohol should be added. Put all into a bottle and shake well. It is ready for use at once, but must always be well shaken when applied. Pour out a little into a saucer, dip a soft flannel into it and rub the furniture according to the grain. Polish with a chamois skin or a dry flannel rolled up tightly for a rubber.—4. Take 1 oz. of yellow rosin and 1 pt. of raw linseed oil; melt the rosin in a pipkin, and add to it by degrees ½ of the oil; when thoroughly incorporated, add by degrees the remainder. Before using the polish, it will be best to wash the table well with tepid water and rub it quite dry.—5. 1 oz. beeswax and ½ oz. white wax cut into thin shreds and dissolved in 1 pt. of turpentine. It will require to be stirred occasionally while dissolving; apply with a piece of flannel and polish with a dry, soft duster.—6. For a polish to clean up and brighten old furniture, pianos, etc., dissolve 4 oz. orange shellac in 1 qt. of 95 per cent. alcohol; to this add 1 qt. of linseed oil and 1 pt. of turpentine; when mixed add 4 oz. of sulphuric ether, and 4 oz. of aqua ammonia; mix thoroughly before using. Apply with a cloth or sponge, and rub the surface to which it is applied until the polish appears.

FURNITURE, Spots on, to Remove.—1. Spots on furniture, from anything hot or from alcohol, can be removed by rubbing hard with sweet oil and turpentine. When the spots disappear, wash in milk warm soap-suds, dry quickly, and polish by rubbing briskly with chamois skin.—2. Rub them with essence of peppermint or spirits of camphor, and afterwards with furniture polish or oil.—3. Use a little aquafortis and water, or oxalic acid and water, rubbing the part by means of a cork till the color is restored; afterwards, wash the wood well with water; dry and polish.—4. Take 4 oz. of vinegar, 2 oz. of sweet oil, 1 oz. of turpentine; mix and apply with a flannel cloth.

GILT FRAMES, To Clean.—1. Rub with a sponge moistened with turpentine.—2. When the gilt frames of pictures, looking-glasses, or moldings of rooms have specks or dirt upon them from flies or other causes, they may be cleaned with white of eggs gently laid on with a camel's hair pencil.—3. Rub gently with a cloth dipped into sweet oil and wipe dry with a chamois skin.

GILT FRAMES, To Restore.—Take sufficient flour of sulphur to give a golden tinge to 1½ pts. of water; boil in this water 4 onions; strain, and when cold wash with a soft brush any part that requires restoring; when dry it will come out as good as new.

GLASS GLOBES, To Clean.—If the globes are much stained on the outside by smoke, soak them in tolerably hot water with a little washing soda dissolved in it; then put 1 teaspoonful of powdered ammonia into a pan of lukewarm water, and with a tolerably hard brush wash the globes till the smoke stain disappears; rinse in clean cold water, and let them drain till dry. They will be quite as white and clear as new globes.

GLASS, To Clean.—1. If the glass is particularly soiled, a pinch of soda in the water will cleanse it easily.—2. Take fine powdered indigo, dip it into a moistened linen rag, smear over the glass with it, and then wipe it off with a perfectly dry cloth; or fine sifted wood ashes, applied by a rag dipped in spirits, will answer just as well.

GUTTA PERCHA, To Clean.—Use a mixture of soap and powdered charcoal, polishing afterwards with a dry cloth and a little charcoal.

HAIR CLOTH, To Clean.—Take pure benzine to remove stains from hair cloth furniture.

HAIR MATTRESSES, To Clean.—Hair mattresses that have become hard and dirty can be made nearly as good as new by ripping them, washing the ticking, and picking the hair free from bunches, and keeping it in a dry, airy place several days. Whenever the ticking gets dry fill it lightly with the hair, and tack it together.

INK, To Remove from Wood.—1. Inky spots on floors can be extracted by scouring with sand wetted in oil of vitriol and water; when the ink is removed, rinse with strong pearlash water.—2. Wet salt will also get ink out.—3. Turpentine will remove ink from white wood work.—4. Stains of ink may be removed by strong vinegar, or a solution of oxalic acid.

INK, To Remove from Paper.—1. To remove ink stains from a book, first wash the paper with warm water, using a camel's hair pencil for the purpose; by this means the surface ink is got rid of; the paper must now be wetted with a solution of oxalic acid, in the proportion of 1 oz. to ½ pt. of water; the ink stains will immediately disappear; if then washed with a strong solution of chloride of lime the acid will be prevented from injuring the paper or parchment; finally, again wash the stained place with clear water, and dry it with white blotting paper.—2. Alum, amber, sulphur and saltpetre, 1 part of each, in fine powder, mixed.—3. Solution of muriate of tin, 2 dr.; water, 4 dr.; apply with a camel's hair brush. After the writing has disappeared, pass the paper through water, and dry.

INK, To Remove from Silver.—Silver ink-

stands frequently become deeply discolored with ink, difficult to remove by ordinary means. It may be completely eradicated by making a little chloride of lime into a paste with water, and rubbing it upon the stains.

IVORY, Stained, To Whiten.— 1. Discolored ivory may be restored to its original whiteness by cleaning it with a paste, composed simply of burnt pumice stone and water; after cleansing, place the article under a glass in the sun's rays.—2. Emery powder rubbed on the white ivory knife handles will remove an ordinary stain; should the stain be deep, rub first with emery cloth and then with the powder.—3. The whiteness may be restored to ivory handles as follows: Wash with soaped flannel and lukewarm water; then wipe very dry; soak them occasionally in alum water that has been boiled, and allowed to cool; let the handles lie for 1 hour in this; then remove and brush them well; after this take a clean linen towel, dip it in cold water, squeeze it out, and while wet wrap in around the handles, leaving them in it to dry gradually, as, if dried too rapidly out of the alum water, the handles will be injured.—4. Salts of lemon will remove stains from the ivory handles of knives.—5. To whiten organ or piano keys, make a thin paste of spirit of ammonia and Spanish whiting, and rub them thoroughly with the mixture; when dry, wipe off the powder with a flannel rag.

JAPANNED WARE, To Clean.—Wash it with a sponge dipped in clean cold water, wipe it dry and polish it with dry flour well rubbed on with a soft cloth.

KETTLES, To Clean.—1. The best way to clean the inside of old iron pots and pans is to fill them with water in which a few ounces of washing soda is dissolved, and set them on the fire. Let the water boil until the inside of the pot looks clean. A clam shell is more convenient for scraping kettles and frying pans than a knife. It does the work in less time. A pot cleaner as shown in the illustration is also sold for the same purpose.—2. (*Porcelain-lined.*) Boil peeled potatoes in it. The porcelain will be rendered nearly as white as when it was new.

Pot Cleaner.

KNIVES AND FORKS, To Clean. — 1. After being used, all knives should be wiped on a coarse cloth, so as to insure their freedom from grease previous to being cleaned; dipping the blades in hot water not only fails to remove any grease that may be on them, but is almost sure to loosen the handles. Handles of ebony should be cleaned with a soft piece of cloth dipped into sweet oil, and left lying for about 10 or 15 minutes with the oil on them, then wipe them with a clean cloth. Ivory or bone handles should be washed with a soap cloth or flannel and lukewarm water, and then wiped with a dry towel. —2. To clean steel forks, fill a small barrel with fine gravel brick dust or sand, mixed with a little hay or moss; make it moderately damp, press it well down and let it always be kept damp. By running the prongs of the steel forks a few times into this, all the stains on them will be removed.—3. The way to clean a stained steel knife is to cut a solid potato in two, dip one of the pieces in brick dust, such as is usually used in knife cleaning, and rub the blade with it.—4. The fine siftings of coal ashes are also excellent to scour knives with.

LAMP BURNERS, To Clean. — To clean lamp burners, wash them in ashes and water, and they will come out bright as new.

LAMP CHIMNEYS, To Clean.—1. Lamp chimneys can be washed easily by holding them over the nose of the teakettle when the kettle is boiling furiously. This will make them beautifully clear; they must then be wiped in and out with a clean cloth. — 2. Put the chimneys in strong soda water; let it be moderately hot. The longer they lie in it the better; rinse in cold water; drain and polish by rubbing with a soft cloth.

MARBLE, To Clean. — 1. Take two parts of common soda, one part of pumice stone, and one part of finely powdered chalk; sift it through a fine sieve, and mix it with water; then rub it well all over the marble, and the stains will be removed; then wash the marble over with soap and water, and it will be as clean as it was at first.—2. Make Spanish whiting into a paste by moistening with water in which a piece of washing soda is dissolved; spread on a piece of flannel, and well rub the marble, the process being repeated 2 or 3 times. It should be washed off with soap and water, and the marble afterward polished with a cloth. — 3. To remove stains from statuary marble, take equal parts of fresh oil of vitriol and lemon juice; shake up these substances very thoroughly in a bottle; wet the spots with the mixture, and in a few minutes afterward rub with a soft linen cloth, and the spots will entirely disappear. — 4. To clean marble mix quicklime with strong lye, so as to form a mixture having the consistency of cream, and apply it immediately with a brush. If this composition be allowed to remain for a day or two, and be then washed off with soap and water, the marble will appear as though it were new. — 5. To clean gray marble, rub with linseed oil, and no spots will show. — 6. Iron rust or ink spots may be taken out in the following manner: Take ½ oz. butter of antimony and 1 oz. oxalic acid, and dissolve them in 1 pt. rain water; add flour, and bring the composition to a proper consistence; then lay it evenly on the stained part with a brush, and after it has remained for a few days, wash it off, and repeat the process if the stain is not quite removed. — 7. To clean smoke off marble, wet a piece of flannel in strong ammonia and rub the marble quickly with it and then wash off with hot soap suds.—8. Stains in marble caused by oil can be removed by applying common clay, saturated with benzine. If the grease has remained long enough it will become acidulated, and may injure the polish, but the stain will be removed.

MATTING, To Clean. — Matting, after being

swept, should be wiped with a damp cloth. Hot salt and water will thoroughly cleanse it, and will not discolor it.

MICA, To Clean.—Mica in stoves (often wrongly called "isinglass") when smoked, is readily cleaned by taking it out and thoroughly washing with vinegar a little diluted. If the black does not come off at once, let it soak a little.

MIRRORS, To Clean. — 1. Take a newspaper, fold it small, and dip in a basin of clean cold water. When thoroughly wet, squeeze it out as you do a sponge; then rub it pretty hard all over the surface of the glass, taking care that it is not so wet as to run down in streams. Let it rest a few minutes; then go over the glass with a piece of fresh newspaper, till it looks clear and bright.—2. Wipe the mirrors with borax water, the cloth being wet enough to dampen it.

OIL CLOTHS, To Clean. — 1. Use half milk and half water. Skim milk, if not sour, is just as good as new milk. This makes oil cloth look as if varnished.—2. Rub them once in three months with boiled linseed oil. Put on a very little, rub it well with a rag, and polish with a piece of old silk. Oil-cloths will last years if kept in this way.

PAINT, To Clean. — 1. Use but little water at a time; keep it warm and clean by changing often. A flannel cloth is better than cotton. Put but a little soap, or skim milk in the water; add soap to the cloth when needed. A sharp piece of soft wood is indispensable for the corners. A saucer of soft sifted ashes, or whiting, used when paint is badly smoked or fly-specks are thick, is better than soap; wipe last with a clean wet towel, and don't spill a drop of water. —2. Dissolve 2 oz. of soda in 1 qt. of warm water, which will make a ready and useful solution for cleaning old painted work preparatory to repainting. The mixture, in the above proportions, should be used when warm, and the wood work afterward washed with water to remove the remains of the soda.—3. An oz. of pulverized borax, 1 lb. best brown soap in small pieces and 3 qts. water are to be mixed and put on the fire. It should simmer until the soap dissolves, being frequently stirred. Do not allow it to boil. Use with flannel and rinse off as soon as the paint is clean. — 4. In washing painted walls it is a good plan to remove from the room everything that can be injured by steam and then hang sheets wrung from hot water in the room. The vapor, condensing on the walls, softens the dirt, which may be wiped off with woolen cloths wrung from soda water.

PAINTINGS, To Clean. — 1. Castile soap and water can be used on oil paintings without danger, care being taken of course not to wet the back, or let water through cracks. For ordinary dusting of pictures a silk handkerchief should be used.—2. Sponge with warm water; then cover with spirits of wine, renewed for ten minutes and wash off with water; but without rubbing. Repeat the process until the whole is removed. —3. Mix linseed oil, 2 oz., with methylated chloroform, 1 oz.; and apply a little over the painting, previously washing it with clean water applied with a little cotton wool; wipe off the composition with a soft silk handerchief during the next day. The mixture possesses the valuable property of restoring the faded colors of paintings.—4. Spread a coating of copaiba balsam on the old painting, and then keep it face downward over a dish of the same size filled with cold alcohol, at an altitude of about 3 ft. The vapors of the liquid impart to the copaiba a degree of semi-fluidity, in which state it easily amalgamates with the varnish it covers. Thus the original brilliancy and transparency are regained without injuring the oil painting.

PAPIER-MACHÉ, To Clean. — Wash papier-maché articles with a sponge and cold water (without soap); dredge while damp with flour, and polish with a piece of flannel.

PICTURE FRAMES, To Clean.—Black walnut frames may be renewed by first brushing thoroughly with a stiff brush, to remove the dust, and then applying pure linseed oil with a proper brush. In the absence of a brush a piece of new bleached muslin will answer the purpose.

PIE PLATES. To Clean.—Pie plates that have been used much for baking are apt to impart an unpleasant taste to the pies, which is owing to the lard and butter of the crust soaking into them and becoming rancid. It may be removed by putting them in a brass kettle with wood ashes and cold water, and boiling them in it for 1 hour.

PLASTER FIGURES, To Clean.—A coating of whiting and very thin glue applied with a brush will restore whiteness to plaster figures and make them once more real ornaments.

RUST, on Stoves.—1. To keep a stove free from rust in any atmosphere you have only to rub off all the rust you can and varnish it with common varnish. In the autumn, after putting it up again, the varnish will all burn off in a very short time, and all odor from it will go with it.—2. To remove rust from stoves, rub them with a rag dipped in oil of tartar. The rust will disappear immediately.

RUST, on Tin.—1. If tinware is well rubbed with lard and then with common unslacked lime, before being put away, it will never rust. This is also the best plan to remove rust.—2. Rub fresh lard over every part; then put it in an oven and heat it thoroughly; thus treated, any tinware may be used in water constantly, and remain bright and free from rust indefinately.

RUST, To Remove from Steel.—1. Every particle of iron rust, when the iron is not eaten into, may be removed by softening it with petroleum and then rubbing well with coarse sand paper.—2. To remove rust from steel rub well with sweet oil; in 48 hours use unslacked lime, powdered very fine; rub till the rust disappears.

SEA SHELLS. To Clean.—1. Fresh water shells can be cleaned by soaking them in a solution of chloride of lime and polishing them with pumice stone.—2. Boil in milk. This will cleanse them thoroughly.

SILVER, To Clean.—1. Silver plate can be beautifully cleaned and made to look like new by dipping a soft cloth or chamois skin in a weak preparation of ammonia water and rubbing the articles with it.—2. Wash in hot water containing a good quantity of concentrated lye;

or, if very black, boil for some time in soft water with a considerable amount of washing soda added; then wash in a good suds, rinse in clear water, and rub with flannel cloth, or, better, chamois skin, and your silver will not often require cleaning, but will shine like new for a long time.—3. The discoloration can be readily taken from silver spoons by washing them in water in which potatoes have been boiled.—4. To remove egg stains from silver spoons, rub with salt and it will entirely remove the discoloration.—5. Rub with slices of lemons or limes; then wash with soap suds, rinse off and polish with chamois skin.—6. Wet a flannel cloth in kerosene, dip it in dry whiting and rub the plated ware; let it dry on it, and then polish with a chamois skin.—7. Make a solution of ½ lb. cyanuret potassa in 2 gals. rain water; immerse the article till the tarnish has disappeared; then rinse off carefully in 3 or 4 waters, and dry in sawdust.

SILVER, Powders for Polishing.—1. An article for cleaning silver and other metallic ware is the zinc white (No. 1. quality) used by painters. Rub it fine with a knife, sprinkle it on a soft flannel cloth, with which rub the ware; then brush off with tissue paper, or any clean soft cloth.—2. Jeweller's rouge, ¼ lb.; prepared chalk or levigated burnt hartshorn, ¾ lb.; mix.—3. Quicksilver with chalk, 1 oz.; prepared chalk, 11 oz.; mix. Used to clean and polish plate.—4. Cream of tartar, common salt and alum, equal parts; a little of this powder added to the water in which plate is boiled gives to it a silvery whiteness.

SILVER. Washes For.—1. Cyanide of potassium, 3 or 4 dr.; nitrate of silver, 8 to 10 gr.; water, 4 oz.; apply with a soft tooth brush; wash the object thoroughly with water; dry it with a soft linen cloth, and polish with a chamois skin.—2. Mix 1 pt. of alcohol, ½ pt. of ammonia, ½ pt. of distilled water, 4 oz. of Spanish whiting; rub on with a sponge, and wipe off with a cloth.

SPICE MILLS, To Clean.—Grind a teaspoonful of rice through the mill and all impurities will be removed. A coffee mill may be fitted to grind any spice in the same way, using rather more rice. The rice will of course be flavored by whatever may have been in the mill. It is useful to thicken soups, or gravies, or sauces, when the spice is no objection.

SPONGES, To Bleach.—Wash and squeeze them out repeatedly in water; then plunge them in a mixture of 1 part muriatic acid and 6 parts water, in order to separate all calcareous matter. This immersion is for 1 hour, after which they are carefully washed in clean water, and then plunged in a second bath of muriatic acid, prepared as at first, except there is added 6 per cent. of hyposulphite of soda dissolved in a little water. The sponges are allowed to remain in this bath for 24 hours. A final washing with water removes the chemical substances, and the sponge acquires a beautiful whiteness.

SPONGES, To Clean.—1. A strong solution of salt and water, in which they should soak for a few hours, and then be thoroughly dried. Sponges should be kept suspended where the air can freely circulate around them. Quick evaporation of the moisture keeps them in good order.—2. Sponges can be cleansed by washing them in ammonia and water (use the proportion of 1 teaspoonful to 2 qts.), and afterwards in a solution of muriatic acid—1 part acid to 25 parts of water.—3. Steep the sponge in milk for some hours; then squeeze it out and wash in cold water.

STEEL. To Clean.—To clean steel ornaments, dip a small brush into some paraffin oil and then into some emery powder, such as is used in the knife machines, and well brush the ornaments and all the rust will soon come off; polish with a dry leather and duster.

STONE STEPS, To Clean.—Boil 1 lb. of pipeclay with 1 qt. of water, 1 qt. of small beer, and put in it a bit of stone blue. Wash with this mixture, and when dry rub the stones with flannel and a brush.

STOVES. To Clean.—If the stove is greasy, wash it off with a piece of flannel dipped in hot water containing a little soda. Mix a little black lead or stove polish with enough water to form a thin paste; apply this to the stove with a soft rag or brush; let it dry a little and then polish it with a stiff brush. If there are any steel fittings about the stove, polish them with emery paper; if they have rusted from neglect, rub some oil on them at night and polish them with emery paper in the morning. If the fittings are brass they should be cleaned with emery, or finely powdered and sifted bath brick dust rubbed on with a piece of damp flannel and then polished with dry dust and chamois skin.

STOVE PIPES, To Clean.—1. To free the pipe of soot, take the stove handle or any convenient implement and rap the pipe smartly on all sides from top to bottom. The soot will fall into the stove and be harmlessly consumed, or it can be removed in the usual way. If there be a horizontal pipe, this should be taken down twice a year and thoroughly cleaned. Or, if the pipe be only a few feet in length, and the arrangements will admit of it, provide the horizontal pipe with a permanent scraper, as follows: To the end of a stout wire, a few inches longer than the pipe, attach a small segment of a disc of sheet iron, at right angles to the wire; remove the elbow and thrust the scraper into the pipe; pass the other end of the wire through a hole punched in the elbow, loop the end of the wire for a handle and replace the elbow. After first rapping the pipe the soot can all be drawn out and let fall into the stove. Clean the pipe thus as often as once a fortnight during cold weather.—2. To clean out a stove pipe place a piece of zinc on the live coals in the stove. The vapor produced by the zinc will carry off the soot by chemical decomposition.

STOVE, To Polish.—1. For a stove of medium size, pulverize a piece of alum the size of a large hickory nut; stir into 2 tablespoonfuls of vinegar; add this to the stove blacking, mixed with water in the usual manner; apply this mixture with a cloth or brush to a cold stove, and while wet rub briskly with a dry brush. The polish will appear at once.—2. If stove polish is mixed with very strong soap suds the lustre appears

immediately, and the dust does not fly around as it usually does.—3. A tablespoonful of molasses added to the blacking will cause it to adhere better and retain the polish longer.

STOVE POLISH, To Make.—½ lb. black lead finely powdered; the whites of 8 eggs well beaten; dilute with sour beer or porter till it becomes as thin as shoe blacking; after stirring it, set it over hot coals to simmer for 20 minutes; when cold it may be kept for use.

SWEEPING.—Set the broom evenly and move it with long, regular strokes, being careful not to fling the refuse about the room, or to raise much dust. A quantity of fresh grass or weeds cut up wet in a basin and spread over painted floors, oil cloths or matting will take off all the dust, and make them look very clean and nice. Used in sweeping the same as tea leaves. It is particularly good for chambers.

TEAPOT, To Clean.—If a tin teapot has become brown inside, and the tea made in it tastes brackish, put in a little sal soda, soft soap and water, and boil; have your dish rag wrung out of hot water; pour the water out in a pan, put in your dish cloth and wipe quickly; pour the water back and boil again; repeat several times and it will all wipe off almost as bright as new.

TIN, To Clean.—1. All kinds of tins, molds, measures, etc., may be cleaned by being well rubbed with a paste made of whiting and water; they should then be rubbed with a leather, and any dust remaining on them should be removed by means of a soft brush; finally, they must be polished with another leather. Always let the inside of any vessel be cleaned first, since in cleaning the inside the outside always becomes soiled. For very dirty or greasy tins grated bath brick and water must be used.—2. Kerosene will make tin tea-kettles as bright as new. Saturate a woolen rag and rub with it. If very dirty, mix the oil with fine ashes.—3. The fine, soft coal ashes which are found in the pipe in the spring, and which sift under the pan, are excellent to scour tin with. Take a piece of old flannel, dip lightly into soft soap, and then in the ashes and rub; it will brighten up your tinware surprisingly; rub well with a clean flannel after polishing with the soap and ashes.—4. Common soda is excellent for scouring tin, as it does not scratch the tin, and will make it look like new. Apply with a piece of moistened newspaper and polish with a dry piece.

TORTOISE SHELL, To Polish.—Take some whiting (having rubbed it between the finger and thumb that there may not be a particle of grit); mix with water to the consistency of cream; rub with a very soft rag; polish with some of the dry whiting.

UPHOLSTERY, Faded, To Restore.—Beat the dust thoroughly and afterward brush, then apply a strong lather of Castile soap by means of a hard brush; wash the lather off with clear water, and afterward wash with alum water. When dry the colors will be restored to their original freshness.

WALL PAPER, To Clean.—Wipe down with a flannel cloth tied over a broom or brush; then cut off a thick piece of stale bread with the crust on, and rub them down with this. Begin at the top and go straight down. Plastered walls and ceilings may be cleaned in the same way.

WALL PAPER, To Remove Grease from.—1. To remove oil marks on wall paper, or the marks where inconsiderate people rest their heads, take pipe clay or fuller's earth, and make it into a paste about as thick as cream, with cold water; lay it on the stain gently, without rubbing it in; leave it on all night. It will dry by morning, when it can be brushed off; and unless an old stain, the grease spots will have disappeared. If old, renew the application.—2. Lay several folds of blotting paper on the spot and hold a hot iron near it until the grease is absorbed.

WINDOW GLASS, To Clean.—To clean windows, especially in freezing weather, when it is impossible to use water, tie up some finely powdered whiting in a small piece of muslin. Dab it over the glass thoroughly; the dirtier the glass the more whiting will adhere to it. Next smear it evenly with a damp rag, and let it remain until perfectly dry; then rub it off with a leather. This is an easy, clean, and a thorough plan. If alcohol be used instead of water, it will dry in less time and polishes the glass better.

WINDOW GLASS, To Remove Paint from.—1. Moisten a rag with spirits of turpentine and rub paint spots on windows. For the floor pour on a little turpentine; let it remain for a few moments and scrape up. The turpentine will evaporate in a short time.—2. To remove paint from windows, take strong bicarbonate of soda and dissolve it in hot water; wash the glass, and in 20 minutes or ½ hour rub thoroughly with a dry cloth.—3. Scour with fine ashes and water.

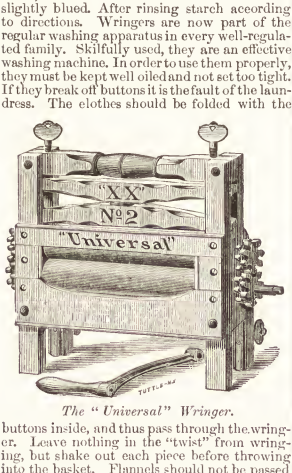
WOOD, To Remove Grease from.—1. For removing spots of grease from boards, take equal parts of fuller's earth and pearlash, ¼ lb. each, and boil in 1 qt. soft water; while hot, lay it on the greased parts, allowing it to remain on them for 10 or 12 hours; after which it may be scoured off with sand and water. A floor much spotted with grease should be completely washed with the mixture, the day before it is scoured.—2. To take oil out of a floor, wash with a mop dipped in strong hot lye of potash or wood ashes, and let it dry without wiping; then wash in suds. This will take the oil out of floors which have been finished in linseed oil, but will need several applications.

ZINC, To Clean.—1. To clean zinc rub on fresh lard with a cloth and wipe dry.—2. Dissolve 2 oz. alum in 1 qt. vinegar and clean the zinc with this as hot as you can use it, afterwards rubbing dry.—3. Put on the zinc a little sulphuric acid and rub over with a cloth so that every part is wet. Afterward wash off with clear water, and then the zinc will be bright and clear.—4. Scour with sifted coal ashes; afterward rub with kerosene.

LAUNDRY.

REMARKS.—The first grand requisite is plenty of good soft water; when it is necessary that hard water should be substituted, some simple chemical process can be used successfully to lighten the labor. If soda is chosen, the less quantity that will suffice the better. This should be dissolved by pouring boiling water over it before it is put in the tub. Borax is a simple and harmless addition of real value.

WASHING. — Before beginning to wash, the clothes should be assorted, and the fine ones kept separate all through the washing. Rub the clothes in warm, not hot water. Turn them and rub them till perfectly clean in the first water. If the water becomes much soiled, throw it out and take fresh; for if the water is allowed to become very much soiled, the clothes will be dingy. The clothes should then be rubbed out as thoroughly in the second as in the first water. After the second rubbing put the clothes in cold water to boil, without rubbing soap on them or putting soap in the water; they are soapy enough. Too much soap makes clothes yellow and stiff. As soon as they begin to boil remove them to the sudsing water. If they boil long they will be yellow. Let each article be well "soused" up and down in the sudsing water, rubbing it out thoroughly with the hands to get the suds out; wring and throw in the "rinsing-water," which is the last water. Let this be slightly blued. After rinsing starch according to directions. Wringers are now part of the regular washing apparatus in every well-regulated family. Skilfully used, they are an effective washing machine. In order to use them properly, they must be kept well oiled and not set too tight. If they break off buttons it is the fault of the laundress. The clothes should be folded with the



The "Universal" Wringer.

buttons inside, and thus pass through the wringer. Leave nothing in the "twist" from wringing, but shake out each piece before throwing into the basket. Flannels should not be passed through them, as they rub the wool up into little hard naps. The "Universal" wringer is constructed in a superior manner and gives satisfaction. Clothes should be on the line as quickly as possible after the rinsing in bluing water, or there will be danger of some streaks and cloudy looking places when dry. Be sure to stretch every inch possible to the sun and wind. Garments hung double, or in bunches or festoons, will not bleach. Care should be taken to see that the clothes-pins are clean, and the clothes line should always be wiped with a cloth before the clothes are hung upon it. If they are left in the yard instead of taking in after using, they will mildew and stain the clothes badly.

STARCHING. — For starching muslins, ginghams, and calicoes, dissolve a piece of alum the size of a shellbark, for every pt. of starch, and add to it. By so doing, the colors will keep bright for a long time, which is very desirable when dresses must be often washed; the cost is but a trifle. A shirt should always be starched on the wrong side. Shirts may either be dressed by single or double starching, and single starching may be either cold water starch or it may be hot. The double dressing is the most economical, and gives the most satisfaction; when properly done there need be no more dread of limp cuffs and collars. Mix a handful of starch in a basin with just as little cold water as will moisten it thoroughly; put in a piece of white wax or spermaceti, larger than a penny, then pour boiling water into the basin till the starch looks clear, stirring all the time with a spoon. If you do not happen to have white wax, a lump of butter or a bit of candle will do. The linen should be just out of the rinse water, and starched before it dries. Take a shirt at the back of the yoke; then with the right hand gather up the breast of the shirt and the collar, like a fan. Hold them tightly in your left hand, and dip them into the starch, and see that they are thoroughly soaked in it; then wring them with your right hand. But the starch is much too hot yet to touch it with impunity; so first dip the hand into the basin of cold water, then quickly wring out the starch, always dipping the hand in the cold water before each new turn. After the starch has been well wrung out of the collar and fronts, dry-rub them. The cuffs of the shirt must be done in the same way. Then hang up the shirt to dry, but remember always to fold in the starched parts, for fear of dust and smut settling on them; and hang them in a clean, airy place. The following are good rules for making starch: 1. Take 1 oz. of the best starch, add just enough soft water to make it, by rubbing and stirring it into a thick paste, carefully breaking all the lumps and particles; when rubbed perfectly smooth, add nearly or quite a pt. of boiling water, with bluing to suit the taste, and boil at least ½ hour, taking care to keep it well stirred all the time to prevent its burning; when not stirring, keep it covered to prevent the accumulation of dust; also keep it covered when removed from the fire, to prevent a scum from rising on it; to give the linen a fine, smooth,

glossy appearance and prevent the iron from sticking, add a little spermaceti, a piece as large as a nutmeg, to the starch when boiling, and ½ teaspoonful of the finest table salt.—2. White wax, 3 oz.; spermaceti, 3 dr.; borax, 6 oz.; gum tragacanth, 1½ oz.; melt together with a gentle heat; when you have prepared a sufficient quantity of starch in the usual manner for a dozen pieces, put in a piece of the above polish the size of a large walnut, more or less, according to the amount of washing; this will make a beautiful polish, and also make the goods very stiff.

IRONING.—The irons should be scrupulously clean. They should always be perfectly wiped before putting away, and kept in a dry place. If the starch sticks to the flat iron take a bit of beeswax, put it between two sheets of paper and then rub the warm flat iron over it; or keep it tied up in a rag to rub on the irons; then, if covered with brown starch, scrape it off with a knife and rub the flat iron on the oiled paper; this gives linen a fine gloss. The warmth and heaviness of the iron should be regulated by the articles to be ironed. A shirt board for ironing is a necessity in every well regulated family. This should be covered with at least two thicknesses of blanket, and have the ironing sheet, also double, smoothly pinned over it so that it cannot slip. Iron holders should have a cover of white cotton cloth, made to fit nicely, and fastened on with buttons, and when it becomes soiled it can be removed, washed and replaced. To keep your ironing board clean and free from dust, take two breadths of calico (an old dress skirt may be used) and make a bag to slip the board in when you put it away. Muslins and laces require to be ironed twice, gently pulling them out after the first ironing. Embroideries should be ironed over several thicknesses of flannel. As a general rule, all fine muslin work should be ironed first under a piece of old cambric, as it clears the muslin from the starch and prevents it from being scorched. The bosoms and cuffs of gentlemen's shirts should also be ironed in a similar manner. In ironing pocket-handkerchiefs the flat iron should be passed over each side before the middle is touched, slightly pulling each corner with the left hand while you iron with the right. To iron plaits neatly, the frills should be laid straight in front of the ironer, while she makes the creases of the desired width with the right hand, holding the point of the hem with the left hand till the iron has pressed it down. All plaits must be laid even to the thread to look well. Laces are to be carefully brought into shape, and all the edge or purling pulled out like new. In ironing silks, cover them over with paper or fine cotton, and use only a moderately heated iron, taking great care that the iron does not touch the silk at all, or it will make the silk look glossy, and show that it has been ironed. Any white article if scorched slightly can be in part restored, so far as looks go; but any scorching injures the fabric.

BLACK GOODS, To Wash.—1. The best method of washing black calicoes and dark brown cambrics is to put 1 pt. of wheat bran into 4 qts. of cold water; boil for ½ hour; strain into a tub, and add sufficient warm water to wash 1 dress; do not use soap; rinse, and add blueing to your starch to prevent the white appearance starch leaves on dark colors. The bran softens the water. Wash brown linen in this way, adding a little hay to the bran water while boiling. If there are grease spots on the linen use a little soap on them. Brown linen should not be dried in the sun.—2. Wash black percale or calicoes as usual, and rinse with a strong solution of salt. This will prevent black from running, and also colors.—3. A teacupful of lye in a pail of water is said to improve the color of black goods.—4. For washing black or navy blue linens, take 2 potatoes, grated into tepid soft water, into which 1 teaspoonful of ammonia has been put; wash the linens in this, and rinse them in cold blue water. They will need no starch, and should be dried and ironed on the wrong side.

BLANKETS, To Wash.—Put 2 large tablespoonfuls of borax and 1 pt. bowl of soft soap into a tub of cold water; when dissolved put in a pair of blankets and let them remain there over night; next rub them out and rinse thoroughly in two waters, and hang them to dry; do not wring them. This recipe will also apply to the washing of all kinds of flannels and woolen goods.

BLEACHING COTTON.—1. Cotton is more easily bleached and appears to suffer less from the process than most other textile substances. In the chemical system of bleaching the goods are "washed" and "bucked" as on the old plan, then submitted to the action of a weak solution of chloride of lime, and afterwards passed through water soured with hydrochloric or sulphuric acid, when they have only to be thoroughly washed, and to be dried and finished for the entire completion of the process.—2. Into 8 qts. of warm water put 1 lb. of chloride of lime; stir with a stick a few minutes; then strain through a bag of coarse muslin, working it with the hand to dissolve thoroughly; add to this 5 bucketfuls of warm water; stir it well and put in the muslin; let it remain in 1 hour, turning it over occasionally that every part may be thoroughly bleached; when taken out wash well in two waters to remove the lime; rinse and dry. This quantity will bleach 25 yds. of yard wide muslin. The muslin will bleach more evenly and quickly if it has been thoroughly wet and dried before bleaching.

BLEACHING COTTON CLOTHES.—1. A bleaching preparation may be made by dissolving 2 lbs. of sal soda in 1 gal. of hot water, and add 1 lb. of good lime; stir the mixture for a few minutes, allow it to stand for ½ hour, and then carefully pour off and bottle the clear liquid; ½ pt. of this may be added to each tub of water.—2. 1 tablespoonful of turpentine boiled with white clothes will aid the whitening process.

BLEACHING LINEN.—Linen may be bleached in a similar way to cotton; but the process is much more troublesome and tedious, owing to its greater affinity for the coloring matter existing in it in the raw state. Under the old system several alternate buckings with pearlash or potash and lengthened exposure on the field, with

one or two sourings, and a final scrubbing with a strong lather of soft soap, constituted the chief details of the process. In this way a high degree of whiteness, though not an absolutely pure or snow white, was produced. Grass bleaching or crofting is still extensively used for linen; but it is more generally employed only for a limited time, and in combination with a modification of the system at present almost universally adopted for cotton goods; while, in some cases, crofting is omitted altogether, and the bleaching conducted wholly by the latter process.

BLEACHING LINEN CLOTHES. — 1. Work them well in water, to which some strained solution of chloride of lime has been added, observing to well rinse them in clean water, both before and after the immersion in the bleaching liquor. The attempt to bleach unwashed linen should be avoided, as also using the liquor too strong, as in that case the linen will be rendered rotten. — 2. Linen garments which have become yellow from time may be whitened by being bathed in a lather made of milk and pure white soap, 1 lb. of the latter to 1 gal. of the former. After the boiling process the linen should be twice rinsed, a little blue being added to the last water used.

BLEACHING SILK.—Silk is usually bleached by first steeping it and then boiling it in solutions of white soap in water, after which it is subjected to repeated rinsings, a little indigo blue or archil being added to the last water to give it a pearly appearance. When required to be very white the goods are cautiously submitted, for 2 or 3 hours, to the action of the fumes of burning sulphur, and then finished by rinsing, as before. Boiling or sulphuring is not required for the white silk of China.

BLUE, To Set. — 1. Blue calicoes, which fade so easily, may have the colors set by washing them the first time in salt and water. After this, and ever after, they may be washed in the common way.—2. To set colors in blue cambric, dip it into a solution of saltpeter, using two or three cents worth to a pailful of water. Salt will injure the fabric.

BLUING, To Make. — 1. If raw indigo is used to make the bluing water—and in careful hands it is as good as any—a few lumps should be tied tightly in a little bag and allowed to soak a short time in the water, which should be cold. — 2. Take best Prussian blue, pulverized, 1 oz.; oxalic acid, also pulverized, ½ oz.; soft water, 1 qt.; mix. 1 or 2 tablespoonfuls of it is sufficient for a tub of water, according to size of tub. —3. Dry soluble blue dissolved in water, makes a good bluing; it can be bought at any drug store.—4. 20 lbs. white potato starch; 20 lbs. wheat starch; 20 lbs. Prussian blue; 2 lbs. indigo carmine; 2 lbs. finely ground gum arabic are mixed in a trough, with the gradual addition of sufficent water to form a half fluid homogeneous mass, which is poured out on a board with strips tacked to the edges. It is then allowed to dry in a heated room until it does not run together again when cut. It is next cut, with a suitable cutter, into little cubes, and allowed to dry perfectly.—5. Put a little neutral sulphate of indigo into the water.

BUFF COLOR, To Set. — 1. For buffs or gray linen, a tablespoonful of black pepper to a pailful of water will set the color and not harden the water at all. Let the article to be washed soak in this water ½ hour or so and then wash as usual.—2. To wash fine linen so that it will retain its color, take as much hay as will color well the amount of water you wish to use; boil and rinse the goods in it, using a little soap.

CALICOES, To Prevent Fading.—1. If the calico is of fading colors, never rub on soap, but get out the grease spots with French chalk or magnesia, and then wash in a solution of hard soap and water. If the colors are red or green, add a little vinegar, or lemon juice, to the last rinsing water. Calicoes should never be washed in very hot water, nor hung with the right side out, nor permitted to freeze while drying.—2. Steep 3 gills of salt in 4 qts. water. Put in the calico while the solution is hot, and leave until the latter is cold. In this way the colors are rendered permanent, and will not fade by subsequent washing.

CHINTZ, To Wash.—Boil 2 lbs. of rice in 2 gal. water till soft, and pour the mixture into a tub; let it stand until it attains a warmth generally used for colored linens; then put the chintz in it, and wash it with the rice instead of soap, until all the dirt has disappeared. Next boil another 2 lbs. of rice, as above, in another 2 gal. water, but strain the rice from the water, and mix it in warm water; wash the chintz in this till quite clean, and afterwards rinse it in the water the rice was boiled in. This will answer the same end as starch, as no wet will affect it, as it will be stiff while it is worn.

COFFEE STAINS, To Remove. — The stains must be soaped before putting into water; this will make them disappear.

COUNTERPANES, To Wash. — Cut a lb. of moulted soap into thin slices; put it into a pan with ½ oz. potash, and 1 oz. pearlash; then pour a pail of boiling water on it; let it stand till it is quite dissolved; then pour hot and cold water into your scouring tub, with a bowl of your solution of soap; put your counterpane in it, and beat it well out with a doll, often turning the counterpane over in the tub. When this is done, wring it across a gallows or hook, which is done by turning the two opposite ends round each other, and putting a small clean stick between them; by this method you may wring it as dry as possible; the harder, without injuring it, the better. Having given it this first liquor, you may put in some old cottons or woolens, that the liquor may not be thrown away, and then give your counterpane a second liquor, as before; wring it out again, and rinse in clean, cold water; then pour a sufficient quantity of boiling water into the tub, with a small quantity of the solution of soap, so that you will reduce it to a very thin lather. Put 3 teaspoonfuls of the liquid blue into the tub when ce your goods were taken, and the acid of the liquid blue, and the alkali of the pearlash, and the soap lye, will cause a slight fermentation or effervescence; stir this thin, blue liquor, with a stick, and put in your counterpane; beat it out with the doll about 5 minutes, which will color the coun-

terpane of a fine azure blue, of the lightest shade; but as it dries in the wind, the blue mostly goes off, and leaves a brilliant white.

FLANNELS, To Bleach.—1. Hang the flannels loosely in a tight barrel over the fumes of burning sulphur.—2. A solution of 1½ lbs. of white soap and ⅔ oz. spirits of ammonia, dissolved in 12 gal. soft water, will impart a beautiful and lasting whiteness to any flannels dipped in it, no matter how yellow they have been previous to their immersion. After being well stirred round for a short time, the articles should be taken out and well washed in clean, cold water.

FLANNELS, To Shrink. — New flannel should always be shrunk or washed before it is made up, that it may eat out more accurately and that the grease which is used in manufacturing it may be extracted. Cut off the list along the selvage edge of the whole piece; then put it into warm water without soap; begin at one end of the piece and rub it with both hands till you come to the other end; this is to get out the grease and blue with which new white flannel is always tinged; then do the same through another water; rinse it through a clean lukewarm water; wring it lengthwise, and stretch it well. In hanging it out spread it along the line straight and lengthwise. If dried in festoons, the edges will be in great scallops, making it very difficult to cut out. It must be dried in the sun. When dry, let it be stretched even, clapped with the hands, and rolled up tightly and smoothly till wanted.

FLANNELS, To Wash.—1. Take soft water, as warm as you can bear your hands in; make a strong suds, well blued; in washing fine flannels wet but one piece at a time; soap the dirty spots and rub with the hands, as washboards full the flannels; when half clean, add 3 times as much blue to the rinse as for cotton clothes; rinse well; wring tight; shake briskly for a few minutes; hang out in a gentle breeze; when nearly dry, roll smooth and tight for an hour or two; press with a moderately hot iron; if embroidered, press on the wrong side. — 2. Take half the weight of soda that there is of soap; boil them with water, allowing 1 gal. to every lb. of soap, and use it when perfectly cold; wet the flannel in cold water; then wash it in fresh cold water, with some of the boiled mixture amongst it; wash in this, changing the water till the flannel becomes perfectly clean; then rinse it well in cold water, and dry it in the shade.

FRUIT STAINS, To Remove from Cotton or Linen. — 1. Recent stains of fruit may be removed by holding the linen tightly stretched over a tub and pouring hot water over the part. This must be done before any soap has been applied to it.—2. As soon as the stain is made on table linen, rub on it common table salt, before it has had time to dry; the salt will keep it damp till the cloth is washed, when the stain will disappear; or, wash the stain lightly when the cloth is removed.—2. Almost all fruit stains can be taken out by soaking and rubbing in sweet milk before washing. —3. 10 grs. oxalic acid in ½ pt. water; wet the article stained in hot water; apply to the top of the bottle so that the liquid will reach it, then rinse it well.

GLOVES, White Thread, To Wash.—These articles are so delicate as to require great care in washing, as they must not be rubbed. Make a lather of white soap in cold water, and put it into a saucepan; soak the gloves well; put them in and set the saucepan over the fire; when they have come to a hard boil, take them off, and when cool enough for your hand, squeeze them in the water; having prepared a fresh, cold lather, boil them again in that; then take the pan off the fire and squeeze them well again, after which they can be stretched, dried and then ironed on the wrong side.

GRASS STAINS. To Remove. — Pour boiling hot water on the stains before washing the garments.

GREASE, To Remove from Cotton.—1. White goods, wash with soap or alkaline lyes. Colored cottons, wash with lukewarm soap lyes. — 2. Cold rain water and soda will remove machine grease from washable fabrics. — 3. Ammonia will also remove grease stains.

GREASE, To Remove from Wool. — Dissolve a large tablespoonful of borax in a pt. of boiling water; mix ¼ of it in the water in which the wool is to be washed; put in one piece of goods at a time, using soap if needed, and if necessary add more of the borax water; wash well and rinse in cold water, or in water only slightly warmed; Shake well, and hang where the goods will dry quickly.

INK STAINS, To Remove from Cotton or Linen. —1. Ink stains are readily removed by the application alternately of strong aqueous solutions of oxalic acid and chloride of lime; rinse well with water before soaping.—2. To take ink out of linen, soak the ink spot in milk; then wash out the milk and the ink will come out with it. —3. Ripe tomatoes will remove ink and other stains from white cloth.

IRON RUST, To Remove. — 1. Saturate with sour milk and the spot will be removed. — 2. Squeeze lemon juice into a cup, add a pinch of salt, and rub the stains in this. Then wash in clear, tepid water. Sponge goods that cannot be rubbed. This is excellent for removing iron rust or ink from black goods.

JELLY BAGS, To Wash. — Use no soap; wash them in as hot, clean water as the hands can endure; rinse in boiling water and wring as dry as possible; then dry where no dust will reach them.

LACE CURTAINS. To Wash. — If the curtains are new, soak awhile to take out the starch before putting them into the suds; wash and boil, suds and rinse; starch in thin boiled starch and then in very thick boiled starch, which should be deeply blued, take as many sheets as you have curtains, and stretch and pin them to a carpet in a room as free from dust as possible; then pin the curtains to the sheet (stretching them to their former size). The pins in the curtains should not be more than 3 in. apart; when dry, they are ready to hang up.

LACE, To Wash. — 1. Applique lace can be nicely washed by first sewing it carefully, right side down, to a piece of woolen flannel; wash, stiffen slightly, and press before removing from the flannel.—2. (*For white silk lace or blonde.*)

Take a bottle covered with clean linen or muslin and wind the blonde round it, securing the ends with a needle and thread, not leaving the edge outward, but covering it as you proceed; set the bottle upright in a strong cold lather of white soap and very clear soft water, and place it in the sun, having gently with your hand rubbed the suds up and down on the lace; keep it in the sun every day for a week, changing the lather daily, and always rubbing it slightly when the suds are renewed; at the end of the week take the blonde off the bottle, and pin it backward and forward on a large pillow covered with a clean tight case; every scollop must have a separate pin, or more, if the scollops are not very small. The plain edge must be pinned down also, so as to make it straight and even; the pins should be of the smallest size; when quite dry, take it off, but do not starch, iron or mess it; if ecru is desired dip into clear cold coffee; lay it in long loose folds, and put it away in a pasteboard box. —3. (*Veil.*) Put the veil into a strong lather of white soap and very clear water and let it simmer slowly for ½ hour; take it out and squeeze it well, but be sure not to rub it; rinse it in two cold waters, with a drop or two of liquid bluein the last; have ready some very clear and weak gum Arabic water, or some thin starch, or rice-water; pass the veil through it, and clear it by clapping; then stretch it out even, and put it to dry on a linen cloth, making the edge as straight as possible, opening out all the scollops, and fastening each with pins; when dry, lay a piece of thin muslin smoothly over it, and iron it on the wrong side.

LAWNS AND THIN MUSLINS, To Wash. — 1. Boil 2 qts. wheat bran in 6 qts. or more of water ½ hour; strain through a coarse towel and mix in the water in which the muslin is to be washed; use no soap and no starch; rinse lightly in fair water. This preparation both cleanses and stiffens the lawn. — 2. Muslin dresses, even the most delicate colors, can be cleaned in 10 minutes or ¼ of an hour, without losing their color. Melt ½ lb. soap in 1 gal. water; empty in a washing tub; place near two other large tubs of clear water, and stir into one a qt. of bran; put the muslin in the soap, turn it over and knead it for a few minutes; squeeze it out well, but do not wring it lest it get turned; rinse it about quickly in the bran for a couple of minutes; rinse again well for a couple of minutes in clear water; squeeze out dry, and hang it between two lines. A clear dry day should be chosen to wash muslin dresses; ½ doz. may be done in this way in ½ hour. When the dress is dry make the starch; for a colored muslin, white starch and unboiled, but made with boiling water, is best for muslin dresses; stir the starch with the end of a wax candle; dip the dress; hang it again to dry; when dry rinse it quickly and thoroughly in clear water; hang it to dry again; sprinkle and roll it up; afterward iron it with very hot irons. This rinsing after stareheing is called clear starching.

MILDEW, To Remove from Linen.—1. To extract mildew from linen, put strong soap and salt on the mildew spots; keep them moist and expose to the sun; repeat the process several times; the soap used should be soft, such as is home made from the lye of wood ashes.—2. Mix soft soap and powdered starch, half as much salt, and the juice of a lemon; put it on both sides with a brush; let it lay on the grass for a day and a night, till the stain comes out.

NANKEENS, To Wash.—Nankeens will keep their color by washing as follows: Put a large handful of salt in a vessel with 1 gal. of cold water; put the articles in and let them soak 24 hours; then wash in hot lye, without soap, and without wringing.

QUILTS, To Remove Stains From. — Streaks can be taken out of badly washed quilts by laying them on the grass over night, when the dew falls; early in the morning, before the sun shines, turn the wet side down and let it remain until dry; the streaks will be gone.

QUILTS, To Wash.—To wash quilts, comforts, tickings, sackings, etc., soak in pure cold water 24 hours or more; then rub through warm water with a little soap, and rinse well.

RED TABLE LINEN, To Wash.—1. To wash red table linen, use tepid water, with a little powdered borax; wash the linen separately and quickly, using very little soap; rinse in tepid water containing a little boiled starch; hang to dry in the shade; iron when almost dry.—2. Red border napkins will bear boiling with other clothing, but scalding is all that is necessary.

SCORCHED LINEN, To Whiten.—1. For whitening scorched linen, it is often sufficient to wet it with soapsuds and lay it in the hot sun.—2. Put 1 lb. of white soap into 1 gal. of milk, and boil the scorched article in it.—3. Peel and slice 2 onions; extract the juice by pounding and squeezing; cut up ½ oz. of fine white soap and add to the juice; 2 oz. of fuller's earth and ½ pt. vinegar; boil all together; when cool spread over the scorched linen and let it dry on it; then wash and boil out the linen, and the spots will disappear, unless burned so badly as to break the threads.

SEERSUCKER, To Wash.—This fabric, being raw silk, need not be ironed. It requires only careful washing, without rubbing, in a suds of Castile soap; then to be rinsed out, stretched gently each way and hung out to dry.

SILK HANDKERCHIEFS, To Wash.—Silk handkerchiefs should be washed with borax, in tepid water, with little or no soap; iron them before dry.

STOCKINGS, Black, To Wash. — Wash in a cool lather of plain white soap and rain water, with a little ammonia mixed in it; keep from the air while drying, by rolling in a cloth; do not wring, but press the moisture well out; epsom salts and water form a good rinse.

STOCKINGS, Colored, To Wash. — 1. Wash colored hose in milk warm water; rinse; turn and dry quickly.—2. Put 1 tablespoonful of salt in 1 qt. of water; let the stockings soak in that for 10 minutes, and then take them out and wash in soap and water.

STOCKINGS, Silk, To Wash. — They should be washed in cold water with white soap, rinsed in cold water, laid flat on a fine towel, rolled tightly until dry, and rubbed with a piece of flannel to restore the gloss.

STOCKINGS, Woolen, To Wash.—These should be soaked all night, and washed in hot suds with beef's gall, 1 tablespoonful to ½ pail of water; iron on the wrong side.

TIES. To Wash. — 1. To wash gentlemen's neckties, let them soak a little; then wash with soap and hot water; rinse in cold water, slightly blued; dry; dip once more in cold water; starch and wring them thoroughly; then iron. —2. Muslin ties with silk embroidered ends can be washed and made to look about as good as new again by washing the muslin in quite strong suds, holding the ends out of the suds with your left hand; then, when the plain part is clean, get some fresh water, make a weak suds and rinse the whole tie in it, squeezing it in your hand, not wringing it; dip the tie in cold water in which you have put a little blueing and a bit of starch; then lay the tie, while wet, on a perfectly clean ironing board; pin the ends out carefully, just as you wish them to look when dry; then lay a thin cloth over the plain part and iron it dry, but do not iron the ends, as the hot iron will flatten the silk embroidery so it will not look well; let it remain on the board until dry. If the ends are inclined to draw and will not hang as you wish them to, then take a piece of flannel, double it and lay the ends on that and press lightly with an iron that is just warm.

TOILET MATS WITH BORDERS. To Wash.—Wash in a thick lather; rinse in tepid blue water; wring them in a dry cloth; iron immediately, while still damp.

WASHING FLUIDS. — 1. Good hard soap, ½ bar; saltpeter, 1 oz.; borax, 1 oz.; soft water, 4 qts.; dissolve over a slow fire; when partly cool, add 5 oz. spirits of ammonia.—2. Take 1 lb. of sal soda and ½ lb. of unslacked lime; put them into 1 gal. of water and boil 20 minutes; let it stand till cool, then drain off and put into a strong jar or jug; soak your dirty clothes over night, or until they are wet through; then wring them out and rub on plenty of soap, and in one boiler of clothes, well covered with water, add 1 teacupful of washing fluid; boil ½ hour briskly, and then wash them thoroughly through one suds; rinse, and your clothes will look better than with the old way of washing twice before boiling.—3. (*For Woolen Goods.*) Ammonia, 4 oz.; white Castile soap, 4 oz.; alcohol, 2 oz.; glycerine, 2 oz.; ether, 2 oz.; dissolve the soap in 1 qt. soft water, over the fire, and add 4 qts. water; when nearly cold add the other ingredients; bottle and keep well corked. Use a cupful of the fluid in each pail of warm water; put the clothes in and stir them around; then rinse in warm water and iron.—4. Sal soda and borax, ½ lb. each; gum camphor, 1 oz.; alcohol, ½ pt. Dissolve the soda and borax in 1 gal. of boiling rain water; pour in 2 gal. of cold rain water; add the camphor, first dissolved in the alcohol; stir well and bottle for use; 4 tablespoonfuls of the preparation are to be mixed with 1 pt. of soft soap, and the clothes boiled in a suds made of this. It is all the better if the clothes are soaked over night before putting them into the suds.

RENOVATING.

REMARKS. — The spots on garments may sometimes be made to disappear by merely sponging them with pure water; washing the sponge in clear water several times and squeezing it as dry as possible by wrapping it in a piece of alpaca. If the garment is very much spotted and soiled follow the specific directions given hereafter. Acid stains, as seen in the receipts, may be made to disappear by neutralizing with dilute alkalies, and alkaline stains by the use of weak acids, when the color has not been destroyed.

BLACK CLOTHING, To Clean. — Remove all dust from a garment every time it is worn. Black especially should be treated in this way: Shake thoroughly and brush with a brush or old silk, or other material, being particular that the dust that settles in the folds is all removed. A strip of old black broadcloth, 4 or 5 in. wide, rolled up tightly and sewed to keep the roll in place, is better than a sponge or cloth for cleansing black and dark colored clothes. Whatever lint comes from it in rubbing is black and does not show. When black clothes are washed, as they may often be previous to making over, fresh clean water should be used, and they should be pressed on the wrong side before being quite dry. If washed in water previously used for white clothing, they will be covered with lint. The following preparations are useful in cleaning black goods: 1. If the articles are very dirty and contain grease spots, dissolve a little strong soap in warm water, and mix it with a small quantity of ox gall; touch over all the spots of grease, dirt, etc., and rub them well with a stiff brush until they are entirely removed; after which the garment should be rubbed all over with a brush or sponge and warm water, to which should be added more of the soap and ox gall. After the garment has been well rubbed over with this mixture, rinse until the water passes off clean. Then hang up to dry. — 2. (*Cassimere.*) Wash in hot suds with a little borax in the water; rinse in very blue water and iron while damp on the wrong side.

BLACK CLOTHING, To Restore. — 1. Soft water, 1 gal.; make a strong decoction of 2 oz. extract of logwood by boiling the extract with the water; ¼ oz. saleratus; strain; when cool add 2 oz. gum Arabic in powder; bottle, cork well and set aside for use; clean the material well from grease and dirt, and apply the above liquid with a sponge evenly; dilute to suit the color, and hang in the shade to dry; afterwards brush the nap smooth, and it will look like new.—2. 2 oz. common tobacco boiled in a gal. of water. — 3. (*Alpaca.*) Sponge the right side with clear, cold coffee, which has been strained through a piece of black calico or muslin (a bit of black muslin is better than a sponge to dampen with) and iron immediately with a hot iron on the wrong side.

BLOOD STAINS, To Remove. — 1. These may be obliterated from almost any substance by laying a thick coating of common starch over the place; the starch is to be mixed as if for the laundry, and laid on quite wet.—2. Steep the article in a solution of iodide of potassium in 4 times its weight of water. This would probably not injure silk of moderately fast color.—3. For removing blood spots from woolen goods of tender colors, rub them with the inner side of a crust of bread.

BOMBAZINE, To Remove Grease from. — Gall is excellent for taking spots from bombazines and after being washed in it they look as good as new. It must be thoroughly stirred into water, and not put upon the cloth. It is used without soap. After being washed in it, the cloth which you want to clean should be washed in warm suds, without using soap.

CLEANING COMPOUNDS. — 1. Dissolve 1 oz pure pearlash in a pt. spring water, and to the solution add a lemon cut in small slices; mix the ingredients well; keep the mixture in a warm state for 2 days; then strain it and bottle the clear liquid for use. A little of this poured on stains will remove them; as soon as they disappear the cloth should be washed in clear water. —2. 1 oz. pulverized borax, put into 1 pt. boiling water and bottled for use will be found invaluable for removing grease spots from woolen goods.—3. Take 1 pt. hot water; slice into it 2 oz. shaving soap; add to it 2 oz. spirits ammonia, and 1 teaspoonful powdered saltpeter; put into a bottle and shake until thoroughly dissolved; pour a little into a saucer; dip in a sponge and rub the material vigorously. — 4. 4 tablespoonfuls spirits ammonia; the same of alcohol; 1 tablespoonful salt; shake the whole well together in a bottle, and apply with a sponge or toothbrush. This removes ink, paint, fruit or acid stains from silk, linen or woolen articles.—5. Mix 1 oz. borax and 1 oz. gum camphor with 1 qt. boiling water; when cool add 1 pt. alcohol; bottle and cork tightly; when wanted for use shake well and sponge the garments to be cleaned. This is an excellent mixture for cleaning soiled black cashmere and woolen dresses, coat collars and black felt hats.—6. Fuller's earth, 6 lbs.; French chalk, 4 oz.; pipe clay, 1 lb.; make into a paste with rectified oil of turpentine, 1 oz.; alcohol, 2 oz.; melted oil soap, 1½ lbs.; compound the mixture into cakes of any desired size, for sale if required, keeping them in water or small wooden boxes.

CLOTH, Scouring of. — The common method of cleaning cloth is by beating and brushing, unless when very dirty, when it undergoes the operation of scouring. This is best done on the small scale, as for articles of wearing apparel, etc., by dissolving a little curd soap in water, and, after mixing it with a little ox gall, to touch over all the spots of grease, dirt, etc., with it, and to rub them well with a stiff brush until they are removed, after which the article may be well rubbed all over with a brush or sponge dipped into some warm water, to which the previous mixture and a little more ox gall has been added. When this has been properly done, it only remains to thoroughly rinse the article in clean water until the latter passes off uncolored, when it must be hung up to dry. For dark-colored cloths the common practice is to add some fuller's earth to the mixture of soap and gall. When nearly dry, the nap should be laid right, and the article carefully pressed, after which a brush, moistened with a drop or two of olive oil, should be several times passed over it, which will give it a superior finish. Cloth may also be cleaned in the dry way as follows: First, remove the spots as above, and, when the parts have dried, strew clean damp sand over it, and beat it in with a brush, after which brush the article with a hard brush, when the sand will readily come out, and bring the dirt with it. (See *Remarks* and *Black Clothing.*)

COAL OIL, To Remove. — Cover the spot with finely powdered chalk or corn meal; lay a paper over it, and rub it over with a moderately heated iron; 2 or 3 applications are all that is necessary.

COFFEE STAINS, To Remove. — Mix the yolk of an egg with a little milk-warm water, and use it as soap on the stain. For stains which have been on the material for some time, add a few drops of spirits of wine to the egg and water.

COLOR, To Restore. — 1. If the color is taken out by acids, wet the spots with liquid ammonia to kill the acid, and then wet with chloroform to restore the color. If the color is destroyed by alkalies, wet with acid to destroy the alkali, and then with the chloroform to restore the color.— 2. If discoloration from any acid, the color may be restored by rubbing a solution of carbonate of soda or magnesia on the part. In this case, avoid the use of soap with water, as the former will restore the red appearance. — 3. Citric acid serves to receive and raise certain colors, especially greens and yellows; it destroys the effect of alkalies and any bluish or crimson spots which appear upon scarlets. In its stead acetic acid may be employed, or sulphuric acid diluted with 100 times its weight of water; or lemon juice.

CRAPE, To Remove Water Stains from. — Wherever a drop of water falls upon a black crape veil or trimming, a conspicuous white spot remains. To obliterate it, spread the crape on a lap-board or table, and place some weight upon it to keep it steady; then slip a piece of old black silk under the stain; take a large camel's hair brush, dipped in common black ink, and paint out the white spot; then wipe it off gently with a small bit of soft old black silk.

CRAPE, To Renew. — 1. Rinsing it in ox gall and water, to remove the dirt; afterwards in pure water, to remove the gall; and lastly, in a little gum water, to stiffen and crisp it. It is then clapped between the hands until dry.—2. Skimmed milk and water, with a little bit of glue in it, made scalding hot, restores rusty Italian crape. If clapped and pulled dry like muslin, it will look as good as new. — 3. Thoroughly brush all dust from the material; sprinkle with alcohol, and roll in a newspaper, commencing with the paper and crape together, that the paper may be between every portion of the material; allow it to remain in the roll until perfectly dry.

FEATHERS, To Bleach. — To bleach black,

brown or gray feathers, first thoroughly wash with soap and water, to free from any oil they may contain; next transfer to a bath composed of bichromate of potash dissolved in water, to which has been added a few drops of nitric or sulphuric acid. In this bath they rapidly lose their black, brown, or gray color, and become almost white; on being removed from this bath they are well rinsed in water, and are then fit to be dyed, even the most delicate color. Great care is required in the process, as the fine of the feather is apt to be destroyed, if kept too long in the bath. A bleached feather may be readily known by the yellow color of its stem.

FEATHERS, To Clean.—1. Cut some white curd soap in small pieces, pour boiling water on them and add a little pearlash; when the soap is quite dissolved, and the mixture cool enough for the hand to bear, plunge the feathers into it and draw them through the hand till the dirt appears to be squeezed out of them; pass them through a clean lather with some blue in it; then rinse them in cold water with blue to give them a good color; beat them against the hand to shake off the water, and dry by shaking them near a fire. Black feathers may be cleaned with water and some gall, proceeding as above.

FEATHERS, To Curl.—When they are nearly dry, draw each fibre or flue over the edge of a small blunt knife; turning it around in the direction you wish the curl to take; then if the feather is to be flat, place it between the leaves of a book to press it.

FEATHERS, To Restore.—1. Black feathers are revived by holding over smoke made by throwing sugar on live coals. Then rub on a little nice oil, and curl.—2. Take a little salt and sprinkle it upon the hot stove and hold the plume over the smoke a few minutes.

FURS. To Clean.—Strip the fur articles of their stuffing and binding, and lay them as much as possible in a flat position; they must then be subjected to a very brisk brushing, with a stiff clothes brush; after this, any moth eaten parts must be cut out and be neatly replaced by new bits of fur to match.—1. Sable, chinchilla, squirrel, fitch, etc., should be treated as follows: Warm a quantity of new bran in a pan, taking care that it does not burn, to prevent which it must be actively stirred; when well warmed, rub it thoroughly into the fur with the hand; repeat this 2 or 3 times; then shake the fur, and give it another sharp brushing until free from dust.—2. White furs, ermine, etc., may be cleaned by laying the fur on the table and rubbing it well with bran made moist with warm water; rub until quite dry, and afterward with dry bran; the wet bran should be put on with flannel, and the dry with a piece of book-muslin; the light furs, in addition to the above, should be well rubbed with magnesia, or a piece of book muslin after the bran process.—3. Wash them in a cold lather of soap and water, with a little soda and blue in it; then draw them with the hand, the same as flannel, through several lathers, until they are clean; rinse in clean water; shake well, and hang up to dry, frequently shaking them while damp.—4. Thoroughly sprinkle every part with hot flour and sand and well brush with a hard brush. Then beat with a cane; comb it smooth with a wet comb, and press carefully with a warm iron. Furs are usually much improved by stretching, which may be done as follows: To 1 pt. soft water add 3 oz. salt; with this solution sponge the inside of the skin (taking care not to wet the fur) until it becomes thoroughly saturated; then lay it carefully on a board with the fur side downward, in its natural position; then stretch as much as it will bear into the required shape, and fasten with small tacks. The drying may be quickened by placing the skin a little distance from the fire.

GLOVES, Kid, To Clean.—1. Pour 1 teacupful of benzine into a pint bowl, and put a pair of gloves into it, soaking them completely and rubbing them together just as if you were washing cotton rags; then rinse them in fresh, clean benzine; squeeze them as dry as you can; beat them against each other, and hang them out in the air. In an hour or less the odor will be gone, and they will be found to be clean and soft.—2. Go over them with a clean towel dipped in skim milk, wearing them during the process and until they are quite dry.—3. Procure some gasoline, put on one glove, pour some of the fluid into a saucer, and cork the bottle to prevent evaporation; then rub the glove all over, quite hard, with a sponge wet with the contents of the saucer; keep the glove on your hand until nearly dry, but avoid stoves and lamps; then repeat the operation with the other. The odor of gasoline is disagreeable. Hang the gloves out of the window for a while. Then put away with a sachet.—4. Wash the hands thoroughly clean; then put on the gloves and wash them, as though you were washing your hands, in a basin containing spirits of turpentine, until quite clean; then hang the gloves up in a warm place, or where there is a free current of air, which will carry off all the smell of the turpentine.—5. Use a strong solution of pure soap in hot milk beaten up with the yolk of 1 egg to 1 pt. of the solution; put the glove on the hand and rub it gently with the paste, to which a little ether may be added; then carefully lay by to dry. White gloves are not discolored by this treatment, and the leather will be made thereby clean and soft as when new.—6. Put your glove on; take a piece of cotton, pour some rose oil on it, and rub gently all over until you think it is clean; then take another piece of cotton and rub until dry, and you will be surprised to find how soft and nice it looks. The same gloves can be cleaned several times, especially light ones. Be careful and use the oil in a cool place, as it is very explosive.—7. Dissolve 3 oz. of soap by heat in 2 oz. of water, and when nearly cold add 2 oz. of eau de Javelle, and 1 dr. of water of ammonia; form a paste, which is to be rubbed over the glove with flannel till sufficiently clean.

GLOVES, Wash Leather, To Clean.—1. Wash them in warm water and soap until the dirt is removed; then pull them out into their proper shape, or stretch them on wooden hands; do not wring them, but place them one on the other and press the water out; mix a little pipe clay, or pipe clay and yellow ochre, according to

the color required, with vinegar or beer; rub this over the outside of the gloves, and let them dry gradually in the shade or by the fire, but at some distance from it; when about half dry, rub them well and stretch them on the hand or wooden mold; after they are rubbed and dried brush them with a soft brush, to extract the dust; finally, iron the gloves with a smoothing iron moderately heated, taking the precaution to place a piece of cloth or paper over them.—2. Stretch them on a hand, or lay them flat on the table, and rub into them a mixture of finely powdered fuller's earth and alum; sweep this off with a brush, sprinkle them with a mixture of dry bran and whiting; lastly, dust them off well.

GREASE SPOTS, To Remove.—1. Cover the spots with French chalk, buckwheat, potter's clay or magnesia; over this place a piece of brown paper; set a moderately warm iron on this, and let it remain till it gets cold. Be careful not to have the iron so hot as to scorch or change the color of the cloth.—2. Gasoline or benzine is excellent for cleaning coat collars, etc. The stained portion should be laid between two sheets of blotting paper, and the upper sheet well soaked with benzine. In this way, if sufficient time be given, the whole of the fatty matter becomes dissolved and absorbed by the paper.—3. Turpentine, chloroform and ammonia in water are all good for removing grease spots.—4. Oil of turpentine and oil of lemons, equal parts; both of the ingredients should have been recently distilled or rectified.

GRENADINE, Black, To Renovate. — Take strong, cold coffee, strain it, and wring the grenadine out of it quite tight, after which shake out and fold up; then iron it with a moderately hot iron over a piece of any old black material.

HATS, To Clean.—After well brushing the hat, get about 1 wineglass of spirits of ammonia; put it in nearly 1 qt. of lukewarm water; well sponge the hat the way of the nap; then hang it up, and, when nearly dry, get a hot iron and cover it with a piece of cloth and iron the hat all over. Great care should be taken that the iron is not too hot, or it will burn the cloth.

HATS, To Stiffen.—For a stiffening, dissolve borax 10 parts, carbonate of potash 3 parts, in hot water; then add shellac 50 parts; boil until all is dissolved; apply with a sponge or a brush, or by immersing the hat when it is cold, and dip at once in very dilute sulphuric or acetic acid to neutralize the alkali and fix the shellac.

LACE, Black, To Clean.—1. Wipe off the dust carefully with a cambric handkerchief; then pin it out upon a bed, inserting a pin in each projecting point of the lace; sponge it all over with table beer, and do not remove the pins till it is perfectly dry. It will look quite fresh and new.—2. Throw into alcohol; churn up and down till it foams. If very dirty, use the second dose of alcohol, squeeze out, pull out the edges, lay between brown paper and leave under a heavy weight.—3. Green tea will revive rusty black lace, and render it as good as new.—4. Pass through a warm liquor of ox gall and water; after which rinse in cold water; then finish as follows: Take a small piece of glue, about the size of a bean; pour boiling water upon it, which will dissolve it, and when dissolved, pass the lace through it; then clap it between your hands and frame it or pin it out, taking care to keep the edge straight and even.—5. Silk lace may be cleansed by washing and rinsing it in benzine. When clean, hang it in the open air until all odor has left it; press between folds of white paper.

LACE, Gold and Silver, To Clean.—1. Reduce to fine crumbs the interior of a 2 lb. stale loaf, and mix with them ¼ lb. of powder blue; sprinkle some of this mixture plentifully on the lace, afterwards rubbing it on with a piece of flannel; after brushing off the crumbs, rub the lace with a piece of crimson velvet.—2. Lay the lace smooth on a woolen carpet or piece of woolen cloth, and brush it free from dust; then take burnt alum; powder it fine, and afterwards sift it through a lawn sieve; rub it over the lace with a fine brush and it will restore its brightness, if it be not too much worn on the threads.—3. Sew the lace in a clean linen cloth; boil it in 1 qt. of soft water and ½ lb. of soap, and wash in cold water. If tarnished, apply a little warm spirits of wine to the tarnished spots.

NAP, To Raise.—Clean the article well; soak it in cold water for ½ hour; put it on a board, and rub the threadbare parts with a half worn hatter's card filled with flocks, or with a teazle or a prickly thistle until a nap is raised; then lay the nap the right way with a hatter's brush and hang up to dry.

NITRATE OF SILVER, or NITRIC ACID, Stains, To Remove.—Apply iodine, and afterwards rub briskly with strong water of ammonia.—2. Apply dilute solutions of permanganate of potassa and hydrochloric acid, followed by washing with hyposulphite of soda solution, and rinsing in plenty of fresh water.

PAINT, To Remove.—When fresh, make repeated applications of spirits of turpentine or spirits of wine, rubbed on with a soft rag or flannel. Ether also will answer, if applied immediately. When neither turpentine nor benzine will remove paint spots from garments, try chloroform; it will remove paint which has been on for six months.

RAIN SPOTS, To Remove.—Carefully sponge the articles all over with cold water, and hang to dry in a cool place.

RIBBONS, To Renew.—1. Wash in cool suds made of fine soap, and iron when damp; cover the ribbon with a clean cloth, and pass the iron over that; if you wish to stiffen the ribbon, dip it, while drying, into gum Arabic water.—2. Rub magnesia or French chalk on greasy silk ribbon; hold near fire, and brush off grease.—3. Lay the soiled ribbon or piece of silk in a plate, and cover it with camphene; then lay it, after rubbing it a little with a piece of flannel, in a clean cloth to dry it somewhat, and iron it on the wrong side; then put the ribbon outside in the air.

SCOURING BALLS.—1. Dry fuller's earth, moistened with the juice of lemons; add a small quantity of pearlash, and a little soft soap; knead the whole well together into a thick elastic paste; form it into small balls and dry them

in the sun; when used, moisten the spot on the clothes with water; then rub it with the ball, and let the spot dry in the sun; when washed with pure water the spot will disappear.—2. Whiting and pipe clay, equal parts; water, q. s. Used for soldiers' belts, trousers, etc.—3. Pipe clay, 2 lbs.; fuller's earth, 1 lb.; whiting, ½ lb.; water, q. s.—4. Bath brick, 1 lb.; pipe clay, 2 lbs.; soft soap, ½ lb.; ox gall, ½ pt.

SEALING WAX, To Remove.—Dissolve the spots with spirits of wine or naptha. Apply the spirit with a camel's hair pencil.

SHAWLS, White Merino, To Wash.—Wash the shawl in fair suds made beforehand; rub no soap on the shawl; rinse in clear warm water with two changes; then take a solution of gum Arabic, and add to it warm water till you think it will produce a little stiffness like starch when dry; press with a moderately hot iron before quite dry, laying a clean cotton or linen cloth between the iron and the shawl. Wash knitted shawls in the same way, but do not iron.

SHOES. White Satin, To Clean.—Put in the shoe something which will fill it out; then rub the shoe gently with a piece of muslin dipped in spirits of wine; do this several times; then wipe the shoe carefully with a piece of dry muslin.

SILK, Black, To Clean.—1. To bullock's gall add boiling water sufficient to make it warm, and with a clean sponge rub the silk well on both sides; squeeze it well out, and proceed in like manner; rinse it in spring water, and change the water until perfectly clean; dry it in the air and pin it out on a table; but first dip the sponge in glue water and rub it on the wrong side; then dry before a fire. — 2. Brush and wipe the silk thoroughly; lay it on a flat table with the side up which is intended to show, and sponge with hot coffee strained through muslin; allow it to become partially dry, then iron. — 3. Take a piece of carbonate of ammonia the size of a walnut; add 1 gill of alcohol and ½ as much water; sponge and press while damp. — 4. Sponge the silk with beer.— 5. Sponge with a decoction of common black tea; then iron with a moderately hot iron on the wrong side.

SILK, Colored, To Clean.— Salts of ammonia with lime, will take out the stains of wine from silk. Spirits of turpentine, alcohol, and clear ammonia, are all good to remove stains on colored silks. Spots of ink can be removed by saturating them with lemon juice, and rubbing on salt, then putting them where the sun will shine on them hot, for several hours. As fast as it dries, put on more lemon juice and salt. Iron mold may be removed in the same way. Mildew and most other stains can be removed by rubbing on soft soap and salt, and placing it where the sun will shine on it hot. Where soap and salt will not remove stains lemon juice and salt will generally answer. The above things will only remove stains in warm, clear weather, when the sun is hot. Sulphuric acid, diluted with water, is very effectual in removing fruit stains. Care should be taken not to have it so strong as to eat a hole in the garment, and as soon as the stain is out, it should be rinsed in pearlash water, and then in fair water. The following mixtures are also useful for cleaning silk: 1. Grate potatoes into cold spring water, say a large potato to every qt. of water, of which 5 or 6 will do for a couple of dresses. If for very light silk, pare the potatoes; if for dark, merely wash them clean. The pan of water must not be stirred in the least for 48 hours; then, very slowly and steadily pour off the clear liquor, but not a particle of the sediment, into a large open vessel, dip the pieces of silk into this liquid up and down a few times, without creasing them; then wipe them on a flat table with a clean towel, first one side then the other; hang each one as dipped upon a line to allow the drops to drain off a little before wiping. Have a damp cloth to cover them in till all is done; then iron one way, on the soiled side.—2. For colored silks, mix ½ pt. of pure Holland gin, 4 oz. of grated white soap, and 2 oz. honey; shake until thoroughly mixed in a bottle; spread the silk smoothly over a board covered with linen and sponge with this mixture till all spots are out.—3. Put a wineglassful of ox gall in 2 gal. of water, and rinse the silk, first in clear water, then in the gall and water; never wring silk, but shake out the water and hang to dry; iron on the wrong side.

SILK, White, To Clean.—1. Grate ½ lb. of curd soap in 1 gal. lukewarm water; set it on the fire in an earthen vessel set in a tin or iron one filled with water; stir until all the soap is perfectly dissolved; place the silk in a deep white china dish or bowl, and pour the hot suds over it; let it stand 10 minutes; then squeeze without rubbing, until clean; if very dirty, repeat the process; rinse in lukewarm water, clear, and hang smoothly over a line to dry; while still damp smooth the silk over long pieces of damp linen, and roll both together tightly for 1 hour; then iron on the wrong side, with the linen between the silk and the iron. The iron must not be very hot or it will yellow the silk.—2. White or light silk may be cleaned by rubbing it on both sides with corn meal, and carefully dusting it with a bit of silk or fine handkerchief.

STRAW HATS, Black, To Renew. — 1. Old black straw hats that look rusty and dirty may be made to look almost as nice as new, providing they are not battered up so as to be out of shape, by blacking them with ladies' shoe polish. — 2. Best alcohol, 4 oz.; pulverized black sealing wax, 1 oz.; put them into a vial, and put the vial into a warm place, stirring or shaking occasionally until the wax is dissolved; apply it when warm before the fire or in the sun.

STRAW, To Bleach.—1. Expose to the fumes of burning sulphur in a close chest or box. — 2. Immerse in a weak solution of chloride of lime, and afterwards well wash in water. — 3. Dip the straw in a solution of oxygenated muriatic acid, saturated with potash. The straw is thus rendered very white, and its flexibility is increased. — 4. Mix powdered sulphur to a mush with water; plaster it thickly over the straw, and place in hot water several hours; brush off when dry.—5. Rub the soiled straw with a cut lemon, and wash off the juice with water; stiffen with gum water.

TAR, To Remove.—Scrape off as much as you can; then wet the place thoroughly with good salad oil or melted lard and let it remain for 24

hours; if linen or cotton, wash it out in strong, warm soapsuds; if woolen or silk, take out the oil with ether or spirits of wine.

VELVETEENS, To Clean.—To wash velveteen use cold water, and do not wring; but shake thoroughly; spread on the line as much as possible; when partially dry take down and shake again.

VELVETS, To Restore.—1. The best mode of cleaning any kind of velvet is to sponge it with benzoline, and apply a weak solution of gum Arabic to the back; then sew it in a frame (an embroidery frame will do), and iron it on the wrong side with a damp rag placed between; if the nap requires raising, hold it with the wrong side downward over a basin of hot water; if there are any grease spots, pour turpentine on the place, and rub it till dry with a flannel.—2. Strain it tightly over a board, and sponge with pure Holland gin, the sponge being squeezed out very hard, that it may be damp, not wet; then hold near a fire, the wrong side to the heat, until the pile begins to rise; iron by passing the wrong side over the edge of a warm flat iron, as no pressure must come upon the right side.

House Furnishing.

REMARKS. — There is nothing more changeable or delusive than that ineffable something called "Style"—that which nearly every woman, and some men, worship even more than "Fashion." Yet it is higher and better than the latter, especially when dominated by "Good Sense" and "Taste." We will not attempt to describe styles, then, which are so fleeting, but will refer only to the apparent tendency of modern house furnishing, finishings, and decoration. First, let us note the partial return to imitations of antique art. This has been carried to the extreme of the bizarre, as also the importation and copies of relics of Japanese or Chinese barbaric ages. A revulsion from these has followed, so that a chair from the Middle Ages, or a vase from Japan, must now be comfortable or pleasing, and not racking to the frame or hideous to the eye, to open the purses of connoisseurs. Therefore, with discrimination and taste, duly exercised, innumerable are the remaining examples and opportunities of reproducing simple, yet unique and elegant, ancient forms, each piece a study of itself. The beauty of simplicity thus becomes a revelation, exposing the ugliness of much modern machine-made, veneered and badly shaped furniture. Another pronounced and almost wholly pleasing change has been to simple, square forms, in place of the long ruling bulbous shapes, devoid of any true art or purpose in design. This revolt has been so pronounced that the second-hand furniture shops are full of the old shapes, and the square forms prevail in everything, manufacturers not attempting to vary them much yet, except by decoration. The truth of this change will be seen on a visit to any well equipped furniture store, or even by reference to most of the engravings of modern interiors which we give in this department. The art education of the country is progressing so fast during its peace and prosperity, that the taste of its people is being elevated in all that pertains to the decoration and comfort of its homes; and in a wise avoidance of extremes in too great collections of storks, sunflowers, or whatever may be "the rage" at any time, and an earnest seeking after the fit and beautiful, safety and gratification lie.

Settled in Life.

In furnishing a house a leading idea should control the management of each room; the different rooms contrasting, but the transition from one to another being rather a mild surprise to the senses than to the mind. All kinds of furniture are ever changing, the old returning and the modern disappearing, and such selections of styles should be made as will serve best to make the house home-like and comfortable, and at the same time give satisfaction to the eye of taste and contribute to the culture of the beautiful. Carpets being the most expensive articles, it is safest to buy them first, and then to let their color guide in the tone and style of the curtains, paper-hangings (unless the paper is already on the wall), chair covers, hearth rugs, and the various minor articles. The tints of the carpet, of the paper or paint of the walls, and of the window curtains, should be all in harmony or in pleasing contrast, in each room. No pat-

tern or total of ornament of a room can be considered perfect if any of the three primary colors is absent, either in its pure state or in combination. When colored figures are placed upon a ground in contrast, they should be bordered by a lighter tint of their own hue. Thus, a green leaf on a red surface should have an edging of lighter green; colored ornaments on a gold ground should have an edging of a darker color; and bordering lines of white, black or gold form proper edgings for colored figures placed upon grounds of another color. Gold ornaments, on whatever ground, should have a narrow black boundary line; golden or colored figures may be used upon black or white grounds without edging of any kind. Regular sets of furniture, all to match, are no longer the necessary style; instead, the upholsterer makes a sofa, one large arm chair, and a smaller chair *en suite*, and then varies the effect with fancy seats of all sorts; wicker chairs, ebonized or gilded and fitted with movable cushions; dainty rockers, Louis XV. chairs, Turkish ottomans (which are merely frames holding piles of soft cushions), tete-a-tete chairs, and so on in endless variety; blending colors and making contrasts as carefully as a florist makes up a bouquet. If double parlors are to be furnished, or a large parlor which calls for two sofas, the two may be different from each other and yet harmonize—carpets, curtains and seats all uniting to form one harmonious whole, in which, however, there is no suggestion of sameness. In draperies or hangings, which terms include curtains, portieres and lambrequins, the materials are too numerous to be catalogued. Turkoman stripes, rich shellas, giving the effect of rich plush, alike on both sides, are an economical purchase in spite of first cost, since, comparatively speaking, they last forever.

General Furnishing.

CARPETS. Paper.—The floor of a spare chamber, seldom used, may be covered with wall paper at little expense. Select a paper looking as much like a carpet as you can find; first paper the floor with brown paper or newspaper; put a good coat of paste on a section of the paper the length of the room; then lay down and smooth (see PAPER-HANGING); when the floor is all covered, size and varnish; only glue size and common dark varnish need be used, and the floor will look all the better for the darkening these will give it; when dry, put down a few rugs by the bed-side and before the toilet table. If not exposed to constant wear, or if occasionally revarnished, it will last for years.

CARPETS. Rag.—To make a nice rag carpet, you should have the pattern you wish it wove in your mind, to guide you in arranging the colors, and the number of balls you may want of each. Care should be taken in cutting and tearing the rags, so that they will be even-sized threads in the filling; for if the texture of the carpet is uneven it will wear out more easily. The more wool there is, both in warp and woof, the longer the carpet will retain a new, clean look.—1. A carpet may have a plain stripe of one color, either black, brown or gray, and the fancy stripe can have the other colors, such as red, blue, green or yellow, etc.; squares can be made in the fancy stripes, by cutting two colors equal lengths and sewing together alternately. A hit and miss stripe can be made by sewing all colors together. Two colors can be twisted together; for example, red and white, or blue and white, which has a very pretty effect. For 20 yds. of carpet it will take 30 lbs. of rags and 3 balls of yarn to make that number of yards 1½ yds. wide. —2. For 33 yards of carpet get 25 lbs. of brown chain and 15 of orange, and 9½ lbs. of white. A pretty stripe for the rags is: 4 threads of red, 3 of white on each side of the red, and 3 of black on each side of the white; then 4 threads of blue on each side of the black; put all the colors of rags between the stripes. The white cotton rags may be colored indigo blue according to the receipts in DYEING. The thinner the rags the prettier they will color. Dip the brown and orange in weak salt water before weaving, to set the colors. Those colors are most serviceable, as they do not fade nor show dirt as some others do.

CARPETS, Selection of.—A carpet should always be chosen as a background upon which the other articles of furniture are to be placed, and should be adapted to the room for which it is chosen. The surface of a carpet serving as a ground to support all objects, should be quiet and negative, without strong contrast of either form or color. The leading forms should be so composed as to distribute the pattern over the whole floor, not pronounced either in the direction of breadth or length. The decorative forms must be flat, without shadow or relief, whether derived from ornament or direct from flowers or foliage. In color, the general ground should be negative, low in tone, and inclining to the tertiary hues; the leading forms of the pattern being expressed by the darker secondaries; and the primary colors, or white, if used at all, should be only in small quantities, to enhance the tertiary hues and to express the geometrical bases that rule the distribution of the forms. The laws regulating the harmonies and contrasts of color should be attended to. Small rooms need no borders; wide borders suit large apartments. French moquette and body Brussels is the best carpets to wear. Aubusson, Axminster and Turkey are equally good, but their price is of course high. Tapestry Brussels is not as desirable, as when the gay figures wear off there is nothing left but hemp. On this account, an ingrain (two-ply) will often outwear a tapestry. The most durable carpets are closely woven and thick, soft and pliable. In body Brussels the colors can be distinguished on the wrong side.

Aubusson.—These carpets are of French make. This is not a pile or velvet carpet, but a kind of fabric very much like the ordinary reps used in upholstering furniture, but stouter. The patterns are said to be worked, in part, by the nee-

dle. Imitation Aubusson carpets and rugs are made.

Axminster.—The pile is very rich and soft. This carpet is made both in breadths and in whole pieces, and is high priced. The softness of these carpets is due to the same cause which principally gives that quality to Turkey and other eastern kinds, in distinction from Brussels and analogous varieties. The surfaces of all consist of woolen loops woven on a backing of hempen threads. In the eastern, Axminster, Moquette and Wilton (or velvet pile Brussels) the loops are cut through and sheared, making a very soft pile.

Body Brussels.—These carpets are very durable, and if of a good quality are handsome and expensive. The materials employed are linen and yarn; a number of wires are inserted between the linen and wool, which are withdrawn when the carpet is made; the loops thus formed are allowed to remain, and this gives the corded appearance to the surface. This may be termed the favorite durable carpet.

Ingrain, or Two-Ply.—Is made of 2 threads only, and the colors are reversed on the other side; in the best both threads are wool; in the cheaper kind the warp is of cotton. It is most frequently used in bedrooms. It is the favorite durable cheap carpet, as it is reversible in use.

Linoleum.—Is a peculiar preparation of linseed oil hardened or oxidised, mixed with ground cork, pressed on canvas by rollers, then painted and printed, and used for floor cloth. It is preferable to the ordinary oil cloth, because it is more elastic, not so cold, noiseless, and impervious to dampness. For rooms that are not much used the figured linoleum is pretty; but where there is much wear it is best to obtain the plain, and have a bright figured border, or the figures will wear off and the surface look shabby.

Matting.—It is not desirable to have carpets on the floors of sleeping rooms in summer, and matting may be substituted, which will give the rooms a cool and fresh appearance. Matting coarse and loosely woven is soon worn into holes, but if fine and closely woven is very durable. Cocoanut is thick, strong and useful. Indian is made in squares of red and white, and is not so pliable as cocoa.

Oil Cloth.—A strong, substantial covering for floors is known by this name. It is made by printing canvas or other strong fabrics, in various colors and designs. It is well adapted for covering the floors of halls, public rooms and places of business where much traffic is carried on. The poorer qualities are not nearly as good as linoleum, but the best qualities are claimed to be equally as good. Oil cloth may be made to last much longer by frequently varnishing.

Tapestry Brussels.—Tapestry carpet is similar in essentials to the Brussels, but in place of the material being all dyed in the wool, the pattern of the warp threads is printed. It is the cheapest elegant floor covering where much wear is not expected.

Three-Ply.—This is the same as ingrain, except that a third thread is added. It is the prettiest and heaviest of the cheaper all-wool carpets, but will not last much longer than ingrain, as one layer of thread is apt to wear off.

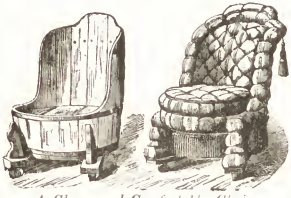
Turkey and Persian.—Persia and Asia Minor are the seats of the finest fabrics for tapestries and carpets, but India is not far behind these countries in the same art. The textile fabrics of these lands have been always held in the highest esteem. Their softness of texture gives an added charm of perfect fitness. The Turkey carpet is not adapted to the recesses and angles of rooms, but should occupy the centre of the floor, with a margin around it. This margin should be parqueted or stained, or may be covered with oil cloth or linoleum bearing geometrical patterns. When a Turkey or Persian carpet (or any modern imitation thereof) is procured of the full size of the room, it should be provided with a broad border. The use of good Turkey, Persian or Smyrna rugs upon parquet or stained floors has much to recommend it, both on the score of good taste and comfort. Turkey carpets proper are made from 6 ft. square upwards. They are produced by hand, every separate stitch being knotted and tied.

Velvet.—The weaving of velvet carpets is the same as with Brussels, only the loops are cut, thus giving it a high velvet pile. It wears better than tapestry, and has a rich and soft effect. The finest velvet carpet made is the Wilton.

CARPETS, Stair.—Body Brussels is the most economical for stairs. Tapestry looks well for a while, but soon grows shabby. Stair carpets should always have cotton pads under each step and over the edges. They can be made to last a long time by having a yard more than the length needed to cover the stairs, for then they can be changed so that the same place in the carpet will not come upon the edge of the stairs every time it is put down.

CHAIRS, To Upholster.—To upholster an old chair, measure the back of the chair for its width; divide the width needed into three equal parts; take a strip of flannel for each part, each strip being of a different color; dark blue, olive green, or garnet; or the two outside strips may be alike, the center one being the darkest color. These strips should be long enough to cover the back and seat, and hang down about 6 in. from the seat, and over the back. Finish the ends with fringe. The strips may be embroidered with rows of herringbone stitch in bright colored silk or wools, or with vines of autumn leaves; or the strips may be ornamented with inch wide strips of gay colors of any material put on in clusters across the strips, or lengthwise, the edges button-holed or feather-stitched down. Patchwork in bright colors of either woolen or silk goods make pretty stripes. After ornamenting the strips sew them together, press the seams flat, and cover the joint with a fancy stitch of some kind. If the woodwork of the chair is defaced, paint it black, with here and there a narrow ring of bright yellow, or better still of gilding. Make flat thin cushions for the back and seat, tacking them firmly on; then put on the covering, tacking it on with brass-headed nails to the top of the back, and both the front and back of the seat. Flag bottomed chairs can be made to look nicely by first taking a strip of

strong cloth as wide as the chair seat, and twice the length; pass it under the chair and sew it tightly together on the top; cut a pattern exactly fitting the chair, and cover with rep, cretonne or chintz. Finish with a border of the same about 3 in. wide. A good easy chair can be manufactured as follows: The chair consists merely of a barrel cut off above the second hoop so as to form a complete back with half arms at



A Cheap and Comfortable Chair.

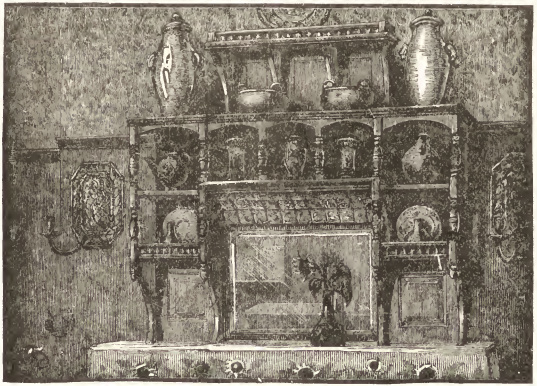
the side. The barrel thus cut is mounted on two strips of wood, having castors under their ends, and brackets above to form the legs and to add to the appearance of the chair. A head is fitted to the circular portion, and the whole is then neatly upholstered.

FIRE-PLACE.—Many of the modern stoves and their appurtenances of firedogs and fenders are great improvements on the fireplaces of even a score years back. The perforated brass Queen Anne fender, the brass or wrought iron fireguard and fire sets are artistically superior to any cast iron artificially bronzed article. The free employment of encaustic tiles and *plaques* around the grate and for the hearth brightens still more

Brass Fender.

the most cheerful place in the room. Best of all is the wrought iron grate itself, with antique firedogs of steel or brass. Many grates are too large and too open. Obtain from the nearest iron foundry or gas works a quantity of "clinkers," or save the residuum of your furnace; place these at the sides and back of the grate; a little wire may be used to hold them in position, if necessary; having thus reduced the dimensions of the grate, light the fire with wood and coals in the ordinary manner; in an hour or two the clinkers become red hot and throw outwards a great heat, although but a small supply of coals be required for the centre. The advantage of using clinkers instead of bricks or other material is that the fire is more sightly. Whether simply laid or lit the grate has the appearance of being filled with coals. It is easy to save a large per cent. of coal by this process. Small coal readily burns throughout fires so constructed, being held in the interstices of the clinkers.

Fire Set.



Mantel-Piece Decoration.

FLOORS.—To prepare floors for coloring or hard polish, proceed as follows: If the floor is already painted or spotted with paint, cover with caustic potash; leave this on till the paint is dissolved. It will take perhaps 36 hours if the paint is old and hard; then scour the floor, not letting the mixture deface the washboards. In case of wide cracks between the flooring, have them puttied, or the dust will gather in them, showing ugly stripes between the shining boards. If the planks are narrow and of equal width, color alternately oak and walnut, by first staining the entire floor oak and then the alternate stripes dark. It would be safe to dilute the mixture with an equal quantity of turpentine, as it is too thick when bought. In staining in stripes, lay a board on each side of the stripe to be stained and then draw the brush between. This guards the plank from a false stroke of the brush, and saves time. But if the dark staining should run over on the light plank, wipe it off with a bit of flannel dipped in turpentine before it dries. If the floor is to be all walnut, stain without a brush. Buy at a grocer's, for a medium sized room, a 1 lb. can of burnt umber, ground in oil; mix a sufficient amount of this with boiled linseed oil to color without perceptibly thickening the oil; by trying the mixture upon a bit of wood till the desired color is attained, the quantity may be easily determined. It should be a rich walnut brown. Rub this thoroughly into the wood with a woolen cloth, till the stain ceases to come off. Never use boiled oil on the floor. Like a varnish it attracts and holds the dust, which can only be removed by caustic potash, sand paper, or the plane. If the coloring matter is not dark enough when dry, rub on another coat. The floors may look dull, but in a few weeks, with proper care, will be satisfactory. When the staining is done prepare for the next day's waxing. Mix 1 gal. of turpentine with 1 lb. of beeswax, shaved thin. Soak the wax all night in the turpentine before using; rub it on with a woolen cloth. When the wood finally becomes well polished, the wax need only be applied once a week or fortnight. When the floor is polished, lay rugs on the floor. (See *Rugs*; and STAINING, in PAINTING AND PAPER-HANGING.) Floors are frequently made of oak, disposed in patterns, grooved and tongued together. The wood is usually 1 in. thick, and great care is taken in laying it, the wood being keyed at the back for farther security. Different colored woods are frequently employed with great effect small pieces being so disposed as to produce geometrical patterns. All angular figures can be used as bases for the patterns. Large rooms may be finished by a border of parquetry, and sometimes a large centre ornament is introduced. Floors of this kind are extremely durable, but necessarily expensive from the careful workmanship needed. A thin parquetry, something like stout veneer, is also used. This is affixed to the original flooring boards of the room by means of glue, or glued on a backing of cloth—then called "wood carpet."

FOOTSTOOLS AND OTTOMANS.—Footstools and ottomans may be manufactured out of boxes, or peck and half bushel measures. Nail old bagging looscly on the top, leaving one side open until you have filled it heaping with cotton, hay, moss or excelsior. Nail the canvas very tightly all around the sides and over the top, and cover with embroidery, or with material to match the furniture; cover the edges with gimp or fringe; nail a piece of oil cloth over the bot-

Footstool.

tom to make it slide easily over the carpet when moving it; the top may be fastened by a piece of strong leather or hinges to one side of the box and stuffed, covered and trimmed. Castors can be placed on the bottom to move it with less trouble. Legs can be made, and covered with plush or gilded.

HANGINGS.—There may be a rolling shade next to the window sash; then long curtains of lace; and inside of all heavy curtains of rich damask, satin or raw silk; in the summer these may be removed, and only the lace curtains and the shade be retained. At the top of the inner curtains is usually a lambrequin trimmed with fringe. When putting up curtains which are to be draped, in a low room, put the cornice, to which the curtains are to be fastened, close to the ceiling, even if the window is put in lower down, as it gives the effect of greater height to the room; the curtains meeting at the top will conceal the wall.

Chintz.—In using cretonne or chintz for curtains the right side should be in the room. It is customary to line such curtains with colored silesia, buff, blue or rose color, to match the ground of the chintz, and this makes a pretty show on the outside.

Dining Room. — Scarlet Holland shades trimmed across the ends with antique lace are pretty good and serviceable for a dining room, giving a soft and warm light to the room.

Hall Door.—Holland or oiled calico shades of red, trimmed across the bottom with antique lace, are pretty for hall doors. A very tasteful hall curtain is made of bobbinet, worked in some desired pattern with linen floss. The curtain may be fastened to the door either plain or fulled at the top and bottom. A lining of colored silesia should be added as a finish. The same effect may be obtained by using dotted Swiss instead of the bobbinet. Another pretty curtain is made of antique lace insertion and ribbon.

Lambrequins.—A pretty mantel can be made of pine wood painted black, the lambrequin fringe or drapery fastened to the edge with brass headed nails; make the drapery of any plain dark cloth; have it straight and not more than

5 in. deep; baste on one or more rows of velvet ribbon 1½ in. broad; cover this with a network of coarse sewing silk in long stitches, using bright colors; finish it with fringe; if you cannot

Mantel Lambrequins.

buy fringe make it; cut the material for your drapery deep enough for fringe and all, say 9 in.; with sharp scissors cut the lower edge into strips 4 in. deep, and ¼ in. wide; prepare two more strips 4 in. deep in the same way; have them of contrasting colors; for instance, if your drapery is garnet, have one of blue and one of yellow. Fasten these strips underneath the fringe on the drapery; take a bright colored coarse silk; tie these three fringes into little tassels, drawing the under colors forward to give a variegated appearance. Instead of the velvet bands, embroidery presents a pretty effect. Satin, painted or embroidered, is often used instead of cloth.

Madras.—A great point in favor of Madras curtains is, that while they are gaily colored, the figures and colors show on both sides, and are visible inside and outside the window alike by night and day. Among choice designs are detached floral figures on a light ground, floral stripes and a charming oriental effect in cross stripes of maroon and gold, picked out with pale blue. This last lights up beautifully the maroon, brightening into crimson and gold, flashing out in all its gleaming brilliancy whenever the gaslight falls upon it. A desirable style for back windows is a Madras curtain with dado and border of oriental design, the centre being in leaves on a dark background, the effect against the light giving the impression of the pattern suspended in air, or painted on the window, as the background disappears altogether as the light shines through.

Persian Tapestry.—Curtains are made of silk-faced tapestry or satine in solid color, with wide dado of Persian tapestry framed in plush with straight valance at the top to match the dado.

Portieres.—Portieres for a single door hang straight and smooth like a window shade, closing the door and forming a panel of tapestry framed in plush, to be swept aside with a touch of the hand. Windows and double doors and the entrance to alcoves call for more voluminous draperies, a full curtain on each side, and perhaps lambrequin above. Poles and rings are the usual idea in cornices, and a slight pull on a silken cord furls the drapery instantly, leaving door and window open, and closes it again as readily.

Silk Rag.—Collect every available scrap of new or old silk about the house. Any very high colored pieces may for a very small sum be dyed crimson or dark blue, which gives richness. Cut the silk into strips, from ½ to ⅔ in. wide; bias, straight, even or irregular may all be used if fastened together securely; roll the strips into balls, keeping each color to itself; 11 lbs. of silk will make 8 yds. of curtain 35 in. wide. The woof of linen thread is scarcely visible. The weaver usually folds the strips into narrow bands to suit himself.

Unbleached Muslin.— Pretty curtains can be made of unbleached cotton, trimmed with a stripe of cambric; choose a delicate and pretty vine harmonizing in color with the other appointments of the room. In place of a cornice, a box plaiting of the cambrics may be used for a heading. Curtains can also be made from the same material after some of the various patterns of lambrequins, folded over a short space at the top, and trimmed all around with red fringe, the fringe being made from red calico cut in slashes. Curtains made from chocse cloth and of two straight parts, looped back from the windows with autumn leaves and a wreath of autumn leaves across the top, can be made to look very pretty. The leaves, if sprinkled with rosin and ironed quickly with a hot flat-iron, will retain their original colors and beauty for years.

LIGHT.—For softness, purity and delicacy of effect the light of wax candles is unapproachable; and in the mansions of the rich, where expense is not regarded, it is the favorite esthetic light. Elegant sconces are made for holding the candles. Next to these, in point of taste and light, is an elegant lamp; for the light given by a lamp is much softer and steadier than gas light, which last injures delicate furnishings and vitiates and heats the air of rooms. In the arrangement of gas in the principal rooms, either of two plans may be followed—a central chandelier may be employed, or the light be distributed around the room by bracket burners; for the dining-room a chandelier of simple and tasteful form, with glass globes, may be used above the table; and a bracket over the sideboard lights the china and plate; the strides made in electric illumination will soon give us further choice of lights, and this agent will doubtless be found to have its advantages and disadvantages.

Sconce.

REFRIGERATOR. Cheap. To Make. — Secure two dry goods boxes, the more substantial the better, one of them to be 3 or 4 in. smaller than the other on all sides, and fix the tops to open on hinges of iron or stout leather; the larger the boxes, of course, the more convenience and comfort is afforded; place 1 or 2 in. of sawdust over the bottom of the larger box, and set the smaller one into it; bore a ¾ in. hole through both boxes at either end, near the top, and insert a roll of stiff pasteboard in each to act as ventilators; fill the space between the boxes with sawdust; put in shelves at either end, leaving space

in the center for the large deep pan or pail that is to hold the ice; there can also be two or three pegs, on which to hang pails of milk or fruit; a large tin pail, with a thin round board at the bottom to prevent it being bruised, would be the most convenient thing for holding the ice.

RUGS. — The main open space, on parquetry or stained and polished floors, should be covered by a large rug, made of American Smyrna, velvet or Brussels, edged with a border to match. 1. Very handsome rugs can be made of burlap canvas fastened to a stout frame of the desired size for the rug, and then narrow strips of red, green and gray flannel "drawn in" in any pattern desired; the border should be of solid color—gray is the prettiest, and is a neat finish; loops must be left on the surface and the whole carefully trimmed off when the pattern is complete. — 2. A good ornamental small rug can be made of Turkish toweling, decorated; pieces of cloth or velvet can be cut into leaves from cretonne and stitched on; it is not best to cut each leaf separately, for the effect is better if a large cluster is laid on, and veins made in the leaves of bright heavy silk. — 3. Take a coffee sack, and bind it with something dark; tack it to 4 laths; have a hook made of wood or iron, the same as a crochet-hook, only larger; tear the rags as for a carpet; place the end of a rag under canvas; put your hook through, and draw it up; then skip every other thread, and draw up in loops ½ in. long; care should be taken to draw each end of the rag to the top of the canvas; dark rags for border, and plain, such as copperas color, make a nice ground; then bright for flowers; old red flannel and green of any kind, make a very handsome border.—4. Take for the foundation ¾ yards of brown cambric, or scarlet flannel, or the best end of an old sheet; make buttons of any old, thick cloth, by cutting the largest one 2 in. across, round of course; the second size, 1½ in. across; the smallest, 1 in; have a great contrast in the color; sew them upon the foundation, one in the centre, six around it, twelve around that, then twenty-four, and so on; when the foundation is covered, line with old bed-ticking, if you have it, or old calico, or an old sheet; bind the edge and it is done; the buttons are made by sewing one upon the other, as in felling a seam, sewing the smallest one on the second size, and the second size on the largest; have all the buttons of one row alike.

STOVES. — The multitude of patterns, which have emanated alike from inventors and their critics, is so voluminous that it is impossible to attempt to give a list of the numberless stoves in use; of late years, gas stoves, both for heating and cooking purposes, have come largely into use; the simplest gas-stove is the best; they should not be surrounded by a non-conducting material, as that affords no advantage; the Bunsen burner should be employed, as the mixture of common air with the gas not only prevents the formation of soot, but also intensifies the heat; gasoline stoves are also largely used, and if great care is exercised to prevent conflagrations, are desirable; oil stoves are objectionable on account of their greasy nature, their odor, and the soot they are likely to make.

WARDROBES. — Cheap wooden wardrobes and other articles of furniture can be improved by painting them black and ornamenting the panels with flowers, rather longer than life; storks and bullrushes, sunflowers, lilies, large daises, and poppies all look well.

WINDOWS. Frosted.—Windows may be made only translucent by frosting or crystalizing as follows: Make a solution of glauber or Epsom salts in hot water and cover the glass with it, using a "dauber" made of a soft roll of muslin; the glass must first be freed from grease by washing with water and soda.

PARTICULAR APARTMENTS.

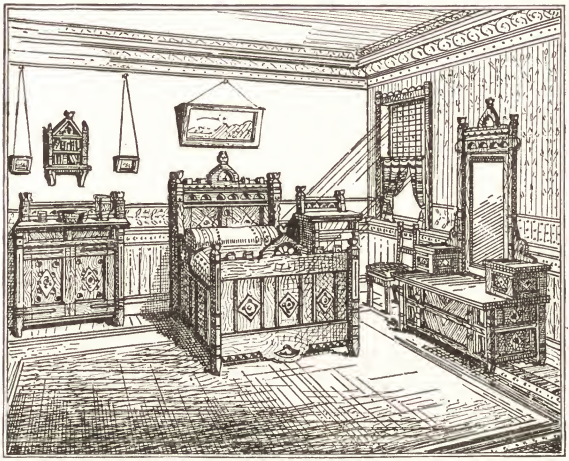
BATH-ROOM. — Encaustic tiles make an excellent wall covering, either over the whole surface or employed as a dado; if these are not employed, a plain paper well varnished, or matched pine boarding, also carefully coated with varnish, will answer; copper is the best material for the bath, and cast iron with porcelain enamelled interior the next best; the bath should, if possible, be placed in a recess; for the floor, linoleum or Indian matting is to be preferred, especially the former; a washstand, towel rail, one or two chairs of cane or other light material, a rug or two, a wire wall pocket to hold sponges and a blacking box and brushes complete the fittings.

BED-ROOM.—A bedroom should impress the observer with the idea of a dainty cleanliness reigning supreme in every part of it, while the prevalence of cool, soothing tones of color suggest repose and rest. The paint might be delicate chocolate, the walls soft pea green; no color equals green for giving rest to the eyes, and in its paler tints it offers a pleasant sense of coolness during the most sultry days of summer, while they are free from the suspicion of coldness seen in many of the gray shades commonly used; light colors make a room appear

Brass Bedstead.

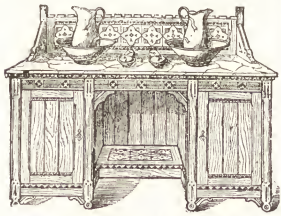
larger than the dark shades; woodwork painted chocolate, and cream walls look well with

the least possible amount of furniture; and whatever furniture there is should be as free as



Modern Bedroom.

bright-blue furniture coverings and curtains, or maroon paint and citrine wall with deep blue; a wall of a pale tone of blue and sage-green woodwork will harmonize with furniture cover-

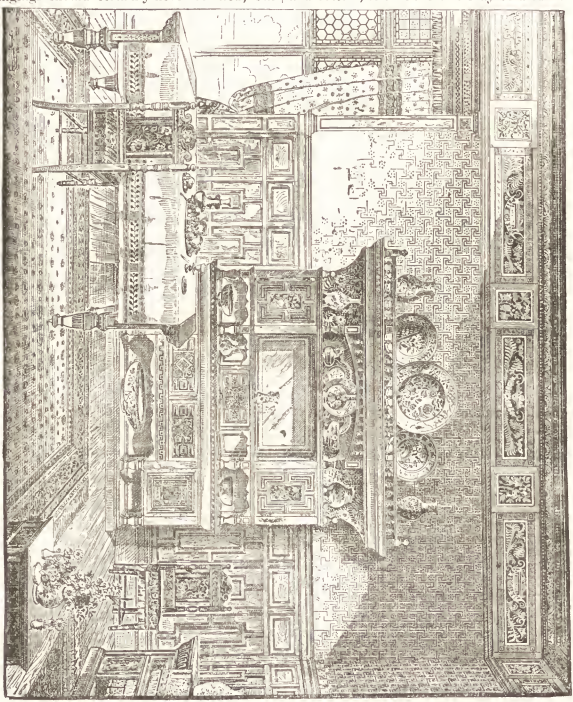


Gothic Double Washstand.

ings bearing a design of autumn-tinted leaves; stained boards are best for bedrooms; a square of carpet covers the center, leaving 3 feet all round the room; dust collects under furniture and chairs, dresses and draughts of air sweep it up into the corners; but the boards, being without covering, allow of its being easily taken up with a duster; the bedroom should have in it possible of all that can hold dust and fluff; in the bedroom the furniture selected should be simple; let the bedstead be plain, but yet not too plain; the brass bedstead recommends itself for elegance, simplicity, and as leaving no hiding places for bugs; let the dressing case be the object of attraction; the marble-top washstand and table are the most desirable articles of furniture; if the owner of the room makes it a business room also, instead of the table there should be an escritoire; this should be as ornamental as means will allow, and odd; the chairs should correspond with the main pieces of furniture, at least three in number; besides these, there should be an easy rocking chair, a low reclining chair and a settee; the rocking chair and settee are very pretty made of willow ware, decorated with ribbons; if these are used then there should be two easy chairs; make these of some pretty lively cover; in a gentleman's room a handy article is a blacking box; on the walls, have a few photographs, chromos, and two large companion pieces; in the corners of the room have little

Blacking Case.

fancy brackets and catchalls; let most of the decorations be of your own handy work; a towel-rack, the china set, the toilet set, and mantel ornaments must be selected with regard to adding to the appearance of the room; the absence or presence of hangings is a disputed point; very many people object to them on the score of injury to health; heavy, old-fashioned hangings should certainly never be used; but



A Modern Dining Room.

in a well ventilated apartment a canopy and head curtains can not be at all prejudicial to health if open to the air; and they can be made to contribute not a little to the picturesqueness of a modern bed-room; the material of hangings may be reps, chintz, dimity, or cretonne; a pretty toilet table for a lady is made as follows: Nail 4 pine boards together so as to form a box about the size of a small bureau; the sides are left open; let the back rise 4½ feet above where it joins the top board, sloping till at the top it is not more than a foot across; on this nail a half circle, projecting ½ foot in front; then cover the box with some delicate colored silesia or cambric; nail tight all round, except at the sides, where it should be fastened only on top, and left loose at the sides and bottom, so that the box may be used as a closet; cover the cambric with white dotted Swiss, with a broad hem at the bottom and two deep tucks above, both finished with narrow lace edging; at the top of the table nail a flounce of the same material; round the top nail a plaiting of narrow ribbon, with fine brass-headed nails; fasten long loops and ends of narrow ribbon in the centre of the top and festooned up at the end of the table; in the centre of the black

board, half way to the top, cut a piece out 1½ feet long and 1 foot wide; on this plait the narrow ribbon; in the opening place a fine mirror, fastened on the back with cleats; from the half circle at the top a long curtain of dotted Swiss muslin is nailed a little full, opening in the middle and fastened with a bow of blue ribbon, with a broad hem and tucks, edged with lace like the bottom part; this curtain falls apart from the mirror, leaving that and the table open, and reaches nearly to the floor, fastened at each corner of the table with bows. In regard to the mattress there is no better form than one made of moss or horsehair, both for children and adults. The pillows should also be made of the same material. In selecting covers for the bed the very best are those which give the maximum of heat with the minimum of weight; hence blankets are better than heavy wadded quilts, and a light down covering better than either; one of these thin coverlets takes the place of two or three blankets, and causes much less fatigue to the sleeper; white bed-spreads are the nicest outside coverings for a bed, but, to save labor, colored calico or chintz can be used; sheets should be from two and a half to three yards long and two breadths wide unless made of full breadth linen; linen sheets last longer than cotton ones, and in hot weather are most comfortable, but in a variable climate cotton sheets are much preferable. Every bed-room, even those of the boys, should be provided with a clock; always the plainest procurable; one striking the hours with a soft tone, but without any useless apparatus for indicating the quarters; besides the large mirror of the dressing case, a hand mirror is very desirable.

BILLIARD ROOM.—The wall decoration of this room should be of tolerably light character, but not too delicate, as the apartment is generally a smoking-room also, and the fumes are apt to cause discoloration; either Brussels carpet or linoleum is the best floor covering, with a set of billiard mats of kamptulicon or corticine around the base of the table; a settee or two and a few chairs will be sufficient furniture, and if the billiard table is of modern Gothic design these should match; on the walls should be a marking board and cue-stand; or a circular revolving cue-stand may be preferred; over the table a four or six-light chandelier; if any pictures be desired, sporting scenes are most suitable.

DINING ROOM.—The chief articles of furniture in this room are the sideboard, a good substantial table and the chairs; the chairs should be cushioned, if possible; the table should be selected in regard to size of the room; cover the sideboard with plate or bright china, white and colored glass, Japanese lacquer-work and flowers; one complete tea-set, one dinner set, 2 dozen napkins and six tablecloths are necessary in this room; a side-table is a great addition to hold the silver water pitcher and goblets. For the floor, nothing is superior to good parquetry or linoleum, and a carpet of such dimensions as to leave some vacant floor space around it. The curtains may either contrast or harmonize with the wall decorations. Deep rich colors are best, and the material may be reps, damask, tapestry, pekinade, or cretonne. Tuileries or other lace is best for summer. The fireplace should be of good dimensions. Bronzes and statuettes are the best adornment for the walls on brackets, and bronze, marble or oak for the clock-case. In purchasing china, glass and earthenware, care should be taken to select those sets that, in case of breakage, can be readily matched; peculiar or rare patterns should be avoided, unless oddity is aimed at; in that case the broken piece can be replaced by an odd one.

The Old is the Best.

DRAWING ROOM.—Light, brightly decorated walls are here a desideratum, with tones of delicate color on the ceiling. If the floor is parqueted or stained, the patterns and colors should partake of the prevailing delicacy which ought to characterize this room. With parquet floors, rugs are preferred scattered about, to even a large central carpet. Where the floor is ordinary wood, the space outside the carpet, or in recesses, bays, etc., can be filled in with plain felt carpet of crimson, sage green, or other self-colors, or Indian matting, or floorcloth printed in tile patterns. Failing these expedients, stain may be applied. The patterns both on the walls and carpet should not be bold, but small and graduated. Hearth-rugs should partake of the character of the carpet. Sometimes rugs of sheepskin or Angora are dispersed about. For the window curtains see *Hangings*. Stained or painted glass of a light character may be used in part of the windows. The chandeliers should be of plain, effective design, or painted. If the furniture is of the Queen Anne style, wall sconces, plated or brass, are well suited. The necessary articles in this room are chairs of every style and color, tete-a-tetes, at least 1 table, ottomans, 1 or

2 sofas, and 1 piano. The stove, if of antique design, can be set in encaustic tiles, or with large side-painted *plaques* in the jambs; fenders and fire-irons lighter and more elegant than those of the dining-room. For Queen Anne style, the old-fashioned fender of perforated brass has been re-introduced. Mantelpieces are furnished with stages of shelves forming an *etagere* for the display of *bric-a-brac*, especially porcelain. The furniture should be light and elegant in character, ebonized wood, with incised gold linings and ornaments, seems well suited for the drawing room, as are pieces in which marqueterie or boule work enter. The upholstering of the couches, etc., should be light both as to fabric and hue. Mirrors are scattered all over the room. Cabinets and chiffoniers are very elaborate, and take a conspicuous place, being the receptacles in which the art treasures of the owners are displayed. Marble, inlaid wood, or ormolu clocks, and parian statuettes and bronzes form adjuncts for the mantleboards. A tasteful piano, screens, *jardinieres*, and portfolio rests, with a hundred nick-nacks, make up the *ensemble*. Anything which suggests pleasant ease and enjoyment finds its fitting place here. For pictures, water-color landscapes, choice engravings, and *photo-gravures* are suitable.

A Corner of the Drawing Room.

HALL. — It is not necessary to have a stereotyped hat and umbrella rack; have a Gothic hall table and seats; for an umbrella stand, get or decorate some neat, handsome tall jar; they can be had in every imaginable style; have a mirror, large or small, of some odd shape, framed in a durable way, with many pegs for the hats and coats; if the hall is dark have a

white cast or bust at the end; in a corner have an ornamental little cupboard, to hold brushes and other things needed on going out and coming in; make the hall look as large as possible; for floors, encaustic tiles or parquetry; if boarded, good linoleum or oil-cloth with rugs is the best covering; for lighting, plain pendants or brackets; a fireplace looks hospitable.

Gothic Hall Seat.

skewers; 1 basting ladle and slice; 1 toasting fork; 1 measuring pail, so graduated and marked that one can tell at a glance how many quarts of fruit or milk are in it; 1 rag-bag for odds and ends; 1 knife board, covered with thick buff-leather, on which is put the polish to be used.

KITCHEN TABLE AND SETTEE, Combined.—The illustration shows plainly how this is made. This table economizes space, affords a good seat, has a nice shelf on which to place the ironing cloths, etc., and when adjusted as a table is suitable for every purpose.

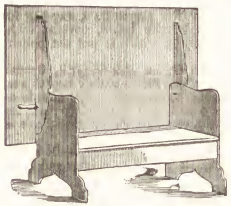
KITCHEN TABLE. To Make. — It should be 8 feet long, 2 feet 7 in. high, and should be

A Hospitable Hall.

KITCHEN.—The walls may be either covered wholly or partially with pine matched board, stained or painted; the floor uncarpeted with 2 or 3 undyed sheepskins thrown about; or it may be partially covered with linoleum or cocoa matting; plenty of shelf and closet room; chairs and tables of unpainted wood; a good range; a plate-rack, towel-horse, and round towel; no curtains at windows, as they catch dirt; some of the necessary utensils are: 1 iron pot; 1 fish kettle; 2 large iron saucepans, one with a steamer; 1 stew-pan; 2 small saucepans for vegetables; 2 butter saucepans; 1 small saucepan lined with china, for boiling milk; 1 gridiron; 1 frying-pan; 1 baking pan; 2 bread pans; 1 bunch of

2 feet 3 in. wide on top; below, it is enclosed at the back and ends and has doors in front; it has no floor, but stands directly on the floor of the room and is movable; the enclosed space below is divided into 3 compartments; the right hand closet contains the flour barrel; a door coming down to the floor opens to admit it and closes tightly again until the next barrel is needed; inside there is a space to hang baking pans by their rings on the partitions; over the flour barrel there is a lid that is raised whenever the flour is to be taken out; the sieve and scoop remain in the barrel; the lid is a part of the surface of the table and opens over the whole width of the flour compartment; above the door of the mid-

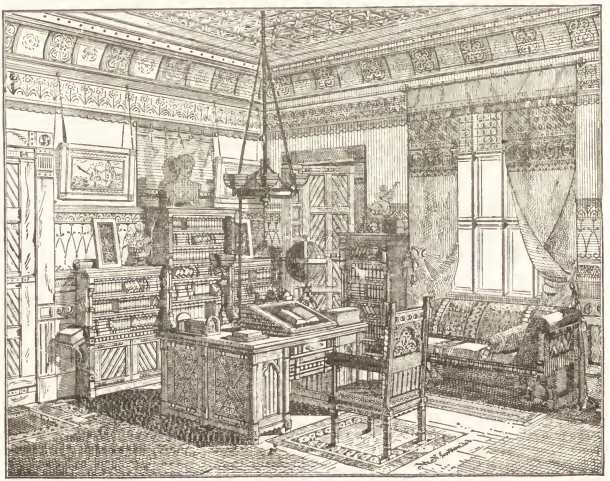
dle closet there is a drawer without back or sides,



Combined Table and Settee.

which is the bread-board; when drawn out and turned round, the front becomes a back, and is very useful in preventing the scattering of flour in rolling pastry; when returned to its place the roller can remain upon the board; below this drawer is a closet with door, and a shelf large enough for a pan of milk, or bowls and pudding dishes; below the shelf is space for a bucket of sugar, a jar of lard or cream, and a molasses jug; the left-hand closet has at top a drawer divided into two compartments, one for eggs, the other for spices, yeast powders, nutmeg grater, and cake cutter; a shelf below holds boxes of saleratus, a bag of salt, boxes of rice or tapioca, jug of syrup, jars of preserves, while in use, or is an excellent place to keep pies; the table, including its surface, being about 1½ in. higher than a flour barrel, a short woman cannot mold bread or roll pastry easily without something to stand on; a narrow piece of board about two feet wide, with two pieces of board nailed across its under side, is one of the best; there should be a narrow strip of wood nailed upon the back of the surface of the table, and one across, between the principal part of the table and the flour division, to keep water from flowing over the back or into the division containing flour, when washing the table after cooking.

LIBRARY.—The wall decoration here is a secondary matter, as the principal space is supposed to be filled by the book cases; it is a common error to decorate too darkly; the tints should be tolerably light, although grave in tone; for the carpet and curtains a tolerably bright crimson or some soft green may be selected; oak is the best material both for the book cases, chairs and writing tables, and some form of Gothic the best style; bronzes and statuettes are suitable ornaments to this room; in the centre should be a large table or desk with small drawers, to hold papers, pencils, ink, pens, pamphlets and newspapers. All the chairs should be selected in regard to comfort; leather covered chairs, brightened up with bright tidies, are the best. The fireplace should be a

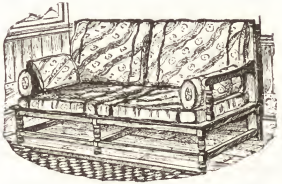


The Library.

large, open one; small book-stands may be

Use and Beauty.

handy to the large chairs; an argand burner or student's lamp should be on the table; in this room also the secretary can find a corner; place a plaster bust or urn at the top of each book case.



Sofa with Changeable Cushions.

SMOKING ROOM.—This is generally combined with the billiard room, but, if possible, should be separated; it should be a little snuggery, cheerfully but not too delicately decorated; walls and upholstering in shades of olive, sage green, or peacock-blue; or, if a warmer style is preferred, an oak dado round the room, a frieze paper with some lively pattern above, and a deep crimson paper for filling in between; striped Oriental, damask, or rep curtains, the stripes running horizontally; parquet border to floor, and Oriental or Smyrna rugs about easy chairs, upholstered in morocco, roan, or reps; tile-lined fireplace. If any pictures they should be glazed, and the frames not heavily gilded; a couple of neat cuspidores are necessary adjuncts; also 1 or 2 little tables to hold the paraphernalia of a smoker.

ORNAMENTS.

ACORNS, Fancy Articles of.—Picture frames, brackets, boxes, and baskets of all shapes and sizes for the reception of flowers and ferns, may be made with acorns. The foundation is made of cardboard or wood, according to the strength necessary for the style of article. When the framework is completed the ornamentation is begun. Fir-cones are very generally used with acorns; the frame is covered with cones, which

Fancy Basket and Bracket.

are sewed or stuck on with liquid glue, after which the acorn cups or the full acorns are put on. Some design should be made and followed out in the placing of the acorns. Arrange the acorns on a table, and when the pattern is formed leave it undisturbed, while other acorns are taken and fixed according to the copy. Full designs look most effective—that is to say, those which require the acorns to be clustered and grouped together. When the work is complete, varnish the whole.

ALABASTER, Imitation of.—Common plaster of Paris figures may be made to look like alabaster by dipping them into a strong solution of alum water.

ALUM BASKETS.—A very pretty basket can be made to look as if composed of crystals, as follows: Obtain a very small wire basket; wind lamp cotton round every part; fill it with clinkers from a stove; suspend this in a solution of alum mixed in the proportion of 1 lb. to 1 qt. of water, in which it has boiled until dissolved; do not let the basket touch the sides of the pan, or become exposed to the air; let it remain in the solution 24 hours; when taken out carefully suspend it in the shade until perfectly dry. Different hues may be given to the crystals by adding powdered turmeric to the hot solution to obtain a yellow; litmus for a red; logwood for purple; common writing ink for black. For a blue tint use sulphate of copper instead of alum. Very beautiful variegated crystals are obtain-

able by taking ½ oz. each of the sulphate of iron, zinc, magnesia, alum, soda and potash; dissolve these separately, and afterwards pour them together; now let them rest, and when the water has evaporated and the crystals are dry they are of many colors.

AUTUMN LEAVES.—1. Gather the leaves from the trees before frosts, getting all the shades and tints possible, singly and in sprays suitable for pressing, and at once placed between the leaves, not too near together, of books or newspapers, and several pounds weight laid upon them; keep while pressing in a cool place, and as often as every other day change into new books; this is important, because the paper absorbs the dampness from the leaves. They should be kept in press between two and three weeks. They are then ready for a coating of oil or varnish. A mixture of 3 oz. of spirits of turpentine, 2 oz. of boiled linseed oil, and ½ oz. of white varnish is preferable to either alone; get a perfectly smooth board, large enough to lay a spray upon, with no reaching of the leaves beyond the outer edges; take a piece of soft cloth to apply the dressing; after the application the leaves must be laid carefully on boards or papers, not overlapping each other, until dry, and then disposed of as taste suggests, avoiding as much as possible a stiff, unnatural arrangement; the stem can be broken off and a fine wire attached in its place, which makes them a little more yielding to handle.—2. Spread the fresh leaves and press them in a suitable dish, with alternate layers of fine sand, which is thoroughly dry and quite warm; when the sand has cooled they may be removed, smoothed under a hot iron, dipped for a moment in clear French spirit varnish, and allowed to dry in the air. By many, melted white wax or paraffin is preferred to the varnish. These latter must not be too hot.

BACHELOR'S COMPANION.—Make a pasteboard box 5 in. long, 2 in. wide, 1¾ in. deep; cover and line, and bind each of the four sides of the box separately, afterward overcasting them together; make a cover in the same way; the bottom needs no kid piece, but should be neatly covered on both sides with the same material as the lining; fasten in one end a small cushion for pins; partition off an inch at the other end for buttons, and you will still have room for thread and tape; a little strap on the inside of the cover will hold a paper of needles, or make a tiny needle-book of two leaves of woolen goods, of a color to correspond with lining, and fasten it on to the cover; put an elastic loop in the lid, and a button on the box to keep it closely shut; on one side of the box put a strap to hold scissors.

BOUQUET, Dried.—The background make of fern, and to every leaf or cluster of leaves add a small sprig of fern, the whole interspersed with light, feathery grasses, which can be gathered in the fields or woods at any time during the fall; tie tightly, to prevent becoming disarranged when removed from the vases to be cleansed, which can be done by blowing the breath on them; they should never be shaken.

BOUQUET, To Arrange.—The main feature in arranging cut flowers is to show each flower separately and not a quantity crowded together, forming a mass of petals, but that each flower may be seen reposing quietly among the green, giving to each bloom an individual character. A few colors in a bouquet have a much prettier effect than a mixture of many colors.

BOUQUET, To Keep Fresh.—1. When you receive a bouquet, sprinkle it lightly with fresh water; put it into a vessel containing some soapsuds; this will nutrify the roots, and keep the flowers bright as new; take the bouquet out of the suds every morning, and lay it sideways into clean water; keep it there a minute or two; then take it out, and sprinkle the flowers lightly by the hand with water; replace in the soapsuds, and it will bloom as fresh as when first gathered. The soapsuds need changing every 3 or 4 days.—2. Cut ½ in. from the end of the stem in the morning; put the freshly trimmed end instantly into quite boiling water; the petals become smooth and resume their beauty in a few minutes. Colored flowers, carnations, azaleas, roses and geraniums, may be treated in this way. White flowers turn yellow.—3. If the bouquet during the heat of the day is wrapped in paper which has been soaked in water, and then put in a box, in the evening they will be fresh and pretty, and can be placed in water, but they should be replaced in the wet paper for the night. In this way they will keep fresh several days.

BOUQUET, To Preserve.—1. Immerse them in a solution of gum Arabic and water two or three times, waiting a sufficient time between each immersion to allow the gum to dry. The whole surface must be completely covered; for if the air only gets entrance at a pinhole the labor will be all lost.—2. Provide a vessel with a movable cover; fit to the top a piece of fine metallic gauze; replace the cover; pass through a sieve into an iron pot, sand sufficient to fill this vessel, and heat it with ½ per cent. of stearin, carefully stirring; place the flowers on the gauze; remove the bottom of the vessel; pour in the sand and stearin, so as to cover and envelope them; place on the top of an oven for 48 hours; remove the cover, invert the vessel and the sand runs away through the gauze, leaving the flowers dried in their natural position.

Bracket.

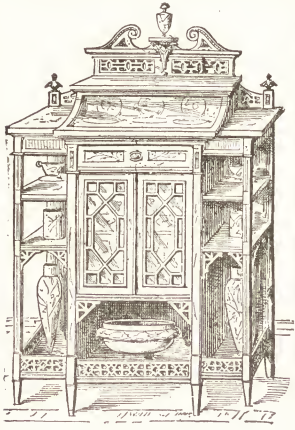
BRACKETS.—A useful and ornamental bracket can be made as follows: Make the rough bracket, any design desired, of wood; then on this nail pieces of bark or rustic branches, prepared for the purpose, covering it completely. More elaborate brackets are made with a background of glass, thus adding much to the beauty of the articles.

CABINETS.—These are of all sizes, from the tiny corner cupboard, which holds at the most two or three treasured pieces of china, to the large Queen Anne cabinets. Cheap ones can be manufactured at home. A pretty

shell cabinet is made as follows: Make a frame 20 in. long at top and 15 in. at bottom; the sides 3½ in. in width or smaller, to suit one's convenience; place the shelves in on the slant, the upper edge being higher by ¼ in. than the lower; select the shells; arrange them on each shelf, putting the handsomest ones in the centre. Having decided where to place them, use putty to stick them on,

Rustic Bracket.

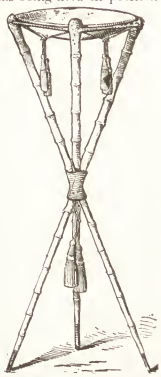
first heating and keeping it warm all the time. If it is too stiff, put in a very little boiled linseed oil. Glass doors should be fastened on. The



Parlor Cabinet.

shells present a pretty effect when the shelves are not used; they are arranged in the same way on the sides and back of the cabinet. If the shelves are used, either paint or cover with black velvet the back and sides of the cabinet. The outside is to be ornamented by wood carving or paint.

CARD RECEIVERS.—A pretty card receiver can be made with three bamboo canes or walking sticks, bound together at the middle to form a tripod, the three sticks being held in position by a strong cord wound vertically between the canes. The outer winding is of some kind of ornamental cord tied together and furnished with tassels. The cord which binds the canes together is wound so tightly as to spread the upper ends of the canes slightly beyond the final dimensions. The heads or upper ends of the canes are bored transversely, and are drawn together by a fancy cord, which is held tight by the spring of the canes. Other cords with tassels are hung loosely about the upper ends of the canes. An ornamental platter rests upon the cords, and forms a receptacle for cards.



Card Receiver.

The canes may be gilded with gold leaf with good effect, or a coating of gold paint may be applied. Small ones to set on the table can be made in any shape desired of cardboard, ornamented with pictures. The edges can be ornamented by pinking, and the different pieces joined together by bows of bright ribbon. If the different parts are made of bristol board, an ornamental design should be embroidered on each, the edges bound with ribbon, and the backs lined, before sewing them together. Cardboards covered with acorns are also pretty.

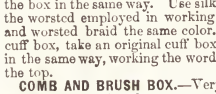
COLLAR BAG.— 3 balls tidy cotton, No. 6 or 8; 2½ oz. red zephyr; bone needle; 2 chain, Afghan stitch; widen at each side until you have 13 rows from the point and 25 stitches on needle; then narrow to a point, having 13 rows to form each point; make 4 of these pieces; work a figure or large initials in cross-stitch with zephyr; crochet a row of short red stitches around each piece; crochet them together with short white stitches on right side, beginning at point; scallop with red around top; wrap wire and fasten inside, to give it shape; a long cord from each point, caught at top with a short cord and 2 large tassels at bottom, finish this pretty article. Choose as large a figure for each piece as you can get on. Pretty ones are made of canvas worked and edges bound with braid.

COLLAR AND CUFF BOXES.—Make one of pasteboard, 6 in. across and 4½ high, with the cover on; cut a piece of perforated cardboard round just the size of the cover; work on it a bunch of roses, cherries, violets, pansies, or a simple pattern, or decorate it with embossed pictures, and glue it upon the cover; put a

strip of the same colored cardboard around the edge of the cover, and finish both edges with box-plaited worsted braid; take a strip of cardboard long enough to go around the box and lap enough to fasten, and wide enough to cover it when the cover is on; work the word *Collars* across the front and mucilage upon the box; finish with about 3 embossed pictures across the back and box-plaited braid around the bottom edge; put the cover on, and the box is done. If something more elaborate is desired, line the cover with very thin silk, puffed in, and sew into it a puff of cotton batting, scented with perfume powder; put the perfume between the silk lining and the cover; then line the box in the same way. Use silk the color of the worsted employed in working the outside, and worsted braid the same color. To make a cuff box, take an original cuff box and cover it in the same way, working the word *Cuffs* across the top.

Collar Box.

COMB AND BRUSH BOX.—Very pretty ones can be made of cigar boxes, or pasteboard ones of the length and width of brush and comb. Line the box inside and out with a pretty color in silk or woolen material; fasten the lid, and when covered fasten by overcast stitches to the lower part; cover all with a puffing of Swiss muslin, edged with lace or bright zephyr; the cover of the top of the lid fill with some material that will allow the pins to be stuck in easily; or the lid may be made so as to fit down on the box, in which case, the box must be covered tightly with the desired material. The sides and top of the lid only should be ornamented.



Cover to Comb and Brush Box.

COMFORT, For Baby. — Take two widths of cheese cloth the required length; on the upper side mark it off in diamonds 4 in. square; with worsted, say light blue, follow these marks in a long, loose chain stitch; stretch the under piece of cheesecloth on your frames and cover it thickly with the best cotton batting, from which all seeds and specks have been picked out; lay the top piece over this, and with your needle make little tufts of blue worsted at the intersection of each diamond; work these tufts through to the under side, which will hold it all firmly in place; fasten the edge with two rows of machine stitching, and if you like finish with little blue tassels about 2 or 3 in. apart.

CORK ORNAMENTS. — On account of the resemblance of cork to stone, very pretty ornaments can be made to represent architectural models or picturesque ruins. The model must be decided upon; then the cork cut into the shape of the stones to be represented; the cork may be used in its natural color or dyed black; when the blocks of cork are prepared they must be attached to the foundation; when the article is complete, varnish it lightly with shellac varnish. For illustration of a pretty window box made in this way (see *Plant-stands and Pots*, in WINDOW GARDENING).

COUNTERPANES. — 1. A handsome one is made of satin and lace; take a square of antique lace and line it with the desired shade of satin; around it sew an insertion of satin of the desired width; around this one of antique lace, and so on until it is of the desired size, lining each insertion of lace or not; finish with a deep edge of lace.—2. A pretty and attractive one is made of the odd bits of silks lying around; make squares of crinoline lined with calico of the desired size; on these baste the odd ends of silk regardless of color or shape, turning their edges in neatly; around the edge of each piece, work the feather-edge or herring-bone stitches; a flower or any design may be embroidered on the larger pieces of silk; when all the squares are done place them on a foundation lined with some desired material and join their edges by some fancy stitch.

CRAZY CUSHIONS. — These can be made in the same way as the counterpanes—of odds and ends of silk.

CRYSTALLIZED FLOWERS AND GRASSES. — Sink in a solution of alum, of 1 lb. to 1 gal. of water, after the solution has cooled; the colors will then be preserved in their original beauty, and the crystallized alum will hold faster than when from a hot solution; when you have a light covering of crystals that completely covers the articles, remove them carefully, and allow to drip for 12 hours.

DOYLEYS.—Take fine linen; fringe the edge and hem-stitch within, describing a central square; the corners of this hem-stitching do not intersect; the inside is divided into diamonds with brownish yellow silk in outline stitch, and inside of the diamonds are central rings with rays and four-leaved clovers also in outline stitch; other doyleys have bunches of cherries, flowers and conventional designs, but these are all done in brown tints, scarcely varied with other colors, and in the finest of silks; still others have Chinese and Japanese pottery designs, done in the lighter blues, reds and olive greens.

FEATHER FANS. — 1. Take card-board, the white breast feathers of the turkey, thick flower wire, glass and steel beads; the foundation of the fan is of two circles of cardboard measuring 3½ in. in diamcter, and covered with white glazed calico; the feathers must be washed in lukewarm soap and water, and dried, then sewed to the foundation; care being taken to choose the sizes, so as to preserve the shape of the fan; the feathers at the edges should measure 5½ in., so that the fan, when complete, is 9 in. in diameter; the handle is of strong wire, twisted over tightly with ribbon of two shades, finished with a button covered with silk, and ornamented with beads.—2. To make a peacock feather fan, cover a Japanese fan both sides with dark green silesia; sew on the small pea-fowl feathers, commencing at the edge and working to the centre; sew them on thickly so that the silesia may not show; fasten a cluster in the middle to hide

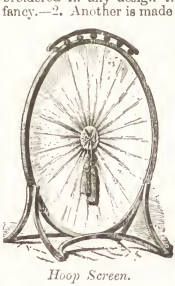
the last ones sewed in; cover the other side in the same way; but as it is difficult to cover both sides without the stitches showing after the feathers on one side, cut a piece of satin for the wrong side and cover the silesia, leaving one side dark green satin, the other peafowl feathers.

FERNS.—Ferns when placed in a room should always be in groups. To group them in masses above pictures, first fill all the space between the cords and for 2 in. outside with pins stuck in the wall, and placed about 3 in. apart; then, commencing at the top, by the nail, hang the ferns on the pins, building downward until the whole space is filled.

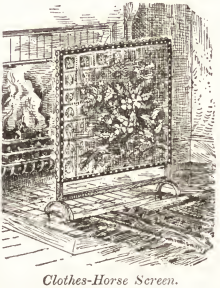
FIRE SCREENS.—1. The stand for a pretty embroidered fire screen has a base sawed out of a pine board covered with plush, and supported on four wooden balls forming the legs. The vertical standard of the screen is a broomstick covered with plush, and having a brass knob on the top to finish it, and a brass hook screwed in the side near the top to receive the cord which supports the horizontal bar. The latter is simply a wooden stair rod, which may be covered with plush or not as the taste of the maker may dictate.

Embroidered Fire Screen.

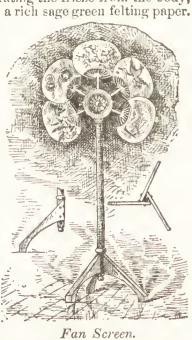
The screen itself is made of any pattern and embroidered in any design that the maker may fancy.—2. Another is made of boy's hoops, two of these forming the frame upon which the screen is stretched, while a third and fourth are cut up for the legs, braces and the top ornament. The screen may be made plain and painted, or embroidered, or the material may be attached to one of the hoops by one of its edges, and be gathered in the centre. In either case the material is fastened to the side of one of the hoops after it has been covered on the inner edge and one side with plush. The other hoop is then covered in the same way and placed against the first in such a way as to include the screen between the two hoops; a ribbon plush is then tacked upon the edge of the screen so as to cover both hoops; the legs, braces and top ornament of the screen are made of sections of hoops covered with plush, and fastened together with brass screws.—3. Another pretty screen is made of bamboo walking canes, cut and placed together according to fancy. The satin or velvet is pretty, either embroidered, painted or covered with green ferns.—4. A very useful one is made with a single clothes horse. Tack common cotton cloth to the bottom and carry it over the top and down the other side to the bottom. All the exposed portions of the wood on the edge and the feet, which are cut a little concave on the inside, should be covered with a good coat of black shellac, and rubbed down with emery cloth to a soft even surface. Next in order is the decoration, which consists of paper. At the top use a pretty strip of single band frieze paper 18 in. wide, a background of gold, against which grows very nicely grouped sunflowers, with leaves, stems and buds comprising a low-toned mixture of olives, old gold, browns and rich warm red. Below this a narrow strip border of peacock blue, edged with black, separating the frieze from the body, which should be a rich sage green felting paper. To put the paper on, first make a strong flour paste; lay the paper, face down on a flat clean board, and cover all parts equally with a good coat of paste, avoiding lumps. Give the surface of the screen which is to be covered a coat of the same; take up the paper carefully by the top, putting it and the corners exactly in place; then draw the hand downwards, smoothing the paper well in to place; at the bottom another strip of blue and black must be added; at the top, where the cotton is left exposed, tack on



Hoop Screen.



Clothes-Horse Screen.



Fan Screen.

the front and back edge with brass-headed nails a strip of plush 3 in. wide, a deep rich red. Cover the back with a neat and harmonious paper, put on as the front; or both sides may look alike. Both sides, instead of the above, may be covered with oil-cloth, on which is painted some fancy design in oils; or with satin, hand painted; or with satin, velvet or plush, embroidered.—5. A round upright of white wood 1 in. thick and 3 ft. 6 in. in length is set into a 3-sided piece at the bottom, and a simple flat leg is screwed into each of 3 faces; at the top fasten a round disc 1½ in. thick; into the edge of this bore a number of holes, equal to number of fans to be used; into these fit Japanese fans; finish the wood work with black shellac.—6. A very handsome screen is made of black satin, embroidered. The design is to be worked with colored silks in embroidery stitch; the tufts of the pampas work in 4 shades of brown; the leaves in 4 shades each of olive and bronze; and the stalk in brown; for the bird on the wing take several shades of gold and crimson; for the bird on the stalk, peacock blue, and on the breast a delicate rose; the kingfisher work in green and red, and the fish in its bill in pearl. For the flowers of the flag use 5 shades, from light to dark, of purple; and for the leaf, 4 shades of green; the trefoil flowers work in yellow; the pond lilies make with 3 shades of white tipped with pink; for the centre of the lily use olive and 2 shades of yellow; the cat-tails work in 3 shades of brown, and the leaves in olive and green; for the dragon-flies use green and gray; for the water, 3 shades of peacock blue, and work the grasses in the background in olive. Procure a suitable frame and fasten the satin on it neatly.

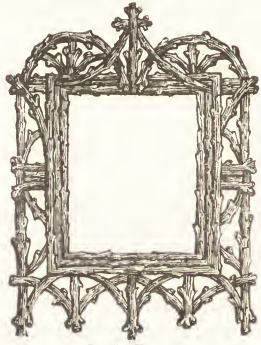
Embroidered Satin Screen.

FOOT WARMER.—An ornamental yet useful article can be made out of an old box; if possible it is preferable to have it round; line it neatly with some woolen fabric and cover it on the outside with silk or other light material of the same shade and color as the lining or of a contrasting color; the outside covering may be embroidered, or 3 or 4 ruffles of lace may be sewed on; woolen goods or silk embroidered makes pretty ruffles instead of the lace; the lid should be made to fit and covered and lined the same as the box; it should be fastened on by bows of ribbon or brass hinges; a bright silk cord finishes the edge of both box and lid neatly; inside of this place the hot bricks, or, better still, a rubber bag filled with hot water.

FRAMES.—1. For etchings and old wood or copper-plate engravings, nothing is better than a plain oak frame, flat, with a small bead on the internal and external edges; the frame must

Foot Warmer.

by no means slope to the picture; it is best flat, but if there be any inclination, let it be from the picture; these oak frames need not be stained nor varnished; an etching should be placed in a large mount, or mounted on a piece of drawing-board, so that it has a good margin; if the pictures are small, the frames may be made to hold two, three and upwards; plain pine frames, ebonized, and with a few incised gold lines, look well for landscape and architectural photographs; they may be easily made by an amateur.—2. Procure a glass of the required size; then a card of bristol-board the same size,

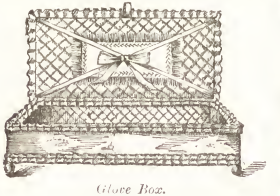


Rustic Frame.

to which glue or paste the picture after neatly cutting out; paste a sheet of strong paper, about 1 in. larger than the glass, on the back of the card, folding the edges neatly over on the glass;

thereby holding glass and picture together; procure black glazed paper and bind the edge, and trim with a strip of gilded paper inside the black edge.—3. Take yellow, withered leaves; dissolve gum Arabic; get mixed black paint and some copal varnish; choose perfect leaves; dry and press them between the leaves of books; rub the surface of the frame with fine sand-paper; give it a coat of fine black paint; when the paint is dry, rub smooth with pumice-stone, after which apply two more coats of paint; allow it to dry; after which arrange the leaves in any manner and variety you desire; gum the leaves on the under side, and then press them upon their places; dissolve some isinglass in boiling water; while the solution is warm, brush it over the work; when dry, give three coats of copal varnish, being particular to allow sufficient time to elapse between each for drying before putting on another coating; cut the frame from wood. —4. A little care in selection of material, and skill in handling tools, will frame engravings and paintings at slight cost. Oak wood, denuded of the bark, presents a beautifully corrugated surface; out of which the knife easily removes the few fibres which adhere, and it is ready for varnishing as soon as it is seasoned; the season cracks, should they occur, may be filled with dark-brown putty, and will even heighten the general effect. Take a thin board, of the right size and shape for the foundation or mat; saw out the inner oval or rectangular form to suit the picture; nail on the edge a rustic frame, made of the branches of hard seasoned wood, and garnish the corners with some pretty device, such, for instance, as a cluster of acorns.

GLOVE BOX. — Take a long, narrow pasteboard box 4 in. wide, 3 high, and 10 long; 1 yard of satin; a piece of feather-edged satin ribbon 1 in. wide; 2 yards of very narrow gros-grain ribbon; 4 round gilt beads or buttons having holes in each end; 4 large pins with which to fasten these on the box; 2 sheets of white wadding, and 2 spools of blue sewing silk;

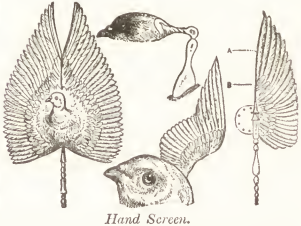


Glove Box.

cut a strip of satin 4 in. wide and long enough to fit round the box; draw this smoothly round the sides of the box, leaving ½ in. at top and bottom to be turned in; then cover the bottom with a plain piece of satin; turn in the edges and overcast with sewing silk to the piece which is fitted round the sides; for the lining cut pieces of pasteboard to correspond with the bottom and sides of the box, but a trifle smaller; cover them with quilted blue satin, sew the bottom and sides firmly together, and slip it within the first box; sew the edges of the 2 boxes together all round the top; trim it around inside with satin ribbon box-plaited; fasten a bead at each corner, thus forming the feet; a pin is run through the bead and the point inserted between the 2 layers of pasteboard, holding it securely in place; the upper and lower edges of the outside of the box trim with plaited ribbon; cover the lid outside with several layers of wadding and then draw the satin smoothly over it; it may be painted or embroidered before putting it on; line it with quilted satin; strap across the lining narrow gros-grain ribbon with a bow where it is crossed; these straps hold in place a sachet made of 2 layers of wadding, between which place the sachet powder; cover this with blue satin fringed out on each edge; cat-stitch the pieces together; then fasten the lid on by firmly sewing the back edges of it and the box together; a piece of narrow gros-grain ribbon about 5 in. long should be sewed to each side of the lid and carried down to each side of the box; trim the edge of the cover all round with plaited ribbon; place a short loop of gros-grain ribbon in the middle of the upper edge of the lid by which to lift it.

HANDKERCHIEF HOLDER.—Take two pieces of cardboard 6 in. square, one for the bottom and the other for the top, which is made to open like a portfolio; take a piece of blue ribbon 2 in. wide and 50 in. long; gather both sides; line the top and bottom with silk; fasten them together with the gathered ribbon; when completed it will look like a portfolio.

HAND SCREENS. — 1. A pretty mode of decorating Japanese hand-screens that have become discolored and damaged is to cover them neatly and tightly with a piece of China crepe, soft silk or merino, showing the sticks; then work a pretty floral design in crewel silks.—2. To make hand screens of feathers, select a bird; the common house pigeon is well suited for this



Hand Screen.

purpose; first remove the wings by severing the muscles at the elbow joint; place the bird on its back; place a weight on its tail and feet to keep it steady; raise the breast feathers around the top of the furcula bone, carefully holding them back; cut the skin across with the point of a pen knife; continue the cut downward towards the head on each side; turn the bird over and

join the cuts straight across the back; replace the bird and turn the skin inside out over the head by gently pulling and cutting; take care to cut the skin as deeply down into the orifice of the ear as possible; also avoid cutting the eyelids; sever the head at the base of the skull and scrape off all pieces of flesh or skin on the skull and jaw; take the eye out whole by carefully cutting around it; scoop out the brain from the hole at the base of the skull; stuff the cavity of the skull firmly with wool with sufficient arsenical soap to wet it; poke little bits of the same into the palate and the space between the jaws; rub the skull over with the soap and redraw the skin over the skull; now stuff the exterior nostrils with the soaked wool; open the mouth and stuff in as much wool as possible, pressing it down with a knife; make a little hollow indentation in the centre of the space for the eye-ball; use the wool to aid in this process; put the back of the eye in the hollow and arrange the front according to nature with the aid of a darning needle; press the skin firmly to the skull; a wire should be inserted to obtain the natural pose of the bird; fasten the head on to a board prepared for the purpose; a little stroking and smoothing of the feathers, and perhaps a little more stuffing with wool, so as to bring up the breast of the bird into its natural shape, will be all that is required; possibly aided by a pin or two being stuck through the edge of the skin of the breast into the board, and the head thus fastened is complete; remove all the flesh and sinews that lie between the pinion and elbow joints on the wings; rub the skin and bones well with arsenical soap, being careful of the feathers; lay each wing on the board and stretch them out; begin by confining the bone close to the elbow joint by strong pins, one on each side; then confine the first pinion feather, by fastening it with a single pin close to the stalk and 3 in. from the end; pin each succeeding feather in the same way; if the feathers do not lie flat to the board, pin strips of card board across the whole wing; take off the wing coverts (tufts that grow on the back of the bird) with the piece of skin on which they grew, and after being rubbed with arsenical soap, lay them down flat on the board; put the boards away where no dust can reach them; now select the handles and fasten them to a piece of board 3 or 4 in. round; make holes in the board by which the wings are fastened on when taken off the stretching board; tie the wings on in their proper position with a darning needle and twine; when both wings are fastened on, tie them together at points A and B; now put the head on; take it off the board, and pull out all the wool as far as the skull, taking care not to soften the hardened skin, or displace the feathers; sharpen a piece of copper bell-wire to a fine point, and insert it up the neck-bore through the skull, holding the pigeon's head in the palm of your hand, until the wire comes out at the top of the head; turn down the extreme end of the wire with a small pair of pincers, and withdraw the wire till the turned end is hidden amongst the feathers; replace the cotton wool, taking care to bend the wire to the shape, and, as far as possible, to keep it in the centre of the neck; bore a hole in the binder's board to match the position of the wire; glue the edges of the skin of the breast to the board; pass the wire through; press the head close down and then turn the wire on the other side and tie it to one of the wing-bones, or to some of the strings by which the wings were fastened on; glue the wing coverts side by side, on the inside of the wings, to cover the bones and fastenings, making their upper ends just cover the tie A; and at the other ends, if they are not quite neat in themselves, a small bow of ribbon may be glued on afterwards.

LAMP MATS.—1. Crochet a square or round mat the size desired; work a chain very loose of 16 stitches and fasten into each stitch around the edge; work five of these chains into each stitch.—2. Use bed-ticking; cut it any shape you wish and work the white with brown and red yarn in herring-bone stitch; first a row of brown, then a row of red; finish with crochet border in chain stitch.

LAMP SHADES.—1. A beautiful lamp-shade can be made of large sheets of fine, thin Bristol board; cut the sheets the shape of the wire frame, making a scalloped edge and bottom by placing a 25 cent piece on the edge and drawing a pencil around it; when this has been repeated all along on both sides, cut half of the mark away; procure a number of beautifully colored autumn leaves, either natural or embossed ones, and break off the stems close to the leaves; paint a vine all around the shade, and join the leaves to it in natural order, sticking them on with gum tragacanth; when completed let it lie under pressure for a few hours, then give the whole a coat of colorless varnish; when thoroughly dry, join the shade together with gum, pressing it dry with a hot iron; then fasten it to the wire frame.—2. For a circular shade, cut a perfect circle of size desired, fold it into 4 equal parts, and cut away one of the quarter sections; this will give a correctly proportioned figure for the shade; when the 2 edges are united, take fine white or tinted card board and cut by the pattern, forming the lower edge into large scollops, and with a "pinking-iron" finishing the edges of these; place the piece right side up on a flat, smooth surface; mark out the exact centre of each division formed by cutting the same number of small scollops at the top as at the bottom; run a line from one to the other; design some graceful figure, the simplest being an oval; but a prettier one is formed by marking a diamond or square of proper size; then draw a circle intersecting the diamond, thus forming 4 segments of a circle and 4 points of the square by effacing the inner lines of each figure. A clover leaf intersected by a triangle, forms another graceful figure; bind the edge with gold paper, or carefully pink it in small scollops; cut pieces of gelatine paper of some bright color, or, if preferred, using a set of small diaphanie plates, you may form charming illuminations; but a still more artistic embellishment for these spaces is obtained by using architect's transparent cloth with painted designs; in tracing the designs the transparent cloth may

be placed upon the picture and the outlines carefully traced, then with lamp-black rubbed up with dammar varnish fill in the centres, using great care to keep the outlines distinctly defined; put on the color with a camel's hair brush abundantly charged; the transparencies should be fastened in place with strong boiled paste with a little white glue added. It is well to line the circle of card-board with isinglass or transparent paper in order to protect from the heat of lamp or gas; the shade requires two circular pieces of wire united by 3 perpendicular pieces, and as many horizontal ones extending from the bottom ring to a ring in the centre fitting round the lamp-burner.

MIRRORS.—Glass is of great value in furnishing a room as it answers the same purpose as water in a landscape; too much glass is of course detrimental; small hand mirrors are not only ornamental but useful in the bedroom; they are made in various forms, the single oblong glass being the most common; triplex and duplex mirrors are also handy things in the bedroom; a plate glass surrounded by a rustic frame, presents a pretty effect; ivy vines may be twined over the frame.

Triplex Mirror (Open).

Triplex (Folded).

PEN WIPERS.—1. Make one in the form of a miniature tea cosy; line the cosy with stiff card and fill in with strips of cloth or, better, with ends of black worsted; the outside should be prettily worked.—2. Arrange cloth in 3 different colored rolls and pad by odd scraps until about ½ in. in diameter; form small strips of enameled cloth similar to those used for shawls, and fasten the tiny luggage together; a few threads of gold-colored silk will represent the buckles.—3. A parasol pen wiper is made of bright colored silk, attached to an ivory handle, and filled inside with cloth. — 4. Take a few sheets of the softest tissue-paper you can get, and fold and roll them all together into a bundle about 8 in. long; put an India rubber band around the middle of the roll, and then cut off the tops so as to allow insertion of pen for wiping, making the packet into hour-glass shape.

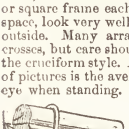
PIANO COVERS.—An upright piano may have a scarf with long ends to hang down on either side of the top. If the piano is scratched or marred it will conceal the fact in a great measure; if it is new it serves as a protection, while at the same time it is ornamental. One style is to have on one end a bar of music, with notes and words added to suit the fancy. Another is peacock blue serge bordered with old-gold satin, on which is worked peacock's eyes in filoselle. Below this is a band of green-blue plush, with a fringe of tufted crewels. Square pianos should always be covered with a cloth cover, of a color in harmony with the rest of the

Rustic Looking Glass.

furniture. A pretty border, not loud or pretentious, is a great addition around the edge.

PICTURES, To Choose and Hang.—A light picture makes a room look larger, and a picture darker than the wall it is hung upon will reduce the size of the room, unless the lightness of the frame is sufficient to compensate for the difference. If the room is small, hang very light pictures in it, and when it is uncomfortably large reduce it with dark ones. But there are other things to be considered. Pictures which represent narrow interiors do not enlarge rooms much, because they convey a feeling of confinement; but landscapes with vast distances enlarge rooms immensely. In engravings and water-colors the margin has an important effect. The whiteness of it may be ample compensation for the darkness of the print itself. The judicious selection of subjects is a matter of the first importance in the acquisition of pictures. This is especially the case when they are but few in number, and intended for the adornment of the rooms of a small house. As a general rule, oil paintings are considered most appropriate to the dining-room, but good engravings are also admissible. Paintings and engravings should not, however, be both used, as the effect of mixing the dissimilar forms of art is injurious to both. For the drawing-room, water-color drawings, or chromos, best harmonize with the lighter and brighter style of the apartment. Photos of good size may also be employed. For bedrooms, bright, cheery water-color drawings,

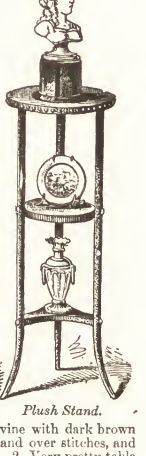
chromos, or photographs may be sparingly used, but the walls of a bedroom should never be crowded. Particular care should be taken to exclude unpleasant subjects, as in cases of illness their effect on the patient may become absolutely injurious. The same observation applies with equal force to the nursery. The pictures here need be of little money value, but they ought always to be pretty and tasteful, and if some of them are seasoned with a spice of fun it will be none the worse. It is seldom well to hang a sombre picture in a broad light, or a cheerful, sunny one in a shaded corner. A moonlit landscape or a night storm at sea are better placed in a mild light, while a group of laughing children, or a harvest scene, seem naturally to require a strong one. Companion pictures should be near together. The space between two windows, if not occupied by a mirror, is very nice for a gilt-frame picture of good size; dark frames look better in a more subdued light. Three pictures of the same general appearance hung in a horizontal row—about half the width of the picture is considered a proper distance between them—with two smaller above and the same below, matching the spaces, and making seven in all, are a very convenient and common form; or if the central piece is larger than the others the effect is equally good. Two ovals, one above the other, with a smaller rustic or square frame each side, matching the vacant space, look very well; or vice versa, the ovals outside. Many arrange pictures to represent crosses, but care should be taken not to overdo the cruciform style. A good guide for the height of pictures is the average height of the human eye when standing. Rods of brass placed just below the cornice, supported at intervals by brackets and having sliding hooks for any degree of adjustment, are best to hang pictures from. Picture cord is the usual agent of suspension, but gilt wire cord is perhaps less conspicuous and does not harbor dust. When cord is used care should be taken that its color harmonizes with the walls. Large hooks are always found useful, attached to the cornice.



Cornice and Hook.

PLUSH STAND.—This consists of two circular pieces and one triangular piece of pine board and three round sticks with bent ends. Rake handles, such as are used in hay rakes, answer well for the legs. The top and shelves are covered with plush, the legs are covered with the same material. The plush is applied to the legs with glue. It may be tacked on the two shelves and on the top, but the upper side of the top should not be covered until after the stand is put together, as it may thus cover the screws used in fastening the top to the legs. The plush is drawn down over the edges of the top, and the edge afterward covered with a brass strip fastened with brass nails. A large ornamental brass nail is placed in each leg opposite the two shelves. The legs should be covered with old gold plush, the top and shelves with maroon or garnet plush.

TABLE COVERS.—A very pretty cover can be made of fine gray ladies' cloth, 1½ yds. square, hemmed nearly all around, and decorated in the following manner: With a piece of chalk draw the outline of a vine running all around the cloth, about 2 in. from the edge; cut, from dark green cloth, a large number of ivy leaves; different sizes of real English ivy leaves answer for patterns, and the imitation ones will look very natural; place at unequal distances apart, along each side of the vine, marked with a large cluster in each corner, and a simple spray running around the cloth; tack them all on first, then fasten each leaf down by button hole stitching around the edge with zephyr the same shade as the leaves; work the vine with dark brown Berlin wool, simple over and over stitches, and the effect is really pretty.—2. Very pretty table covers are of satin, with velvet borders, at the corners of which are squares of plush, the borders being worked in point Russe stitches on both edges in colored silks.



Plush Stand.

POTTERY, To Decorate.—In this work, wood, glass or tin can be used, and two or more articles of different material may be cemented with white paint to form a receptacle for cards or fruit, according to the style of dish desired; when well dried, give the whole a coat of paint prepared as follows: Mix ⅜ of No. 1 coach varnish and ½ Japan dryer; use paints to color; if desired to paint brown, pour a little of the above in a dish and mix in with a paint brush burnt umber to give the right shade; do not get it too thick; for scarlet, use a little of the best vermilion by mixing what you need in another dish; decorate with embossed pictures or any fancy pictures, gilt bands, etc.; then varnish with the prepared varnish, clear, not too thick. If light tints are desired, procure white zinc ground in varnish, and for pale pink mix a very little vermilion in some of the zinc; pale blue, use ultra marine blue; pale green, use chromic green, or Paris green will do; mix these colors for pale tints with the white zinc, and always finish with a coat of demar varnish.

SCRAP BAGS.—1. A neat scrap bag or catch-all consists in simply trimming one or both sides of a rush basket with flowers and grasses, finished off with a bright jaunty bow.—2. Take 2 medium sized, 3-ply wooden plates; bore in

each 12 holes near the edge and at equal distances from each other, leaving a space where there are no holes for the opening of the bag; paint or draw with India ink on the bottom of each plate, which is to be the outside, some pretty design; take a piece of satin about ¾ yd. long and over ½ yd. wide; hem each end and run in a short piece of elastic; gather each side and draw up till it makes a puff just long enough to reach between the two end holes of a plate; bind the edges of the puff; make 12 little slits in each binding corresponding to the holes in the plates; take 2 yds. of satin ribbon, ½ in. wide; put it through the first hole on the outside of the plate and through the first slit in the binding, through the second slit and second hole, and so on till it comes out through the twelfth hole in the plate; tie the ends together in a bow; take 2 yds. more of ribbon and do the same with the other plate.

SHAVING CASES.—Take ½ of a sheet of silvered perforated card board; cut off round at the bottom, running up to a point at the top; bind around with worsted braid of any color; box-plait enough of the braid to go around, catching together by one edge, and sew just under the edge of the binding; cut a back the same size, of plain card board, and pierce 2 holes through each; put a ribbon through to hang up by; fill with any kind of paper.

SLEEPING ROLLS.—Measure the width of your chair back and make a stout linen bag, drawn up at each end, of a length corresponding to that width; the diameter depends upon the amount of support you wish to give to the sleeper's head; stuff the bag with the best hair, and after closing it put on the cover, knitted and crocheted to match the roll in size; draw up the cover at the ends and put on tassels, and strings to fasten the roll to the chair.

SOFA PILLOWS.—1. Take little scraps of silk and ribbon cut the width of a pencil and 2 or 3 in. long; knit with strong tidy cotton, in the same way fringe is knit into mittens; as it is heavy and cumbersome work, it is best to knit it in strips or squares and then join together.—2. A handsome cushion cover or sofa pillow can be made of bed ticking; get narrow braid of different colors; sew them on each stripe, or work them with worsted on the white strips in different stitches.

TABLE MATS.—A ball of No. 6 white tidy cotton and medium size crochet hook; set up a

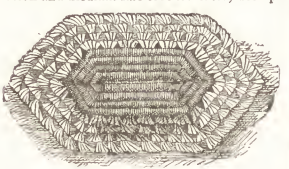


Table Mat.

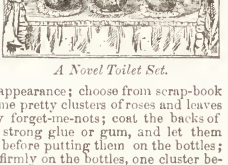
chain of 32 stitches, and crochet back 1 row plain, widening at the end of the row; turn the work every time, as you do not work round, but must leave it open at one end, for the work is to be ribbed; widen 6 times each row; make the mat 6-sided by widening at each end and at the four corners; crochet until there are 9 ribs, counting from the centre; make the border of shell stitch. This is the largest mat in the set. Smaller ones are made in the same way by using 21 stitches and making 6 ribs from the centre.

TEA COSIES.—They are made in cap shape to cover the teapot, and must be warmly wadded and lined. Quilted silk, satin or merino are the materials most used for them. Some are daintily embroidered or hand painted.

TIDIES.—1. Select any pattern resembling lace; edge-work the main pattern with split zephyr; then fill in all the other stitches of the border with sewing silk.—2. A pretty tidy is made by taking white tidy cotton No. 8. Make a diamond in Afghan stitch; commence with 1 stitch; widen once each time across on each side alternately until you have 30 stitches; work 10 times across, and narrow the same as you widen until done; embroider in cross stitch any little flower or pattern in each diamond; sew them together, there being 7 of them; crochet around the edge with the same color of worsted that you embroidered the flower with; make 4 tassels for the ends.—3. Lace tidies are made by sewing velvet or satin ribbon and insertion together alternately, finishing them with a row of lace and insertion; scarlet velvet and black lace look very rich.—3. Use a teacup for a pattern and cut out pieces of bleached cotton or silk, a quantity of small pieces; turn in the edge; gather it by whipping the thread over; then draw it up together as closely as possible with a strong thread; fasten a tuft of corn-colored zephyr in the centre of it; it is quite a representation of a daisy.

TOILET SET.—The straw-covered bottles in which the Farina cologne is put up can be very prettily ornamented for the toilet table in the following manner: First give a coat of any good gold paint; directions for its use are given with each bottle; after the gilt is dry rub with a piece of cotton batting until of a somewhat burnished appearance; choose from scrap-book pictures some pretty clusters of roses and leaves with a few forget-me-nots; cut the backs of these with strong glue or gum, and let them dry a little before putting them on the bottles; then press firmly on the bottles, one cluster being sufficient for each; the corks are also gilded, or it gives a much handsomer finish if glass stoppers are used; these, too, should be gilded; tie a bow of bright ribbon round the neck just below the stopper; gild the powder box in the



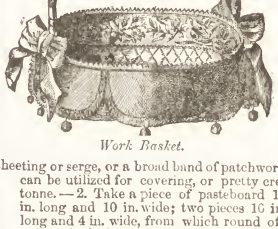
A Novel Toilet Set.

same manner as the bottles, and a similar design of roses and forget-me-nots glued on the side; a bow of the same colored ribbon used for the bottles is placed in the middle of the cover, and answers as a handle by which to lift it off; the basket is then lined with silk or satin.

WALL POCKETS. — Cut a tastefully shaped piece of stiff pasteboard 18 in. broad and 20 in. high, rounding off the lower corners, and cutting a large scallop out of each side above, which form a point in the centre and at each end; cover with bright colored cambric, lining the back with white muslin; cut a piece of white pique to fit the lower half of the pocket after gathering in ½ of its size; also a piece of the same, fitted in the same manner to the upper part, and upon this arrange 3 small pockets; cut in small half circular pieces; the centre one arranged as a watch pocket, with open circle in the centre; ornament the edges of all the pockets with quillings of the bright colored cambric, pinked out on each edge and inclosed in the band, binding the tops of the 2 large pockets with a strip of strong elastic; fasten the upper pocket to the card board back along the sides and bottom; then the lower pocket; which should extend 2 in. above the lower edge of the upper one; sew the pinked quilling around the entire edge, and form suspension cords of the cambric pinked out on the edges, with bows of the same.

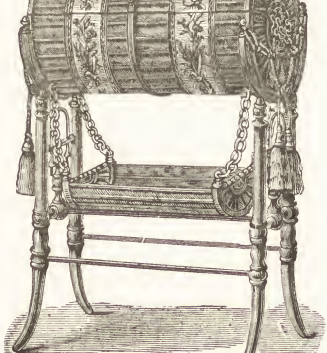
WHISK BROOM HOLDER.—Cut 2 pasteboard hearts 10 in. long, 8 across the top; cut 2 wedge-shaped pieces 3 in. long and 1 at the top for the sides; cover with black lady's cloth, and line with blue flannel; after joining together, work around the edges with gold-colored silk in button hole stitch; on the front work with gold colored silk some pretty pattern in chain stitch; in the centre work your monogram; hang with blue cord and tassels.

WORK BASKETS. — 1. Take a wooden pail; draw a piece of satin in a frill round the top, and fasten it with small tacks, and draw in again with a draw string round the bottom, and again secure it; fasten a ruche round the top and bottom and twist satin ribbon round the handle; make a top of cardboard, covered neatly with satin, with a ruche round the edge and a fall of lace; attach by a ribbon on one side, so that it will come off, and hang down when the receptacle is being used; black satin with a ruche of gold-colored satin round the edge, with a fall of cream-colored lace, looks well and suits all furniture, though red or blue is very pretty and bright looking; a piece of embroidered crash,



Work Basket.

sheeting or serge, or a broad band of patchwork can be utilized for covering, or pretty cretonne. — 2. Take a piece of pasteboard 16 in. long and 10 in. wide; two pieces 10 in. long and 4 in. wide, from which round off uniformly the lower corners; cover one side of each of these with black or colored alpaca; sew the two end pieces along the sides to form the foundation of the basket, putting the covered sides out; next cut a piece of cherry-colored silk as large as the bottom part; lay a layer of cotton over, and quilt in diamonds; baste this over the bottom and half way up the sides; cut pieces in the same way to fit the rounded ends; take a piece of the silk 4 in. wide, and long enough to extend round the basket, which piece cut into 10 scallops, and ornament the edges with a narrow silk braid fringe or embroidery; sew the ends together; then, putting the lambrequin or drape over the basket, sew it round the edge; next cut a strip of corn-colored flannel or cloth to go round the inside; pink each edge and embroider the design on it with cherry-colored, yellow, black, and white silk; or use a figured ribbon for this band; for the handle cut a piece of pasteboard ½ in. wide; sew a wire on each edge and cover with cherry and corn-colored ribbon wound round it; finish with ball-buttons and bows of ribbon. — 3. A handsome and convenient work-stand can be made as shown in cut. Get a cabinet maker to make a frame; then, if



Work Stand.

wicker-work is preferred for the receptacles, get them made by a basket maker, and line and trim to suit, seeing that the upper half of the largest receptacle is the smallest part of the cylinder. Or a good way would be to have a paper-box manufacturer make the sections of the cylinder, which completely cover and line according to taste. Hang the smaller receptacle by cords or light chains.

HOUSEHOLD MISCELLANY.

BEDS, Dampness in.—After the bed is warmed, put a glass globe in between the sheets, and if the bed be damp a few drops of wet will appear on the inside of the glass.

BEDS, To Warm.—1. Take a long stone quart bottle, let it be filled with boiling hot water, with a good cork; wrap it up in 2 or 3 folds of flannel or woolen cloth; this done about ½ hour before bedtime, introduce it between the sheets at the foot of the bed; the water thus bottled will be found to retain its heat till the next morning. — 2. Providing one has neither warming pan or soapstone, bricks make a very good substitute; heat them well, wrap in thick brown paper so as not to scorch, and move about between the sheets.

BLANKETS, To Store.—Spread a large coarse sheet on the floor; fold up the blankets and place them on it, having sprinkled between every fold either shreds of tobacco or bits of camphor; having piled the blankets smoothly, put the remainder of the sheet around them and over them, and pin up tightly in various places; then lay the whole in a large chest or dark closet; let them remain unopened during the summer.

BOOKS, To Preserve.—A few drops of any essential oil will secure libraries from the effects of mold and damp; Russian leather, which is perfumed with the tar of the birch tree, never molds.

BREAD, Stale, To Freshen. — Put a stale loaf into a closely-covered tin vessel; expose it for ½ hour or longer to a heat not greater than that of boiling water; allow it to cool, when its freshness will be found restored.

BREAD, To Keep Moist.—Keep a large earthen jar—a cover of the same material is better than a wooden one—and have it well aired and fresh; let the bread be well cooled after it is taken from the oven; then place it in the jar and cover closely.

BROOMS, Care of. — Keep a separate broom for the parlor, the dining room, sleeping room and kitchen; when the latter is too much worn for use in the house, send it to the barn, take the second best for the kitchen, the broom from up stairs for the dining room, the parlor broom for the chambers, and let the new one be kept for the parlor and hall. Leaning heavily on a broom when stooping to pick up articles while sweeping, results in bent and broken splinters and a worthless broom; when a new broom is purchased provide a way for hanging it up; always hang or stand it with the brush up; if the broom becomes one sided, scald it and bend it back; if brooms are wet in boiling suds once a week, they will become very tough, will not cut a carpet, will last much longer, and will always sweep like a new broom. (See *Sweeping* in Household Cleaning).

BUTTER, Rancid, To Sweeten.—Put 15 drops of chloride of lime to 1 pt. of cold water, and work the butter in it until every particle has come in contact with the water; then work it over in pure cold water.

BUTTER, To Keep Cool.—Butter may be kept tolerably firm in even hot weather by setting the crock containing it in a shallow dish of water, with a cloth tucked well over it, so that the vessel is covered and the ends are under it in the water.

CANDLE, To Burn Slowly. — Put finely powdered salt on the candle till it reaches the black portion of the wick; it will give a dull light, suitable for the sick-room, and be sure to last the entire night.

CELLARS, Dampness in, To Test. — Take a thermometer, a glass tumbler filled with water, and a piece of ice; then notice how low the thermometer, when placed in the tumbler, has to sink before any moisture begins to show itself on the outside of the vessel of cold water; the lower the temperature to which the thermometer has to sink before moisture is precipitated, the less there is of it in the moisture of the cellar.

CELLARS, Dry Rot in.—This, in cellar timbers, can be prevented by coating the wood with whitewash to which has been added enough copperas to give the mixture a pale yellow hue.

CELLARS, Freezing in. — Paste the walls and the ceiling over with 4 or 5 thicknesses of newspapers; make a curtain of the same material; paste over the window at the top of the cellar; paste the papers to the bare joist over head, leaving an air space between them and the floor; it is better to use a coarse brown paper; whatever paper is employed, sweep down the walls thoroughly, and use a very strong size to hold the paper to the stones; it is not necessary to press the paper down into all the depressions of the wall; every air space beneath it is an additional defence against the cold.

CELLARS, Mold in.—1. Put some roll brimstone into a pan and set fire to it; close the doors, making the cellar as nearly air-tight as possible for 2 or 3 hours, when the fungi will be destroyed and the mold dried up; repeat this operation every 2 or 3 months, and the cellar will be free from parasitical growth. — 2. Pour 2 parts of concentrated sulphuric acid over 1 part of common salt; during the process all openings must be closed, so as to prevent any escape of the gas, and the greatest care exercised not to enter the cellar after the operation until it has been thoroughly ventilated.

CHEESE, To Keep Moist.—1. Take a linen or cheese cloth; dip it in white wine; squeeze out

excess of wine and wrap up the cheese in it; by doing this the cheese is not only kept moist, but the flavor is improved.—2. Cut a sufficient quantity for a few days' consumption from the cheese, and keep the remainder in a cool place, rather damp than dry, spreading a thin film of butter over the fresh surface, and covering it with a cloth or pan to keep off the dirt.

CHINA, Care of. — When fine china is put away in the china closet, pieces of paper should be placed between them to prevent scratches on the glaze or painting; the china closet should be in a dry situation, as a damp closet will soon tarnish the gilding of the best crockery; in a common dinner-service, it is a great evil to make the plates too hot, as it invariably cracks the glaze on the surface, if not the plate itself; when the glaze is injured, every time the "things" are washed the water gets to the interior, swells the porous clay, and makes the whole fabric rotten.

CHIMNEYS, Burning of.—Place movable fire-frames of iron work near the base of the chimney, one above the other, about 1 foot apart; no flame passes through them, whilst the draught in the chimney is not interfered with, the result being that no fire can happen in the chimney.

CHIMNEYS, Cure for Sooty.—Plaster the inside with salt mortar; the proportions used are 1 pk. salt added, while tempering, to 3 pks. mortar; chimneys thus treated have remained perfectly clean for 15 years.

CHIMNEYS, Smoking. — 1. Large fire-places are apt to smoke, particularly when the aperture of the funnel does not correspond in size; for this a temporary remedy may be found in opening a door or window—a permanent cure by diminishing the lower aperture; the best method of cure is to carry from the air a pipe under the floor and opening under the fire. The chimney may only smoke when the wind is in a particular quarter, connected with the position of some higher building, or a hill, or grove of trees; the common turn-cap, as made by tin and iron men, will generally be found a fully adequate remedy.—2. Use a screen or blower of fine wire gauze, from 36 to 40 wires to the inch, immediately in front of the fire and about 2 in. therefrom.

CHIMNEYS, To Sweep. — When soft coal is used daily, the chimney requires sweeping every 3 or 4 months; should it smoke, it is a pretty sure sign that sweeping is necessary; for though the chimney itself may be clean enough, the chimney-pot may have become choked up in some way or other that prevents the smoke having free egress. Persons often clean their own flues in the following manner: After the fires are out at night, a mat or other convenient material is then fixed against the front of the mantelpiece, in the same way that it would be by the sweep; then pass a gun up the chimney as high as can be reached from the left-hand side, removing the mat only just enough to admit his right arm, and holding the mat close with the other; the gun is then fired up the chimney; as soon as the soot has settled and the gun reloaded (of course with powder only), the operation should be repeated, 2 discharges of the gun being generally sufficient; the mat must remain safely secured against the chimney-piece all night, and in the morning ascend to the roof and sweep down as far as can be reached; for this purpose a long stick should be procured, to the end of which an old broom, or, better still, a brush should be attached.

CISTERNS. Waterproofing.—To make cisterns and tanks waterproof, paint thickly on the inside with a mixture composed of 8 parts of melted glue and 4 parts of linseed oil, boiled with litharge. In 48 hours after application it will have hardened so that the cistern or tank can be filled with water.

CISTERN WATER. To Clear.—1. Never allow a mudhole to remain about a well. If the water is muddy and impure throw in a peck of lime to purify it; if animalculæ appear in the water throw in ½ gal. of salt to make them settle to the bottom.—2. Add 2 oz. of powdered alum and 2 oz. borax to a 20-barrel cistern of rain water that is blackened or oily, and in a few hours the sediment will settle, and the water be clarified and fit for washing.

CISTERN WATER, To Keep Sweet.—1. To prevent cistern water from becoming impure, have the supply pipe run nearly to the bottom of the well, where the purest water is always to be obtained.—2. First collect the water in a tank, and filter it into the cistern below the surface. This will remove the organic matters, and prevent fermentation. Care should also be taken to prevent surface drainage into it.—3. The spout from the roof should have a joint in it, which can be drawn aside so as to prevent any water falling on the roof from reaching the cistern. It should be kept thus drawn aside during dry weather; when rain comes on allow the roof to get thoroughly washed off before replacing the joint. If this be done the water will always be clear and fit to drink.—4. Drop into the cistern a large piece of common charcoal.

CLINKERS IN STOVES, To Remove.—When the firebricks have become covered with clinkers which have fused and adhered, they may be cleaned by throwing oyster or clam shells into the fire box when the fire is very hot, and allowing the fire to go out. The clinkers will generally cleave off without the use of much force the next morning. From 1 qt. to a peck will be sufficient for most stoves, and the operation can be repeated if some of the clinkers still adhere. Salt sprinkled on clinkers adhering to firebrick will also loosen them.

CLOTHES. Burning. To Extinguish. — The clothes of females and children, when on fire, may be most readily extinguished by rolling the sufferer in the carpet, hearth-rug, table-cover, or any other woolen article at hand; if this be expertly done, the flames may be rapidly put out, unless the skirts of the dress be distended by hoops or crinoline, when there is great difficulty in staying the progress of the flames. Should assistance not be at hand, the person whose clothes are on fire should throw herself on the ground and roll the carpet round her; or if such a thing is not in the room, she should endeavor to extinguish the flames with her hands, and by rapidly rolling over and over on the floor. In

this way the fire will be stifled, or the combustion will proceed so slowly that less personal injury will be experienced before assistance arrives.

COAL, Artificial.—1. 125 parts sifted peat; 10 parts river mud; 1,000 parts anthracite dust, and 100 parts residues of schist oil, or 120 parts of dry coal pitch; mix.—2. Small coal, charcoal, or sawdust, 1 part; clay, loam, or marl, 1 part; sand, or ashes, 2 parts; water, q. s.; make the mass up wet into balls. For use, these balls are piled on an ordinary fire to a little above the top bar. They are said to produce a heat considerably more intense than that of common fuel, and ensure a saving of one-half the quantity of coals, while a fire thus made up will require no stirring, nor fresh fuel for 10 hours. The quantity of the combustible ingredient in them should be doubled when they are intended to be used with a very little foundation of coal.

COAL OIL, Dangers of.—It should be kept in some portion of the house where neither sunlight nor any fire nor artificial heat can come. Lamps should be filled in the daytime and under no circumstances should be filled at night with another light near. The oil itself is not explosive; it is the gas engendered by the oil that occasions the explosions that daily occur. A half empty lamp, although standing on a table, without being touched, is liable at any moment to explode. Great care should be taken to buy none but oil above a safe fire test. This is nominally 112°; but 140° or over should be insisted on.

COAL OIL, To Test.—In a small cup or glass place a small quantity of oil to be tested; immerse in the oil the bulb of a good thermometer; suspend the cup containing the oil in a vessel of water; move about close to the surface of the oil a lighted taper, and note the degree on the thermometer at which the oil begins to emit inflammable vapor (the flashing point), and again that at which the oil inflames. Oil to be used in lamps should not take fire below 112° Fahrenheit. In applying the lighted taper the flame must be kept away from the glass of the thermometer.

COAL, To Protect.—Soft coal should be kept protected from the frost, rain and snow. If allowed to become wet and then subjected to alternate heat and cold, it will crumble and become difficult to handle and hard to burn. Dry coal is tolerably clean to handle, while it kindles easily and produces comparatively little smoke.

CORKSCREWS, Substitutes for.—A convenient substitute for a corkscrew may be found in the use of a common screw, with an attached string to pull the cork. Or, stick two steel forks vertically into the cork on opposite sides, not too near the edge; run the blade of a knife through the two, and give a twist.

CORKS, To Remove.—With a stout string projected into the bottle, turn the bottle around until the cork is caught in a loop of the string, and with force pull out the cork.

CORN COBS, As Fuel.—Corn cobs make the best and cheapest summer fuel to be obtained. They are richer in potash than any wood, and the ashes ought to be saved for soap making.

CREAM, To Keep.—Cream already skimmed may be kept 24 hours, if scalded without sugar; and, by adding to it as much powdered lump sugar as will make it sweet, it will keep good 2 days in a cool place.

DISHCLOTHS.—1. Get a pair of wooden needles and one ball of candle wicking; set up a row of 20 stitches; knit back and forth until you use up the ball; then it will be done—a nice, soft, thick dishcloth.—2. Have about ¼ yard square, when folded 4 times, or any other dimensions that may suit, of mosquito netting; baste it together strongly and it will make a perfect dishcloth. This is porous and light as a sponge, and can be cleaned with the least labor, and rendered perfectly sweet.

DOORS, Creaking.—Rub a little soap or a mixture of tallow and black lead on the hinges; or apply to them with a feather a little sweet or sperm oil once or twice a year.

DOORS, Slamming.—To prevent the noise of door slamming, a small piece of vulcanized India rubber, cork or leather may be placed so as to receive the shock.

EARTHENWARE AND IRON, To Season.—Put new earthenware into cold water, letting it heat gradually till it boils; then let it cool. Brown earthenware especially may be toughened in this way. A little rye or wheat bran thrown in while it is boiling will preserve the glazing from being injured by acid or salt. New iron should be gradually heated at first, as it is apt to crack.

ECHOES IN HALLS, To Correct.—This can be remedied by the stretching of small wires at the proper height and at suitable distances. The wires, although so small as to be hardly visible, break the sound waves and prevent the reverberation that has hitherto been the chief obstacle and annoyance to listeners. Only three or four wires crossing the room each way produces this improvement.

ENAMEL, For Copper Vessels.—12 parts of white fluor spar; 12 parts of unburnt gypsum, and 1 part borax; finely powder, intimately mix and fuse in a crucible; the fused mass is then poured out, and after cooking rubbed to a paste. Coat the vessel inside with this preparation, using a brush; place in a warm place to dry; then subject to a gradually increasing heat till the preparation fuses. On cooling, the vessel is covered with a white enamel, adhering firmly, and impervious to vegetable acids.

FABRICS, To Make Fire-proof.—80 parts pure sulphate of ammonia; 25 parts carbonate of ammonia; 30 parts boracic acid; 12 parts pure borax; 20 parts starch; 1,000 parts distilled water. Dip in this while it is hot; dry and iron.

FEATHER DUSTER, To Make.—A good feather duster may be made by boiling the wing feathers of a turkey or chicken for 5 or 10 minutes; then rinse them in tepid water; dry them and tie them up in bunches to use in greasing pans and for brushing egg over tarts or pastry; take any round stick of the proper size, such as the end of a broom handle, for the handle of the brush; if one happens to have an old duster handle that can be used once more, with a saw make a series of grooves or deep notches in the

lower end of the handle; by the aid of a hammer the lower portion of each quill should be so flattened as to pass into the grooves; as fast as feathers are put in they should be tied with strong twine; as the work proceeds glue should be added, that the feathers may be more firmly fastened; in this way new rows of feathers, followed by the twine and glue, may be added, until the end is completely covered and the duster is of sufficient size, after which the finishing row of large feathers selected for the purpose is placed around the whole and tightly bound with twine; outside of the base of this last row of feathers, a neat strip of leather may be glued to improve the appearance and render the feathers more secure.

FEATHERS. Goose. To Keep Sweet. — Goose feathers are more oily and sooner turn rancid than chicken feathers; they should be well washed in hot water, with plenty of soap, and a cup full of ammonia to a barrel of water; then rinsed and dried; if chicken feathers are mixed with them, or the large goose feathers, the vanes should be stripped from the quills; the vanes then curl up and are as elastic as the other feathers.

FEATHERS, Moth Proof. — Dip the joint or fleshy ends of turkey, geese or chicken wings into a strong solution of copperas; this makes them moth-proof, as well as more durable.

FEATHERS, To Change,—To change feathers from one bed to another, make an opening at the end of the tick to be emptied and also in the one to be filled, and sew them together; then rip the seam at the side of the one to be emptied; make the opening large enough to put your hand through; put the feathers into the new tick with your hand; you will find it can be done quickly and without scattering the feathlers; if you make the opening for your hand too large pin it at the wrist.

FEATHERS, To Utilize. — The wings of turkeys, geese and chickens should never be thrown away; they are excellent for cleaning windows, and much more economical than chamois; they are also useful for putting on paste when papering walls; cut the plume portions of the feathers from the stems with scissors; throw away the stems and put the remainder in coarse sacks; when the bags are full, close them up, and subject the contents to a thorough kneading with the hands; at the end of 5 minutes the feathers become a down of great lightness, even more so than eider down, which is considered so valuable.

FIRE ALARMS. — 1. A device for indicating fire in any one of a series or suite of rooms has been made by drawing a long iron wire through all the rooms near the ceiling; one end is fixed to the wall, and the other is secured to a common house bell hung on a spring; in each room the wire is broken and the gap is closed by a small strip of gutta-percha; under each piece of gutta-percha is a short slack piece of chain, so that when it melts the ends of the wire will be held secure; in case of a fire in any room the gutta-percha melts (at 100° Fah.), and the wire is drawn apart by a weight at the end where the bell is placed; this frees the spring, and the bell rings; the bit of chain prevents the weight from falling, and as each room is provided with a different length of chain, the distance the weight has fallen records the room where the wire is parted. — 2. An old gun loaded with a heavy charge of powder, and hung near the rafters in a barn, or in any dangerous locality about the house, makes an excellent fire-alarm; the explosion is caused by the heat.

FIRE, Causes of.—Allowing sparks to fall on the floor and remain there without extinguishing them; carrying a light into rooms containing inflammable substances; smoking carelessly and in dangerous places, as workshops, warehouses, on shipboard, etc.; keeping matches in improper places, and neglecting to pick up those that may happen to fall on the ground; improper construction of buildings; covering up a fire place when not in use, with wood, or paper and canvas, etc.; the soot falls either from the flue itself or an adjoining one into the grate; a neighboring chimney takes fire, a spark from this falls down the blocked-up flue, ignites the soot in the grate, which smoulders until the covering is burnt through, and thus sets the building on fire; loss of property is sometimes caused by want of proper care in hanging up or removing the goods in dry goods store windows when the gas is burning; putting hot ashes in wooden boxes or barrels, where the coals will remain alive, when covered, for 3 or 4 days; leaving cloths soaked in oil around the premises; after a few days they ignite of themselves; they are frequent causes of fires in shops; the careless practice of allowing the wick cinders or trimmings of the wick to collect around the burner; they are apt to take fire and thus, unobserved, heat the lamp, until the oil begins to vaporize, when an explosion takes place; reading in bed with a lamp standing on a chair or stand beside it; the reader falls asleep, and with the movement of an arm, or of the bed covering, the lamp is knocked over, and the room is on fire in an instant.

FIRE, Chimney on. — 1. Shut the doors and windows, and stop up the bottom of the chimney with a piece of wet carpet or blanket, throwing a little water, or flowers of sulphur or salt, on the fire before doing so; by this means the draught is stopped, and the burning soot extinguished for want of air.—2. Burn a few pounds of "carbon disulphide" on the hearth; the combustion of this substance produces large volumes of carbonic and sulphurous acid gases, both of which are effectual extinguishers of flame.

FIRE KINDLERS.—1. Take rosin, any quantity, and melt it, putting in for each pound being used, from 2 to 3 oz. of tallow; when all is hot, stir in pine sawdust to make very thick; and, while yet hot, spread it out about 1 in. thick, upon boards which have fine sawdust sprinkled upon them, to prevent it from sticking; when cold, break up into lumps about 1 in. square; but if for sale, take a thin board and press upon it, while yet warm, to lay it off into inch squares; this makes it break regularly, if you press the crease sufficiently deep, greasing the marked board to prevent it from sticking.—2. Take 1 qt.

of tar and 3 lbs. of resin; melt them; bring to a cooling temperature; mix with as much sawdust, with a little charcoal added, as can be worked in; spread out while hot upon a board; when cold break up into lumps of the size of a large hickory nut, and there will be, at a small expense, kindling material enough for a household for 1 year.—3. Dip corn-cobs for about 1 minute in a bath composed of 60 parts melted resin and 40 parts tar; spread out to dry on metallic plates heated to the temperature of boiling water.

FIRE, To Deaden. — If you are in a hurry to broil a steak and the fire is too brisk, a little salt will deaden it.

FIRE, To Escape from.—Escape from apartments on fire may be best effected by creeping on the hands and knees to the window or door; the atmosphere of a room so full of smoke as to produce suffocation to a person standing upright, may generally be safely breathed on nearly a level with the floor; a damp cloth, or handkerchief, tied over the mouth and nostrils, or over the whole face and head, will enable a person to effect a passage through the densest smoke, and in many cases, to escape from buildings on fire, when otherwise it would be impracticable; should descent by the stair-case be found impossible, then the window should be immediately sought, and a ladder or fire-escape waited for; a good ready-made fire-escape is a knotted rope; in the absence of either, if the danger is imminent, a rope should be made by tying the sheets and blankets of the bed together (being careful to tie square knots), one end of which should be firmly secured to one of the bed-posts, and with this apparatus descent should be cautiously attempted. Jumping out of the window should be avoided, as persons run just as much danger in performing such an exploit as they do by remaining in the burning building. When it is impossible to escape from a burning building by the stairs or windows, retreat may be sometimes secured by a trap-door opening on to the roof, or by a skylight, when, unless it be an isolated house, the roof of one of the adjoining buildings may probably be gained with safety. When arriving at a large hotel, one should familiarize himself with its plan before retiring.

FIRE, To Extinguish.—If the fire appears at all serious, and there are fire engines within a reasonable distance, it is best to wait until they arrive. Many buildings have been destroyed from opening doors, and trying to extinguish fires with insufficient means. If no fire extinguisher is at hand, collect as many buckets outside the room on fire as can be obtained, keeping the door shut; then creep into the room on hands and knees (if the heat and smoke are considerable), and throw the water as nearly in the direction of the fire as possible, keeping the door shut while more water is being collected. When an apartment is found to be on fire, the door, chimney and windows should be immediately closed, if possible, and only opened for the purpose of projecting water on the flames. By this means the supply of air will be cut off, and rapid combustion prevented. It is found that sal ammoniac (5 oz. to the gal.) added to water used to extinguish fires renders its action more effective. Salt and kitchen soda act less effectively.

FLIES, To Drive from a Room.—Place a castor oil plant in the room and the flies will leave.

FLOUR, Musty. — Carbonate of magnesia, 3 lbs.; flour, 765 lbs.; mix. This causes the flour to become more wholesome, producing lighter and better bread than when alum is used, and absorbs and dissipates the musty smell.

FURNITURE, Friction of. — The slides and rests of desks or bureau drawers may be made to move easily by spreading common stove blacking evenly with a cloth or the finger over their surfaces.

FURNITURE, Swelling of. — Sulphuric acid rubbed on the edges of bureau drawers will prevent their swelling in damp weather.

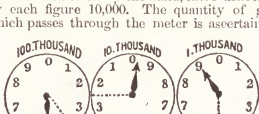
GAME, To Keep.—Newly ground coffee sprinkled over game will keep it sweet and fresh for several days. Clean the game, that is, wipe off the blood, cover the wounded parts with absorbent paper, wrap up the heads, and then sprinkle ground coffee over and among the feathers or fur, as the case may be; pack up carefully, and the game will be preserved fresh and sweet in the most unfavorable weather. Game sent open and loose cannot be treated in this manner; but all game packed in boxes or hampers may be deodorized as described. A teaspoonful of coffee is enough for a brace of birds, and in this proportion for more or for larger game.

GAS LEAKS.—To know how to read the meter will show how to detect escaping gas. To detect the locality of a leak the first thing is to see that no burners have been left turned on by accident, which is often the case where the cock has no stop, and is caused by the cock being turned partially round again as to open the vent. The next thing is to try the joints of the gas fittings. If gas is escaping it will take fire at the leak, if a lighted match is held near the joint; or if too little to burn steadily, it will momentarily catch and extinguish in little puffs. If beneath the floor, the sense of smell will generally detect the section of the floor under which the leak is, as it escapes, owing to its levity, upwards through the crevices of the floor, and penetrates the carpet, if there be one. If bracket or side burners are used, and the escaping gas is behind the casings, the crevices in the casings, or the openings where the pipe enters the room, will let the escaping gas enter the room sufficiently at these points to indicate somewhat nearly the location of the leak. In such cases never apply a light to the crevices or casings, but turn off the gas at the meter, and send for a gasfitter, otherwise an explosion may occur.

GAS METERS, To Prevent Freezing.—½ pt. of good glycerine is said to prevent the freezing of 1 gal. water, though at least double the proportion is preferable in the country, whatever the temperature in the winter may happen to be.

GAS METERS, To Read.—The figures on the index at the right hand denote even hundreds. When the hand completes the entire circle it denotes 1,000, and is registered by the hand in the centre circle, pointing to 1—each figure in the centre circle being 1,000, this entire circle

being 70,000, and is registered on the index of the left hand circle by the hand, there denoting by each figure 10,000. The quantity of gas which passes through the meter is ascertained



Face of Gas Meter.

by reading from the index at the time the amount is required to be known, and deducting therefrom the quantity shown by the index at a previous observation. If the whole is registered by the hands on the three circles above it indicates 49,900; amount at previous observation, as shown by the dotted lines, 42,500; this shows amount which passed through since last taken to be 7,400. The register at all times shows the quantity that has passed through since the meter was first set, by deducting from which the amount that has been paid for (without any regard to the time when) shows that the difference remains unpaid.

GAS. To Avoid Waste of.—Turn the gas partly off at the meter; much gas is burned to waste by too great pressure in certain localities. In buildings of any size a good regulator will soon pay for itself.

GLASS OR CHINA, To Pack.—Procure some soft straw or hay to pack them in, and if they are to be sent a long way, and are heavy, the hay or straw should be a little damp, which will prevent them from slipping about; let the largest and heaviest things be always put undermost in the box or hamper; let there be plenty of straw, and pack the articles tight; but never attempt to pack up glass or china which is of much consequence till it has been seen done by some one used to the job. The safety of glass articles packed together in a box does not depend so much upon the quantity of packing material used as upon the fact that no two pieces of glass come into actual contact. In packing plates, a single straw placed between two of them will prevent them from breaking each other. In packing bottles in a case, such as the collecting case of the microscopist and the test case of the chemist, rubber rings slipped over each will be found the best and handiest packing material. They have this great advantage, they do not give rise to dust.

GLASS STOPPERS, To Remove.—1. Heat the neck of the bottle over a flame, or take one turn with a piece of listing around the neck of the bottle and move it backwards and forwards very rapidly, having previously stood the bottle in some hot water to warm the air or contents inside. The friction of the listing will warm and expand the neck without warming and expanding the stopper; and the pressure produced within the bottle by previously heating its contents will tend to elevate the stopper. If bottle stoppers be greased slightly before they are put in, it will prevent them from sticking.—2. Put a few drops of sweet oil about the cork, and set the bottle near the fire where it will get warm.—3. When a stopper has been fixed by crystallization from solution, water will sometime set it free, and it is more efficacious in such cases than oil, because it dissolves the cement. When the cementing matter is a metallic oxide or sub-salt, a little muriatic acid may be useful, if there be no objection to its application arising from the nature of the substance within.

GLASS, To Prevent Cracking.—1. When boiling water is poured suddenly into a glass jar, the glass will crack if there is nothing to carry off the heat from the glass, because then the glass retains the heat, and the expansion breaks it. If a metal spoon is in the glass, or the jar is placed on a wet folded towel, these absorb and carry off the surplus heat and save the glass.—2. When new, all glass and earthenware should be placed in cold water in a saucepan, and after some hours the saucepan containing the vessel or vessels should be placed over the fire until the water reaches the boiling point.

HEATING. Economy in.—For warming 3 rooms a single heating stove should be used, the heat from which passes into 2 drums; one of these drums is placed in a room adjoining that containing the stove, and the other is up stairs in a room above the second one; the intermediate drum, or that between the stove and last one, heats the room from 6 to 12 degrees hotter than the stove can heat, though both rooms are of the same size and the drum is somewhat smaller than the stove; fuel, and consequently expense, is not only saved by the use of sheet-iron drums, but the house is more comfortably and completely warmed, not only with less fuel but with no trouble of making and keeping up fires.

ICE, To Keep.—1. Small quantities of ice may be preserved in summer by making a small bag large enough to hold the ice; then make another much larger bag, and fill the space between with sawdust or feathers.—2. Cut a piece of flannel about 9 in. square, and secure it by a ligature round the mouth of an ordinary tumbler, so as to leave a cup-shaped depression of flannel within the tumbler to about half its depth. In the flannel cup so constructed, pieces of ice may be preserved many hours; all the longer if a piece of flannel 4 or 5 in. square be used as a loose cover to the ice cup; cheap flannel with comparatively open meshes is preferable, as water easily drains through it, and ice is thus kept quite dry; when good flannel with close texture is employed, a small hole must be made in the bottom of the flannel cup, otherwise it holds water and facilitates the melting of the ice.

IRON AND STEEL. To Prevent Rusting.—Dissolve ½ oz. of camphor in 1 lb. of hog's lard; take off the scum, and mix as much black lead as will give the mixture an iron color; iron and steel goods, as well as machines of all kinds, rubbed over with this mixture, and left with it on for 24 hours, and then rubbed with a linen cloth, will keep clean for months.

KNIVES AND FORKS, To Preserve.—1. Scour bright; wipe thoroughly; dry them by the fire; dust fine wood ashes fresh from the stove

plentifully over the knives on both sides, leaving those which adhere to the blades; wrap in a piece of cloth and roll up in a paper, taking care to fold the ends of the paper so that the knives are all covered up.—2. When not in use, rub the steel part with a flannel dipped in oil; wipe the oil off after a few hours, as there is often water in it; or dust the blades and prongs with quicklime, finely powdered and kept in a muslin bag.—3. Make a flannel bag, and stitch from top to bottom, 1½ in. apart, a dozen times, making a receptacle for each; roll, and keep in a dry place.

LAMP CHIMNEYS. To Prevent Cracking. — 1. Place the chimneys in a pot filled with cold water; add a little cooking salt; allow the mixture to boil well over a fire and then cool slowly; chimneys become very durable by this process, which may also be extended to crockery, stoneware, porcelain, etc.; the process is simply one of annealing, and the slower the process, especially the cooling portion of it, the more effective will be the work.—2. If the chimney-glass of a lamp be cut with a diamond on the convex side; it will never crack, as the incision affords room for expansion produced by the heat, and the glass, after it is cool, returns to its original shape, with only a scratch visible where the cut is made.

LAMP-LIGHTERS. — Cut old postal cards lengthwise into strips ½ in. wide; they burn readily, do not give off sparks, and leave scarcely a trace of ashes.

LAMPS, Care of. — Always keep a lamp full of oil; never allow it to get more than half empty, as the space above fills with gas, which is easily ignited, especially if the oil is not thoroughly rectified; and the light will not burn so high or clear as when the lamp is full; occasionally soak the wicks before using in either strong vinegar or alum water; dry them thoroughly, and the lamp will give a clearer light and will not smoke or smell disagreeably; in lighting the lamp, turn the wick up slightly at first, until it gets well started and the oil flows freely to the flame; and then turn up to the desired height; if the flame drops to any considerable extent after the wick is turned up, make a change in the wick; never attempt to extinguish a lighted lamp by blowing down the chimney; the best way to extinguish the light is with the mouth upon a level with the top of the chimney, and about 1 foot or more from it; blow horizontally over the top and the light will go out instantly.

LAMPS, Night. To Make. — 1. Take a cork about 1 in. across, and cut a piece off the top about ⅛ in. thick; make a hole in the centre; take a piece of tin the size of the little finger nail, and make a small hole in the centre sufficient to hold a common white cord; fill a common goblet ⅔ full of water and pour over that about ¼ in. of sperm oil; place the tin on the cork and put a piece of cord 1 in. long through the holes, then set the cork afloat on the oil, and you have a good night lamp; kerosene or other low test oils should not be used.—2. If sulphide of lime be enclosed in a bottle the figures of a watch may be distinguished by its aid; to renew the luminosity of the mass place the bottle each day in the sun or in strong daylight; or burn a strip of magnesium wire close to a bottle; it will thus absorb light, which will again be available at night time.—3. Take a stick of phosphorus and put it into a large dry vial, not corked, and it will afford a light sufficient to discern any object in a room when held near it; the vial should be kept in a cool place, where there is no current of air, and it will continue its luminous appearance for 12 months.

LEAKS, To Stop.—1. Yellow soap, beaten up thick, with whiting, and rubbed into the leak, has sometimes stopped it when all other things have failed. —2. Coal tar applied hot to a roof will cure it of leaking; take an old broom or tie rags on an old broom stick, and use for spreading the tar over the desired surface.

LIGHTNING, To Escape. — Avoid standing under trees to escape from the rain during a thunder storm, but boldly expose yourself in the open; it will preserve you from the lightning; avoid standing close to any metallic bodies, as lead pipes or iron railings, etc.; when in doors during a thunder storm, sit or stand as near to the middle of the room as convenient; avoid standing at the window or sitting near the wall,

MARBLE, To Pack.—Marble should be put in a box by itself, wetted sheets of clean paper laid between the pieces, and each piece held firmly in its place by side-pieces and wedges; it may then be carried over a rough road in a wagon without injury.

MATCHES, Care of.—Parlor matches light the most readily, and are much more dangerous than the common matches; the general stock should be kept in a tin box; for each room where matches are used there should be a match safe of some kind; in the kitchen and bedroom, or wherever else matches are in frequent use, have the match safe fixed and always in the same place, so that it can be found, if need be, in the dark.

MATS, Husk.— 1 bushel basketful and 1 boiler full of husks is sufficient to braid a large mat; have ready a teakettle full of hot water, and turn on the boiler of husks; begin a common 3 strand braid, and as you bring over a strand place about 3 husks on, leaving the large ends of the husks up; when enough is braided for a mat, sew firmly with twine in any shape you choose—long, round or oval; then sprinkle warm water on upper side; run a fork through the husks, splitting the ends into a mass of little, curly fibres; then with the shears trim off evenly.

MATTRESS FILLINGS.—1. A cheap and very comfortable bed, with an underbed of straw, hay or husk, can be made by putting on the top a light cotton mattress; for the two sides of the mattress bed-ticking is best, and they should be somewhat longer and wider than the top of the bed, as in tying, the size is somewhat reduced; put 2 or 3 times as much cotton between the sides as is put between those of a "comfortable," and tie quite closely; finish by turning in the 2 edges and sewing them overhand, or stitch on machine; beds of straw or husk look infinitely better and far more comfortable when the ticks are made

like those of a mattress, with a straight, upright piece sewed all around; the corners should be clipped off so that the ticks will be round at the corners, as it fits the bedstead better. — 2. The best way to save husks is to pick the ears from the stalks and carry them into the barn, where the husks may be stripped rainy days, and the coarser parts saved for fodder; after stripping, the husks should be allowed to become perfectly dry before putting into the tick; it is a good plan to spread them for awhile upon the floor of a warm room.

MEAT, To Protect from Flies. — Use a wire meat safe, or cover the joints with a long loose gauze, or some thin cloth, and hang them from the ceiling of a dry room; pepper and ginger should be sprinkled on the parts likely to be attacked by the fly, but should be washed off before the joint is put to the fire.

MILK, Sour, To Sweeten.—Milk or cream may be sweetened after it has become slightly sour, by a small portion of carbonate of magnesia; saleratus also will correct the acid, but slightly injures the flavor, unless very delicately managed.

MILK, To Prevent Souring.—1. Put 1 teaspoonful of scraped horseradish into each pan, and it will keep sweet for several days. — 2. Dissolve ½ thimbleful of California borax in hot water; put into the milk and it will keep perfectly sweet.

MIRRORS, Care of.—Avoid hanging a mirror near a stove or fireplace, or where the sun can shine on it; if this precaution is neglected, granulation is likely to occur, even in a comparatively dark room, by the influence of warmth instead of light; A lamp or gas jet, if placed too close, while burning, though it may not crack the glass, will often bring about the same injurious crystallization, and will even sometimes cause the amalgam to melt and run off.

MIRRORS, To Pack.—In packing mirrors for removal, they should be placed by themselves in a box, and fixed in their places by side pieces and wedges, driven closely and nailed; laths should be placed across mirrors, and no elastic materials, as pillows or feather beds, be used in packing them.

MOLD, In Vaults, To Prevent.—A small lump of camphor placed in the safe, will prevent the accumulation of mold upon the money, books or paper.

NAILS, Names of.—Many persons are puzzled to understand what the terms "fourpenny," "sixpenny," and "tenpenny," mean as applied to nails. "Fourpenny" means 4 lbs. to the thousand nails, or "sixpenny" means 6 lbs. to the thousand, and so on; it is an old English term and meant at first "ten pound" nails (the "thousand" being understood), but the old English clipped it to "tenpun," and from that it degenerated until "penny" was substituted for "pounds"; when a thousand nails weigh less than 1 lb. they are called tacks, brads, etc., and are reckoned by ounces.

NAILS, Rusted, To Draw. — First drive them in a little, which breaks the hold, and then they may be drawn out much easier.

NAILS, Rusting, To Prevent. — Cut nails may be made flexible by heating them; but if, instead of allowing them to cool in the open air, they are thrown when red-hot into linseed oil, it will prevent them rusting almost as long as if they were galvanized.

NAILS, To Drive.—When driving a nail into a wall, clothes-press or closet, to hang things on, drive it through a spool to the head; dip the tips of nails in grease and they will easily drive into any hard wood, where otherwise they would double and break.

NAILS, To Remove Rust from.—Mix 1 pt. linseed oil with 2 oz. of black lead, stirring until the whole is thoroughly incorporated; heat the nails red hot and steep them in the mixture. They should then be well drained and shaken up in an old nail bag until dry.

NOISE, To Deaden.—Rubber cushions under the legs of a workbench are an effective method of deadening noise. Kegs of sand or sawdust, applied in the same way, afford similar immunity. A few inches of sand or sawdust being first poured into each keg, there is laid on it a board or block, upon which the leg rests, and around the leg and block is poured fine, dry sand or sawdust. By this simple means, not only all noise, but any vibration and shock are so completely prevented that an ordinary anvil thus mounted may be used even in a dwelling house, without annoying its occupants.

NUTMEGS, To Select.—To select nutmegs, pick them with a pin; if they are good the oil will instantly spread around the puncture.

NUTS, Rusty, To Remove.—Pour a little kerosene or other oil on the nut and let it have time to penetrate; try the nut both ways; if it can be moved at all, the battle is half won; keep moving it as far as possible; put on oil and then turn it back again, and repeat again and again. If a hot iron can be placed on the nut, so as to expand it without expanding the bolt, the nut can often be started. Hammering the nut will sometimes heat it sufficiently to have the same effect.

PAILS AND TUBS, To Prevent Shrinking.—Saturate with glycerine and they will never shrink.

PIPES, To Test.—Take soiled cotton waste and sulphur, the smoke from which, after ignition, is blown into the drain or pipes; if leakage exists in the latter inside of the house, the smoke and smell both issue forth and show that something is wrong, and generally tell just where the fault or faults are.

POKER, To Harden.—When a poker has become soft and bent, it may be again hardened by making it hot two or three times and plunging it every time into a pail of cold water. The sudden cooling of steel makes it again hard.

POLISHED METALS, To Prevent Rusting.—(See CLEANING.)

RUBBER, To Restore Elasticity of.—Use a simple mixture composed of 1 part of aqua ammonia with 2 parts of water, in which the articles should be immersed until they resume their former elasticity, smoothness and softness, the time required varying from a few minutes to an hour.

SCISSORS, To Sharpen.—Take a fine file and sharpen each blade, being careful to keep the same angle as they had at first; file till the rough places are all taken out; put a little oil on the edges of the blades, and snap together; then wipe off.

SCREW. To Start.—A screw that refuses to be started may sometimes be drawn by applying a piece of red hot iron to the head for 1 minute or 2 and then immediately applying the screw driver.

STEAM KETTLE, Economical.—Take the dinner kettle that comes with a 7 or 8 in. stove; place in the bottom of it half a brick nicely washed; pour in water to nearly or quite cover the brick, and set it over the fire; when it boils, or nearly so, set in the bread or pudding dish, and cover closely with a tin cover, of conical form, with a rim set on the edge so that it will fit the kettle closely, and suffer no steam to escape; if this cover does not come with the kettle, one can be made at the tin shop for half a dollar; the flat cover throws the steam back on to your bread and cannot be made to fit as nicely; this arrangement has the advantage over a steamer set over the kettle in that it brings the bread much nearer the fire, requires much less fuel, raises it lighter and cooks it more thoroughly; all batter and berry puddings, and even biscuit and custard puddings, are cooked very nicely in this manner; a breakfast Johnny-cake may be cooked in this way with much less fuel than it would require to bake it; an Indian pudding, made as for baking, can be steamed over a fire that would have little effect upon the oven of a large stove; be careful not to fill the dish too full, as steaming raises the pudding more than baking; stir it down once or twice.

STOVE PIPES. To Prevent Rusting. — Apply pure graphite (plumbago) ground to a very fine powder and mixed with a little water; then rub over with some of the same, dry.

STOVES. Cracks in. To Mend.—1. Good wood ashes are to be sifted through a fine sieve, to which is to be added the same quantity of clay, finely pulverized, together with a little salt; the mixture is to be moistened with water enough to make a paste, and the crack in the stove filled with it.—2. An excellent cement for iron stoves or furnaces is a paste of soluble glass and barytes, with or without some fine fire clay; or the soluble glass may be replaced by a solution of borax, and both these and barytes by a mixture of clay and powdered glass.

TASTE OF WOOD, To Remove. — To prevent this scald the vessel well with boiling water, letting the water remain in it until cold; then dissolve some pearlash or soda in lukewarm water, adding a little lime to it; wash the inside of the vessel well with this solution; afterward scald it well with hot water, and rinse with cold water before using.

TIN CANS, To Remove Lids from. — Place a shovelful of live coals on the top, which will speedily unsolder them; they can then be removed by the aid of an old case knife; care must be taken or the side seam will also open.

TINWARE, To Mend.—1. Take a vial ⅔ full of muriatic acid; put into it little bits of sheet zinc, as long as it dissolves them; then put in a crumb of sal-ammoniac and fill up with water, and it is ready for use; with the cork of the vial wet the place to be mended, with the preparation; then put a piece of sheet zinc over the hole and hold a lighted candle or spirit lamp under the place, which melts the solder on the tin and causes the zinc to adhere without further trouble; wet the zinc also with the solution; or a little solder may be put on in place of zinc, or with the zinc.—2. Put putty on the outside; let it dry well, and the pan will never need mending in the same place again.

UMBRELLAS, Care of.—Always stand a wet umbrella with the handle down; one trial will convince you of the rapidity with which it will drain, and your umbrella will last longer if dried quickly.

WALLS. To Deaden. — The propagation of sound through the ceiling may be most effectually prevented by insulating the floor from the beams by means of porous light substances, as a layer of felt, a filling of sand, or of stone coal dust, the latter being particularly effective; it is difficult to prevent the propagation of sound through thin partitions, but double unconnected walls filled in with some porous matcrial answer the purpose best; covering the walls and doors with hangings, as of jute, is also quite serviceable.

WATERING POTS, To Repair.—Tin watering pots much used in the garden often become rusted at the lower corners, and begin to leak; the holes may be effectually stopped by covering them inside with a small piece of linen dipped in copal varnish, the tin being previously thoroughly dried; when the varnish hardens by drying, they are perfectly water tight.

WATER-PIPES. To Prevent Freezing.—1. The tying up of the ball-tap with straw or flannel during severe weather will, in general, prevent the freezing of water-pipes. The surest method is to have the main pipe higher than the cistern or other receptacle; and, being thus of a regular incline, the pipe will immediately be exhausted when the supply ceases. When water remains in the pipes, if each tap be left dripping, the circulation of the water will prevent it from freezing in the pipes.—2. When the frost begins to set in, cover the water-pipes with hay or straw bands, twisted tight round them.—3. In pumping up water, let all the water out of the pipe when done; but if this is forgotten, and it should be frozen, take a small gimlet and bore a hole in the pipe, a little distance from the place where it is let off, which will prevent its bursting. Put a peg into the hole when the water is let off.

WATER, To Ascertain if Hard or Soft.—1. Dissolve ½ oz. of good white soap in 1 pt. of hot rain water; let it cool and settle; mix about 1 oz. of this with 1 pt. of the water to be tested and let stand a few minutes; if the water is soft it will remain clear; if hard it will become opalescent. — 2. Procure a small quantity of soap dissolved in alcohol; let a few drops of it fall into a glass of water to be dried; if the water becomes milky it is hard, but if little or no milkiness results, the water may be said to be soft.

WATER, To Cool.—Fill a jar with water; wet
