PROJECTILE FORCE.—The *projectile force* is that produced by the combustion of the powder in the piece, causing sudden development of gas, the expanding force of which, acting on the projectile, impels it forward and out of the piece. It is physically impossible to obtain exact uniformity in the charges. In practice there will always be a difference in the weight and shape in the cartridges, and in pushing them home, greater pressure will be applied at one time than at another, thus causing want of uniformity in combustion. The temperature of the piece, arising from previous discharges and from the temperature of the air or rays of the sun; the nature of the projectile and its movement in the bore; the condition of the bore with respect to humidity and foulness—all have more or less influence on the combustion of the powder, and consequently on the velocity and range. Above all, however, is the want of uniformity in the *quality* of powder. In this respect considerable latitude must be allowed in the size and density of grain or pellet, in the manipulation of the ingredients, and in its condition resulting from age, moisture, and handling. With small charges, especially with fine-grained powder, it is possible to so mix the contents of different barrels for any series of shots as to secure a fair degree of uniformity for that particular occasion; but with charges requiring large quantities of powder, this, except to a limited degree, is impracticable.

PROJECTILES.—In a military sense, the term projectile is applied to a mass usually thrown from a firearm by some explosive to strike, or destroy a distant object. To accomplish this, a projectile should have certain hardness, tenacity, and weight. If it be soft and weak compared with the body struck, it will spread out laterally or break into pieces, and presenting an increased surface will meet with a greater resistance, and consequently will penetrate less than if it had retained its original form. High density gives to the mass the least possible volume, whereby the effect of the resistance offered by the air and by the body to be penetrated is diminished. Different materials have been used for projectiles. Stone, lead, wrought-iron, steel, cast-iron, and chilled iron possess peculiar properties which render each advantageous according to the object to be attained.

Prior to the invention of gunpowder, large masses of stone without regard to form were thrown from machines constructed for that purpose. This material was very generally employed until the year 1400; but its want of strength and density, qualities required in a projectile propelled by powder, necessitated its use in large masses and with comparatively small charges. Such projectiles were destructive against unbacked walls of masonry, but broke if ricocheted on earth. As late as 1807, stone balls of enormous caliber were used by the Turks in defending the passage of the Dardanelles.

Lead, as a material for projectiles, possesses the essential quality of density; but it is too soft to be used against very resisting objects, since it is flattened even against water. From its softness and fusibility, large projectiles of this material are liable to be disfigured, and partially melted, by the violent shock and great heat of large charges of powder. Its use is chiefly confined to small-arms and case-shot, which are generally directed against animate objects. These defects of lead may be corrected, in a measure, by alloying it with tin, antimony, etc.

From the first introduction of cannon, wrought-iron projectiles have at different times been tried. This metal has great density and tenacity, but has not a high degree of hardness, cannot be easily worked into the necessary shapes, and when used in large masses becomes very expensive. Steel possesses the qualities required in a projectile, but is very costly and difficult to manipulate.

The adoption of cast-iron for projectiles caused an important advance in artillery. It has great hardness, sufficient density and tenacity; is cheap, easy to mold, and can at slight cost be given exact forms.

Recent improvements in the manufacture of this metal have so greatly increased the strength of projectiles made from it, that they can be used effectively against heavy armor. Cast iron, *chilled* by being cooled rapidly, has its hardness, crushing strength, and density increased. Projectiles so prepared are now employed with excellent results against the most powerful armor, and are found about as effective as those of steel and very much less costly. Compound projectiles, uniting the good and correcting the bad qualities of different metals, have sometimes been used. Thus, at the siege of Cadiz, cast-iron shells filled with lead, forming projectiles of great strength and density, were thrown from mortars to a distance of three miles and three-quarters.

Projectiles may be either *spherical* or *elongated*. Spherical projectiles are commonly used in smooth-bored cannon, and for this purpose possess certain advantages over those of oblong form: 1st. They touch the surface of the bore at only one point, and are therefore less liable to wedge in the bore and endanger the safety of the piece; 2d. The centers of figure and inertia coincide; 3d. The mass is embraced in the least possible volume; 4th. As they turn over in their flight, the surface presented to the resistance of the air is uniform and a minimum; 5th. In ricocheting on land or water, their rebounds are more certain and regular, and less deviation occurs from the plane of fire.

It was known at an early day that the spherical ball was not the one to which, for an equal weight, the air offered the least resistance. In order that any advantage may be gained from an oblong projectile, it must move through the air in the direction of its length; numerous unsuccessful attempts have been made to ensure accuracy in its flight when fired from a smooth-bored piece. One of the simplest plans for this purpose is to place the center of gravity, or inertia, in advance of the center of figure, or resistance. As these points should be in the longer axis of the projectile, the force of inertia and the resistance of the air, acting along the same right line and in opposite directions, will tend to preserve the line of flight. This was tried on a hollow, pointed projectile in the time of Louis XIV.; the cavity was divided into two compartments; the front one was filled with leaden balls and powder, and the rear one with powder only. The flight of these projectiles was uncertain and irregular, some of them bursting in the air, and others striking the object sidewise. Another plan of this kind, proposed by Thiroux, is to make the projectile very long, with its rear portion of wood, and its point of lead or iron, somewhat after the manner of an arrow; but it does not appear that that method has ever been submitted to the test of practice.

Attempts have also been made to give an elongated projectile a motion of rotation around its longer axis: 1st, by cutting spiral grooves on the base for the action of the gas from the charge; 2d, by forming such grooves on the forward part for the action of the air; 3d, by combining he preceding methods in the same projectile; 4th, by causing the air to enter a cavity at the front end, pass through nearly the length of the cylinder, and escape by radial openings at the sides. None of these plans have succeeded in practice, for the reason, perhaps, that the projectile naturally turns over end for end, and the charge and the air do not act with sufficient promptness, energy, and certainty to prevent it. An oblong projectile, thrown under a high angle and with a moderate velocity, can have rotation about its shortest axis arrested by attaching to its rear portion a light body, by means of a chain or cord; the resistance which this body experiences from the air will cause the projectile to move point foremost. Projectiles with wide flanges or wings, operated by springs by which they were extended after the shot left the piece, have been tried, but without success.

Projectiles may be further classified according to their construction and mode of operation, as *solid*, *hollow*, and *case shot*. Solid projectiles produce their effect by impact; they are used in *guns* and in *small-arms*; those for guns are known as *solid shot* or *shot*, and those for small-arms as *bullets*. Such projectiles are required when great range, accuracy, and penetration are sought; they must, therefore, possess great strength and density, and be fired with large charges of powder.

Shells are hollow shot which act both by impact and explosion, for which purpose they contain an explosive and a fuse to ignite it at the proper time. As they have less strength, they are fired with smaller charges of powder than solid projectiles, and are used against animate objects and such inanimate ones as will not cause them to break on striking. The thicker the sides of a shell, the greater its ability to resist the shock of discharge, and the greater the penetration and accuracy; on the other hand, a shell should be capable of containing sufficient explosive or incendiary material to accomplish the proposed end. The number of pieces resulting from an explosion varies with the brittleness of the metal, and is increased by giving to the interior the form of a regular polyhedron. A dodecahedral form has been found advantageous. The most rapid and violent explosive practicable should be employed; the size of the fuse-hole should be as small as possible, and should diminish with the size of the cavity, to prevent the loss of too great an amount of gas.

Case-shot act only by impact; they consist of a collection of small projectiles enclosed in a case or envelope. The envelope is intended to be broken, either in the piece by the shock of discharge, or at any point of its flight, by a charge of powder, inclosed within it; in either case, the contained projectiles continue to move on after the rupture, but cover a larger surface, and attain a greater number of objects. These projectiles can be used with effect only against animate objects situated at a short distance from the point of rupture; they are divided into *grape*, *canister*, and *shrapnel*. Grenades are projectiles that are commonly thrown by the hand, or are rolled down the slopes of a work. They are designed to act only by the force of their own explosion. *Hand Grenades* are thrown against troops in mass; for this purpose any spherical projectiles filled with powder only and weighing not over six pounds are suitable; these can be thrown from 20 to 30 yards; they are provided with a short fuse which is ignited by a match, or, in the act of throwing, by a special device. Projectiles have been designed especially for this service, an example of which is the "Ketchum" hand grenade. This is a small oblong percussion shell, which explodes on striking a slightly resisting object; a guide attached to the rear end causes it, when thrown, to move point foremost. *Rampart Grenades* are intended to be rolled down a breach in its defense, or to be thrown over the rampart, etc. Spherical shells of any size will answer for this purpose; those unfit for firing may thus be utilized. Shells are fired from guns, from howitzers, and from mortars. They are made of cast-iron, and their caliber is expressed in the same manner as solid shot of an equal diameter. The thickness of metal in spherical shells is about *one-sixth* of the diameter, and their weight, when empty, is generally about *two-thirds* of that of the corresponding solid shot. In the United States' Service, there are two kinds of spherical shells; one for guns, and another for mortars. Each consists of the *sides*, the *cavity*, the *fuse-hole*, and the *ears*; and, in gun-shells, the *reinforce*. The sides are thicker in gun-shells than in mortar shells of the same size, to withstand the high charges of powder with which they are fired. The fuse-hole is used for inserting the charge, and to hold the fuse for communicating fire to it. All shells of eight inches or more in diameter have ears to receive the "hooks" used in lifting the projectile to the muzzle of the piece in loading. The reinforce of metal, about the fuse-hole of the gun-shell, gives a greater bearing surface to the fuse, and prevents it from being driven in by the force of the discharge; this reinforce also serves, in a measure, to compensate for the metal taken out of the fuse-hole, and thereby render the shell more nearly concentric. In some services, shells have, in the upper hemisphere, a *charging-hole*, placed at an angle of 45° with the fuse-hole, through which the charge is poured immediately before the shell is used and after the fuse has been inserted. This is not necessary with the fuses used mostly in the United States' Service, as the powder and fuse can be readily introduced at the moment of loading.

A carcass is a thick shell which has three additional holes, of the same dimensions as the fuse-hole, pierced at equal distances apart in its upper hemisphere, their exterior openings being tangent to the great circle perpendicular to the axis of the fuse-hole. The object of a carcass is to set fire to wooden structures, by the flame of an incendiary composition issuing from the holes. This shell has no fuse, and is not intended to be exploded, although a charge of powder may be placed beneath the composition to prevent it from being approached by the enemy.

A stand of grape-shot is composed of nine small cast-iron balls, disposed in three layers of three balls each. The diameter of the balls for grape-shot varies with the size of the piece; being used at longer distances, they are larger than the shot for the corresponding canister. Grape-shot are employed only in the siege and sea-coast services; as now constructed, they cannot be used in rifled pieces.

The envelope for a stand of canister-shot, consists of a tin cylinder, closed at the bottom by a thick plate of cast-iron, and at the top by one of sheet-iron. The plates are kept in place by cutting the ends of the cylinder in strips about 0.5 inch long, which are turned down over the plates. A wire handle is attached to the top plate. To give more solidity to the mass, and to prevent the contained balls from crowding upon each other when the piece is fired, the interstices are closely packed with saw-dust. For a gun, 27 small cast-iron balls are used, arranged in four layers, the top of 6 and the remainder of 7 each: this makes the diameter of the balls about one-third that of the bore. For howitzers, the envelope contains 48 balls, in four layers of 12 each, the balls being smaller than those in a canister for the corresponding gun. Canister-shot are used in all services. For those in which the charge of powder is attached to the projectile, the canister has a block of wood, called a sabot, to which the envelope is nailed at the bottom; the lower plate rests upon this block; the wire handle is omitted. The parts composing a stand of grape or canister begin to separate the moment they leave the piece.

Shrapnel are cast-iron shells, in which, besides the bursting-charge of powder, is placed a number of small balls. Their sides are much thinner than those of ordinary shells, in order that they may contain a greater number of bullets; the thickness must be such that, when supported by the bullets, the case will not be broken by the force of discharge, but will yield readily to a small bursting-charge. The weight of the case, empty, is about one-half, and, when filled, about equal to that of the solid shot of the same diameter. This projectile is prepared by filling the case with leaden musket-balls well packed in; the interstices are then filled with melted rosin; this prevents the fracture of the envelope by the bullets, when the piece is fired. The *chamber* for the powder is afterwards bored out. The case is stengthened by a *reinforce*, and to increase the effect of the bursting-charge, the lower portion of the fuse-hole is closed by a *disc*, of wrought-iron, perforated with a small hole for the passage of the flame from the fuse. A shrapnel may be made to explode at any point of its flight, and, as the bursting-charge should be only sufficient to open the envelope, without scattering the bullets too much, the execution depends on the velocity which the case has at the moment it is broken. This projectile is therefore of more general use than grape or canister, and should be fired with as large a charge as possible. It may be used in all services, but is most effective in the field. A defect of this construction is that the bullets, adhering to one another and to the case, are not always separated by the bursting-charge. The shrapnel adopted in the English Service is known as the "Boxer diaphragm shell." It consists of a thin cast-iron shell, weakened by four grooves down the sides to make it open out more readily; of a wrought-iron *diaphragm* which divides the shell unequally, the upper portion containing the bursting-charge, and the lower being filled with balls of hardened lead, packed in coal dust. A *socket* is screwed into the fuse-hole and passes through the diaphragm; this forms a channel for the introduction of the bullets and coal; the bottom of the socket is then closed by a plug. Into this socket is screwed the fuse, the fire from which is communicated to the powder-chamber through the *fire-hole*. The bursting-charge is inserted at the *loading-hole*, closed by a metal screw-plug.

The advantages to be derived from the use of elongated projectiles having once been established, it became necessary that some means should be devised to make their flight accurate. It has been found that to do this with certainty, a motion of rotation about its longer axis must be communicated to the projectile, and this end has been satisfactorily attained only by cutting spiral grooves, or "rifles" in the surface of the bore of the piece, with which the projectile is connected, and by means of which it starts with a motion about an axis parallel to or coincident with that of the bore. The rotation continues during the flight of the projectile. Without this rotation, an elongated projectile will naturally turn over end for end, and present a constantly varying surface to the resistance of the air. This "rifle-motion," therefore, tends to cause the projectile to move through the air in the direction of the least resistance, thereby increasing the range, and the effect of impact, and, furthermore, giving steadiness to the projectile by distributing the deviating forces uniformly around its line of flight. The more important advantages of elongated projectiles are, that the form may be altered at any time, and the center of gravity can be placed at any desired point; the projectile may be elongated so as to oppose, for an equal weight, a diminished surface to any resisting medium; by this, the range is extended, and a flatter trajectory with greater accuracy and penetration obtained. The chief disadvantages are, increased strain on the gun; greater probability of jamming and injury to the bore; irregularity of ricochet; increased complication and expense of manufacture; and the liability of any soft metal on the exterior to be accidentally injured.

The different systems of projectiles for rifled pieces are classified according to the manner in which they are caused to follow the grooves. The systems are distinguished by some peculiarity of construction, and are generally known by the name of the person by whom designed, or by the place at which first made. The same principles are applicable to different systems, and the same precision of fire may practically be obtained from several. All systems are comprised under three classes: 1st. Projectiles with projecting ribs or studs; or having a peculiar cross-section. 2d. Projectiles having a portion that is expanded by the action of the gases in the bore. 3d. Those more or less of whose surface is compressed by the charge into the form of the bore. The first and second classes are applicable to muzzle-loading pieces; the third to breech-loaders only. The principal points to be considered, as regards the piece and the projectile, are the *surest* and *safest* means of causing the projectile to follow the grooves of the piece. To fulfil these conditions, the projectile should be simple in construction, and of sufficient strength to admit of its use with the largest charge that may be desired; it must not be liable to jam in the bore in loading or firing; and must produce a moderate and uniform strain on the gun. The system that most nearly complies with these requirements, and gives insured accuracy of fire with uniform and high velocities, should be the best. In many systems, one or more of these considerations have been sacrificed to some extent, to secure a closer compliance with others thought to be of greater importance or of easier attainment.

1st Class. Solid flanges, projecting from the body of a projectile and so shaped as to fit the rifling of the bore, were the means first used to communicate the rifle-motion in cannon. In some cases, there was for each groove a rib extending the entire length of the cylindrical portion of the projectile, while in others, sets of rounded buttons were employed. These projections were of the same material as the body of the projectile, and being of a very unyielding nature, frequently led to the bursting of the piece; buttons of zinc, copper, or bronze, firmly secured in mortises in the projectiles, were therefore adopted. The buttons are arranged in rows of two or more so that each row enters freely into a corresponding groove, in loading. When the bore of a gun is a twisted prism, with any plane figure for its base, the projectile, if shaped to fit it, will receive the rifle-motion when fired. The Whitworth cannon is rifled in this manner, the cross-section being a hexagon with rounded corners. Guns have also been constructed with ribs projecting from the bore, fitting into corresponding grooves in the projectile. To the last system belongs the Vavasseur gun, which has given good results; the system preceding has not, however, proved so satisfactory.

The principal advantages of systems of the first class are that the projectiles are strong, and that the required motion is communicated to them with great certainty and regularity. The escape of gas around the projectile, as it causes injury to the bore, is an objection to the class; various experiments have been made to overcome it, the latest being by the attachment of a metal cup to the rear of the projectile, which, by the action of the powder, is expanded and pressed against the sides of the bore. The French studded projectile, employed generally on the Continent with muzzle-loading cannon, and the Woolwich system, similar to it and used in England, are the best representatives of this class.

2d. Class. In projectiles of the second class, the body is composed of a hard metal, as cast-iron, and there is attached to it, generally at the base, a cup, band, or other arrangement of softer metal, which is expanded by the action of the charge into the grooves of the gun, when fired. Expanding projectiles are easy to load, are not liable to overstrain the piece, and those of different systems can generally be fired from the same piece—a point of great importance. Such projectiles do not always withstand the heaviest charges of powder, and are not certain to receive the rifle motion. The use of projectiles of this class is confined more particularly to the United States. The most important are the Parrott, Hotchkiss, and Butler systems.

3d Class. In breech-loading cannon, the receptacle for the charge is of larger diameter than the bore of the piece. The projectile is of the same size as this chamber, and must be reduced to enable it to pass into the bore. Such projectiles are embraced under the third class; the body has a coating of soft metal, which is compressed as the projectile is driven through the bore, the grooves compelling it to follow the direction of the rifling. The same result is sometimes accomplished by one or more rings of soft metal. The chief advantages of this class are, that the projectile is generally certain to take up the rifle-motion; that its axis is steady on leaving the bore; and that the wear of the bore, from gas passing the projectile, or from any irregular movement of the latter, is prevented. The objections are, that the necessary compression of the coating, the sudden closing of windage, and the fouling of the bore, produce undue strain upon the piece; that the velocity of the projectile is reduced by the force expended in compressing it; and that the soft metal forms an extra weight, which is useless in penetrating resisting objects. The German and the French systems are the most prominent types of this class. All small-arms, at the present time, use bullets of this class, which being entirely of soft metal are readily compressed without their general form being injured.

In consequence of windage and of the action of gravity, the axis of the projectile does not always coincide with that of the bore, in firing; this gives rise to inaccuracy of fire. With projectiles of each class means have been devised to overcome this difficulty, partially if not entirely, by the system of rifling, or by the nature of the chamber. These properly relate to the construction of the piece. See *Armor-piercing Projectiles, Armstrong Projectile, Chilled Projectiles, Compression Projectiles, Deviation of Projectiles, Effects of Projectiles, Elongated Projectiles, Expanding Projectiles, Fabrication of Projectiles, Calling Bodies, Form of Projectile, Inspection of Projectiles, Penetration of Projectiles, Preservation of Projectiles, Rockets, Rupture of Shells, Shells, Small-arm Projectiles, Solid Shot, Spherical Projectiles, Steel Projectiles, Studded Projectiles* and *Trajectory*.

PROJECTION.—The representation, on any surface, of the parts of fortification and other objects as they appear to the eye of the observer. It thus includes perspective, and is most simply illustrated by the shadow of an object thrown by a candle on a wall; the shadow being the projection, and the place of the light the position of the eye. The theory of projections is of great importance, both in mathematics, engineering, and geography: being in the former cases, perfectly general in its application; while in the latter only the projection of the sphere is required. Projections of the sphere are of various kinds, depending on the position and distance of the eye from the sphere, and the form of the surface on which the projection is thrown; thus we have the *orthographic, stereographic, globular, conical,* and *cylindrical or Mercator's* projections. Another projection frequently employed is the *gnomonic*. In gnomonic projection, the eye is supposed to be situated at the center of the sphere, and the surface on which the projection is thrown is a plane surface which touches the sphere at any one point (called the *principal point*). It is evident that a map constructed on the gnomonic projection, is sensibly correct only for a circular area whose circumference is at a small angular distance from the principal point. From the position of the eye in the gnomonic projection, it follows that all great circles, or portions of great circles, of the sphere are represented by straight lines, for their planes pass through the eye. The distance of two points on the sphere, when measured along the surface, is least if they are measured along a great circle; and as the distance of the projections of these points on the plane is represented by a straight line, which is the shortest distance between two points on a plane, this projection, if employed in the construction of mariners' charts, would at once show the shortest course. Maps of the earth's surface have been projected by the gnomonic method, the surface of projection being the interior surface of a cube circumscribing the sphere, and the complete series consequently amounting to six maps; but it is not fitted for the construction of maps of large portions of the earth's surface. The gnomonic projection derives its name from its connection with the mode of describing a gnomon or dial. The orthographic and stereographic projections were employed by the Greek astronomers for the construction of maps of the heavens; the former, or *analemma*, being the best known and most used. The stereographic, called *planisphere* by the Greeks, is said to have been invented by Hipparchus, and the gnomonic is described by Ptolemy. The others are of modern invention. In mathematics, the theory of projections is general in its application, and has been employed within the last few years to generalize the ancient geometry, as a powerful aid to algebra. Its basis is the investigation and determination of those properties which, being true of a figure, are also true of its projections, such properties being necessarily dependent, not on the "magnitude," but on the "position" of the lines and angles belonging to the figure. These properties are generally denominated *projective properties*. For instance, the three conic sections, the parabola, ellipse, and hyperbola, are merely various projections of a circle on a plane, and all "positional" properties of the circle are at once, by this theory, connected with similar properties of the three conic sections. The theory is also largely employed in demonstrative mechanics.

PROKING-SPIT.—An early name for a large Spanish rapier.

PROLONGATION OF THE LINE.—A tactical maneuver effected by parallel movements at the right or left of any given number of men on a front division.

PROLONGE.—A strong hemp rope used with field pieces to attach the gun to the limber when firing in retreat, or advancing, instead of limbering up; for the same purpose in crossing ditches; for slinging a piece to a limber; for righting carriages when upset, and for various other purposes. It is usually 26′ 7″ long, and is carried wound around the prolonge-hooks on the trail of the piece. It has a hook at one end and a toggle at the other, with two intermediate rings, into which the hook and toggle are fastened to shorten the distance between the limber and carriage.

PROLONGED FLANK.—In fortification, the flank extension from the angle of the epaule to the exterior side, when the angle of the flank is a right one.

PROMOTION.—The efficiency of any body of men depends upon the energy of the individuals composing it; the root of that energy is emulation; and emulation can only be secured by maintaining a proper current of promotion. The efficiency of a service is thus dependent on the system of promotion adopted; and so important, consequently, does promotion become, that in the present article it is purposed to glance at the rules observed in the principal armies of the world.

In the *Army of France* it is a very common saying that every Conscript has a Marshal's *bâton* in his knapsack. Speaking of the times of the Revolutionary War, this was doubtless true, for battalions chose their chief officers from their own ranks—a Conscript of one year was often a Lieut.-Col. the next, and perhaps a Brig. Gen. the following. In the quieter times of recent years, however, progress is slower; and, although promotion is open to all, and a considerable proportion of the officers do rise from the ranks, yet it is very rarely indeed that an officer who has so risen ever attains a higher grade than that of Captain. Junior commissions are—if the rule of the service were strictly followed—given, one-third to men from the ranks, one-third to cadets from military schools, and one-third by government patronage. In practice it appears that in the artillery and engineers two-thirds of the first positions are given to pupils from the Polytechnique, and the remainder to men from the ranks; while in the Line two-thirds of the officers rise from the ranks, and one-third come from the Military School of St. Cyr. Before officers can be promoted certain service in each rank is required, viz., as 2d Lieutenant, two years; as Lieutenant, two years; as Captain, four years; as Major, three years; and as Lieutenant Colonel, two years. These periods are, however, curtailed in time of war. Promotion takes place in the regiment up to the rank of Captain, two-thirds by seniority, and one-third by selection. From Captain to Major (*chef d'escadron ou de bataillon*), promotion is divided equally between seniority and selection; while to all higher ranks it falls exclusively to selection. The selection is made on reports by the Inspectors General of the several arms—their reports being founded on personal observation, and the testimony of senior regimental officers. To maintain rapidity of promotion there is a fixed age at which officers *must* retire—viz., Lieutenant General, 65; Major General, 62; Colonel, 60; Lieutenant Colonel, 58; Major, 56; Captain, 53; and Lieutenant, 52. These ages do not prevent the officers of a regiment from being the opposite of youthful.

In *Austria* all officers are at first Cadets; but a large proportion of these Cadets are nominated from men in the ranks by their comrades. Promotion goes by seniority, and in the regiment, with occasional selection from other regiments. The organization and officering of the *German Army* are both peculiar. Every German subject, of whatever rank, is bound to serve from the age of 20 to 25; but in practice this service is reduced to a year in the case of professional men. Every officer must serve in the ranks but not necessarily longer than a day. Young gentlemen intended for officers enter the ranks, *aspiranten*. They do duty as common soldiers for from six to nine months, and pass two examinations. Afterward they remain nine months at a division school or twelve months at an artillery and engineer school. They then become eligible for appointment as officers when vacancies occur which, however, they cannot obtain unless recommended by the officers of their respective regiments. Two-thirds of the first commissions are given to these aspiranten, and one-third to pupils from the cadet schools.

In the *Italian Army*, one-third of the Sub-Lieutenants are promoted from the ranks. Of subsequent promotion, two-thirds go by seniority, and one-third by selection. It is always urged against the *British* system of army promotion, that it is too exclusive, and confines the commissions to the upper classes of society; and there is no doubt that promotion from the ranks is much rarer than in almost any other army. But, on the other hand, it is argued, the constituents of the force are very different. Soldiers in Britain are not Conscripts, who necessarily comprise men of all classes and all degrees of education, but are taken as a rule, from an extremely low and very uneducated class of society. Again, Britain has a true middle class, which is wanting in almost every continental nation. Its army is not, therefore, necessarily aristocratic because it is not officered from the ranks. Lastly, the habits of the different classes of society differ so greatly, that unless the soldier be very superior to his comrades, promotion to a commission is a small boon.

With regard to the actual system of promotion which obtains; in the ranks, promotion from Private up to Company Sergeant takes place in the company, and is made by the regimental officers. The promotion of Company Sergeants to be Staff Sergeants is made throughout the regiment. All these promotions are by selection entirely. Of the commissioned officers, the Quartermasters and Riding masters are appointed almost exclusively from the ranks; but they have no further promotion to look forward to—Sergeants and Sergeants-major are occasionally gazetted to Ensigncies or Lieutenancies. The junior combatant officers acquire their commissions either by a competitive examination open to the whole nation, or by previous service in the militia as officers, or in the ranks of the army as non-commissioned officers. The artillery and engineers are officered entirely by Cadets from the Royal Military Academy, whose subsequent promotion is by seniority only. In the cavalry, guards, and line, vacancies are, since the abolition of the purchase system in 1871, filled by "seniority tempered by selection," the selection becoming more strict as the higher ranks are reached. The promotion of officers, up to the rank of Captain, is mainly regimental, and is, at the same time, by seniority; but seniority is, in this case qualified by what has been called negative selection—that is, in other words, the exclusion of those officers who do not prove their fitness for promotion at the periodical inspections and examinations. Above the rank of Captain, for *substantive* or *regimental* rank, seniority is little regarded, and selection is more absolute; but officers may hold at the same time *army* or *brevet* rank, conferred for distinguished service, or for mere seniority, in the general list of the whole army. This brevet rank does not affect the position in a regiment, and adds but a small sum to the officer's pay; but it is of great importance, inasmuch as Colonels rise by seniority alone to be general officers, and Colonel is almost exclusively a brevet rank (the only exceptions being in the artillery and engineers, where Colonel is a regimental rank). Under these rules, it sometimes happens that an officer who has never held higher regimental rank than Captain, may become successively, for good service, Brevet-Major, Brevet-Lieutenant Colonel, and Brevet-Colonel, until he succeeds, in his turn, to the rank of Major General.

In the *United States Army*, promotions in the line are made through the whole Army, in the several lines of artillery, cavalry, and infantry, respectively. Promotions in the Staff of the Army are made in the several departments and corps, respectively. Officers may be transferred from the Line to the Staff of the Army without prejudice to their rank or promotion in the Line; but no officer can hold, at the same time, an appointment in the Line and an appointment in the Staff which confer equal rank in the Army. When any officer so transferred has, in virtue of seniority, obtained or become entitled to a grade in his regiment equal to the grade of his commission in the Staff, he vacates either his commission in the Line or his commission in the Staff. No officer of the Corps of Engineers below the rank of Field-Officer can be promoted to a higher grade, until he has been examined and approved by a Board of three Engineers, senior to him in rank. If an Engineer officer fail on such examination he is suspended from promotion for one year, when he is re-examined before a like Board. In case of failure on such re-examination, he is dismissed from the service. When any Lieutenant of the Corps of Engineers [or Ordnance Corps] has served fourteen years' continuous service as Lieutenant, he is promoted to the rank of Captain, on passing the required examination, but such promotion does not authorize an appointment to fill any vacancy, when such appointment would increase the whole number of officers in the corps beyond the number fixed by law; nor can any officer be promoted before officers of the same grade who rank him in his corps. When promotions in the Ordnance Department of the Army are allowed by law, no officer of the corps, below the rank of Field Officer, can be promoted to a higher grade until he has been examined and approved by a Board of not less than three Ordnance Officers, seniors to him in rank. If an Ordnance officer fail on such an examination he is suspended from promotion for one year, when he is re-examined before a like board. In case of failure on such re-examination, he is dismissed from the service. When any officer in the line of promotion is retired from active service, the next officer in rank is promoted to his place, according to the established rules of the service; and the same rule of promotion is applied, successively, to the vacancies consequent upon such retirement. See *Appointment*, and *Staff*.

PROOF-HOUSE.—A house fitted up for proving barrels of fire-arms. They are extra heavily charged, laid on a bench, primed, and fired by a train of powder into a bank of sand. The average loss in England is four per cent. on 600,000 barrels annually. A second proving takes place when the piece is ready for assembling.

PROOF OF GUNPOWDER. A process pursued in testing gunpowder as regards its quality, strength, and uniformity. The quality is ascertained, both small and large grain, by its general appearance, its firmness, glazing, uniformity of grain, and density; its strength and uniformity, as explained further on. The weight of a cubic foot of government powder varies according to the nature of the powder. The process of *flashing* is also resorted to for testing the cleanliness and intimate mixture of the ingredients. With this view, about 3 drachms of powder are placed on a glass plate, and fired with a red-hot iron, when, if the powder has been properly made, no residue or foulness should be left. In addition to the above proof, the hygrometric test is a very necessary one to be taken of all natures of powder. The usual mode adopted to test the explosive strength or pressure of gunpowder in a gun is thus explained: An 8-inch proof gun is fitted with 3 screw gauges, or "crushers," by which the pressure of the exploding charge is recorded at three points in the bore, namely—in the axis by a gauge screwed through the cascabel of the gun; by a gauge, screwed into the side of the gun at $7\frac{3}{4}$ inches from the end of the bore; and by a gauge screwed into the side of the gun at $15\frac{1}{2}$ inches from the end of the bore. The velocity of the shot, or cylinder, is measured by two chronoscopes. For this purpose four wire screens are arranged in front of the gun at the respective distances from the muzzle of 90 feet, 100 feet, 210 feet, and 220 feet. Nos. 1 and 3 screws belong to No. 1 instrument, Nos. 2 and 4 screws to No. 2 instrument. The velocity of each projectile is, therefore, registered at two points in front of the gun, namely, at 150 feet and 160 feet, by two independent instruments. This affords a complete check on the method of recording the velocity. The "crusher" gauge, or instrument for measuring the pressure caused by the explosion of the charge, consists of a screw-plug of steel, provided with a movable base which admits of the insertion of a small copper cylinder, $\frac{1}{2}$ inch in length, into a chamber. One end of this copper cylinder rests on an anvil, while the other is acted upon by a movable piston. The copper cylinder is centered in the chamber by a small circular watch spring. The action of the apparatus is as follows: Upon the explosion of the charge, the gas, acting on the area of the piston, one end of which is almost flush with the interior of the bore, crushes the copper cylinder against the anvil. The amount of compression which the copper thereby sustains becomes an indication of the pressure. The area of the copper cylinders used for proof of gunpowder is $\frac{1}{12}$ square inch, while the area of the piston is $\frac{1}{8}$ square inch. To form a table of pressure, a series of experiments has been carried out in a testing machine, so as to determine the pressure required to produce a definite amount of compression in copper cylinders corresponding to those used in the instrument. The tabulated results furnish a means of comparison whereby the amount of compression produced in the "crusher" becomes a direct indication of the pressure at that part of the bore where the plug is inserted. The interesting experiments carried out by the committee on explosives have shown that the pressure indicated by each "crusher gauge" is, practically speaking, a true measure of the strain on the gun at that point.

The *modus operandi* of conducting an individual experiment in connection with the proof of gunpowder is as follows: The electric batteries and wire screens for use with the chronoscope having been duly prepared, the operator having satisfied himself that the instruments are in thorough working order, the command is given to "load." Upon this the men at the gun insert a cartridge of 35 lbs. weight and 19 inches length into the bore, and ram it home until a stopper on the stave of the rammer comes in contact with the face of the muzzle. The cylinder, flat at both ends, is then inserted and rammed home in a similar manner. This proceeding insures uniformity, as, owing to the stops on the rammer staves, each charge occupies the same space in the bore. The "crusher" plugs are then screwed into their respective holes, the copper cylinders having previously been fitted into the chamber in the extremity of the plug. All is now ready. The operator adjusts the chronoscopes, and gives the signal to fire. The projectile passes through the wire screens before it buries itself in the earth butt at which it is directed. The operator notes the readings of the instruments. The "crusher" plugs are withdrawn, and the little copper cylinders removed, stamped with the experimental number of the series, and measured in a calipers or micrometer gauge. A reduction in the length of the copper cylinder of $\frac{1}{16}$ inch indicates a pressure of 12 tons on the square inch; of one-tenth and a half, of 16 tons; of $\frac{2}{16}$, of 21 tons; of $\frac{3}{16}$, of 36 tons, etc. Thus, the operator, in each round, records two velocities, which ought to be almost equal, and pressures at three points in the bore. Let us assume that the pressures at the three points are respectively 17.6 tons, 17.9 tons, and 16.3 tons, and that the observed velocities per second are 1430 and 1426 feet at the respective distances of 150 feet and 160 feet from the muzzle. As a flat-headed cylinder of 180 lbs. weight and 8 inches in diameter, traveling at 1400 feet a second, would, owing to the resistance of the air, lose about 15 feet velocity in passing over 150 feet of space, the mean velocity at the muzzle will be 1443 feet. This batch of powder, therefore, would have passed proof within the terms of the specification. Had, however, the pressure recorded at any one point exceeded twenty tons, or the observed velocities been less than about 1405 feet, or greater than about 1465 feet, the powder would be rejected. The instrument invented by Le Boulengé for proving powder, has now nearly superseded that of Navez-Leurs, both in India and in England.

A very valuable paper on "Fired Gunpowder," by Captain A. Noble, F. R. S., and Professor Abel, F. R. S., will be found in the "Philosophical Transactions of the Royal Society" for the year 1875, in which is given the result of certain experiments for ascertaining the different phenomena of fired gunpowder within the bore of a gun, a subject until very lately veiled in obscurity for want of suitable instruments and data on which to carry out the experiments. The different chronographs which have been invented give us the measure of velocity of a projectile at the muzzle of a gun and during its flight, but the velocity of a shot within the bore from the first movement, along certain fixed points until it leaves the gun, has been left to Captain Noble to discover with his beautiful chronoscope, which is able to record the millionth part of a second. This instrument, in conjunction with the "crusher gauge," enables us to ascertain all the phenomena attending the combustion of gunpowder, such as its tension or pressure—its rapidity of ignition—the time occupied in burning different natures of gunpowder, etc. The subject is so interesting that it cannot fail to attract the attention of all scientific men and that of the practical artillerist. The length of the memoir prevents, in a work of this sort, a longer allusion to the results of the experiments than is now given. See *Eprouvette*, and *Gunpowder*.

PROOF OF ORDNANCE.—Guns of all descriptions are proved before being issued for service. Muskets are tested by being fired with heavier bullets and larger charge of powder than they will in the ordinary way be required to carry. Cannon are subjected to a series of tests. First, they are gauged to ascertain that the dimensions are correct, the utmost variation permitted being .3 in. externally, and .033. in the diameter of the bore, but the position of the bore may frequently deviate .25 in. from the line of the piece's axis. The next trial is by firing twice with very heavy charges—the bore being subsequently minutely examined, to detect flaws or crevices in the metal. A cavity exceeding in depth .2 in. if behind the first re-inforce ring, or .25 if before that ring, condemns the piece. After the proof by firing, water is forced at a great pressure into the bore, in order that it may permeate any honeycombs or flaws; the next day the bore is examined by means of a mirror, which casts a strong light into it. Flaws are then easily detected for while the rest of the bore is thoroughly dry, water will continue for some time to weep or run from the holes, and will stand over them in drops. This operation completes the proof. When a gun bursts in proof, the remainder of the guns of the same sort then in proof are subjected to another round.

Gunpowder for proving ordnance should be of the best quality of the kind used in the gun to be proved, giving not less than the standard initial velocity; it should be proved immediately before being used unless it shall have been proved within one year previously, and there be no reason to suspect that it has become deteriorated. The *cartridge-bags* are made of woolen or raw silk, the full diameter of the bore or chamber. They are filled by weight. The shot must be smooth, free from seams and other inequalities that might injure the bore of the piece, and they must be of the true diameter and weight given in the tables. *Guns* and *howitzers* are laid with the muzzle resting on a block of wood, and the breach on the ground or on a thick plank, giving the bore a small elevation. *Mortars* are mounted on strong wooden frames or iron beds, at an elevation of 45°, supported by the trunnions. Each piece should be fired two rounds with maximum charges and projectiles. The bore, vent, and the exterior surface of every piece which is approved, should be well covered with sperm oil immediately after the inspection. Bronze cannons are fired three times with solid shot and a charge of powder *one-third* the weight of the shot. If the piece has been in service, or if it be new, and its bore be of the true size, the shot should be wrapped in cloth or strong paper, to save the bore as much as possible from injury. See *Inspection of Ordnance*.

PROOF-PLUG.—A plug screwed temporarily into the breech of a gun-barrel to be proved.

PROPER.—A term in Heraldry. A charge borne of its natural color, is said to be proper. An object whose color varies at different times and in different examples, as a rose, which may be white or red, cannot be borne proper.

PROPORTIONAL DIVIDERS.—An instrument designed for dividing a line into any number of equal parts; for describing regular polygons in given circles; for reducing or enlarging the area of a drawing, and also for taking the square and cube-root of numbers. The bodies of the legs of these dividers are made of a flat piece of German silver, or brass, with a rectangular opening cut in each nearly the whole length; the ends of the legs are armed with steel points; the longest two are four or five times the length of the shortest ones. The legs are put together with the rectangular openings exactly opposite each other, and retained in their place by clamp plates and a thumb-screw, which can be moved up and down the opening and made tight at any desired point; these clamp-plates and thumb-screw constitute the joint of the dividers, upon which the legs are opened, and it is easy to perceive that if this joint is exactly halfway between the extremity of the points the two ends will open to the same distance, but if the joint is moved nearer one end the opening of the points will bear the same proportion to each other as the longer does to the shorter part. The cheaper form of these dividers have but one set of graduations, by which lines only can be subdivided; the proportions are $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, $\frac{1}{6}$, $\frac{1}{7}$, $\frac{1}{8}$, $\frac{1}{9}$, $\frac{1}{10}$; that is, if the line across one of the clamp-plates is made to come opposite either of the divisions on the leg, the two ends of the dividers will open in that proportion. The best proportional dividers have one side of one of the legs graduated for dividing lines into $1\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{2}{3}$, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, $\frac{1}{6}$, $\frac{1}{7}$, $\frac{1}{8}$, $\frac{1}{9}$, $\frac{1}{10}$, $\frac{1}{11}$, and the other side of the leg is graduated for inscribing regular polygons of 6, 7, 8, 9 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, and 20 sides in given circles. To use the lines of polygons, bring the line across the clamp plate to coincide with the graduation which is marked with the number that the polygon is to have sides, then open the dividers and make the long steel points take in the radius of the circle, then the distance between the small points will be the length of one side of the

required polygon. The joint of most of the proportional dividers is slipped along the rectangular opening by the hand; but it is frequently quite difficult to bring it exactly to the right place, as a little too much pressure will move the line a little too far, and an opposite pressure may put it too far in the original direction again. For nicety in adjusting the joint to the required point, some proportional dividers are fitted with a bar and micrometer screw, by which the joint can be drawn exactly to the required division. Another plan is to have a rack fitted on the inside of the rectangular opening and a pinion attached to the sliding joint fitting into it; by turning the milled thumb-screw of the pinion the joint is moved up and down in the rectangular opening with great regularity and exactness. Great care must be taken that none of the points of the proportional dividers get broken.

PROPOSALS.—Information in regard to supplies or services for which proposals have been invited by advertisements is furnished to all persons desiring it, on application to such sources as are designated in the advertisement. In case of supplies, they are informed of the kind, quantity, and quality of articles required; place, time, and rate of delivery; conditions of payment, etc. In case of services, they are informed of the nature and extent of the services required; the place where or places between which they are to be performed, and the time allowed for the performance; furnished with or allowed to examine plans and specifications of all buildings, constructions and other works in contemplation, etc. No bidder is informed, directly or indirectly, of the name of any person intending to bid or not to bid, or to whom information in respect to proposals may have been given. All proposals should be inclosed in suitable envelopes, securely sealed, indorsed, and addressed as required by the advertisement, and be delivered to, or received by, the officer to whom addressed before the time appointed for the opening; and no responsibilty should attach to that officer for premature opening of any proposal not so indorsed as to show that it is a proposal, and the particular purpose for which it is made. When an advertisement calls for proposals to deliver supplies or render services at more than one place, a separate proposal should be made for each place, but all may be submitted in the same envelope. The officer whose duty it is to open proposals decides when the time fixed upon for the opening has arrived, and no proposal for that opening is thereafter received as formal. If a bidder wishes to withdraw his proposal, he may do so before the time fixed for the opening, without prejudice to himself, by communicating his purpose, in writing, to the officer who holds it; and when his proposal is reached it is handed to him, or his authorized agent, unread. Proposals are opened and read aloud at the time and place appointed for the opening; and a record of each proposal then and there is made upon an abstract showing fully all its essential particulars. As soon as the proposals have been opened and decided upon, an "Abstract" of them is made, one copy of which, together with one of the duplicates of each proposal offered, is forwarded to the proper Bureau without delay. The "Abstract of Proposals" has a copy of the notice attached, and has separate columns for "No. of proposal," "Name of bidder," "Date of delivery," "Remarks," and two columns (one for quantity and one for price) for each article, variety of article, or package that may be offered; for example under the item of pork, there are two columns (price and quantity) for each of the varieties "Mess," "Prime mess," "Thin mess;" under coffee, two for each of the items "Green, in barrels;" "Green, in bags;" "Roasted, in bags," etc.

The following is the general form of proposal:

The undersigned, engaged in the — business, in response to your — dated the — day of ——, hereby offer for sale to the — Department of the U. S. Army the following stores, viz:

—— —— at —— dollars and — cents per ——, and should this proposal be accepted — hereby bind —— to deliver the stores in strict compliance with the terms of your —— on or before the ——.

(Signature) —— —.

—— ——.

To —— ——,

U. S. A.

On the above proposal is accepted the following:

(Signature) —— ——,

—— ——.

Office U. S. ——,

—— —— .

In all cases where bonds are required from bidders, no proposal is considered unless accompanied by a bond made according to the form prescribed. The condition of the bidder's bond is to the effect that the bidder will not withdraw his proposal within sixty days succeeding the date announced in the advertisement or notice for the opening of proposals; and that, if his proposal be accepted and the contract for which he has bid be awarded him, he will enter into a contract and bond agreeable to the terms of his proposal within such number of days after the day on which he is notified of such acceptance and award as may be designated by the officer representing the United States.

The form of the bidder's bond is as follows:

Know all men by these presents, That we [*name of obligor*], of [*residence of obligor, giving town, county, State, etc.*], as principal, and [*name of surety*], of [*residence of surety*], and [*name of surety*], of [*residence of surety*], as sureties, are held and bound unto the United States of America in the penal sum of —— dollars, to the payment of which sum, well and truly to be made, we do bind ourselves, our heirs, executors, and administrators, jointly and severally, firmly by these presents.

Given under our hands and seals this —— day of ——, 18—.

The condition of this obligation is such that, Whereas the above-bounden [*name of obligor*], in response to a public advertisement and notice dated — —, 18—, and given and published by —— ——, United States Army, has made and presented to —— ——, United States Army, a formal proposal, in writing, whereby he has proposed and agreed to enter into a contract with — ——, United States Army, acting for and representing the said United States, to [*here state in brief the subject of the contract*], according to the terms and conditions set forth in said advertisement or notice:

Now, therefore, if the said [*name of obligor*] shall make and shall not withdraw his said proposal within sixty days from the date of opening the proposals, and shall within —— days from the date on which he may be notified that his said proposal has been accepted and the said contract awarded to him (provided such award be made within the sixty days above mentioned, duly and formally entered into such contract agreeably to the terms of his said proposal, and into such bond for its due performance as shall be required of him, or if his proposal shall not be accepted and such contract not be awarded him, then this obligation shall be void; otherwise, that is to say, if either he shall withdraw his proposal within said sixty days, or fail to enter within said —— days into such contract, if awarded him, and into such bond, to remain in full force, effect, and virtue.

Witnesses:

——— ———, ——— ———, [L. S.]
——— ———, ——— ———, [L. S.]
——— ———, ——— ———, [L. S.]

(Executed in duplicate.)

The following is the form of the Justification of the Sureties:

STATE OF ———,
County of ———, *ss:*

I [*name of surety*], one of the sureties named in the within bond, do swear that I am pecuniarily worth the sum of —— dollars, over and above all my debts and liabilities.

[Signature of surety.]

Before me,

[Signature of officer administering oath, with seal, if any.]

PROSECUTOR.—In Courts-Martial the Judge Advocate is usually the prosecutor; but if an officer prefers a charge, he sometimes appears to sustain the prosecution. No person can appear as prosecutor, who is not subject to the Articles of War, except the Judge-Advocate.

PROTRACTOR.—A mathematical instrument much used in engineering and fortification drawing. Fig. 1, shows the protractor in common use, provided

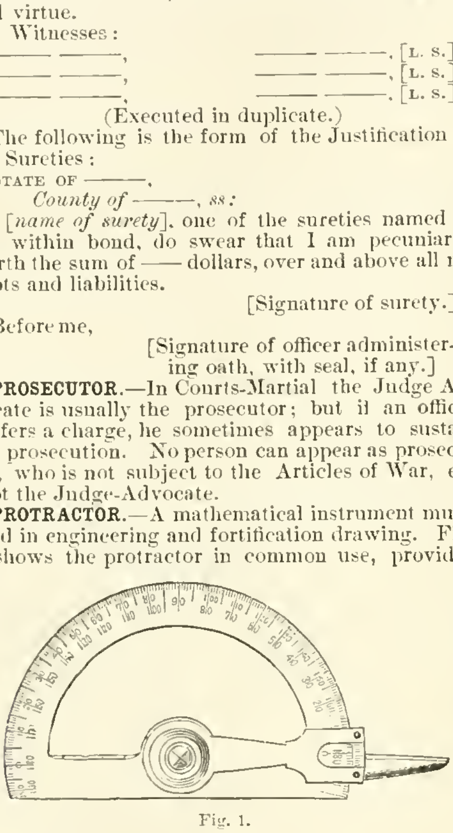

Fig. 1.

with arms and verniers. Crozet's protractor is shown in Fig. 2. It is named from its inventor, an officer of the United States Engineer Corps, and is considered the best among the various protractors yet devised. It may be used with the T-rule or straight edge. The feather edge is always set to the starting point and the line produced without puncturing the paper. The feather edge is the only metallic bearing upon the paper, small ivory projections on the under side of the frame keep the metal from contact with the paper and prevent soiling it.

PROVISIONAL FORTIFICATION.—Broadly speaking, provisional works may be divided into two classes according to the conditions under which they may be expected to be employed. 1st. Works constructed after the beginning of a campaign on sites not previously strategically considered, or which have become important in consequence of strategic developments not anticipated. In such cases neither the topographical nor geological conditions might be fully known, and, which is also of much importance, the extent of the resources of the neighborhood in labor and material might be more or less undetermined. 2d. Works constructed at the declaration of war, or its approach, for a well defined and previously considered object, on sites perfectly well known, and under conditions accurately ascertained before-

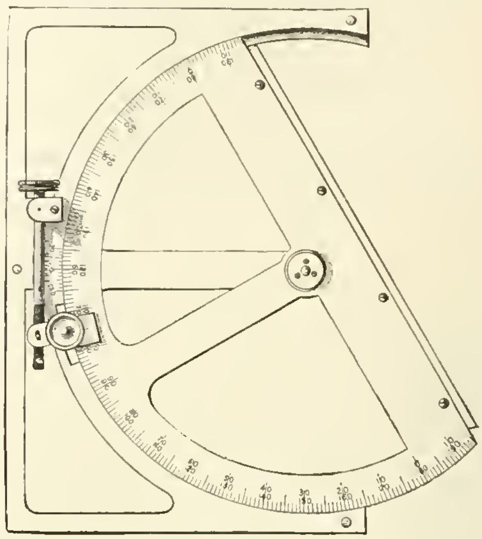

Fig. 2.

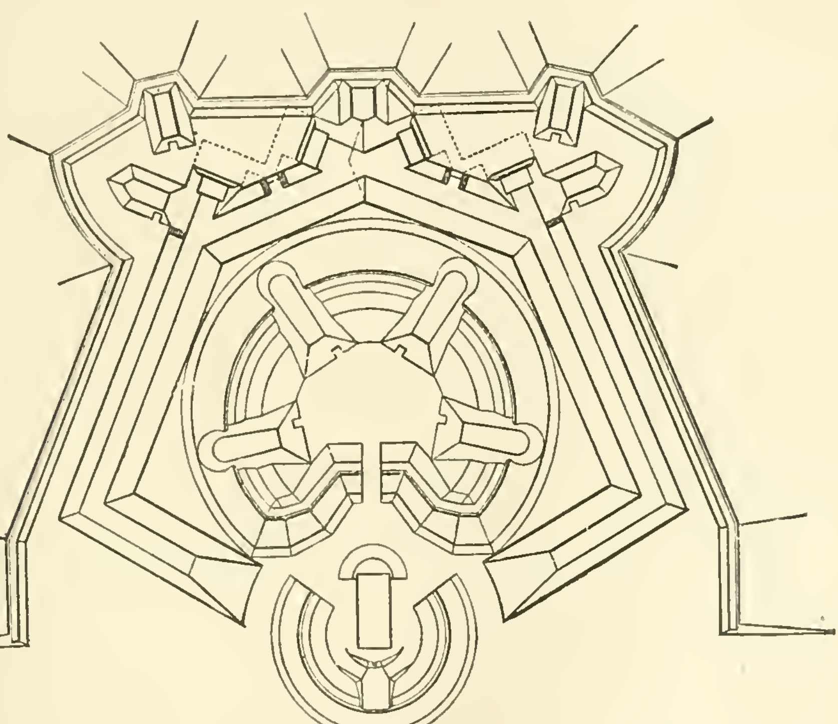
hand. As an instance of works of the first class, Plevna may be cited; as instances of the second, Adrianople and Tschataldscha; as an instance of the possible demand for the second class, London. The former class would usually have to be carried out by Military Engineers capable of adapting standard designs to varying conditions and full of resource, so as to be able to make the best use of the time available and the material and labor forthcoming. On the other hand, works of the latter class could be designed in the fullest sense during the calm of peace. Their requirements in labor and material would be exactly known. The resources of the neighborhood would have been accurately gauged, and the how and the whence to supply deficiencies would have been considered. Moreover, if a properly elaborated design existed, the execution might safely be left to civil labor under civil supervision. In the defense of England both classes of fortification would probably come into play. Certain strategic, commercial, or manufacturing centers would appear to need protection under any circumstances, others would call for fortification as soon as the landing place of the invader, or his subsequent plan of operations, had declared itself.

A method of fortification, in which forethought and brain power applied in advance may save enormous and possibly useless, because misdirected, expenditure, appears to be worth very careful study; and there are circumstances which make provisional fortification particularly applicable to England. The sea secures her time and a fair warning. Her resources in labor and the very ordinary materials required are practically unlimited. Her great railway system facilitates the rapid concentration at any spot of labor and material. Moreover, England possesses in her Civil Engineers a very powerful force, which could at a time of need be applied to the defense of the country. There is a very considerable body of young and able Engineers who, if provided with proper designs, are perfectly well able to carry out all the work necessary to fortify a position, and who have great experience in dealing with, and organizing civil labor on a large scale. In any time of real necessity the *personnel* of the Corps would have demands made upon it which its strength could scarcely meet, and it is no small advantage to have this very real "reserve force" to fall back upon. The same may be said of many of the colonies, and it remains to prepare in peace time a complete system of provisional defense, and by modifying it from time to time to keep it abreast of the advancing power of the attack. A paper army is rightly held up to contempt as a species of deception, which no great nations, jealous of the management of its affairs, should tolerate; but a paper system of fortification may, it is contended, form a very real defense. Only this paper system must be thorough, and the brain power applied to it unstinted. A very little reflection serves to show that the design of a provisional work is a task of considerably greater difficulty than that of a field redoubt. The restriction to two or three days, or less, in the case of the latter introduces a very sharp limitation to the possibilities of design. Extend the time to three or four weeks, or even longer, postulate an ample supply of timber, of railway bars, and even perhaps of bricks and cement, and it will be evident that these possibilities have enormously widened, and that very considerable variations of trace, profile, and general arrangement will present themselves for consideration. It is even contended that the design of a good provisional work is more difficult than that of an analogous permanent structure, and that it affords more scope for clever and resourceful engineering.

The drawing shows a plan of a typical provisional work for the defense of a hill top. This design was furnished by Bluhm Pasha to Colonel Ott of the Swiss Engineers. The work is in trace a circular segment (diameter about 60 yards) and four sides of the polygonal ditch are flanked by caponiers with two tiers of fire, formed in the counterscarp at its front ends. These caponiers are well placed for protection from distant artillery fire, but in the event of the enemy gaining and maintaining possession of the ditch their defenders would be sacrificed. Accommodation is provided for eight overbank guns in the work and one in the gorge traverse. The latter is really a segmental lunette partially inclosing a traverse containing a shell-proof casemate. A covered way affording a good line of infantry fire runs around the work, and the front line is broken so as to form two bastioned fronts and also two places of arms at the shoulders, defiladed by four traverses containing casemates. Brickwork is employed in all the casemates and also in the steps leading from the ditch down into the caponiers and up to the covered way. The total length of the line of fire is about 650 yards run, and to man it, therefore, at least an equal number of men would be needed. Casemate cover for 200 men is provided, and magazine accommodation to the extent of about 645 square feet.

The most salient features of the works attributed to Bluhm are thus: 1. The curved trace of the crest of the main work. 2. The polygonal trace of the ditch; the latter usually unflanked. 3. The combination of artillery and infantry fire from the work itself; the employment of the latter only from the covered way. 4. The curved defensible traverse to cover the gorge; the large lateral traverses containing casemates for men and magazines. 5. The employment of brickwork as much as possible for the walls of the casemates and for stepped approaches. The work appears to have several merits. The circular or elliptic trace cannot well be enfiladed: it affords a maximum of interior space with a minimum of parapet; there are no undefended angles. The old objection to circular redoubts—that they tend to too great a dispersion of fire—has now less weight, since a smaller number of breech-loaders is as effective as a comparatively large number of the old rifles. Nor has the other objection—that the circular trace is suited only to direct defense, and that works so designed have no self-flanking power—quite its old force, since the increased range of artillery enables works belonging to a line to afford each other more effectual mutual flank defense than formerly. Moreover redoubts would frequently be flanked by detached batteries in rear of the general line of their positions. On the other hand, it may perhaps be said that the work above described provides insufficient cover for its garrison, that the broad berm at the angles of the ditch affords a good



resting place for an assaulting party to accumulate prior to the final rush for the parapet, and that there is on the whole too little storm-freedom. The latter objection may, however, be partially met by a liberal use of obstacles. See *Fortification*.

PROVOST.—The temporary prison in which the military police confine prisoners until they are disposed of.

PROVOST CELLS.—In the British service, those certified cells under a Provost or acting Provost Sergeant, in which Court-Martial prisoners may be imprisoned up to forty-two days. Also, called Regimental or Garrison cells.

PROVOST MARSHAL.—An officer appointed in every army in the field, to secure the prisoners confined on charges of a general nature. In the British Army he is an officer, with the rank of Captain, appointed to superintend the preservation of order, and to be, as it were, the head of the police of any particular camp or district. He has cognizance of all camp-followers, as well as of members of the army. His power is summary, and he can punish an offender, taken *flagrante delicto*, on the spot, according to the penalties laid down in the Mutiny Act.

PROVOST SEGEANT.—A Sergeant who is charged with the military police of a corps. He is generally given one or two non-commissioned officers as assistants. In the British service he is also charged with the custody of all prisoners in the cells.

PROWLERS.—Armed prowlers, by whatever names they may be called, or persons of the enemy's territory, who steal within the lines of the hostile army, for the purpose of robbing, killing, or of destroying the mail, or of cutting the telegraph wires, are not entitled to the privileges of the prisoner of war.

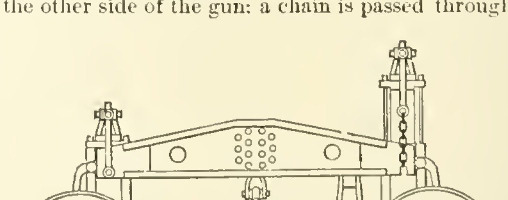
PRUSSIAN BREECH-LOADER.—This method of closing the breech is similar to that of the *Wahrendorf Breech-loader*. The leakage of gas is stopped by a valve and a *papier maché* cup. The sliding block is set up by a wedge tightened by a screw.

PRUSSIAN FUSE.—This fuse might be designated as a *time-concussion-chemical* fuse. It consists of three parts. 1st. The body of the fuse, or fuse-case, which holds the other parts, and is screwed into the eye of the shell, the top being flush with the outer surface. This part has been constructed of both metal (bronze and cast iron) and wood. The interior is divided into two parts, both cylindrical, and with a common axis. The one next the outside of the shell is much the larger in diameter. This case was made the same size for all calibers, but that part destined for the reception of the fuse-composition, is longer for fuses which are to be fired with small charges than for those with which large charges are to be used. 2d. The percussion apparatus consists of a small glass tube, hermetically closed at both ends, partly filled with concentrated sulphuric acid, and wrapped with cotton thread soaked in a composition of 70 parts (by weight) of chlorate of potassa, 10 parts of flowers of sulphur and 20 parts of white sugar, pulverized, sifted, and moistened with alcohol. This covering is put on of such a thickness that the tube can just be inserted in a paper case which serves it as an envelope, and which fits partly into the smaller opening in the fuse-case and partly into a thimble-shaped *breaker* of lead, which is inserted over it in the large part of the opening. 3d. The composition column. The explosive apparatus being in position, there remains between the thimble and the sides of the fuse-case a vacant space, which is filled with compressed meal-powder, filled in by means of a hollow drift, the interior diameter of which is a little greater than the diameter of the thimble. When the composition reaches the top of the thimble, uncompressed mealed powder is filled in to the top of the case. On being fired, the thimble or breaker being supported by the composition around it, is not disturbed. But as this takes fire like an ordinary fuse, and burns down to the bottom of the breaker, it leaves this unsupported; and if the composition is all consumed when the shell strikes, the shock overthrows the breaker, rupturing the glass tube, setting free the sulphuric acid, and exploding the shell. Experiments go to show that, in this fuse, the best material for the fuse-case is beech-wood; and the worst, cast iron.

PRUSSIAN GUN LIFT.—The gun-lift adopted for service in the Prussian Army consists of two telescopic hydraulic jacks, each mounted on a solid base, and carrying suspended from the heads of the two upper jacks a wrought-iron cross-beam, with a double hook depending from the middle for attaching the load. The lower jacks are $8\frac{3}{4}$ inches in diameter, and the upper ones $6\frac{3}{4}$ inches, each having a lift of $3\frac{1}{2}$ feet. They are operated by means of a crank on an axle, which rests in two bearings on the lower jack. A fly-wheel with a handle is attached to each end of the axle; they are used to transport the jack from place to place. The cross-beam is built up of two rolled plates placed vertically, strengthened by angle-irons, and joined together by a top plate riveted to them. A cast-iron block is bolted between the plates at the middle of their length, and a link passes around it and carries the double-hook. Length of cross-beam, 10 feet; weight, 1,430 pounds. Capacity of the lift, 62,000 pounds, raised 7 feet.

Great care must be taken to prepare the foundations for the jacks to set on, so that they shall not yield unequally when the weight is brought upon them, and cause the jacks to upset. If the ground be soft, the foundations may be made of timbers bolted together and resting on piles. The jacks are placed on the bases at the proper distance apart (depending upon the length of the cross-beam, which is usually 10 feet). The cross-beam is brought into position by 24 men, the ends at the foot of the jacks. A chain is passed through the stirrup of the upper jack, and is made fast to the end of the cross-beam, which is raised by pumping the jack, and is rested on a trestle prepared for the purpose. The jack is now lowered, the end of the beam is secured in the stirrup, and the trestle removed. The same operation is performed with the other end, thus bringing the cross-beam into a horizontal position, and the heads of both jacks down. The cross-beam is suspended more quickly and safely by using two trestles; raise both ends of the cross-beam at the same time, rest it on the trestles, lower the heads of the jacks, and suspend the cross-beam in the stirrups, then raise it slightly and remove the trestles.

The cross-beam is placed across the gun, a block of wood of proper shape being first interposed to protect the gun from injury. The first jack is placed 5 feet from the axis of the gun, and the end of the cross-beam is inserted in the stirrup. The second jack is set up in a corresponding position on the other side of the gun; a chain is passed through



the stirrup and made fast to the end of the cross-beam, which is raised by pumping the jack; a trestle is placed under the cross-beam when it is brought to a horizontal position, the head of the jack is lowered, and the stirrup is placed over the end of

the cross-beam. The slings are passed around the gun and hooked to the double hook. By pumping up the jacks the weight is raised. When the gun-lift cannot be set up over the weight to be raised it may be set up on planks, either in front or rear, and then moved into the required position by means of rollers. The lift is taken down in the inverse manner of setting it up.

Twenty-four men transport the cross-beam by two long handspikes run through holes in the beam for that purpose, and place it on a truck or cart. The fly-wheels are used as truck-wheels for transporting the jacks. The keys which fasten them to the axles are removed, also the handles. The heads of the jacks are secured by ropes, and the bolts of the axle-bearings tightened. The jack is brought down into a nearly horizontal position, and the stirrup is placed over the pintle-hook of a field-limber and secured by a rope. See *Gun-lift*, and *Krupp Gun-lift*.

PRUSSIAN NEEDLE CARBINE.—A breech-loading small-arm, having a fixed chamber closed by a movable barrel, which rotates about an axis at 90° to the axis of the barrel, and vertical in the plane of the axis of the barrel. It is opened by turning a lever back and to the right; in so doing the barrel is moved forward by an eccentric as far as the corresponding arm of a heart-shaped slot in the tang of the receiver will permit the rear guide-stud to go. By the same means the butt of the barrel is swung around to the right, so that the mouth of the chamber may be readily reached with the load. As the eccentric turns, an eccentric plate, which is on the same shaft with it, turns also; and by means of a connecting rod, which is linked at its forward end to the eccentric plate and in rear to the cocking-bolt, slides the latter backward against the pressure of a spiral mainspring surrounding the stem of the needle-bolt, against the face of which the vertical arm of the cocking-bolt presses. This motion is so timed, that at the moment the piece is fully opened, the nose of a spring-sear riding over the beveled shoulder of a fillet on the needle-bolt, catches against its square-face and retains the bolt against the pressure of the mainspring, when, in order to load the piece, the resistance of the hand has been withdrawn. It is closed by returning the lever to its place beneath the barrel; the barrel is first swung around in the prolongation of its original position, and is then drawn back so that a gas-plug projecting from the receiver shall enter the mouth of the chamber. The carbine is fired in the same manner as the Prussian needle-gun, and in case of a failure to ignite the charge, the piece, without opening it, may be re-cocked in the same manner. The arm using a self-consuming cartridge-case, the extracting or ejecting apparatus is not needed. The enormous swell left at the muzzle of this piece, it is supposed, is intended to protect it from the indentations likely to occur in common use in the mounted service. See *Needle-guns*.

PRUSSIAN NEEDLE-GUN.—A breech-loading gun (small-arm), having a fixed chamber closed by a movable breech-block which slides in the line of the barrel by direct action. It is opened by releasing a spring catch by pressing down upon it, and then drawing it back by the thumb. This slides a projecting thumb-piece of the lock-tube out of its square notch in the receiver, and allows the handle of the breech-bolt to be raised to a vertical position and the bolt itself to be withdrawn. The piece may then be closed by reversing the movement of the bolt, and may be locked by turning down the base of the handle against a recoil-shoulder formed for it on the receiver. In the act of closing, the front shoulder of the needle-bolt, around the stem of which the main spring is coiled, catches against the nose of a sear, and pushes the lock-tube out to the rear by means of the main spring included between them. By then pushing forward with the hand, the base of the lock-tube until the spring-catch above it engages with a corresponding notch in the upper surface of the bore of the breech-bolt, the main spring is compressed, so that when the sear is pulled out of the way by the trigger, the needle may be darted forward, and, guided by a small hole in the face of the bolt, find its way through the powder in the cartridge to explode the fulminate lying in the base of the paper sabot which surrounds the ball.

The cartridge being self-consuming, no extracting or ejecting devices are required. The butt of the barrel is chambered, and the face of the breech-bolt is counter-bored at the same angle, so as to make a close fit and to prevent, as far as possible, the escape of gas. The recoil-shoulder on the receiver is inclined to the front, so that as the ends of the barrel and breech-bolt wear off, the bolt may be brought forward to supply their loss. The arm may be cocked independently of the bolt, by first withdrawing, and then shoving forward the lock-tube. The system may be dismounted by withdrawing the bolt, and at the same time pulling hard on the trigger; this causes a change of fulcrum to the rearmost of the scolloped surfaces, into which its upper side is formed, and permits the nose of the sear to be pulled completely out of the way for the passage of the bolt. See *Needle-guns*.

PRUSSIAN RIFLING.—The Prussians early adopted and perfected the *compressing system*, and obtained great accuracy and range with charges of one-tenth the weight of the projectile. The rifling consisted of numerous shallow rectangular grooves. The shot was encased by four rounded lead bands or hoops, held in place by grooves in the shot. With this system the shot is larger than the bore, and is squeezed or planed to fit the bore by the lands of the rifling. The shot must therefore be entered at the breech, into a chamber larger than the rest of the bore; and whatever escape of gas there may be around the breech-closing apparatus reduces its range and velocity.

PRYCK-SPUR.—In ancient armor, a spur having a single spike.

PSILOI.—Among the Greeks, Psiloi were the light armed men who fought with arrows and darts, or stones and slings; but were unfit for close fight. They were in honor and dignity inferior to the heavy-armed soldiers. The Psiloi performed all the duties usually devolved, in the present day, upon light infantry, both before and at the opening of an engagement. See *Oplitai*.

PUBLIC ANIMALS.—The animals in the employ of a Government. In the United States, the following specifications govern in purchasing the horses and mules for the military service:

Cavalry Horses—To be geldings, of hardy colors, sound in all particulars, in good condition, well broken to the saddle, from fifteen to sixteen hands high, not less than five nor more than nine years old, and suitable in every respect for Cavalry service. Whenever it becomes necessary to purchase the half-breed horses of California or Southern Texas, the standard of height may be reduced to not less than fourteen and a half hands.

Artillery Horses—To be geldings, of hardy colors, sound in all particulars, in good condition, square trotters, well broken to harness, from fifteen to sixteen hands high, not less than five nor more than nine years old, and suitable in every respect for Artillery service.

Mules—To be strong, stout, compact animals, sound in all particulars, in good condition, well broken to harness, not under fourteen hands high, not less than four nor more than nine years old, and suitable in every respect for the transportation service of the army.

When work-horses are to be purchased, they should be sound in all particulars, fifteen and one-half hands high and upwards, strong built, well broken to work in harness, not less than four nor more than nine years old. For pack purposes, the standard of height may be reduced to thirteen and a half hands, if the animal be in other respects suitable. The pack mule need not necessarily be broken to harness.

For general transportation purposes of the army, horses cannot be advantageously substituted for mules. For draught purposes in the Northern and Eastern States, and at depots in large cities, and for saddle purposes of wagon-masters, messengers, and expressmen, horses may be advantageously used in place of mules.

The following weights are suggested as the minimum, except for the half-breed horses of Texas and Southern California:

	Pounds.
Artillery wheel-horses	1,200
Artillery swing and lead horses	1,100
Cavalry horses	950
Horses for messengers, etc	950
Draft-horses of the Quartermaster's Department	1,200
Wheel-mules	1,200
Swing-mules	1,050
Lead-mules	850

At the headquarters of every regiment of Cavalry, with every company of Cavalry and battery of mounted Artillery, and with the records of every officer in immediate charge of public animals, a descriptive list of horses and mules is kept, showing the name, age, size, color, and other peculiarities of each animal, how and when acquired, his fitness for service, how long he has been in service, the name of his rider or driver, and the particular use to which he is or was applied.

PUBLIC EXIGENCY.—The term "*Public Exigency*," employed in section 3,709, Revised Statutes, refers to an exceptional and urgent necessity, requiring an immediate supply of articles for military use, or the immediate performance of work or service, such as may grow out of the pressure of an existing state of war, rebellion, or insurrection, or of some particular act of warfare on the part of an enemy, or may be occasioned by any unexpected movement of troops; or such as may consist in the destruction or loss of supplies, structures, etc., by fire or the violence of the elements, by acts of rioters or trespassers, by theft or waste, by the negligence of common carriers or others, by the failure of contractors, etc. Exigencies are sometimes assumed to exist where none have legitimately occurred. By carefully observing the laws regulating contracts, and making prompt provision for the future supplies, etc., of the command, recourse to purchases in open market to meet supposed emergencies may ordinarily be avoided. Information can generally be derived from the proper records as to the average quantity of supplies required in years past, which will provide against the happening of such emergencies; and timely advertisements should be made accordingly. But that statute (the act of March 2, 1861), while requiring such advertisement as a general rule, invests the officer charged with the duty of procuring supplies with a discretion to dispense with advertising if the exigencies of the public service require immediate delivery or performance. It is too well settled to admit of dispute at this day, that where there is a discretion of this kind conferred on an officer, or board of officers, and a contract is made in which they have exercised that discretion, the validity of the contract cannot be made to depend on the degree of wisdom or skill which may have accompanied its exercise.

PUBLIC MONEYS.—All officers of the Quartermaster's Subsistence and Pay Departments, the Chief Medical Purveyor and Assistant Medical Purveyors, and all Storekeepers before entering upon the duties of their respective offices, give good and sufficient bonds to the United States, in such sums as the Secretary of War may direct, faithfully to account for all public moneys and property which they may receive. The President may, at any time, increase the sums so prescribed. It is the duty of every disbursing officer having any public money intrusted to him for disbursement to deposit the same with the Treasurer, or some one of the Assistant Treasurers, of the United States, and to draw for the same only as it may be required for payments to be made by him in pursuance of law, and to draw for the same only in favor of the persons to whom payment is made; and all transfers from the Treasurer of the United States to a disbursing officer are by draft or warrant on the Treasury, or an Assistant Treasurer, of the United States. In places, however, where there is no Treasurer or Assistant Treasurer, the Secretary of the Treasury may, when he deems it essential to the public interest, specially authorize in writing the deposit of such public money in any other public depository, or, in writing, authorize the same to be kept in any other manner, and under such rules and regulations as he may deem most safe and effectual to facilitate the payments to public creditors.

All public money advanced to disbursing officers of the United States must, in accordance with the law, be deposited immediately, to their respective credits, with either the United States Treasurer, some Assistant Treasurer, or Designated Depositary, other than a National Bank Depositary, nearest or most convenient; or, by special direction of the Secretary of the Treasury, with a National Bank Depositary, except—1. Any disbursing officer of the War Department, specially authorized by the Secretary of War, when stationed on the extreme frontier or at places far remote from such depositaries, may keep, at his own risk, such moneys as may be intrusted to him for disbursement. 2. Any officer receiving money remitted to him upon specific estimates, may disburse it accordingly, without waiting to place it in a depository, provided the payments are due, and he prefers this method to that of drawing checks. Any check drawn by a disbursing officer upon moneys thus deposited, must be in favor of the party, by name, to whom the payment is to be made, and payable to "order" or "bearer", with these exceptions—1. To make payments of individual pensions, checks for which must be made payable to "order". 2. To make payments of amounts not exceeding twenty dollars. 3. To make payments at a distance from a depositary. 4. To make payments of fixed salaries due at a certain period. In either of which cases, except the first, any disbursing officer may draw his check in favor of himself or bearer for such amount as may be necessary for such payment, but in the last-named case the check must be drawn not more than two days before the salaries become due.

Whenever a United States disbursing officer serving in two distinct capacities, and having moneys advanced to him from two distinct Bureaus, deposits his funds with the Treasurer of the United States, an Assistant Treasurer, or United States Depositary, separate accounts should be kept of such moneys, and the balance to the credit of each should be reported separately on the weekly lists of disbursing officers' balances. These instructions are intended to apply more particularly to Quarter-masters serving as Commissaries of Subsistence, and *vice versa*. See *Disbursing Officers*.

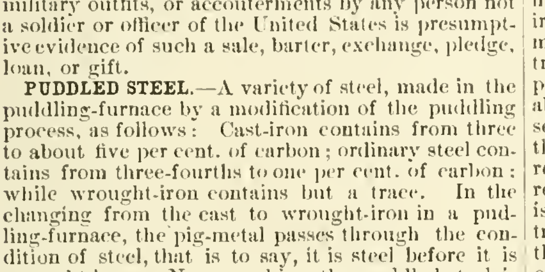
PUBLIC PROPERTY.—It is the duty of all officers to guard the public property for which they are responsible by all means in their power. Whenever information is received that horses, mules, or other property belonging to the United States, are unlawfully in the possession of any person not in the military service, the Quartermaster, or other Staff officer of the Department to which the property belongs, should cause proper proceedings to be promptly instituted and diligently prosecuted before the civil authorities for the recovery of the property, and, if the same has been stolen, for the arrest, trial, and conviction, and due punishment of the thieves, and of all those who aid and abet them by receiving the stolen property, or otherwise.

Upon satisfactory information that United States property, in unlawful hands, is likely to be taken away, concealed, or otherwise disposed of, before the necessary proceedings can be had in the civil tribunals for the recovery thereof, the post or detachment commander should at once order the same to be seized, and hold it subject to any legal proceedings that may be instituted by other parties. Persons caught in the act of stealing public property, or of making way with property recently stolen from the United States, are summarily arrested by the troops, and turned over to the civil authorities for trial. Quartermasters are authorized, when found expedient, after failure of ordinary means of recovery, to offer for recovery of any lost or stolen animal a reward of $25; and, in case of *stolen* animals, an additional reward of $25 for each thief arrested, tried, and convicted, and duly sentenced to punishment.

The clothes, arms, military outfits, and accouterments furnished by the United States to any soldier, cannot be sold, bartered, exchanged, pledged, loaned, or given away; and no person not a soldier, or duly authorized officer of the United States, who has possession of any such clothes, arms, military outfits, or accouterments, so furnished, and which have been the subjects of any such sale, barter, exchange, pledge, loan, or gift, can have any right, title, or interest therein; but the same may be seized and taken wherever found by any officer of the United States, civil or military, and should thereupon be delivered to any Quartermaster, or other officer authorized to receive the same. The possession of any such clothes, arms, military outfits, or accouterments by any person not a soldier or officer of the United States is presumptive evidence of such a sale, barter, exchange, pledge, loan, or gift.

PUDDLED STEEL.—A variety of steel, made in the puddling-furnace by a modification of the puddling process, as follows: Cast-iron contains from three to about five per cent. of carbon; ordinary steel contains from three-fourths to one per cent. of carbon: while wrought-iron contains but a trace. In the changing from the cast to wrought-iron in a puddling-furnace, the pig-metal passes through the condition of steel, that is to say, it is steel before it is wrought-iron. Now, making the puddled steel is simply stopping the common puddling process just at the moment when the decarbonizing mass under treatment is in the state of steel. Several modifications in furnaces and processes have been patented and various fluxes, especially manganese, are differently used by different manufacturers. See *Puddling* and *Steel*.

PUDDLING.—Although the process of puddling is susceptible of considerable modification according to the nature of the pig-metal employed and that of the iron which it is desired to produce, it may be generally stated to include the following operations: 1st. Melting down of the charge with or without the previous heating. 2d. Incorporation of oxidizing fluxes with the charge at a low heat. 3d. Elimination of carbon by stirring the contents of the furnace at a high temperature. 4th. Consolidation of the reduced iron to masses or balls fit for hammering.



The common puddling-furnace is of the reverberatory form, one in which the flame is made to pass over a bridge and then beat down again, or reverberate upon a hearth or surface on which the materials to be heated are placed. It is shown in the drawing, and consists of an oblong casing of iron plates firmly bound together by iron tie-bars, and lined with fire-brick. The fireplace, F, is separated from the hearth, A, by a *fire-bridge*, over which the heated products of combustion with a surplus of oxygen play upon the surface of the molten metal, effecting its conversion, and thence pass through the flue to a lofty chimney, C, in which is suspended a metal damper-plate, by which the draught can be regulated. The fireplace varies in depth with the nature of the fuel employed, being greatest with the hard kinds of coal.

The fire-grate is made of plain wrought-iron bars. A forced draught, produced by blowing air in below the grate is sometimes used. The surface of the grate should be between one-half and one-third of that of the bed or hearth. The charging or fire hole is about a foot above the grate. The bottom of the bed is formed of cast-iron hearth-plates resting upon cast-iron beams. The hearth is covered with cinders or sand, and is terminated at either end by a straight wall or bridge, called respectively the *fire-bridge* and the *flue-bridge*. The roof of the furnace is curved to a flat arch, and is generally made to slope at a small angle towards the flue, which slopes towards the stack. The sectional area of the flue varies with the nature of the fuel, being larger for soft coal. The main working-door is made of brick set in a cast-iron frame; it may be readily lifted and lowered by means of a lever. It is only opened during the introduction of the charge and the removal of the puddled balls. The sill of the door is about a foot above the level of the bed. There is sometimes a second working-door near the flue for introducing the cast-iron, so that it may soften slowly till it be ready for drawing towards the bridge. A small rectangular or arched notch, called the stopper-hole, is cut out of the lower edge of the door for the introduction of the tool used in stirring the metal, and through which the workman can observe the state of the furnace. It may be closed air-tight. The tap-hole, through which the slag, or tap-cinder, is withdrawn from the hearth, is placed below the door-sill. It is plugged up with sand. A portion of the cinder also overflows the flue-bridge, and runs down the inclined surface of the flue to the bottom of the stack, *h*.

When charging the furnace, pieces of metal are successively introduced with a long shovel, and laid one over another on the sides of the hearth in the form of piles rising to the roof, the middle being left open for puddling the metal as it is successively fused. The piles are kept separate, to give free circulation of air round the metal. The working-door of the furnace is now closed, fuel is laid on the grate, and the mouth of the fireplace is filled up with coal; at the same time the damper is entirely opened. In puddling refined metal, or in dry puddling, the furnace is charged with metal alone; but in puddling gray metal—that is, in wet puddling, or boiling, as it is termed—*forge-cinder* is charged along with the metal, and the temperature rises much higher. See *Iron*.

PUGILISM.—The art of defending one's self or attacking others with the weapons which nature has bestowed—viz., the fists and arms. The origin of boxing, or the use of the fists, is likely as old as man himself. We find numerous allusions to it in the classic authors. Pollux, the twin-brother of Castor, in the heathen mythology, was reckoned the first who obtained very great distinction by the use of his fists, conquering all who opposed him, and obtaining, with Hercules, a place among the gods for his sparring talents. The ancients were not, however, satisfied with the use of the weapons of nature, but increased their power by the addition of the cestus. With the ancients, pugilism was considered an essential part in the education of youth, and formed part of the course of training practiced in their gymnasia; it was valued as a means of strengthening the body and banishing fear; but it was practiced in public rather with a view to the exhibition of the power of endurance than for mere skillful self-defense. The earliest account we have of systematic boxing is in 1740, when public exhibitions of Professors of the Art attracted general attention. Up to this period, the science of self-defense had made but little progress, and strength and endurance constituted the only recommendations of the practitioners at Smithfield, Moorfield, and Southwark fair, which had long had booths and rings for the display of boxing. Broughton, who occupied the position of "Champion of England", built a theater in Hanway street, Oxford street, in 1740, for the display of boxing: advertisements were issued announcing a succession of battles between first-rate pugilists, who never quitted the stage till one or other was defeated, the reward of each man being dependent upon, and proportioned to, the receipts. Broughton was for 18 years Champion of England, and with him commences the first scientific era of pugilism. He propounded some rules for the regulation of the ring, and these remained in authority till 1838, when they were materially altered. To Broughton also is due the introduction of gloves for "sparring-matches," where lessons could be taken without injury. The greatest Professor of the Art was Jackson, who was Champion in 1795. He was not only the most scientific boxer of his day, but he gave his art such a prestige and popularity that half the men of rank and fashion of the period were proud to call themselves his pupils. He opened rooms for the practice of boxing in Bond street, and for years these were crowded by men of note. His "principles of pugilism" were, that contempt of danger and confidence in one's self were the first and best qualities of a pugilist; that in hitting, you must judge well your distances, for a blow delivered at all out of range, was like a spent shot, and valueless; that men should fight on most occasions with their legs, using all possible agility, as well as with their hands and that all stiffness of style and position was radically wrong. Jackson is still regarded by many as the best theorist on the "Noble Art," and since his time, it has received no essential improvement. Shaw, the Life-guardsman, who immortalized himself at Waterloo, was a pupil of his, and the prowess which he so brilliantly displayed on the occasion, was owing as much to his scientific training as to his great strength. At this period, pugilism was actively supported by many persons of high rank—the Dukes of York and Clarence, the Earls of Albemarle, Sefton, etc., Lords Byron, Craven, Pomfret. The art of boxing, as an active and healthy exercise, is likely to be maintained; and the display of science between two accomplished boxers is very interesting, while it is deprived of all the horrors of the prize-ring; the rapidity of the blows, the facility with which they are mostly guarded or avoided by moving the head and arms; the trial of skill and maneuver to gain a trifling advantage in position, all give a wonderful interest to the spectator, who can watch the perfection of the art devoid of the brutalities of the ring. The pugilists of the present day are mostly publicans; their friends and the patrons of the "fancy" meet at their houses for convivial evenings, sparring matches, ratting, and the like. It has constantly been urged in defense of pugilism that, were it abolished, the use of the knife would increase and Englishmen would lose their present manly system of self-defense. This may be true, if the use of the fist in self-defense depended on the mercenary exhibition of pugilistic encounters, which, however, is mere assumption.

PULFORD MAGNETIC PAINT.—A paint now universally used instead of anti-corrosion paint for lacquering iron ordnance and projectiles. It is an oxide of iron. This paint is called "magnetic" from the property of being attracted by a magnet.

PULK. A term chiefly used in Russia to denote a tribe or a particular body of men; as, a pulk of Cossacks.

PULLEY.—One of the mechanical powers, consisting usually of a wheel with a groove cut all round its circumference, and movable on an axis: the wheel, which is commonly called a *sheave*, is often placed inside a hollow oblong mass of wood called a *block*, and to the sides of this block the extremities of the sheave's axle are fixed for support; the cord which passes over the circumference of the sheave is called the *tackle*. Pulleys may be used either singly or in combination; in the former case, they are either *fixed* or *movable*. The *fixed pulley* gives no mechanical advantage; it merely changes the direction in which a force would naturally be applied to one more convenient. The *single movable pulley*, with parallel cords, gives a mechanical advantage = 2, for a little consideration will show that as the weight, W, is supported by the two strings, the strain on each string is $\frac{1}{2}$W, and the strain on the one being supported by the hook, the power, P, requires merely to support the strain on the other string. The fixed pulley, is only of service in changing the naturally upward direction of the power into a downward one. If the strings in the single movable pulley are not parallel, there is a diminution of mechanical advantage —*i. e.*, P must be more than half of W to produce on exact counterpoise; if the angle made by the strings is 120°, P must be equal to W; and if the angle be greater than this, there is a great mechanical disadvantage, or P must be greater than W. The following are examples of different combinations of pulleys, generally known as the first, second, and third systems of pulleys. In the first system, one end of each cord is fastened

indlass. 15. Platform crane. 16. Friction windlass.

to a fixed support above; each cord descends, passes round a pulley (to the lowest of which the weight W is fastened), and is fastened to the block of the next pulley, with the exception of the last cord, which passes round a fixed pulley above, and is attached to the counterpoise, P. The tension of a string being the same in all its parts, the tension of every part of the string, over two pulleys, is that which is produced by the weight of P, consequently, as the last movable pulley is supported on both sides by a string having a tension P, the tension applied in its support is 2P. The tension of the string is therefore 2P, and the second movable pulley is supported by a force equal to 4P. It may similarly be shown that the force applied by the strings in support of the last or fourth pulley (which is attached to W) is 8P. Hence we see, that according to this arrangement, 1 lb. can support 4lbs., if two movable pulleys are used; 8lbs., if there are 3 movable pulleys; 16 lbs., if there are 4 movable pulleys; and if there are *n* movable pulleys, 1lb can support 2^n lbs. It must be noticed, however, that in practice, the weight of the cords, and of the pulleys, and the friction of the cord on the pulleys, must be allowed for; and the fact that in this system all of these resist the action of the power P, and that to a large extent, has rendered it of little use in practice.—The second system is much inferior in producing a mechanical advantage, but it is found to be much more convenient in general practice, and is conveniently modified according to the purpose for which it is intended to be used. In this system, one string passes round all the pulleys, and as the tension in every part of it is that produced by the weight of P, the whole force applied to elevate the lower block with its attached weight, W, is the weight P multiplied by the number of strings attached to the lower block; the pulleys in the upper block being only of use in changing the direction of the pulling force. This system is the one in common use in mechanical maneuvers in dockyards and on board ship, and various modifications of it—such as White's pulley, Smeaton's pulley, etc., have been introduced; but the simpler forms have been found to answer best.—The third system is merely the first system inverted, and it is a little more powerful, besides having the weight of the pulleys to support the power, instead of acting in opposition to it, as in the former case. By this time, it will have been evident to the reader that the mechanical advantage is not produced by the pulleys, but by the strings, and that the pulleys are merely useful in keeping the strings in a certain position, changing with as little friction as possible the direction of the pull, and affording a convenient means of attaching the weight. Theoretically, the larger the number of movable pulleys in one combination, the greater is the mechanical advantage afforded; but the enormous friction produced, and the want of perfect flexibility in the ropes, prevent any great increase in the number of pulleys. In Fig. 1, we illustrate the pulleys counterpoised, and the manner of employing them in the mechanical maneuvers. 1. Fixed pulley, power and weight equal. 2. One fixed and one movable pulley, power and weight, 1 : 2. 3. One fixed and two movable pulleys, power and weight, 1 : 2 and 1 : 4. 4. One fixed block of three pulleys of different sizes, and one movable pulley of same character, power and weight, 1 : 6. 5. One fixed block with four pulleys of same size, and one movable of same kind, power and weight, 1 : 8. 6. Wheel and axle, three radii in proportion of 1, 2, and 4. 7. Capstan, cord attached to first system of pulleys.

Pulleys without blocks or carriers are properly *sheaves* or *pulley-wheels*, which are mounted in various ways, according to the purpose for which they are designed. The simplest form is that of a wheel with a nearly flat face, over which a band passes. This is the common machine-pulley used on shafting, which is ordinarily supported by hangers from the ceiling of the shop. Couplings and hangers are carefully arranged in all arsenals and armories. Pulleys so mounted are; *Fast*, being firmly attached to their shaft, from which they receive, or to which they communicate, motion; *Loose*, running free on the shaft, to receive the belt and allow it still to traverse without being affected by, or affecting the motion of. the shafting; *Speed*, having a number of faces or grooves of different diameter, so as to communicate varying speeds with a given rate of motion of the belt or cord. This is common in lathes and analogous machines, and is sometimes called a *cone*-pulley. Fig. 2 shows an improved loose pulley, at present used on most machines, with the advantage of saving the wear of pulley, shaft, and belt. The loose pulley is one inch less diameter

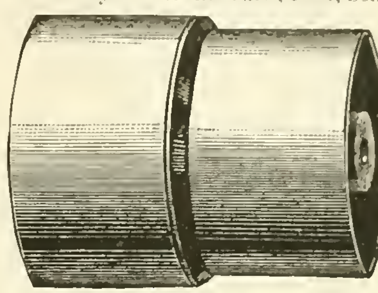

Fig. 2.

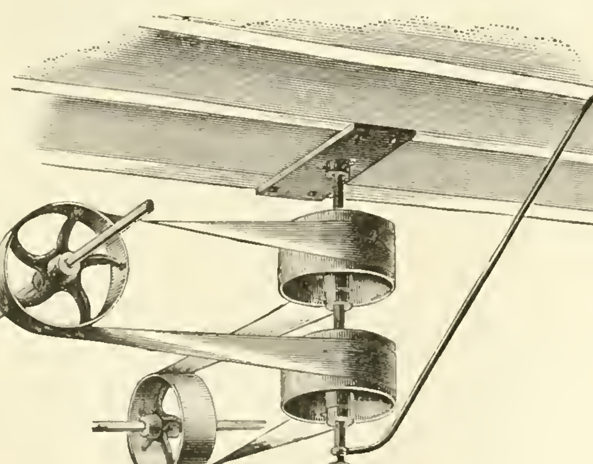

Fig. 3.

than the tight pulley, and thus relieves the tight tension of belt when running idle. A bevel flange connects the pulley faces, and the belt ships with perfect ease. In Fig. 3 is shown what is known as the *mule* pulley, a most useful combination for the general work of the arsenal. Lines of shafting in the same plane, but at an angle, one to the other, to run quickly and noiselessly, should be driven by a belt running over mule pulleys, on a shaft stepped and stayed as shown in Fig. 3. If the mule pulleys are not too small, and if they have long hubs, they will run with little friction and wear. For the sake of an adjustment which is required only in special cases, mule pulleys are commonly placed on expensive arrangements of castings, which, through not permitting the use of pulleys sufficiently large, and through not being properly stayed, cause much trouble and loss of power. These disadvantages are obviated by the arrangement shown in the drawing. The following table gives the weight, principal dimensions, etc., of pulley-blocks, complete, as used in the more common mechanical maneuvers. See *Blocks*, *Mechanical Maneuvers*, *Rope*, and *Tackles*.

PULL-OFF.—In musketry, the test applied to the trigger of all small-arms. The test is regulated so as to require a mean weight of about 7 lbs. to be applied to the finger-piece of the trigger, in order to release the sear-nose from the top-bent; this result is obtained only when the lock and trigger are perfectly clean and free from dried-up oil, or other matter causing obstruction to the free working of the various parts. As a rule, the pull-off of the small-arms in use will be found to be influenced mainly by the condition of cleanliness of the lock and trigger. Should the lock, after having been thoroughly cleaned and oiled, be found to pull-off either light or heavy, *i.e.* below 6 lbs. or above 8 lbs., it may easily be regulated by squaring the sear-nose and top-bent in the tumbler, care being taken to preserve the same angles.

PULSOMETER.—A steam pump of considerable military importance, which requires but little steam for its operation. When the water has been displaced by the steam which follows the water through the opening to the discharge chamber, it will suddenly condense by passing under the water, and the vacuum thereby formed will cause the steam ball to change, shut off the steam, and transmit the pressure to the opposite cylinder, and at the same time induce the water to fill the chamber in place of the condensed steam. Thus will they alternate, keeping up very nearly a continuous stream, as long as there is steam supplied and water to be pumped.

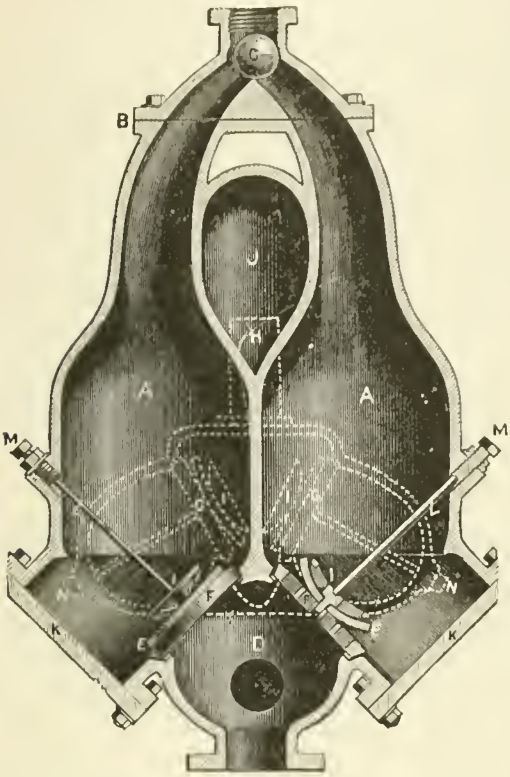
PULLING-JACK.—A variety of *jack* much employed for artillery purposes. To use it, screw one end to some fixed object (that end nearer the pump is preferable); unscrew the valve in the pump by two or three turns with the key, and stretch the jack apart; attach the free end of it to the object to be moved; shut the valve by screwing back the two or three turns that were unscrewed; attach the long lever and pump away at it until the object is moved as desired. When there is not room for the long lever, the pump can be worked by the short lever. If the jack does not start at once, slack the screw in the cylinder close to the pump (which the same key fits) until a drop or two of the fluid comes out; as soon as this occurs, turn the screw immediately back. If the piston or ram will not run out to its entire length or stroke, place the jack in a horizontal position, take out the screw at each end of the cylinder, and fill through both holes with the usual liquid.

The pulling-jack can be used to pull or lift at any angle between the horizontal and the perpendicular, but the direction of its force must be in a straight line, and the force pump always at the lower end when the jack is used in any other way than horizontally. When the pulling-jack is in use, the lever joints must be well oiled and kept free from dirt; when not in use, the piston-rod must be kept in; and when hung up, the end where the pump is must always be downward.

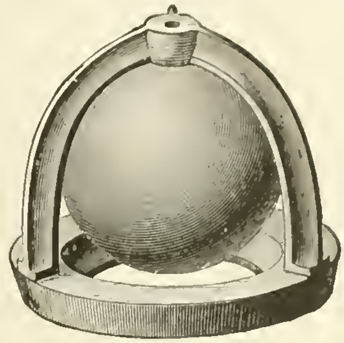
No greater force than that of one man (provided he applies a power of about 150 pounds) need ever be applied to the lever of either the lifting or the pulling-jack, since that force is amply sufficient to work the jack to its full capacity. See *Hydraulic Jack*.

The machine, a section of which is shown in the drawing, consists principally of two bottle-shaped chambers, A, A, joined together side by side, with tapering necks bent towards each other, to which is attached, by means of a flange-joint, B, a continuou passage from each cylinder leading to one common upright passage, into which a small ball, C, is fitted so as to oscillate with a slight rolling motion between seats formed in the junction. These chambers also connect by means of openings with the vertical induction passage, D, which openings are so formed that the valves, E, E, consisting of pure vulcanized rubber, and their seats, F, F, constructed so as to sustain the valves, may be easily inserted. The delivery passage, H, which is common to both chambers, is also constructed so that in the openings that communicate with each cylinder are placed valve-seats, G, G, fitted for the reception of the same style of valves as in the induction passage. I, I, are valve-guards to prevent the valves from opening too far. To facilitate the ready removal of the valves and valve-seats, it will be observed the flanges that cover the openings are slotted to receive the bolts, the nuts of which being loosened they are readily removed and the covers displaced. J, represents the vacuum chamber, cast with and between the necks of chambers A, A, and connects only with the induction passage below the valves E, E. K, K, are flanges covering the openings to the respective chambers, which may be removed for the repair or renewal of valves and seats, when necessary. Vent plugs are inserted into these flanges, for the purpose of drawing off the water to prevent freezing. L, L, are rods extending from the valve-guards to the set-screws M, M, by which the suction seats, valves and guards are tightly pressed to place. N, N, are brass socket-headed bolts by which the discharge seats, valves and guards are drawn down to place. A small brass air check-valve is screwed into the neck of each chamber, A, A, and one into the vacuum chamber



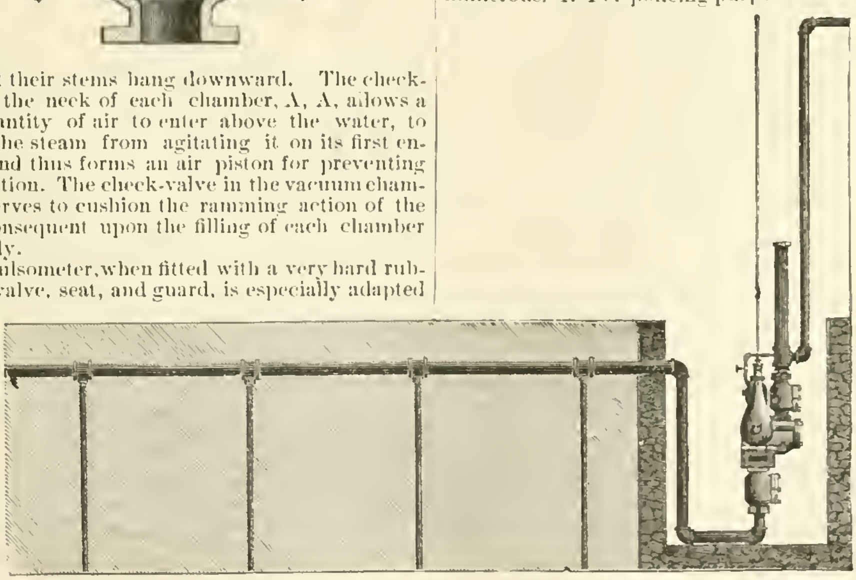
J, so that their stems hang downward. The check-valve in the neck of each chamber, A, A, allows a small quantity of air to enter above the water, to prevent the steam from agitating it on its first entrance, and thus forms an air piston for preventing condensation. The check-valve in the vacuum chamber, J, serves to cushion the ramming action of the water consequent upon the filling of each chamber alternately.

The pulsometer, when fitted with a very hard rubber ball valve, seat, and guard, is especially adapted to coffer-dam work, sinking wells, sewers, excavations, foundations, etc., where all the water to be pumped contains more or less sand, gravel, mud, and other sediment that would clog the grid valve seat and disc valve usually used in the pumps. A pulsometer, 3-inch suction (10 feet), and 3-inch discharge will readily raise water 50 feet out of a well. A branch from the discharge pipe leads into a hogshead or tank, and supplies water to charge the pump before turning on steam to start it, and for furnishing water to the injector for feeding the boiler. The leading of a pipe from a reservoir or water pipe to the middle chamber of the pump for charging will be found very convenient in other situations, especially where the pump is liable to loose its charge from sediment getting under the valves. The chief point to be observed in working the pulsometer on artesian wells is to select a size pump that the well will supply with water. If not a flowing well, a pump of smaller suction than the pipe in the well should be applied. One raising 300 gallons per minute will fail to work on a well giving but 100 gal-

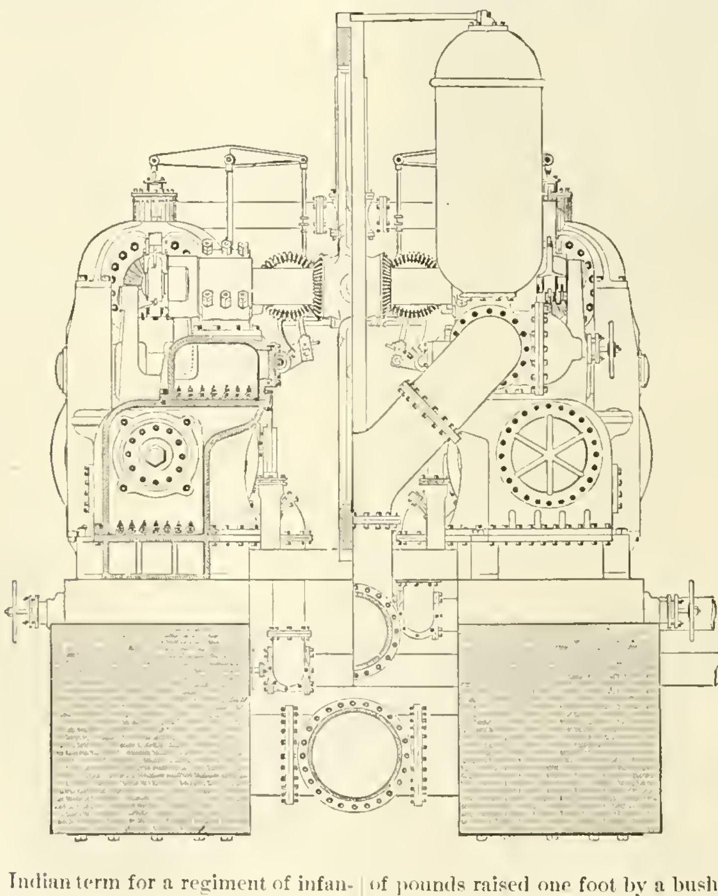


lons. A No. 5 (175 gallons per minute) usually requires a chain of at least five two-inch pipes, connected with a three or four inch main to supply it with water. In cases where the water does not raise to within ten feet of the surface, it will be found advantageous to lower the pump a little in order to obtain the water freely. If the pump is found to be large at times, the remedy may be had by making a connection from the discharge pipe back into the pump and regulated by a globe valve as shown in the above drawing.

The remaining applications of the pulsometer are numerous: 1. For policing purposes and as a fire ex-



tinguisher, it has no equal. The absence of all machinery, its simple arrangement of valves, the easy manner in which they can be replaced without skilled labor, their inability to clog from sediment, and the certainty in which it can be started marks a strong contrast to the ordinary donkey pump. 2. As a pumping engine in garrisons, to be on hand at short notice for pumping out flooded casemates, cellars, excavations, wells, and other inundated places. The pump can be detached from the carriage and lowered to places too low down for suction from the engine, steam being carried to it from the boiler through flexible steam-hose. 3. As a mine pump, there being no exhaust steam to dispose of. It is especially adapted for lifting water from one level to another. For use underground in mines, collieries, etc., where lifts do not exceed 60 to 90 feet, its use has been fully proved. For a greater height one can be used above another. 4. For filling water tanks in foundries, etc., it is very handy, and may be so located as to fill the tanks directly from a contiguous pond, stream, or well, by using the steam from the working engines. By having a flexible steam connection ready for instant application, it would do away with the necessity of water tanks, separate boiler, and the expenses of a special engineer. 5. As an irrigating pump for post and company gardens, its simplicity, strength, durability efficiency and economy are all in its favor. 6. For filling tanks on buildings, for use with elevators, or in case of fire. The pipe leading down from upper tank has hose connections on each floor, from which a hose should be connected and ready to run out to extinguish a fire within a few seconds from time of discovery, and long before an alarm could be made to the department. Hose connections are also made from discharge pipe of pump on the upper floors.



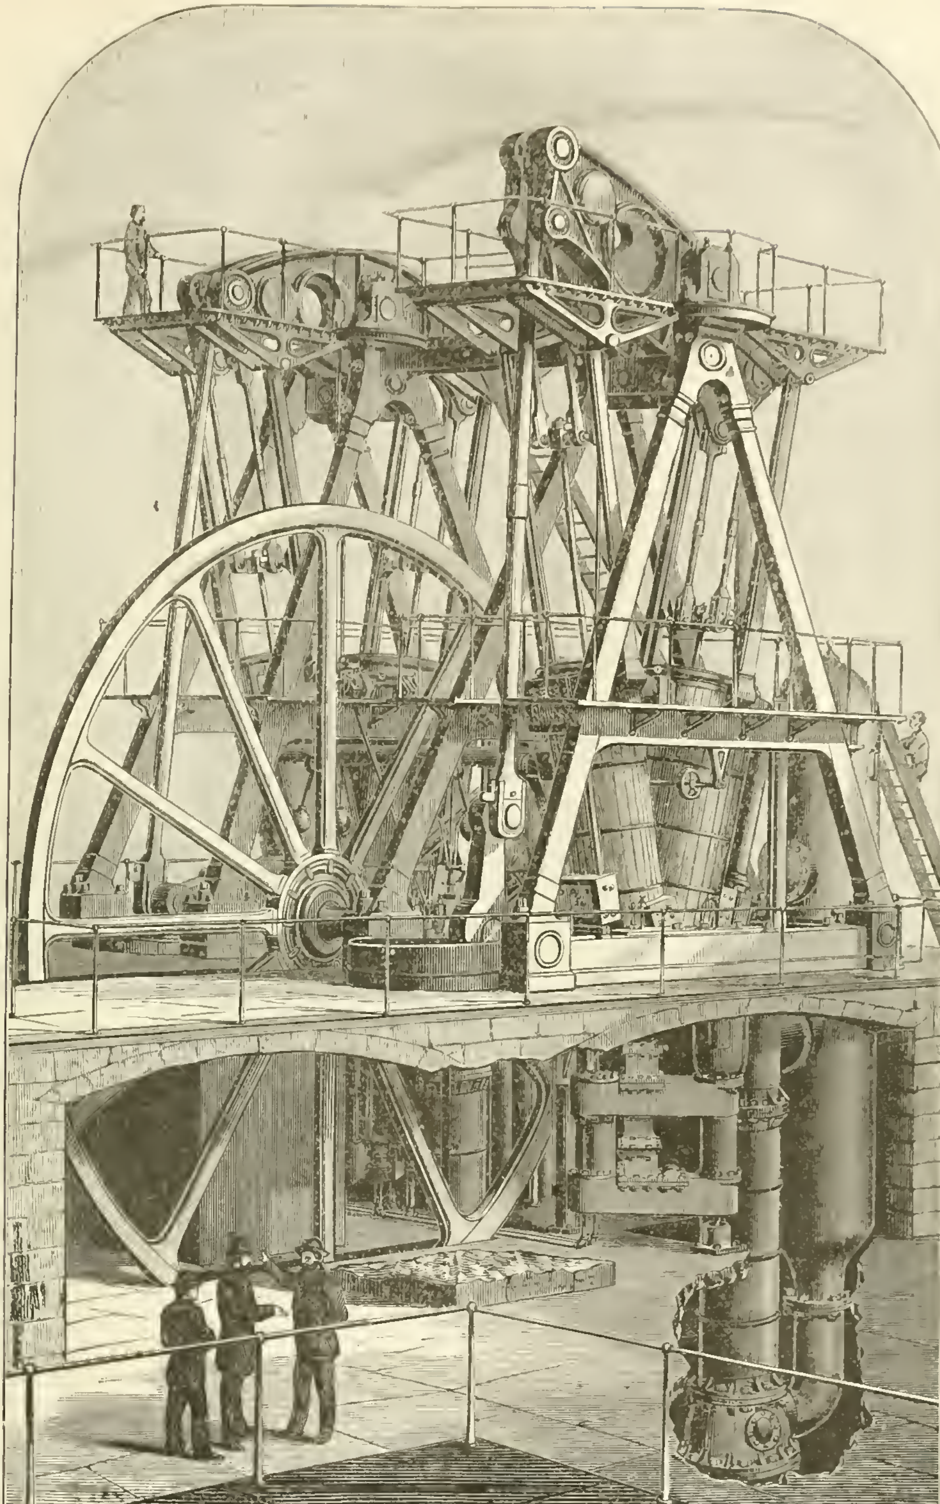
PULTUN.—An Indian term for a regiment of infantry.

PULVERMASSEN. The German name for a kind of baldrick with wooden powder-tubes.

PUMICE.—A mineral found in volcanic countries generally with obsidian and porphyries. In chemical composition, it agrees with obsidian, of which it may be regarded as a peculiar form, rapidly cooled from a melted and boiling state. It is of a white or gray color, more rarely yellow, brown, or black; but so vesicular, that in mass it is lighter than water, and swims in it. The vesicles, or cells, are often of a much elongated shape. Pumice often exhibits more or less of a filamentous structure, and it is said to be most filamentous when silica is most abundant in its composition. It is very hard and very brittle. It is much used in arsenals for polishing wood, metals, lithographic stones, etc., and in the preparation of vellum, parchment, and some kinds of leather.

PUMMEL.—The hilt of a sword, the end of a gun, etc.

PUMPING-ENGINE.—An engine especially designed for pumping, and much used for military purposes. A pump may be driven by an ordinary steam-engine which also drives other machinery, but in the pumping-engine the pump and steam-engine are inseparably connected, and are confined to the act of pumping. There are a good many small machines of this kind which only pump, but they are not commonly called pumping-engines, that term being applied only to large works. The first steam-engines were pumping-engines; that of Newcomen, which was driven by atmospheric pressure (steam being used only to create a vacuum), and Watt's, and the Cornish engine, which used steam as the motive power. There has been much improvement in the duty of pumping-engines since the Newcomen engine. Estimating the work done by the number of pounds raised one foot by a bushel of Welsh coal (94 lbs.), the following notes show the improvement which has been made: Newcomen engine (1769), 5,500 000; the same improved by Smeaton (1772), 9,500,000. Watt's engine (1778 to 1815), 20,000,000. Cornish engine (1820), 28,000,000; the same (1826), 30,-



THE LEAVITT PUMPING-ENGINE

BUILT BY

I. P. MORRIS & CO.,

PORT RICHMOND IRON WORKS, PHILADELPHIA.

000,000; same (1828), 37,000,000; same (1829), 41,000,000; same (1839), 54,000,000; same (1850), 60,000,000. Consolidated mines, highest duty (1827), 67,000,000. Fowey consols, Cornwall, highest duty (1834), 97,000,000. United mines, highest duty (1842), 108,000,000. Among the largest pumping-engines in the world are the three which were employed in the drainage of Haarlem Lake in Holland. Each engine worked several pumps, and had an average duty of 75,000,000 lbs., raised one foot by 94 lbs. of Welsh coal. One of these engines is described as follows: two steam cylinders are placed concentrically, the diameters being 144½ and 84¼ inches. They are united at the bottom, but there is a space of nearly 1½ in. between the inner cylinder and the top. The areas of the pistons are as 1 to 2.85, and are connected to a common cross-head or cap by one principal and four small piston-rods. This engine works 11 pumps, each of 63 in. (5¼ ft.) diameter. The measured delivery of all the 11 pnmps at each stroke is 63 tons. The steam is cut off in the small cylinders at from one-quarter to two-thirds the stroke, and after expanding through the remainder it is further expanded in the large cylinder.

The drawing shows in section the horizontal compound-cylinder pumping-engines, of the type designed by Mr. H. F. Gaskill, an American. The novel featnre by which this type of engine is distinguished is the location of the high-pressure cylinder on the top of the low-pressure cylinder, giving short steam commnnication. This arrangement requires the pistons in the two cylinders to move in opposite directions. These are connected with each other, and the pressure of steam upon them is transmitted to the plunger of the pump in the following manner: The latter is set in line with the low-pressure cylinder, and so receives the thrust produced by the pressure in that cylinder directly. The low-pressure piston is provided with two rods, which are extended to the length of ten feet to the cross-head by which they are connected to the rod of the pump plnnger. Midway in their length, another cross-head is secured upon them, which runs on a gnide. The rod from the high-pressure piston is keyed into a cross-head corresponding to this. The connection between these cross-heads is made by means of a short vertical beam and connecting links, through which also the force exerted in the high-pressure cylinder is transmitted. A shaft carrying a fly-wheel revolves in bearings which are set upon the delivery chambers of the two pumps. The two engines are connected through this shaft by means of cranks set on either end of it, at right angles with each other, and connecting rods from these cranks to the upper ends of the beams. The cranks determine the length of the stroke, control the movements of the pistons and plungers, maintaining those of the two engines and pumps in a constant relation with each other, and give motion to the valve gear. The steam is admitted to the high-pressure cylinders by double-seated poppet-valves. A cut-off mechanism is introduced into the motion of these valves, which is adjustable to cut the steam off at any point in the length of the stroke. The point of cut-off may be fixed by hand, or by the action of the governor when the latter is thrown into gear. The governor is constructed to be operated by changes in the pressure of water in the delivery main, and acts to correct these changes by varying the point of cut-off, and thus the speed of the engine, in accordance with the variations in the demand for water. The communicating valves between the high and low pressure cylinders and the exhaust valves are gridiron slides.

The engraving on the preceding page gives a perspective view of a pumping-engine, having a remarkable capacity and duty, built by the I. P. Morris Company, Philadelphia. It is a compound beam engine, the steam cylinders of which are inclined outwardly at the top to connect with opposite ends of the working beam. The cylinders are jacketed on the sides and heads, steam of boiler pressure being used in the jacket of the high pressure cylinder, and steam of a reduced pressure in the other jacket. The drainage from these jackets is ordinarily returned directly to the boilers. The steam and exhaust valves are gridiron slides giving large openings with small movements. The valves are actuated by cams, which are driven by gearing from the crank-shaft, and a centrifugal governor adjusts the cams, operating the steam valves of the high pressure cylinder so as to vary the point of cut-off and maintain a constant engine speed. The pnmp is driven by a connecting rod attached to one end of the working beam. The pump consists of a plunger, to which is attached a bucket with valve opening upward. There are seven receiving valves, and four delivery valves, in addition to the valve in the bucket, the water being discharged from the pump through two delivery pipes, above and below the bucket respectively. The pnmp valves consist of loaded rubber discs with central guiding stems. The original valves were of metal, double beat, and the introdnction of tbe present form has greatly increased the pnmp's efficiency.

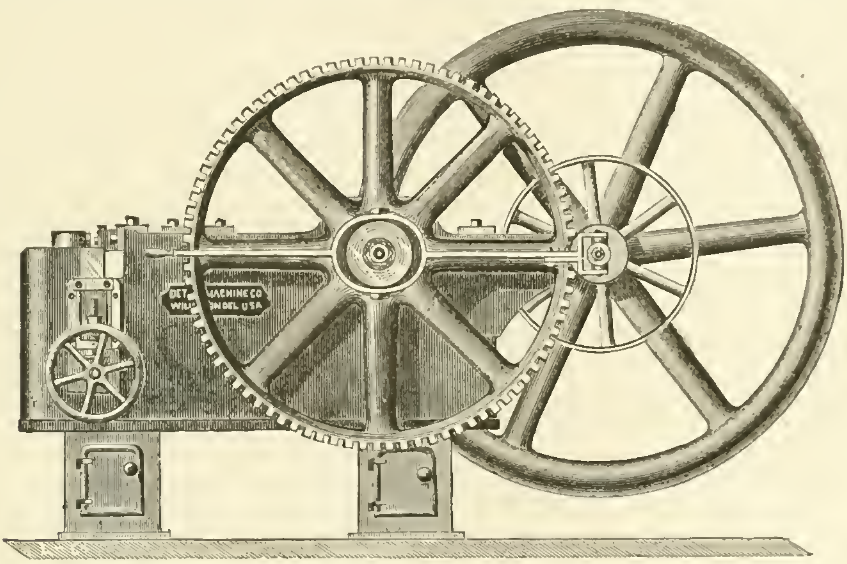
The following are the results of the *duty trial* of this engine:

Pounds of wood used to start fires, 400. Pounds of coal put into furnaces, 3,500. Pounds of coal withdrawn from furnaces at end of trial, 27. Ponnds of coal wholly consumed $(400 \times 0.4 + 3{,}500 - 27) = 3{,}633$. Pressure on main by gauge (lbs. per sq. inch), 64. Water level in well below gauge (ft.), 29.05. Water pressure (lbs. per sq. in.), $29.05 \times 0.433 + 64 = 76.6$. Area of pump bucket (sq. in.), 536.0465. Revolutions of engine, 12,337. Dnty of engine, (ft-lbs., per 100 lbs. of coal),

$$= \frac{536.0465 \times 8 \times 12{,}337 \times 76.6 \times 100}{3{,}633} = 111{,}548{,}925.$$

PUNCHING.—When any heavy beam of wrought-iron—one, say, twelve or fourteen inches square—is struck by a heavy shot at high velocity, the beam snaps short off, as though it were cast-iron. The same shot, striking a wrought-iron plate backed in the usual manner of armor, penetrates or perforates it in a manner similar to the action of a hand-punch on a sheet of iron laid on a block of wood. The effect is entirely local; the hole is made without bending or twisting the plate in one case, or the sheet in the other. The same projectile, propelled with a low velocity, will bend the beam and produce the ordinary fracture of wrought-iron, and in case of the plate, the latter will be distorted, strained, and loosened from its fastenings. A simple way of explaining these phenomena is as follows: In the case of the high velocity the effect is wholly *local*, because the surrounding material has not *time* to propagate the vibration of impact throughout the mass. In other words, the cohesion of the material is not sufficient, in the time allowed, to overcome the inertia of the surrounding mass. The *distribution* of the effect in the other case is due to the low velocity, wherein a certain length of *time* is consumed in accomplishing the blow. During this interval, all surrounding particles of iron have time to sustain the point struck; the force of the blow is thus spread over a large surface, and the cohesion of the particles is undisturbed, since each particle is enabled to contribute the force of its attraction towards uniting the whole. These two distinct effects are called, respectively, *punching* and *racking*. The work done by a shot is represented by its weight multiplied by the square of its velocity at the moment of impact; from which it will be seen that a small projectile moving with great velocity is capable of doing the same amount of work as a large projectile with low velocity. The *character* of the work is, however, as above explained, entirely different. In case of a given projectile, whatever power is employed in racking the side of the vessel does nothing towards penetration, and *vice versa*.

The theory in favor of punching is, that the vital parts of the vessel and the active enemy within—the men, guns, and machinery—are reached at once. A projectile piercing the armor of a vessel carries with it portions of the broken plate, which, together with bolts, nuts, and fragments of wood from the backing, form a species of *langrage*, the effect of which is not less to be feared on a crowded deck, or in a turret, than the explosion of the most formidable shell. But to produce this result the projectile must penetrate entirely through. A projectile moving with a punching velocity has only local effect, penetrating without racking the armor. If it goes but partly through, it does no damage either to the ship or to the enemy within. Therefore, whether from the greatness of range, the thickness of the armor, or want of power in the gun, entire perforation cannot be effected, it is only a waste of ammunition to use it in simply indenting armor. Although a spherical projectile may have, upon starting, greater velocity than a rifle projectile of equal caliber, and consequently may have greater punching power stored up in it at this part of its flight, nevertheless, owing to its greater cross-sectional area, in proportion to its weight, it will lose its velocity more rapidly, and the rifle projectile will soon overtake it in its flight and go far beyond



it in range. At the distances that iron-clads usually engage land batteries, smooth-bore projectiles would possess no punching power; therefore for this kind of work rifles are the only suitable armament for such batteries. They should be powerful enough to do the work effectually. When heavy enough for this, all additional weight is rather a detriment than an advantage, from the fact that light guns are less cumbersome, can be fired more rapidly, are more easily replaced, when disabled, and less costly in ammunition. They likewise stand greater relative charges and yield higher velocities with safety. The 8-inch rifle, carrying a projectile 185 pounds in weight, fired with a charge of 35 pounds hexagonal powder, is the minimum caliber that can be successfully used against the present style of sea-going iron-clads. See *Racking*.

PUNCHING-MACHINE.—The enormous development of our iron manufactures has necessitated the use of machine tools in the place of those made for the hand, and none of the very ingenious inventions for this purpose have played a much more important part than the *punching-machines*, for without them the labor of drilling holes in iron plates for such objects as armor-plates, steam-boilers, iron-ships, bridges, and other great works, would have been so great as to have effectually prevented them from being undertaken. The punching-machine invented by Messrs. Roberts and Nasmyth, with recent modifications and improvements, is in very general use in all our great engineering works and arsenals; its essential parts are the punch, lever, and the spring. The punch is simply a piece of tough, hard steel of a cylindrical form, and of the size of the intended holes; it fits into a socket, which is suspended over a fixed iron plate or bench, which has a hole exactly under the punch, and exactly fitting it. In the socket which holds the punch is a coiled iron spring, which holds up the punch, and allows it to descend when the power is applied, and returns it when the pressure is relieved. The lever, when in action, presses on the top of the punch, and the plate of metal which is to be perforated being placed on the iron bench, receives the pressure of the punch with sufficient force to press out a disk of metal exactly the diameter of the punch, which falls through the hole in the iron bench. The lever is moved by a cam on a very powerful wheel, which presses upon it until it can pass; then the lever being relieved, the punch is drawn up by the spring in its socket, ready to receive the action of the cam when the revolution of the wheel again brings it to bear on the lever. The punch itself is always solid, differing entirely in this respect from the hand-tools. This useful machine will perforate thick plates of iron, such as are used for ship-building, almost as quickly as a workman with an ordinary hand-punch could perforate thin plates of tin; the holes made are quite true, and are ready to receive the rivets. The drawing represents the improved machine, having sufficient power to punch an inch hole through half inch iron; it is driven by an eccentric and sliding box, giving $1\frac{3}{4}$ in. movement to the punch bar; it has a clutch on the eccentric shaft for stopping it without shifting the belt.

There are both fast and loose pulleys on the driving shaft, so that the countershaft is not needed. The weight of the machine is 6,850 pounds.

PUNCTO.—A term applied to the point in fencing.

PUNIC WARS.—The name commonly given to the three great wars waged for supremacy between Rome and Carthage. The Latin word *punicus*, or *pœnicus*, was the name given by the Romans to the Carthaginians, in allusion to their Phenician descent. The Romans, who believed, not without reason, that the Carthaginians never sincerely meant to keep any treaty of peace, employed the phrase *punica fides*, "Punic faith," to denote a false and faithless spirit.

PUNISHMENTS.—Sentences awarded by Courts-Martial or Commanding Officers for crimes committed by officers or soldiers. They are detailed in the Articles of War. They consist of death by hanging or shooting, according to the offense, and of flogging. These are the punishments for the most aggravated and flagrant form of offenses. The minor punishments include imprisonment, loss of good-conduct stripes, degradation of rank, loss of appointments, extra drill, stoppage of pay, and confinement to barracks. An officer can be sentenced by General Court-Martial to death (in time of war), cashiering, or dismissal from the service, according to the crime he is guilty of. In the British service, military punishments include death by shooting, if for any offense against discipline—or by hanging, if for a disgraceful offense; for serious crimes in the field against discipline, flogging, not exceeding 50 lashes, with the cat-o'-nine-tails, for minor offenses, degradation of rank, imprisonment, extra drill, stoppage of grog, loss of good-conduct pay, stoppage of leave, etc. Death, degradation, and loss of leave are the only punishments of those named above which can be inflicted on an officer. An officer can only be punished by sentence of a Court-Martial; he may be cashiered, dismissed the service, deprived of his regiment or ship; or, in the navy, reduced in rank by being placed at the bottom of the list of officers of his grade. In certain of the German armies, punishment is inflicted on the men in the form of strokes with a cane or with the flat of a saber. The punishments established by law or custom for United States soldiers by sentence of Court-Martial, according to the offense, and the jurisdiction of the court, are: death; stripes for desertion only; confinement; hard labor; ball and chain; forfeiture of pay and allowances; and dishonorable discharge from service, with or without marking. It is regarded as inhuman to punish by solitary confinement, or confinement on bread and water exceeding 14 days at a time, or for more than 84 days in a year at intervals of 14 days.

PUPPET-HEAD.—A sliding device on the upper part of the bed of a lathe or boring-machine. It holds the back center, and may be fixed at any required distance from the front center. See *Lathe*.

PURCHASE.—A mechanical power to increase the power applied. The names are various; some indicate a difference in character; others merely in application. Among them are: *whip, whip-upon-whip, luff-tackle, luff-upon-luff, runner, double-runner, barton, jeer, viol, gun-tackle;* as well as *winch, gin, jack, derrick, crab, capstan, windlass*, etc. See *Block, Pulley*, and *Tackle*.

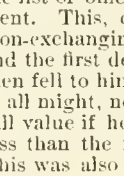
PURCHASE-SYSTEM.—A highly unpopular and much-misunderstood arrangement in the British army; by which a large proportion—more than half—of the first appointment of officers and their subsequent promotion used to be effected. It dates from the first formation of an English standing army, and was formally recognized in the reign of Queen Anne. The system itself was very simple. A price was fixed by regulation for each substantive rank, viz.:

	Price.	Difference.
Lieutenant-colonel................	£4500	£1300
Major......................	3200	1400
Captain................................	1800	1100
Lieutenant............................	700	250
Cornet or Ensign	450	

When any officer holding one of these regimental commissions desired to retire from the army, he was entitled to sell his commission for the price stipulated in the above table £4,500 in the case of a Lieutenant-colonel. This sum was made up by the senior Major, who was willing and able to purchase, buying the rank of Lieutenant-colonel for £1,300; the senior Captain, willing and able to purchase, buying a Majority for £1,400; a Lieutenant purchasing his company for £1,100; a Cornet or Ensign becoming Lieutenant on payment of £250; and lastly, by the sale to some young gentleman of an Ensigncy or Cornetcy for £450. In practice, fancy prices higher than the above were usually given, according to the popularity of the regiment, and vested interest in these over-regulation prices caused most serious complications whenever the Government made any change affecting the promotion of Purchase Officers. The value of commissions in the Guards was also greater; but as they constitute but a few regiments, and are mostly officered from the Nobility, they do not need particular description. No commission could be purchased by one officer unless another officer vacated his position by its sale. Death vacancies, vacancies caused by augmenting any regiment, vacancies resulting from the promotion of Colonels to be Major Generals, were filled without purchase, usually by seniority. No rank above Lieutenant-colonel could be purchased.

It is alleged with truth that purchase enabled the rich man to step over the head of the poorer but perhaps better qualified Non-purchasing Officer; and that money decided where merit should be the only guide. These disadvantages, however, it is replied, were not unmixed. Purchase, it is argued, introduced into the army men of a very high class in society, who gave a tone to the whole of military life. A great proportion of these wealthy men entered with the intention of merely spending a few years in the army. This tended to keep the officers young—a great advantage; and, further, provided in the country, among its gentlemen, a body of men well adapted for commands in the militia and volunteers. Moreover, selection exercised arbitrarily, as it must be when the men from whom the selection is to be made are scattered all over the world, away from the selecting power, is liable to create dissatisfaction. Under purchase, exchange was a common thing; for the rich officers, for private reasons of locality, etc., were glad to change frequently from regiment to regiment, entering in each case at the *bottom* of the list of officers of their rank in their new regiment. This, of course, was an advantage to the Non-exchanging Officer, as it pushed him to the top; and the first death or other non-purchase promotion then fell to him. An officer who had not purchased at all might, nevertheless, sell his commission for its full value if he had served 20 years, or for a sum less than the regulated price after shorter service. This was also a spur to promotion. On the whole, though exposed to the disadvantage and annoyance of being passed over by younger officers, the non-purchasing, *i.e.* the poor officers benefited pecuniarily by the purchase-system. This is proved by the slow progress officers made in corps where purchase did not exist, as, for instance, in the Royal Marines. Few would counsel the formation of a new army with such a system as purchase; but on the other hand, it had its advantages in its workings. Purchase did not exist in the artillery, engineers, marines, 19th to 21st regiments of cavalry, 101st to 109th regiments of foot. The purchase-system was abolished by Royal Warrant in July, 1871; and by the regulation of the Forces Act of the same year, Parliament laid down a scheme for the gradual compensation of officers who had lost the selling rights. Under that scheme it is expected that a sum-total amounting to nearly £8,000,000 will be required.

PURFLED.—A term in Heraldry, used with reference to the lining, bordering, or garnishing of robes, or ornamentation of armor. Often written *Purflewed*.



Purpure.

PURPURE.—In Heraldry, the color purple, expressed in engravings by lines in bend sinister. It is of infrequent occurrence in British Heraldry.

PURSUIT.—A victory, by which the enemy is only forced from the battle-field, is for the most part but a half success, if such it might be called, as the losses under fire are but very small compared to those arising from the demoralization of a broken and dispersed army. A prompt and vigorous *pursuit* is the only means of insuring complete success. Defeated and disorganized, the only hope that remains to the enemy is that he may have time to rally and concentrate his scattered troops. The only way to frustrate this hope is to pursue these disorganized masses, which are in no condition to resist a very inferior force if it assails them in good order. Under these circumstances we may separate our army into corps, forcing the enemy thus upon divergent lines of retreat, and preventing all co-operation between them. In doing this, we must, however, be very careful not to drive the enemy in such directions as will lead to his concentration on any one point.

If the enemy retires in good order, covering his line of retreat from our attempts to turn it, nothing remains to be done but to push him back with our entire force; keeping close upon his heels, and giving him no time to take advantage of defiles or other strong points to check us, so as to make us lose time, and give the opportunity to him to receive reinforcements. When he attempts to do this we should hold him in check on the main road, whilst we attempt to turn his flank, and endeavor to gain his rear. By this promptitude and vigor of action our forces will hardly be retarded, but will be always in position to turn any point upon which he attempts to make a stand, and thus force him to fall back continually as we push forward.

When we have come up with the enemy, we have one of two courses open to us: either to throw ourselves across his line of retreat, or else to leave this open to him, whilst we take a position on his flank. This last course is usually the more prudent, for, however weakened, it is a very dangerous thing to reduce an enemy to despair, and thus call forth heroic efforts, where but a moment before there was nothing but discouragement and a willingness to get away at any cost, even honor. With great superiority of force, by barring the way to the rear, and pressing on vigorously in front, we may hope "*to bag*" the entire army; in all other cases, it is more certain to limit ourselves to operating on the flank, and thus secure a part, with but little loss to ourselves, but with great demoralization of the enemy.

Having dispersed and demoralized the enemy's forces, the more difficult problem remains of holding the conquered territory. This becomes the more difficult when the enemy's territory has no fortified places that we have been able to seize, and thus hold as rallying points for our own troops. All that remains then to be done is to occupy strong strategical and populated points, by detachments of sufficient strength to keep the enemy quiet. This brings about numerous inconveniences: first, as these points must be strengthened by field works, and, in the second place, the main army must be greatly weakened by the detachments that this system renders necessary. In the mean time the enemy's broken forces having retired towards the interior, are there reorganized, recruited, and concentrated, until, at last, an equilibrium between the two contending forces is brought about, and the struggle is recommenced to go, perhaps, through the same phases.

These inconveniences may, in a great degree, be avoided by having a *reserve* force in rear of the movable army, charged with the sole duty of holding the territory occupied. This reserve, which should not be further than a few days' march from the front of operations of the movable forces, should be dispersed over as great an extent, parallel to this line, as practicable; thus enlarging the base of operations, collecting supplies on a greater extent, and keeping a larger amount of population quiet. This reserve may be composed of new levies, and, being held in all points subordinate to the active army, it will be ready to co-operate with it in any way deemed best.

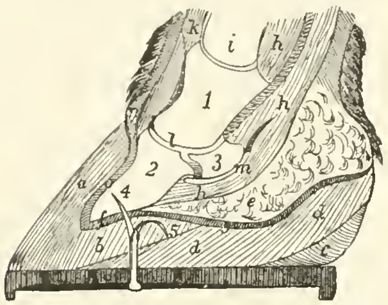
PURSUIVANT.—The third and the lowest order of heraldic officers. The office was instituted as a novitiate, or state of probation through which the offices of Herald and King-at-Arms were ordinarily to be attained, though it has been held that a Herald or King-at-Arms may be made *per saltum*. There are four pursuivants belonging to the English College of Arms: *Rouge Croix*, the oldest, so named, from the cross of St. George; *Blue Mantle*, instituted either by Edward III. or Henry V., and named in allusion to the robes of the Order of the Garter, or perhaps to the color of the arms of France; *Rouge Dragon*, deriving his title from King Henry VII.'s dexter supporter, a red dragon, assumed in allusion to his descent from Cadwaladyr; and *Portcullis*, named from a badge of the same Monarch. There are six pursuivants in the heraldic establishment of Scotland, known by the names of *Dingwall*, *Bute*, *Carrick*, *Ormond*, *Kintyre*, and *Unicorn*—titles which, as well as those of the Heralds, seem to have originated in the reign of James III. The Scottish pursuivants take precedence according to seniority in office.

In ancient times, any great nobleman might institute his own pursuivant with his own hands and by his single authority. The Dukes of Norfolk had a pursuivant, called *Blanch Lyon*, from the white lion in their arms; the pursuivant of the Dukes of Northumberland was styled *Esperance*, from the Percy motto; and Richard Nevil, Earl of Salisbury, had a pursuivant called *Egle Vert*. We even find Sir John Lisle in 1442 making Thomas de Launey his pursuivant, by the title of *Blanch Sanglier*. The ancient costume of a pursuivant of the King was a surcoat, embroidered with the Royal Arms, and worn with one sleeve hanging down in front, and another behind. In 1576 Rouge Croix was severely censured for wearing his coat as a Herald. In later times, however, a pursuivant's coat is worn exactly as a Herald's, the latter officer being distinguished by the collar of SS.

PURVEYOR.—An officer who is charged with superintending the civil affairs of army hospitals, as the payment of men, procuring provisions, medical comforts, bedding, etc. The Purveyor acted independently of the Medical Officer, and was responsible through the Purveyor-in-Chief to the Secretary of State for War. The Department consisted of a Purveyor-in-Chief, Principal Purveyors, Purveyors, Deputy-Purveyors, and Clerks. The Purveyor-in-Chief ranked with a Colonel in the army, and had a salary of £547 per annum, rising to £730 after long service. In 1868, the Department was merged with others in the Control Department; and on the abolition of the latter in 1875, its functions passed to the Commissariat and Transport Department. In the United States Service, the Chief Medical Purveyor is the chief purchasing and disbursing officer of the Medical Department; and under the direction of the Surgeon General, he is charged with the supervision and distribution of all medical and hospital supplies. See *Medical Department*.

PUSH-PICK.—An implement, flat and pointed, used to place the frames and sheeting, when constructing a mine.

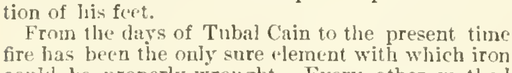
PUTNAM NAIL.—A hot-forged and hammer-pointed horse-shoe nail recently introduced, and regarded by the military authorities as the best machine-made nail manufactured at the present time. These nails are forged separately from the rods, the iron when nearly at a welding heat being drawn out under four hammers, by use of petroleum gas (thus avoiding all sulphur), by which means a firmer, tougher, and more compact nail is made than is possible by any other process. In the pointing as well as in the making, an endeavor has been made to follow the old hand process as nearly as possible. All lameness, temporary, or even permanent, often results from a sliver or thin shell of the nail entering the quick when driven into the hoof, causing great inconvenience and sometimes pecuniary loss, but in these nails great stiffness and ductility has been maintained, the fiber of the iron is kept uninjured, and it is impossible to cause them to sliver. The drawing represents a section of a horse's foot, and shows the frequent effect of driving *cold-cut* horse-nails that are liable to sliver in driving. 1, is the coronet bone; 2, is the coffin-bone; 3, is the navicular bone; 4, is one blade of a *slivering* nail, passing through the quick, or sensitive sole, into the coffin bone; 5, is the other blade of the nail passing out of the wall of the hoof for clinching. The other



parts may be represented as follows:—*a*. The wall. *b*. The sole. *c*. The cleft of the frog. *d d*. The frog. *e e*. The fatty frog, or elastic cushion. *f*. The sensitive sole. *g*. The sensitive sole. *h h h*. The tendons of the muscles which bend the foot. *i*. Part of the pastern-bone. *k k*. The tendons of the muscles which extend the foot. *l*. The coffin-joint. *m*. The navicular joint. *n*. The coronary substance. *o*. The sensible laminæ, or covering of the coffin-bone.

It requires but little observation and reflection to arrive at the conclusion as to the kind of nails to be used in the horse's foot, whether a mangled piece of iron, rendered dangerous by improper manipulation, or one made from the rod at a welding heat, where all the fibers remain intact, and afterwards hammer-pointed. The foot is an important member of the animal's body, and demands the greatest care and attention, for when it becomes injured or diseased, no matter how perfect the other parts may be, the horse's services are diminished or altogether lost. Hence the value of a horse depends upon the condition of his feet.

From the days of Tubal Cain to the present time fire has been the only sure element with which iron could be properly wrought. Every other method has resulted in producing articles of great inferiority where strength and durability are required, and in no place are these two requisites more necessary than in the horse's shoe-nail. The ancients used only charcoal in the working of iron, thus avoiding all sulphurous gases, hence the superiority of their weapons. The old Damascus blades owe their superiority in part to the use of asphalt when being forged, thus avoiding the presence of sulphur, which is so ruinous to all kinds of iron and steel. Profiting by this knowledge, the manufacturers of this nail have abandoned the use of coal and coke in the



forging, and use only pure carbon gas made from petroleum, and are thereby enabled to obtain a much higher temperature in the working of the iron. The Putnam nail is drawn down to a point from the rod of iron, as shown in the drawing, and receives about sixty quick, successive, sharp blows, at a welding heat. It is then scaled by the water process, no acids being used, and afterwards hammer-pointed. It is to all intents and purposes the same as the old-fashioned hand-made and hammer-pointed nail.

PUTTY-POWDER.—A material consisting of peroxide of tin, in great use for polishing small-arms and metal work. It is also used as a coloring material for white glass, and for the white enamels of porcelain, etc. It is made by melting tin; as the surface oxidizes, the scum, which is the peroxide, is raked off, and when cold, is reduced to a fine powder, which is white in color, and the particles are extremely hard. See *Polishing*.

PYRGI.—Movable towers, used by the Greeks in scaling the walls of besieged towns. They were driven forward upon wheels, and were divided into different stories, capable of carrying a great number of soldiers and military engines.

PYRITES.—A common name for the ancient *wheel-lock*, used before the invention of the flint-lock.

PYROBOLI.—Fireballs, used both by the Greeks and Romans. Frequently called *Malleoli*.

PYROMETER.—A term originally applied by Muschenbroek, in 1731, to an instrument which he invented for measuring all the changes produced in the dimensions of solid bodies by the application of heat. It is, however, now applied to any instrument the object of which is to measure all gradations of temperature above those that can be indicated by the Mercurial Thermometer. Desaguliers gives a description of Muschenbroek's instrument, as improved by himself, in his *Experimental Philosophy*. Numerous pyrometers have since been invented, amongst which may be noticed those of Ellicott (described in the *Philosophical Transactions* for 1736 and 1751), Graham (in Do. for 1754), Wedgwood (in Do. for 1782, 1784 and 1786) and Guyton (in the *Annales, de Chimie*, tome 46). None of these instruments, however, gave accurate results for very high temperatures; and it was not till the year 1821 that Professor Daniell announced the invention of his pyrometer, which has supplanted all others, and for which, in an improved form, he received the Rumford Medal from the Royal Society.

The method *by shrinkage* having been adopted for the insertion of the tube of the 8-inch breech-loading rifle, it at once became important to provide some reliable means for measuring, from time to time, the expansion of the cast-iron casing while undergoing heating. It was deemed most desirable, also, in connection with these measurements, to determine accurately the corresponding temperatures, in order to acquire trustworthy data, which might serve for reference in future operations of this nature. The instruments prepared for the above purposes were as follows :

1. For the measurement of the expansion. In this operation, since the instrument would require to be inserted within the bore of the heated casing, it was deemed necessary to employ a measuring tool of such poor conducting material as would undergo itself as little change from the heat as possible. Accordingly, a number of wooden measuring-rods, with steel points screwed into the ends, were constructed. The lengths of these rods were then adjusted by a vernier rule, reading to 0''.001, so as to form a series, gradually increasing by 0''.005, from 22''.00 to 22''.09, or to a little beyond the required expansion. The length of each measuring-rod was stamped upon it, and a stiff wire attached to it at the middle, by which to handle it in taking a measurement. By means of these rods, using a longer and longer one till one was found that would just enter the casing, the measurements of the interior diameter of the heated casing were rapidly, and, it is thought, quite accurately made. The lengths of the measuring-rods, as verified by the vernier rule, immediately after being withdrawn, showed no sensible change. This mode of measurement was devised by the South Boston Iron Company.

2. For the measurement of the temperature. For the determination of the temperature it was decided to employ a pyrometer of the form usually known as the hydro-pyrometer; in which the temperature is as-

certained by exposing to the action of the heat which is to be measured a definite weight of some metal, as platinum, steel, copper, etc, and then quenching the same in a known weight of water, and noting the rise in temperature of the latter. From this data, and the specific heat of the metal employed, the initial temperature of the metal, which is the temperature required, can be readily obtained. Thus, if a piece of platinum weighing 1,000 grains should, when immersed in 2,000 grains of water at a temperature of 60° Fahrenheit, raise the temperature of the latter to 90°, then 90° − 60° = 30°, multiplied by 2 because the weight of the water is twice that of the platinum, gives 60°, the temperature to which a weight of water equal to the platinum would have been raised. To obtain from this the initial temperature of the platinum, in Fahrenheit degrees, we multiply by 31¼, the specific heat of water as compared with platinum, that of the latter being 1, and to the result add the temperature of the water. Therefore $(60 \times 31\frac{1}{4}) + 90 = 1965$ is the temperature required. The principle may otherwise be stated as follows: A body of known weight W is raised to a final temperature T, and then plunged into a quantity of water of weight W′ and temperature t, which is contained in a copper vessel called a "calorimeter." As T is supposed to exceed t, the water gains in temperature by the immersion of the body, and finally attains a maximum temperature A, which is noted. In the change from t to A, the water has gained a quantity of heat equal to $W'(A - t)$, and the body immersed has lost a quantity equal to $Wx(T - A)$; x being the specific heat of the body, that of water being equal to 1. Equating these two quantities we have

$$W'(A - t) = Wx(T - A)$$

Solving in reference to T, we obtain

$$T = \frac{W'(A - t)}{Wx} + A$$

This method of pyrometric measurement was first adopted by Clement-Desormes and Schwarz, for the measurement of the heat of furnaces; it was afterward employed by Regnault in the determination of the specific heats of various substances, liquid and solid, and by Dr. Siemens in some delicate experiments upon the varying electrical conductivity of telegraph wire under different degrees of temperature. The above equation assumes that the only exchange of heat is between the water and the heated body, which is not actually the case. The heat of the body is not given up exclusively to the water in the calorimeter, but partly to the calorimeter itself, to the thermometer, the mixer, and such other instruments as may be employed in the experiments and come in contact, directly or indirectly, with the heated body. A The equation for the most general case can be easily written down, since it is only necessary to express that the quantity of heat given up by the heated body is equal to that gained by the water, the calorimeter, thermometer, mixer, etc.

Let W denote the weight of the body; T its initial temperature; x its specific heat; W′ the weight of the water in the calorimeter; w' the weight of the calorimeter; x' its specific heat; w'' the weight of the mixer, and x'' its specific heat; w''' the weight of the thermometer-tube immersed in the water; x''' its specific heat, and w^{iv} the weight of the mercury in the thermometer-tube, and x^{iv} its specific heat.

Then

$$Wx(T - A) = (W' + w'x' + w''x'' + w'''x''' + w^{iv}x^{iv})(A - t)$$, and

$$T = \frac{(W' + w'x' + w''x'' + w'''x''' + w^{iv}x^{iv})(A - t)}{Wx} + A$$

In the above expression the coefficient of $(A - t)$ is called the *water equivalent of the calorimeter*, and evidently represents a mass of water such that, supposing it to receive exclusively all the heat given up in the experiment, a thermometer placed in it would indicate the variation of temperature actually observed. To determine this value for the particular case under consideration, take the following schedule:

Parts.	Material.	Weight, ozs.	Symbol.	Specific heat, at 572° F.	Symbol.	Thermal capacity.	Numerical value.	
Ball.	Copper.	5.012	W.	.1013.	x.	Wx.	.50772	
Water	....	34.192	W′	1.	......	W′		34.192
Calorimeter	Copper	11.23	w'	.1013	x'	$w'x'$		1.1376
Mixer	Brass.......	1.51	w''	.1002	x''	$w''x''$		.1513
Thermometer-tube............	Glass	.25	w'''	.199	x'''	$w'''x'''$		.0498
Mercury in thermometer-tube............	....	.30	w^{iv}	.035	x^{iv}	$w^{iv}x^{iv}$		.0105
							.50772	
$W' + w'x' + w''x'' + w'''x''' + w^{iv}x^{iv} =$							....	35.5412

From which we determine—

$$\frac{W' + w'x' + w''x'' + w'''x''' + w^{iv}x^{iv}}{Wx} = \frac{35.5412}{.50772} = 70.$$

for the water equivalent of the pyrometer, or the value of each degree in the difference between the temperature of the water before and after the immersion of the heated copper. The expression for the temperature thus becomes $T = 70(A - t) + A$. See *Thermometer.*

PYROPHORE STIRRUP.—A stirrup in very ancient times provided with a lantern, which gave light and warmed the feet of the rider.

PYROTECHNY.—The art of making fireworks, and of unknown antiquity. It was practiced among the Chinese from the earliest times, and has attained with them a perfection unknown in other countries. So much is this the case, that they treat as insignificant the most brilliant of other displays. In their fireworks they introduce many surprises, such as figures of men and animals darting out, but they are somewhat deficient in the mechanical arrangements. Fireworks, as the name is now understood, were hardly known in Europe until the discovery of the composition of gunpowder, and for a long time only very simple pyrotechnic contrivances were used. At present they may be divided into two kinds—the simple hand-pieces, such as squibs, crackers, rockets etc.; and the other, the fixed contrivances which have often very ingenious mechanical arrangements for making some of their parts revolve rapidly when being discharged. The materials used are gunpowder, sulphur, charcoal, saltpeter, filings of steel, iron-copper, etc., and several salts: such as nitrate of strontian, acetate of copper common salt, etc. The ingredients of fireworks are usually filled into paper cases, made by rolling pasted paper round a cylinder of wood, of the proper diameter, until the case is of sufficient thickness, and then cutting the paper tube so formed into the required lengths for squibs, Roman candles, small rockets, and similar articles; they seldom exceed ten inches; one end of each is closed by drawing a piece of string tightly round, so as to pinch it in, or *choke* it, as it is technically called, and then dipping it into melted resin, which effectually seals it. The combustible ingredients are filled in at the open end, and, if necessary, are rammed down with a wooden ramrod; the opening is afterward covered with a piece of touch-paper, to prevent the composition falling out, and to ignite it by. The effects produced by fireworks are either streams of fire issuing straight out of the cases, and much varied with sparks in the form of stars, etc., and colored with brilliant colors, or wheels of beautiful sparks produced by making the cases revolve rapidly. Revolving pieces are made by coiling the paper tube, when not too tightly filled, around a flat wooden center; the force with which the combustion of the materials is carried on, is sufficient to make the board revolve with great rapidity. Small wheels of this kind are called *Catherine wheels*. *Squibs* or *serpents* are made by filling tubes, eight to ten inches in length, with a composition of 1 lb. of niter, 2 oz. of charcoal powder (rather coarse), 4 oz. of gunpowder, 4 oz. of sulphur, and 6 oz. of steel filings. The last is an important ingredient in many fireworks, producing brilliant, feather-like coruscations, which are the more beautiful the larger and cleaner the filings are. *Rockets* are tied to a wooden stick. When they are about to be discharged, this stick is stuck in the ground, and in that position the igniting point of the rocket is downward; when lighted, it rushes into the air with great velocity and reaches a considerable height, discharging as it goes a brilliant stream of sparks. Rockets require a hollow center all down the tube; without this they will not rise. At the end of their course, they often discharge very brilliant clusters of golden, ruby, emerald, sapphire-like stars, or showers of golden or colored rain, or of fiery serpents. This is produced by a supplementary part, called the *garniture* of the rocket, consisting of a shorter and broader paper tube, called the *pot*, attached to the end of the fusee part of the rocket, and filled with a composition made into paste with pure alcohol, and cut into stars, or granulated into small, round bodies for drops. The serpents for rockets are small fusees, with the same composition as squibs; they are so packed as to ignite all at once. The white stars are made of niter, 16 parts; sulphur, 8 parts; gunpowder, 3 or 4 parts; nitrate of strontian added, makes them ruby red; sulphur or acetate of copper, and sulphate and carbonate of barytes, green; zinc filings give a blue color. *Yellow stars* and *yellow showers* are made of niter, 16 parts, 10 of sulphur, 1 of charcoal, 16 of gunpowder and 2 of lamp-black. A deeper and richer golden color is produced by a very slight variation in the composition—viz., 2 parts less of sulphur and charcoal, and 4 additional of gunpowder. Many other ingenious devices are used by masters in the art of pyrotechny, but they are too numerous and too technical to come within the limits of this work. The *Roman candle* is a favorite firework; it is a tube which is held on the ground, and discharges upward a continuous stream of blue or white stars or balls. *Bengal lights* are cases of about an inch or more in diameter, filled with a composition of 7 parts niter, 2 of sulphur, and 1 of antimony. These are much used as signals at sea; they diffuse an immense glare of bluish-white light. *Chinese* or *jasemine fire*, which is used by itself or in combination with other mixtures, consists of 16 parts of gunpowder, 8 of niter, 3 of finely-powdered charcoal, 3 of sulphur, and 10 of small cast-iron borings; the last must be finer or coaser in proportion to the bore of the case to be filled. The compound devices in fixed fireworks, such as are seen at public entertainments, are very complicated in their structure, and are varied more or less by every artist. One nice point in the arrangement is to insure simultaneous ignition of all the various parts. See *Fireworks*.

PYROXYLE—PYROXYLIN.—The action of nitric acid on such vegetable substances as saw-dust, linen, paper, and cotton, is to render them very combustible. In their natural state these substances are almost entirely composed of *lignine*, the constituents of which are *oxygen*, *hydrogen*, and *carbon*; nitric acid furnishes *nitrogen*, a substance which enters into the composition of nearly all explosive bodies. Pyroxyle or gun-cotton has the composition indicated by the symbol $C_6H_7(NO_2)_3O_5$, or $C_6H_7N_3O_{11}$, and is formed by the action of concentrated nitric acid on cotton. The reaction consists in the substitution of nitrogen and oxygen in feeble combination for part of the hydrogen in the cotton or cellulose, and is therefore similar to the one by which nitro-glycerine is produced. The equation illustrating the reaction may be thus written:

$$C_6H_{10}O_5 + 3\ HNO_3 = C_6H_7(NO_2)_3O_5 + 3\ H_2O$$

Cotton or cellulose. Nitric acid. Nitro-cellulose or gun-cotton. Water.

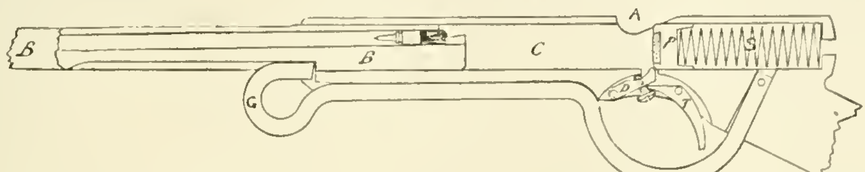
A number of these substitution products are known, but only one is used as an explosive agent. Some of the others are largely employed for making collodion.

Pyroxyle was discovered by Prof. Schönbein, and published to the world in 1846. His method of preparing it consists of mixing three parts of sulphuric acid, sp. grav. 1.85, with one part of nitric acid, sp. gr. 1.45 to 1.50; and when the mixture cools down to between 50° and 60° Fahr., clean rough cotton, in an open state, is immersed in it; when soaked, the excess of acid is poured off, and the cotton pressed tightly to remove as much as possible of what remains. The cotton is then covered over and left for half an hour, when it is again pressed, and thoroughly washed in running water to remove all free acid. After being partially dried by pressure, it is washed in an alkaline solution made by dissolving one ounce of carbonate of potash in a gallon of water. The free acid being thus expelled, it is placed in a press, the excess of alkaline solution expelled, and the cotton left nearly dry. It is then washed in a solution of pure nitrate of potash, one ounce to the gallon, and being again pressed, is dried under a temperature of from 150° to 170°. The sulphuric acid has no direct action on lignine, its use in the preparation of pyroxyle being to retain the water abstracted from the cotton, and prevent the solution of the compound, which would take place, to a greater or less extent, in nitric acid alone. See *Gun-cotton*.

PYRRHIC DANCE.—The most famous of all the war-dances of antiquity, said to have received its name from one Pyrrichos, or, according to others, from Pyrrhus or Neoptolemus, the son of Achilles. Critical scholars, however, content themselves with a general inference deduced from the substantial harmony of the various mythical or legendary accounts given of its origin—viz., that it was a Doric invention. It was danced to the flute, and its time was both quick and light, as may be seen from the Pyrrhic foot, composed of two shorts (⏑⏑), and the Prokeleusmatic, or challenging-foot, of two double shorts (⏑⏑⏑⏑). According to Plato, it aimed to represent the nimble motions of a warrior either avoiding missiles and blows, or assaulting the enemy; and in the Doric States, it was as much a piece of military training as an amusement. Elsewhere, in Greece, it was purely a mimetic dance, in which the parts were sometimes represented by women. It formed part of the public entertainment at Panathenaic festivals. Julius Cæsar introduced it at Rome, where it became a great favorite. The *Romaika*, still danced in Greece, is said to be a modern relic of the ancient Pyrrhic dance; but if Dr. Corrigan's description of it (*Ten Days in Athens*, 1861) is correct, it is not easy to see the resemblance.

Q

QUACKENBUSH AIR-GUN.—The most perfect and effective gun of its class, at present made. Being a hard-shooter,and easily manipulated,it is well suited for practice at short range; and is very extensively used by recruits when learning the principles of aiming and firing. The drawing shows its working parts. Pulling the trigger releases the piston (P), which is then thrown foward by the spring, expelling the air from the chamber (C), through the barrel (B), with great force, carrying the dart or bullet before it. *To load* the gun, the barrel (B) is pushed into the cylinder (C), which re-sets the piston, compresses the spring, and allows the dart or bullet to be inserted through the opening (A), after which the barrel is drawn forward to the stop as shown. It will be observed that the spring guard (G) can be drawn back instantly to remove the barrel for packing, etc.; and that the whole length of the barrel is effective, there being no waste space to occasion a loss of air. The barrel is easily pushed into the chamber, by placing the muzzle upon the floor or against some firm object. See *Air-gun*.



QUADI.—An ancient people living in south-east Germania; of the Suevic race, and inhabiting that part of what is now Bohemia, Lower Austria, and Moravia, which lay between the Sarmatian mountains and Hercynian forests and the Ister or Danube. They were Allies of the Marcomanni, their neighbors on the north-west. The Roman Emperor Tiberius established a kingdom of the Quadi, and made Vannius, one of his generals, King. In 174 B. C. the Quadi, rose against the Empire in confederation with other Germanic races, and it was only after stubborn resistance that they were overcome.

QUADRANT.—In gunnery, an instrument, generally made of brass, for ascertaining or adjusting the elevation of ordnance, particularly mortars, which have no tangent scale. The quadrant is graduated into degrees and parts of a degree,having a movable index, with a spirit-level and vernier attached to it. When the instrument is used, the limb or bar of the quadrant is inserted into the bore of the piece; the index which is attached to the graduated arc is then fixed to the particular elevation required, and the piece elevated or depressed until the spirit-level is horizontal, which is shown by the air bubble running to the center. Another pattern quadrant to that hitherto in use has been introduced. It differs from the one generally known in being altogether of a stronger form; the bar or limb has been reduced to 12 inches in length; the base is broader, and is fitted with a stop to prevent its slipping into the chamber. The counterbalance weight is arranged so as to ensure the quadrant lying flat on the bottom of the bore of the piece. A *Gunner's Quadrant* is an instrument employed, like the spirit-level quadrant, to give angles of elevation or depression when there are no sights to a gun, or when they cannot be used. It differs from the spirit-level quadrant in having no spirit-level,but a plumb-line which is suspended from the right angle.

QUADRANT ANGLE.—The angle which the axis of the piece, when laid, makes with the horizontal plane. It is termed, *quadrant elevation* or *quadrant depression*, according as the piece is laid above or below the horizontal plane.

QUADRATE.—In gunnery, a term meaning to ascertain if a piece of ordnance is properly placed on its carriage, and the wheels are of equal height.

QUADRILATERAL.—In military language, an expression denoting a combination of four fortresses, not necessarily connected together, but mutually supporting each other; and from the fact that if one be attacked, the garrisons of the others, unless carefully observed, will harass the besiegers, rendering it necessary that a very large army should be employed to turn the combined position. As a remarkable instance, and a very powerful one, may be cited the Venetian Quadrilateral (Austrian till 1866), comprising the four strong posts of Mantua, Verona, Peschiera, and Legnago. These form a sort of outwork to the bastion which the southern mountains of the Tyrol constitute, and divide the north plain of the Po into two sections by a most powerful barrier. Napoleon III., in 1859, even after the victories of Magenta and Solferino, hesitated to attack this quadrilateral.

QUADRILLE.—Small parties of horse richly caparisoned, etc., in tournaments and at public festivals. The quadrilles were distinguished from one another by the shape or color of the coats which the riders wore.

QUAKER-GUNS.—Old wooden pieces of ordnance which were made to resemble the real artillery, and placed in the embrasures of forts, in order to deceive the enemy.

QUARREL.—The missiles used for all cross-bows, with the exception of the *cross-bow a galet*, were called *quarrels* or bolts: and often written *quarry*. One kind of quarrel (*vireton*) was feathered so as to regulate the movement by giving a rotatory motion. Another kind (*matras*) ended with a round knob, which killed without shedding blood. See *Articles of War*, 24.

QUARTE.—In tactics, a word of command given in the bayonet exercise: as *quarte parry*, which is executed as follows: Move the piece quickly to the left, the small of the stock passing under the left elbow, the piece covering the left shoulder; the barrel to the left, bayonet in front of, and higher than the shoulder, the left forearm on the right of the piece, the elbow touching the right wrist, the fingers on the stock.

QUARTER.—1. In Heraldry, a subordinary consisting of the upper dexter fourth part of the shield, cut off by a vertical and a horizontal line meeting in the center of the shield. When two or more coats are marshaled together on a shield divided into squares for their reception, such divisions are also called quarters. See *Quartering*.

2. In war, the sparing of the life of a vanquished enemy, which by the laws of war is forfeit to the victor. The expression seems to be derived from the use of the word "quarter" to designate the lodging of the particular warrior; to *give quarter* to a prisoner being to send him to his captor's quarter for liberation, ransom, or slavery. The refusal of quarter is a terrible aggravation of the horrors of war, and is only at all justifiable towards an enemy who has been guilty of atrocious cruelty himself, or of some flagrant breach of faith.

It is against the usage of modern war to resolve, in hatred and revenge, to give no quarter. No body of troops has the right to declare that it will not give, and therefore will not expect, quarter; but a commander is permitted to direct his troops to give no quarter, in great straits, when his own salvation makes it *impossible* to cumber himself with prisoners. Troops that give no quarter have no right to kill enemies already disabled on the ground, or prisoners captured by other troops. All troops of the enemy known or discovered to give no quarter in general, or to any portion of the army, receive none. Troops who fight in the uniform of their enemies, without any plain, striking, and uniform mark of distinction of their own, can expect no quarter.

If American troops capture a train containing uniforms of the enemy, and the commander considers it advisable to distribute them for use among his men, some striking mark or sign must be adopted to distinguish the American soldier from the enemy. The use of the enemy's national standard, flag, or other emblem of nationality, for the purpose of deceiving the enemy in battle, is an act of perfidy by which they lose all claim to the protection of the laws of war. Quarter having been given to an enemy by American troops, under a misapprehension of his true character, he may, nevertheless, be ordered to suffer death if, within three days after the battle, it be discovered that he belongs to a corps which gives no quarter.

QUARTER ARMS.—A term in Heraldry, meaning to place the arms of other families in the compartments of a shield, which is divided into four quarters, the family arms being placed in the first quarter; when more than three other arms are to be quartered with the family arms, it is usual to divide the shield into a suitable number of compartments; and still the arms are said to be *quartered*.

QUARTER BLOCKS.—Small blocks used for various purposes in mechanical maneuvers. They are usually 20 inches long, 6 inches wide, and 2 inches thick.

QUARTER GUARD.—A guard mounted in camp, immediately on the arrival of each corps on its ground. It is placed in front of the center of the camp, at about eighty paces from it and is charged with special duties

QUARTER HUNG.—A term employed when speaking of a gun whose trunnions have their axis below the line of bore.

QUARTERING.—In Heraldry, the bearing of two or more coats on a shield divided by horizontal and perpendicular lines, a practice not to be found in the earlier heraldry, and little in use till the 15th century. Arms may be quartered for various reasons. 1. To indicate dominion. A Sovereign quarters the ensigns of his different States. The earliest instance of quartering in England is found in the paternal arms of Eleanor, daughter of Frederick III., King of Castile and Leon, and first wife of Edward I., as represented on her tomb in Westminster Abbey—the Castle of Castile occupying the first and fourth quarters, and the Lion of Leon the second and third. The arms of England and Ponthieu are similarly quartered on the same monument, and on the crosses erected to queen Eleanor's memory. The received rule regarding the quartering of the ensigns of different states is, that precedence is given to the most ancient, unless it be inferior in importance. Feudal

arms are sometimes quartered in the same way by subjects. 2. Arms of augmentation, or special concession accorded to a subject by his Sovereign, by way of honor, are sometimes granted to be borne quarterly with the paternal arms. These contain a portion of the royal insignia, and have precedence of the paternal coat. 3. The most unusual reason for quartering is to indicate descent from an heiress who has intermarried into the family. Where there is but one heiress, her coat occupies the second and third quarter of the shield, and the paternal arms the first and fourth. Where there are more than one, they are marshaled in the successive quarters in the order of the intermarriages. Where more than four coats have to be marshaled, the number of vertical lines is increased, and the divisions, though more than four, are still called quarters. Where there is an odd number of coats, the last quarter is usually filled up by repeating the first. One of the quarters may itself, be quartered, when the heiress was entitled to bear a quartered coat; the shield is then said to be counter-quartered, and its primary quarters are called *grand quarters*. Quarterings are not allowed to be added to the paternal coat without the sanction of the heraldic authorities. The expression "quarterings" is often loosely used for *descents* in cases where there is no right to quarter from representation. The eight or sixteen quarterings which are sometimes ranged around the Scottish funeral escutcheon, and which are still important for many purposes in Germany, have no reference to representation, but simply purity of blood for four or five generations; *i. e.*, that the father and mother, the two grandmothers, and four great-grandmothers, as also in the case of sixteen quarterings, the eight great-great-grandmothers, have all been entitled to coat-armor. See *Quarter*.

QUARTERLY.—A term in Heraldry, meaning in quarters or quarterings: as, to bear arms quarterly.

QUARTERMASTER.—A regimental Staff Officer, of the relative rank of Lieutenant, whose duty is to look after the assignment of quarters, the provision of clothing, forage, fuel, and all other Quartermaster's supplies; and when on the march he superintends the marking out of camp. He is appointed by the Colonel of the regiment, subject to the approval of the Secretary of War. He vacates his Staff position when promoted to the rank of Captain, or at the discretion of the Colonel. In the British service, the regimental Quartermaster rises, with few exceptions, from the ranks. His duties are to superintend, assign to their respective occupants, and have charge of, quarters, barracks, tents, clothing, etc., used by the regiment. He is also regimental storekeeper. The Quartermaster has no further promotion to look forward to; but after 30 years' service in all including 10 as an officer he may retire with the honorary rank of Captain. He receives 10s. 2d. a day in the cavalry, and 8s. 2d. in the infantry, rising by length of service to 15s. 2d. and 13s. 2d.; with slightly different rates in the guards, engineers, etc. He is not required to join the Mess

QUARTERMASTER AND COMMISSARY OF CADETS.—An Officer of the Army, detailed by the Secretary of War, and assigned to duty as Quartermaster and Commissary of Cadets at the U. S. Military Academy.

He is charged with all matters relating to clothing, equipment, and subsistence of the Cadets, including purveying and supervision of the Cadets' Mess.

A Board of Inspectors, consisting of three officers appointed by the Superintendent, examines and compares with approved patterns all articles of Cadets' clothing, and materials for making the same; and also examines all other supplies furnished by the Quartermaster and Commissary of Cadets, and reports to the Superintendent, at such times as he appoints on the quality and suitableness of the articles; but the Superintendent may assign an officer to inspect clothing and shoes furnished for issue. No clothing or other article is issued or sold to the Cadets without being first inspected and approved. After every muster this Board carefully audits the accounts for clothing, and all other authorized charges against Cadets.

QUARTERMASTER GENERAL. A Staff Officer in the United States Army, who has the rank of Brigadier General, and is at the head of the Quartermaster's Department. In the British army he is a Staff Officer of high rank, whose duty it is to arrange the marches, quarters, and internal arrangements of the army to which he belongs. Every army has some officer of this Department; from a brigade with a Deputy Assistant Quartermaster General, receiving £173 7s. 6d. a year, besides regimental pay, up to a complete army under a Commander-in-Chief, with a Quartermaster General, who is usually a general officer, and receives £691 19s. 7d. per annum, besides his other pay. At headquarters there is a permanent Quartermaster General, responsible for all the movements of the army, the organization of expeditions, camps of instruction, etc. He receives £1,500, besides his pay as a general officer, and has a Sub-Department at the War Office, with clerks, etc. He is under the officer commanding in chief, and the Adjutant General.

QUARTERMASTER'S DEPARTMENT.—Department is charged with the duty of providing the means of transportation, by land and water, for all troops, and all material of war. It furnishes the horses of the artillery and cavalry, and horses and mules for the trains. It provides and distributes clothing, tents, camp and garrison equipage, forage, lumber, and all material for camps and for shelter of troops and of stores. It builds barracks, storehouses, hospitals; provides wagons and ambulances and harness, except for cavalry and artillery horses; builds or charters ships, steamers, and boats, docks, and wharves; constructs and repairs roads, railways, and bridges; clears out obstructions in rivers and harbors, when necessary for military purposes; provides, by hire or purchase, grounds for military encampments and buildings; pays generally all expenses of military operations not by law expressly assigned to some other Department; and, finally, it provides and maintains military cemeteries, in which the dead of the army are buried.

The following are general depots of the Quartermaster's Department in the United States, and the officers in charge thereof report directly to the Quartermaster General: New York, Philadelphia, and Schuylkill Arsenals, Washington, D. C., Jeffersonville, Ind., and San Francisco, Cal. All other depots are under the orders of the Commanding Generals of the Military Departments in which they are situated. The Commander of the Military Division of the Pacific, however, for all purposes of his command, has authority over the depot of San Francisco as over Department depots; but in matters relating exclusively to the collection and manufacture of military supplies, the officer in charge of that depot communicates directly with the Quartermaster General of the army.

The present organization of the Quartermaster's Department consists of one Quartermaster General, with the rank of Brigadier General; four Assistant Quartermaster Generals, with the rank of Colonel; eight Deputy Quartermaster Generals, with the rank of Lieutenant Colonel; fourteen Quartermasters, with the rank of Major; and thirty Assistant Quartermasters, with the rank of Captain.

QUARTERMASTER SERGEANT. A Non-commissioned Officer who assists the Quartermaster in his various duties. He ranks among the regimental Non-commissioned Staff, and is appointed by the Colonel of the regiment upon the recommendation of the Quartermaster. In the British service, he receives daily 4s. 5d. in the cavalry, 4s. in the artillery, 2s. 11d. in the infantry of the line.

QUARTER OF ASSEMBLY.—A rendezvous or place where the troops meet to march from in a body.

QUARTERS.—1. The encampment on one of the principal passages round a place besieged, to prevent relief and intercept convoys.

2. In military affairs, quarters are generally the positions assigned to persons or bodies of men. In a more special sense, the quarters in the army are the places of lodging assigned to officers or men, when not actually on duty. At all posts and stations where there are public quarters in buildings belonging to the United States, officers may be furnished with quarters in kind in such public buildings by the Quartermaster's Department. There is allotted by the Quartermaster at the station, under the direction of the Commanding Officer, to each officer such number of rooms as is allowed to his grade by the Regulations of the Army. When assigned to duty without troops, or temporarily and involuntarily awaiting orders, under competent authority, officers are entitled to the prescribed allowance of quarters. But in no case is an officer furnished with quarters at two different stations at the same time. Application should be made to the Quartermaster on the arrival of the officer at the place where quarters are to be provided. See *Allowance of Quarters*.

QUARTER-SIGHTS.—In gunnery, divisions marked on the upper quarters of the base-ring, commencing where it would be intersected by a plane parallel to the axis of the piece, and tangent to the upper surface of the trunnions. These sights are used for giving elevations up to 3°. The mode of elevating the gun is by bringing the division on the base ring expressing the required degree of elevation and the notch on the *side* of the muzzle in direct line with the object; the gun will then have the proper degree of elevation. To lay the gun point-blank, the lowest notch on the base ring and that on the side of the muzzle are brought directly in line with the object, and though the gun may have been laid point-blank with reference to the object, it may have several degrees of elevation or depression with regard to the ground or plane of the horizon.

QUARTERS OF REFRESHMENT.—The place where the troops that have been much harassed are put to recover themselves, during some part of the campaign.

QUARTER STAFF.—Formerly a favorite weapon with the English for hand-to-hand encounters, being a stout pole of heavy wood, about 6½ feet long, shod with iron at both ends. It was grasped in the middle by one hand, and the attack was made by giving it a rapid circular motion, which brought the loaded ends on the adversary at unexpected points.

QUATERNIONS.—The name given by its inventor, Sir W. R. Hamilton, to one of the most remarkable of the mathematical methods of calculi, which have so enormously extended the range of analysis, while simplifying its application to the most formidable problems in geometry and gunnery. It would be inconsistent with our plan to give even a complete though elementary analytical view of this calculus; but it is possible, by means of elementary geometry and algebra alone, to give the reader a notion of its nature and value. For this purpose, it will be necessary to consider some very simple, but important ideas with reference to the *relative position* of points in space. Suppose A and B to be any two stations, one, for instance, at the top of a mountain, the other at the bottom of a coal-pit. *Upon how many distinct numbers does their relative position depend?* This can be easily answered thus: B is so many degrees of longitude to the east or west of A, so many degrees of latitude to the north or southof A, and so many feet above or below the level of A. Three numbers suffice, according to this mode of viewing the question, to determine the position of B when that of A is given. Looking at it from another point of view, suppose A to be the earth, B a fixed star. To point a telescope at B, we require to know its altitude and azimuth, its latitude and longitude, or its right ascension and declination. Any of these pairs of numbers will give us the *direction* of the line AB, but to determine absolutely the position of B, we require a *third* number—viz., the length of AB. Hence, it appears that any given line AB, of definite length and direction, is completely determined by *three* numbers. Also, if the line *ab* be parallel and equal to AB, it evidently depends on the same three numbers. Hence, if we take the expression (AB) to denote (*not*, as in geometry, the length of AB merely, but) the length and direction of AB; we see that there will be no error introduced, if we use it in the following sense:

$$A + (AB) = B;$$

i.e., if beginning with A, we take the step represented by (AB), we shall find ourselves at B. From this it follows at once that, if C be any third point,

$$A + (AB) + (BC) = C;$$

i.e., beginning at A, and taking the successive steps (AB) and (BC), we are finally brought to C. But we have also

$$A+(AC)=C,$$

by taking the step from A to C at once. Hence, with the present signification of (AB), etc., we see that

$$(AB) + (BC) = (AC),$$

which shows that lines, *when their length and direction are both considered*, are to be added or compounded according to the same law as velocities or forces. In this sense, a line is called by Sir W. R. Hamilton a *vector*. Again, we have evidently

$$A + (AB) + (BC) + (CA) = A,$$

because the three successive steps bring us back to the starting-point. Hence

$$(AB) + (BC) = -(CA),$$

and therefore (AC) = −(CA), or the sign (only) of a vector is changed if its direction be reversed. The rules for the addition, and, therefore, for the subtraction, of vectors are thus extremely simple; and, without any further preface, we are in a position to solve a great many geometrical problems, some of which are of no common difficulty. A comparatively simple one must suffice; let us prove Euclid i. 33 *i. e.*, if AB be parallel and equal to CD, AC is parallel and equal to BD. In vectors, given (AB)=(CD), prove (AC)=(BD). We have at once, by going directly from A to C, and then by the course A, B, D, C,

$$(AC) = (AB) + (BD) + (DC).$$

But (AB) = (CD) = −(DC) by what we have just proved. Hence the first and third terms of the expression for (AC) are equal and of opposite signs, and therefore

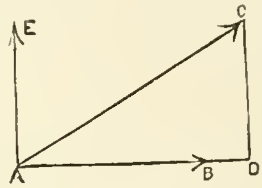
$$(AC) = (BD),$$

This example has been chosen from its simplicity, and gives an extremely inadequate idea of the grasp which vectors take in common geometry.

So far, we have not advanced much beyond common geometrical methods; but we *now* come to the step in which quaternions proper are introduced, a vector being merely a degraded species of quaternion. This new step contains Hamilton's answer to the question, answered over and over again during the last 50 years in forms of the most uncouth complexity, "*How to express the product, or the quotient, of two vectors, or directed lines.*" In other words, keeping to one part of the question only, what is the nature of the factor q in the equation

$$(AC) = q(AB),$$

where A, B, C are any three points? Let us first consider *on how many independent numbers does it depend?* It might at first sight appear to depend upon *six*, for (AB) and (AC), as we have already seen each contain *three*. But let us analyze the process of passing from the one vector to the other, much as we have already analyzed the vector step of passing from one point to another. To simplify the idea of the process, let us suppose it to be effected by a species of rotation. First, then, in



order that (AB) may be turned so as to coincide in *direction* with (AC) it must be turned about an axis perpendicular to the plane of the triangle ABC, and through an angle BAC. Now, the *direction* of a line always depends on *two* numbers, as we have seen above; hence, we will have *two* for the direction of the axis, and *one* for the angle through which AB is turned. But AB and AC are not, in general, of equal length; hence, after their directions have by turning been made coincident, AB must be compressed or stretched till its *length* is the same as that of AC. Thus, a *fourth* number is required for the complete description of the process, and, therefore, q depends upon *four independent numerical quantities*; hence its name, quaternion. A similar investigation, but somewhat less elementary, shows that the *product* of two vectors also depends on four distinct numbers. This will be proved analytically further on in the article. Now, suppose AB and AC to be *equal* to each other, and at right angles; and suppose

$$q(AB) = (AC);$$

i.e., suppose that q turns AB through a right ange in a given plane without altering its length. Apply the operation denoted by q, a second time, and we have

$$q. .q\,(AB = q(AC). \quad q$$

Now q(AC) must represent a vector equal to AC in length, but turned through a right angle in the plane BAC. It must therefore be in the direction of BA produced through A, and equal in length to AB. Hence, by a previous remark, it may be expressed by

$$-(AB), \text{ or by } (BA).$$

Hence, $q.\,q(AB) = -(AB)$, or $q.q = -1$.

The particular quaternion, therefore, which turns a vector through 90° without altering its length, has its square equal to −1. Though, of course, they are essentially a real geometrical conception, this result shows how closely quaternions are connected with what are called imaginary quantities in analytical geometry and algebra. Now it is found, by a careful examination of all the consequences involved, that we are at liberty to represent by a vector of unit length, perpendicular to the plane of two equal lines at right angles to each other, the quaternion which, employed as a multiplier, changes one of these lines into the other. This result we must assume; as its proof, though not in any sense difficult, would require the free use of analytical symbols to condense it within our assigned limits. Hence three vectors, each of unit length, and each perpendicular to the other two, have the property that the product of any two, taken in the proper order, is the third. For illustration, suppose these to be drawn eastward, northward, and upward, and let them be represent-

Palmer R.

ed (according to Hamilton's notation) by i, j, k, respectively; we have the following equations among them:

$$i. j = k,\ j. k = i,\ k. i = j;$$

where it is to be observed that the order of the alphabet is maintained throughout. Also, as before, we see that $i^2 = j^2 = k^2 = -1$.

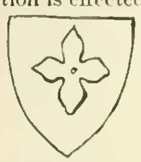
Considering them for a moment as handles to be laid hold of to turn the whole system about one of them, we see that i turns j into the position of k; that is, the operation i may be effected by a lefthanded quadrantal rotation about the eastward line i. What, then, is the result upon the vector i of the rotation symbolized by j? Laying hold of the northward line j, use it as an axis of left-handed quadrantal rotation, and the effect on the system will be not only (as above, $jk = i$) to make the upward line an eastward one, but to make the eastward line a *downward* one; in symbols,

$$j. i = -k.$$

Comparing this with

$$i. j = k.$$

we see that in quaternions, *the commutative law of multiplication does not hold; i. e.*, that the product depends not only on the factors, as in arithmetic and algebra, but upon the *order* in which the multiplication is effected. This is, of course, a little perplexing to the beginner, but is easily got over; and the mere consideration of this fact is often sufficient for the proof of theorems regarded in general as of no ordinary difficulty.



Quatrefoil.

QUATREFOIL.—A heraldic bearing meant to represent a flower with four leaves. It is not represented with a stalk unless blazoned as *slipped*, in which case the stalk joins the lower leaf.

QUEEN.—In its primary signification, the King's Consort, who has in all countries been invested with privileges not belonging to other married women. The English Queen, unlike other wives, can make a grant to her husband, and receive one from him. She can sue and be sued alone, and purchase land without the King's concurrence. The statute of treasons makes it treason to compass her death, or to violate her chastity, even with her consent, and the Queen consenting, is herself guilty of treason. If accused of treason, the Queen is tried by the Peers of the Realm. A duty, amounting to one one-tenth of the value of fines on grants by the Crown, was in former times due to the Queen, under the name of queen-gold. Charles I. purchased it from his Consort, Henrietta Maria, in 1635, for £10,000, but it was not renewed at the restoration. The Queen's Consort is exempt from paying toll, and from amercements in any court. She has a household of her own, consisting of six Ladies of the Bedchamber, a Lord Chamberlain, Vice-chamberlain, Mistress of the Robes, Master of the Horse, and three Equerries, as also her Attorney General and Solicitor General, distinct from those of the King, who are entitled to take a place within the bar along with the King's counsel, and prosecute suits in law and equity for the Queen. It has been the usual practice to Crown the Queen Consort with solemnities similar to those in the coronation of the King. In the case of the *Queen Dowager* is the widow of the deceased King. She retains most of the privileges which she enjoyed as Queen Consort, nor does she lose her dignity by re-marriage; but it has been held that no one can marry the Queen Dowager without permission from the King, on pain of forfeiture of lands and goods. On the marriage of a King, or accession of an unmarried Prince, Parliament makes provision for the Queen's maintenance, in case of her survivance. An income of £100,000 a year, with two residences, was settled on the Queen of George III.; and the same provision was made for the late Dowager Queen Adelaide, at the commencement of the reign of William IV. The Queen-Dowager, when mother of the reigning Sovereign, is styled the Queen-Mother. Until the time of George II, Queens Consort bore the arms of the King impaled with their paternal coat, with the King's dexter and their paternal sinister-supporter; since that period, they have used both royal supporters. It is not usual to place the arms of the Queen Consort within the garter.

The *Queen Regnant* is a Sovereign Princess who has succeeded to the kingly power. In modern times, in those countries where the Salic law does not prevail, on failure of males, a female succeeds to the throne. By an act of Queen Mary, the first Queen-Regnant in England, it was declared "that the regal power of this realme is in the Queen's majestie as fully and absolutely as ever it was in any of her most noble progenitors Kings of this realme;" and it has since been held that the powers, prerogatives, and dignities of the Queen Regnant differ in no respect from those of the King. The husband of the Queen-Regnant is her subject; but in the matter of conjugal infidelity, he is not subjected to the same penal restrictions as the Queen Consort. He is not endowed by the constitution with any political rights or privileges, and his honors and precedence must be derived from the Queen. A Queen Regnant is the only woman who is in her own right entitled to bear her arms in a shield and not in a lozenge. She is also entitled to the exterior ornaments of helmet, mantling, crest, and motto, and may surround her shield with the garter, and the collars and ribbons of all other Orders of Knighthood of which she is Sovereign.

QUEEN ANNE'S POCKET-PIECE.—An ancient 18-pounder cannon at Dover, England. This piece is more than 28 feet in length.

QUEEN'S ALLOWANCE.—An allowance in England, in aid of the expenses of the officers' mess. It is applied towards reducing the cost of wine and diminishing the daily expenses of the mess, in equal proportions, viz., one-half for wine and one-half for mess expenses. This grant is also known as *Regent's Allowance*.

QUEEN'S COLOR.—In the British service, the color carried on the right of the two colors of a battalion of infantry. It is, in the line, the great Union or Union-jack, with the Imperial crown in the center, and the number of the regiment in gold Roman characters below the crown. In the guards, the Queen's color is crimson, with various devices on it.

QUEEN'S REGULATIONS. — Those collections of orders and regulations in force in the English Army, which serve to guide commanding and other officers in all matters of discipline and personal conduct. Financial matters are left to the War Office regulations. The Regulations for the army were first collected in 1788, since when several editions have been issued, the last being in 1873. The current Regulations are supplemented, corrected, and canceled by numerous circulars and addenda; so that they never represent the whole body of military rules for many days together.

QUEUE. A tail-like twist of hair formerly worn at the back of the head by soldiers.

QUEUES D'HIRONDE.—In fortification, lines composed of projecting tenailles, or works, which, from the facility with which an enemy can enfilade their long branches, are considered extremely defective, and consequently are seldom employed.

QUICK-MATCH.—Cotton yarn, of several strands, saturated and covered with an inflammable composition. It is used for communicating fire from point to point in fireworks, etc. The following materials are required in manufacture: *Mealed powder; cotton yarn* wound in loose balls of convenient size (say 1 pound, which will measure about 1,000 yards), such as is used for candle-wick. When doubled and slightly twisted in the fingers it should be about .07 inch in diameter. *Gummed brandy* or *whisky*, in the proportion of 1 ounce of gum to ½ gallon of spirits. The gum is first dissolved in the smallest quantity of hot water or vinegar, and afterward mixed with the whisky. *Strips of paper; thread.* One thousand yards of quick-match require 1 pound of cotton yarn, 8 pounds of mealed powder, $1\frac{1}{4}$ gallons of spirits, and $2\frac{1}{2}$ ounces of gum arabic. Weight when dried, 9 pounds. The following utensils are used in preparing the quick-match: *Wooden* or *copper bowls; 1 quart measure; funnel* or *frame; reel.* Steep the balls of yarn in the gummed whisky until they are quite thoroughly saturated. Make a good paste of mealed powder, by mixing 1 quart of gummed whisky to 2 pounds of powder, and put a layer of it about $\frac{1}{2}$ inch deep in the bowl; on this spread a coil of the cotton by unrolling the ball and distributing it equally on the surface of the paste until there are 5 or 6 yarns over one another; put another layer of the paste, and proceed in this manner until the bowl is full, taking care not to entangle the strands; the last layer of this paste should be a little deeper than the others. After the cotton has been 3 or 4 hours in the bowl, wind it on a reel, or stretch it on nails 40 or 50 feet apart, making it pass through a funnel, or the hand, filled with the paste, and taking care that the several turns of yarn do not touch each other. Before it is dry dredge it with mealed powder; let it dry slowly, then cut it off from the reel or nails and put it in bundles. During the winter quick match should be made in a warm room. Match thus prepared should be hard and stiff, and the composition should hold firmly on. One yard burns, in the open air, 13 seconds. By using *vinegar*, a match is made which burns less rapidly, in the proportion of 4 to 5; and with pure water, in the ratio of 4 to 6. *Alcohol* makes a quicker match, but it cannot be gummed, and the composition does not stick. A slow kind of match is made by adding sulphur to the mealed powder. With $\frac{1}{6}$ of sulphur, one yard of match burns 22 seconds; with $\frac{1}{4}$, 33 seconds; with $\frac{1}{3}$, 53 seconds; with $\frac{1}{2}$, 162 seconds. Quick-match carefully inclosed in tubes burns much more rapidly than in the open air, and more so in proportion as the tubes are made smaller. To communicate fire very rapidly, it is inclosed in paper tubes, called leaders. See *Fireworks.*

QUICKNESS OF BURNING.—The relative quickness of burning of two different powders may be determined by burning a train laid in a circular or other groove which returns into itself, one-half of the groove being filled with each kind of powder, and fire communicated at one of the points of meeting of the two trains; the relative quickness is readily deduced from observation of the point at which the flames meet.

QUICKSTEP.—A lively, spirited march frequently played by military bands.

QUICK TIME.—In tactics, the length of the direct step in *quick time* is 28 inches, measured from heel to heel; the cadence is at the rate of 110 steps per minute, or 2 miles 1613 yards in an hour. See *Cadence* and *Step.*

QUILLED.—In Heraldry, a term used in describing a feather, to indicate that the quill differs in tincture from the rest.

QUILLON.—The ordinary cross-guard of a sword. See *Cross-guard.*

QUILTED GRAPE.—The old pattern grape-shot, which consisted of a round iron plate or bottom, having an iron pin in its center, around which the small shot were piled, quilted with canvas, and tied, so as to appear in form something like a bunch of grapes.

QUINAN BREECH-SIGHT.—An improvement on the pendulum hausse. It is fixed in a socket on the right side of the breech. The scale has a spirit-level, by means of which it is made vertical. The front sight is a short tube with cross-hairs fixed in it. The advantages claimed over the hausse are increased steadiness and accuracy.

QUINTE.—An important guard in fencing. Usually the fifth.

QUINTIN.—An instrument used in the ancient practice of tilting on horseback with the lance. It consisted of an upright post, surmounted by a cross-bar turning on a pivot, which had at one end a flat board, at the other a bag of sand. The object of the tilter was to strike the board at such speed that the rider was past before the bag of sand, as it whirled round, could hit him on the back. Also written *Quintain.*

QUIRITES.—A term applied, in ancient Rome, to the citizens as distinguished from the orgnaized soldiery.

QUISCHENS.—The old term for *Cuisses*, the pieces of armor which protected the thighs.

QUITTING GUARD.—The Articles of War provide that any officer or soldier who quits his guard, platoon, or division, without leave from his superior officer, except in a case of urgent necessity, shall be punished as a Court-Martial may direct. Quitting any post or duty without having received any previous order for that purpose, is severely punished in the army.

QUIVER.—A case or sheath for arrows, formerly worn by archers or bowmen.

QUOIN.—A large wedge, used in place of an elevating screw under the chase of mortars and the breech of short howitzers, to keep them in the proper position when elevating. It has a handle on the large end, by which it is moved.

R

RABINET.—A small piece of ordnance formerly in use. It weighed but 300 lbs., and fired a small ball of $1\frac{3}{8}$ in. diameter, with a very limited range.

RACERS.—Circular rails of metal located in the ground on which the trucks of traversing platforms run. The racers used with wooden platforms are made of wrought-iron, laid with the upper surface raised. For wrought-iron traversing platforms on which heavy muzzle loading rifled guns of less size than the 10-inch stand, flanged racers of wrought-iron are used, but for the guns of a larger size steel is substituted for wrought-iron.

RACHAT DES CLOCHES.—Formerly, in France, when a fortified place was taken, the bells became the property of the Master General of Artillery, which were usually redeemed by the inhabitants of the place at a certain price; it was necessary that the place should be attacked by artillery in order to secure this right over the bells.

RACK.—A straight bar, with cogs or teeth placed along it, so as to correspond with similar cogs or teeth placed on a wheel, thus: If the bar is not movable, the wheel is attached to a traversing frame, and as it revolves, is moved along by the resistance of its teeth to those on the bar. It was in this way that the formation of a railway was first projected, the rail and the driving-wheel of the engine to be both furnished with corresponding teeth. In mechanics, rack-work has innumerable applications.

RACKAROCK.—The name given to a blasting powder formed by the union of two ingredients, one a solid and the other a fluid, both being absolutely inexplosive until combined by the consumer. Many attempts have been made to prepare ingredients that would form an effective explosive immediately upon mixture, but nearly all the plans proposed have proved impracticable from difficulty or danger. The Rendrock Powder Co., of New York, have on the market a powder named as above, the invention of Silas R. Divine. It has been most effectively used in a great variety of operations in tunneling and mining, and has proved to be an explosive of great power—rivaling nitro-glycerine in that respect—and safer than most other high explosives, even after the separate ingredients have been combined ready for use in blasting. In manufacture, transportation, and storage, there can of course be no danger, as the materials are kept separate until wanted for immediate use. A dry oxygen-yielding salt, in a finely-pulverized condition, is packed in cylindrical muslin bags, which form the cartridges. These are dipped into a suitable fluid hydrocarbon—preferably nitrated, as, for instance, nitro-benzole—and allowed to absorb a certain amount, which can be made definite by timing the immersion, or by weighing the cartridges before they are dipped, and arresting the absorption when they have acquired the requisite increase in weight. The porous envelope or cartridge of muslin is an ingenious device. The idea of making explosives by putting the oxygen salt in porous cartridges and then saturating them, seems simple enough after it has once been done, the same as Howe's idea of putting the eye of the needle near the *point*, instead of in the blunt end, seemed simple after it was once disclosed, but the perfection of the invention in both cases was only reached after hard study. Like the invention of the sewing-machine needle, it became necessary to reverse the old processes. The old way in explosives was to make the cartridge fluid-proof—the new way is to make it porous. It allows the free percolation of the fluid to the powder, and when the interstices of the envelope are filled with an oil or fluid that will not mix with water, it resists the entrance of the latter to the soluble salt inside. When the muslin cartridges were first used, they were fully saturated, and removed from the fluid in a dripping condition, and the excess of oil squeezed out by wringing the cartridges. This method was tedious and laborious. At length it was found that by allowing a little time, a small quantity of fluid would equally diffuse through the whole mass of powder contained in the cartridges by capillary attraction. It is desirable not to oversaturate the powder, as there may be too much hydrocarbon for complete combustion with the oxygen furnished by the dry salt. An excess of hydrocarbon will cause more smoke when the powder is exploded, and will not give so high a result dynamically.

In practice, the cartridges are placed in a wire basket and lowered into a pail or vessel containing the fluid, and allowed to remain a certain number of seconds, depending upon the diameter of the cartridges.

For $1\frac{1}{4}$-inch cartridges, about 6 seconds.
" $1\frac{1}{2}$- " " " 8 "
" $1\frac{3}{4}$- " " " 10 "

The cartridges saturated as above, if cut open after saturation, will present in the center of the cross section, an area about the size of the end of a lead pencil which is not wet, but which will be wet if the cartridges are allowed to stand a few minutes before using, as the oil will equally diffuse by capillary attraction. When this mode was first adopted the wire basket containing the cartridges was hung on a spring balance and alternately dipped and withdrawn until the desired increase in weight was obtained.

Mr. A. C. Rand proposed to secure the right proportions by immersion for a certain definite time for each size of cartridge. This plan was successful in practice, and has been in constant use since its adoption. Another mode of securing proper proportions of dry salt and combustible liquid has been introduced by the manufacturers of Rackarock. This is to mix a very volatile liquid like carbon disulphide, with a fixed oil like nitrobenzole, and allow the cartridges to become completely saturated. Then they are allowed to remain in the open air until the volatile ingredient has evaporated, leaving the proper amount of fixed oil in the powder. This mode has also been successful in practice. With reference to the use of nitrated hydrocarbons, it may be stated that the greater the quantity of oxygen that is contained the less the relative weight of the oil that is to be mixed with the oxygen yielding salt. When the hydrocarbon is present in such quantity that the carbon can only be burned to carbonic oxide instead of carbonic acid, the mechanical result is not so great, and more smoke is evolved on explosion. The cartridges when properly prepared are practically waterproof, and remain good for some days in wet drill-holes, as the oil repels the water and prevents its permeating the powder through the muslin. The consistence of the prepared powder is like that of damp brown sugar, and it may be closely packed in the drill-hole, especially if the muslin is slit before the cartridges are dropped in and rammed.

The specific gravity of the powder is from 1.7 to 2 and its density allows the concentration of great power in a small space. It gives the highest results in hard compact rock, and is much used in tunnels, drifts, and shafts, where the rock is firmly bound. The gases produced during combustion are not sickening like those from nitroglycerine and the dynamites.

The sensitiveness of Rackarock can be increased or decreased by special means employed by the manufacturers, and one variety that has been largely used will not explode with a fulminating cap without confinement. In the open air at common temperatures the powder will be scattered about without exploding when a fuse and cap are inserted in a cartridge and fired. But when confined in a drill-hole the powder receives an impact from the detonating primer that causes the whole mass to explode.

RACKING.—It has been shown that the penetration of a projectile depends more upon velocity than weight, and that the elongated is a better form than the spherical for mere penetration or *punching*. It must, however, be remembered that very heavy shot, fired with velocities which might not enable them to penetrate or punch holes in iron armor, may still do great damage, especially if many are fired successively, by breaking bolts and shaking the whole fabric; also, that a spherical shot, having a larger diameter than the elongated projectile, may often do more damage in cracking or shattering a plate, than the latter in *punching* it, the *work* done by the ball being distributed over a larger area. The same argument will apply to the case of two elongated projectiles, having different diameters, striking a target with the same force, as measured by *work*. Hence there are two general methods of attempting the destruction of iron-clad vessels, termed respectively *racking* and *punching*. The American shave shown a preference for the racking system, which requires heavy projectiles of large diameters, fired with low velocities, to destroy and shake off the armor by repeated shocks without penetration, and thus to expose the vessel to the effects of ordinary projectiles. It is believed that the two forces may prepare the way for each other, so as to produce a more formidable result than when they are independently exercised. The defect of the light-shot system when the range is very long or the armor very thick, and of the heavy-shot system when the range is even very short and the armor is laminated, or so constructed as to suffer little from racking and shaking, is the waste of power in producing local effect, that is fruitless because it is incomplete. By combining the two systems, the light fast shot may weaken the armor by the loss of substance and continuity, until the heavy shot can carry in a large section of it bodily; and at the same time the general straining and cracking of plates produced by the heavy shot will make punching all the easier.

The theory in favor of the *racking* system is, that heavy projectiles may be fired with low velocites without straining the gun; that blows given in this way waste no power in punching mere holes, but that the entire work will be expended in straining, loosening, and dislocating the armor and breaking its fastenings, tearing it off and exposing unprotected spots easily vulnerable to shells, at the same time racking and breaking the ribs and sides of the vessel to such extent as to render her unseaworthy. For producing these effects the 15-inch gun, throwing solid cast-iron balls, is quite as formidable as the powerful rifle expending costly bolts; but the accuracy of fire from the rifle is so greatly superior to that from the smooth-bore, as to leave a large margin in its favor. Spherical shot, and slow shot of any form, will do very little execution under water. The concussion from racking blows, although it may not seriously injure the vessel, stuns and temporarily paralyzes many of the crew, and spreading terror to all, greatly interferes with the efficient working of the ship and of her armament. See *Armor-plates* and *Punching*.

RACKING DOWN.—An operation performed with the aid of *rack-lashing* in laying a gun or a mortar platform, for the purpose of securing the flanks and the ribands of the platform together, so as to prevent them from moving.

RACK-STICK AND LASHING.—A piece of two-inch rope, about 6 feet long, fastened to a picket about 15 inches long, having a hole in its head to receive the rope. Rack-lashings are used for securing the planks of a gun or mortar platform, between the ribands and the sleepers.

RACKUMITICK.—A large javelin skillfully used by the Hottentots. With this weapon, they venture to attack the elephant, the rhinoceros, and even the lion.

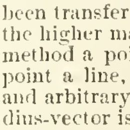
RADIAL DRILL.—An upright machine, designed for drilling a series of holes without changing the position of the work. The value of a radial drill in the armory consists, primarily, in the readiness with which the drill can be moved to the work, or shifted over the various parts of the work, requiring to be drilled. In the use of radial drills having the swinging arm at one fixed and unalterable height above the floor plate, the work must either be blocked up to suit the height of the machine, or extension pieces must be used to lower the drill to the work. In Sellers' machines the swinging arm is raised and lowered by power, and thus quickly adjusted to the proper height, so that the work to be drilled has only to be brought under the drilling machine in any convenient position and height, and the drill is then quickly set to suit the height of the work, thus saving much time. Too much stress cannot be laid on this feature of these drills. As the saddle carrying the swinging arm is so fitted and of such a length as not to require any bolting to place, this adjustment of height is rendered simple in the extreme. The feed motion is obtained through adjustable feed discs. It has a wide range through two series, one for the single gear, the other for the double gear, and can be put on or off instantaneously by a tap of the hand on a lever close to the hand-wheel. All the adjustments of the machine are quickly made, the shifting of the back gear into or out of use being as readily done as on any well-made turning lathe. A convenient clamp is arranged at the bottom joint of the swinging arm to enable the radial arm to be secured in position; but if the drills used are correctly formed and run true, the arm needs no clamping to place.

RADII OF RUPTURE.—In military mining, to effect an explosion of the surrounding ground, a charge of gunpowder is used, which, according to its strength, and the nature of the ground, and the depth at which it is placed, more or less affects the quantity of earth to be displaced. Such an explosion raises and scatters a portion of the superincumbent earth, and causes a hollow or crater. Besides this effect, an internal commotion is caused, capable of injuring or destroying shafts or galleries in the immediate neighborhood. The distances from the charge to which this commotion extends are called *radii of rupture*.

RADIUS.—1. In fortification, a term applied to a line drawn from the center of the polygon to the extremity of the exterior side. There are the *exterior*, the *interior*, and the *right radii*. 2. In geometry, the radius is a straight line drawn from the center to the circumference of a circle. In trigonometry, the radius is taken as unity, and the sines, cosines, etc., are expressed in terms of it. In astronomy the same term is employed in a slightly different sense; and to prevent confusion it is changed to *radius-vector*. The radius-vector is a straight line drawn from the center of force to the position of a body which describes its orbit round the center; if the orbit is a circle, the radius-vector is invariable in its length, but constantly changes if the orbit be any of the other conic sections. From astronomy the term has been transferred to what are callad *polar equations* in the higher mathematics. To express a curve by this method a point is taken for the *pole*; through this point a line, the *axis*, is drawn, indefinite in length and arbitrary in direction; then as one end of the radius-vector is at the pole, its inclination to the axis, and its length at this inclination, will give a point in the curve. Equations of curves, when thus expressed in terms of the radius-vector, and its inclination to the axis, are called *polar co-ordinates*, and are generally much simpler in form than when expressed by rectangular *co-ordinates*.

RAFTS.—Baulks of timber lashed together to form a bridge for crossing a river or stream, when more perfect means are not at hand. From their low degree of buoyancy, however, they are seldom employed. Fir, pine, hazel, poplar, juniper, larch, and willow, being the lightest woods, are the best for making timber rafts. Rafts of timber should not be used in rivers where the velocity of the current exceeds 6 feet per second, or 4 miles per hour. Good rafts can be made of casks or barrels, and form a better bridge than baulks of timber. See *Bridges*.

RAGULED.—In Heraldry, jagged or notched in an irregular manner. A *raguled cross* is one made of two trunks of trees without their branches, of which only the stumps appear. Also written *Raggued*.



Raguly.

RAGULY.—In Heraldry, a term applied to an ordinary whose bounding lines are furnished with serrated projections.

RAID.—A hostile or predatory incursion, especially an inroad or incursion of mounted men; any sudden and rapid invasion by a cavalry force.

RAILLON.—The French term for a short arrow or quarrel.

RAIL PLATFORM.—This platform for siege-mortars consists of three sleepers and two rails for the cheeks of the mortar-bed to slide on, instead of the deck-plank, and is very strong, and easily constructed and laid. The pieces being notched to fit, are driven together at the battery, the distance between the center lines of the rails being equal to that between the center lines of the cheeks. The earth is excavated eight and a half inches, the depth of the sleepers, and the bottom made perfectly level. The directrix being exactly marked by stakes, the platform is placed in position, its center line coinciding with a cord stretched between the stakes marking the line of fire. The earth is filled in as high as the upper surface of the sleepers, and firmly rammed; and the stakes are driven in the rear angles formed by the sleepers and rails, and one at the rear end of each rail.

RAILROADS.—Railroads have played an important part in recent wars. Beginning with the Crimean war of 1855, and ending with the late wars in Europe, the military student will be struck with the importance of this class of communications in the efficient supplying of an army, and in the concentration of troops. By their use, numbers are concentrated and supplied in a space of time which was not dreamed of in the beginning of the present century. It is safe to predict that, in all future wars in civilized countries, the railroad will be the line of communication for an army. If a system of railroads already exists, this system will be used ; if not, temporary lines of railroad will be constructed. It has now become an important part of an officer's education to understand the principles of construction, and the working, of railroads, to know how they can be preserved, and how they may be destroyed. The construction of a railroad for military purposes differs from that intended for peaceful traffic only in the degree of its very great excellence. Economy and rapidity are the most essential qualities looked for in the construction of a military railroad. The principal things in its construction are the grading and the laying of the track. Grades and curves are necessary evils incident to railroads, and a proper selection of them requires an exercise of good judgment, in many cases. Sometimes, the track may be laid on the natural surface of the ground, or with so little filling and excavation as to amount to the same thing. The placing of the cross-ties, the spiking of the rails, and the general finishing of the road are better done, when men used to this kind of labor can be procured. Usually there can be found among the troops, a great many who have a practical knowledge of this class of construction, and these men can be profitably used as foremen and superintendents of the working parties.

The successful working of a railroad requires an efficient superintendent, as much as it requires sufficient rolling-stock and good locomotives. A good man for superintendent can generally be obtained from some of the railroad companies, but he has the defect, as a rule, of knowing nothing of the peculiarities of military service. Nevertheless, his experience and knowledge will be of great service to the military officer in charge of the road, and the working may thus be made successful. From the numbers employed upon the railroads in the United States, there will be no difficulty, in future wars, in the government obtaining as many men as may be necessary, who will be thoroughly cognizant of the duties that may be required of them. In the beginning, there will be some friction and irregularities, but these will wear off, and an efficient corps of trained men can soon be formed. It would be better, however, if "time were taken by the forelock," and a skeleton organization formed in advance. Engineer officers should pay particular attention to this part of their profession, and on short notice organize bodies of workmen whose special duties will be those assigned to construction, working, and preservation of railroads. And since the other officers of the army, are more or less liable to be assigned to duties connected with the preservation, as well as the construction, of these roads, it is equally incumbent on them to acquire this knowledge and be able to put it to a practical use.

The movement of troops by railroad may be divided into five distinct parts, viz:— 1 The march to the point where the troops are to get into the cars. 2. The embarkation. 3. The journey. 4. Leaving the train at the end of the journey. 5. The march from this point to the place of camping. A careful examination made beforehand of each portion of the movement will add greatly to the soldier's comfort, and prevent much confusion, delay, and annoyance. Elaborate rules are laid down, both in the Prussian and French services, for moving troops by rail, and it is recommended that these be read by officers who desire to inform themselves on this subject. A line of railroad used as a line of communication of an army with its base, is protected in a great measure by the army itself. It is, however, liable to injury from cavalry raids of the enemy, and from the acts of a hostile population, if they be present. The parts most liable to be destroyed or injured are the bridges and tunnels. Guards should be stationed near these points, and be protected by field-works or block-houses. The general track of the road should be carefully watched by trackmen and patrols. Cavalry detachments should scour the approaches in every direction, to give timely notice of approaching raids, and to arrest suspicious persons in the vicinity of the railroad.

The destruction of a railroad, or an injury inflicted upon it so that it cannot be quickly repaired, may form, at times, the special duty of any officer. There are two general cases; one, where the injuries inflicted are to prevent its use by an enemy ; and the other, where it is desired to do as much injury as possible, and render the work irreparable, compelling an actual reconstruction of the road. The first consists in removing parts of the rolling-stock and hiding them, or, where rails cannot be obtained, in removing the track at various intervals.

The following is a method of removing the track to render the road temporarily useless: Select a part of the track laid on a high embankment. Tear up the rails of the extremities of the part to be removed. Line the outside of the track with men for the whole length of the portion to be taken up, and have the men to face inwards. At a given signal the men seize the rail next to them; and, at another signal, all lift the rail, raising it and the ties to a vertical position, when they let the whole fall over the embankment. If the road is ballasted, the men must provide themselves with levers to lift the track. The portion thrown over the embankment cannot be replaced until the rails are unfastened from the ties, and this takes time. The second case consists in removing the rails and bending and twisting them so as to render them unfit for use in repairing the road; in burning or blowing up the bridges; destroying the tunnels; disabling the rolling stock, etc. Locomotives can be temporarily disabled by removing parts of the machinery. They may be permanently disabled by firing a round shot through the boiler. Another way, is to let out all the water in the boiler and then build a large fire in the fire-box ; the fire soon destroys the flues. All other kinds of rolling-stock may be temporarily disabled by removing parts, or permanently injured by burning them.

Some labor is required to bend and twist the rails, as it is not an easy matter to remove the rails from the ties. Workmen have special tools for drawing out the spikes and unscrewing the nuts, but these tools are too heavy to be carried upon a raid, where time is so important an element. But when the rails have been taken up, and there is time, it is recommended to form the ties into heaps, and set them on fire. Then to place the rails on the burning heap, loading the ends with other ties. As the rails become red hot, they will bend under the load, and cannot be used again until they are straightened. This bending may also be done by men catching the ends of the rail and bending it, while heated, against a tree or telegraph pole. Rails which are simply bent can easily be straightened by re-heating and hammering. Where only slightly bent, they can be straightened without even being re-heated. To make them useless, it is necessary to give the rail a twist. A twisted rail can only be used again by being re-rolled.

Wooden bridges may be destroyed by burning. A simple device called a torpedo was used in our late war for destroying wooden bridges, where time was of importance. A bolt of ⅞ inch iron, 8 inches long, with head and nut, was used. The head was 2 inches in diameter, and about 1 inch thick. A tin cylinder, 1¾ inches in diameter, open at both ends, enclosed the bolt, and was held in place by the head and the nut. A washer between the head and the cylinder made it tight at that end. The cylinder was filled with powder, and an arrangement made for a fuse near the nut. A fuse was inserted and the nut screwed on, and the torpedo was ready for use.

In using it, a hole was bored into the timber with an augur. The head of the bolt was inserted and was driven by a hard blow into the hole. The fuse lighted, and the explosion tore the timber in pieces. As the railroad bridges to be destroyed were ordinary truss-bridges, it was only necessary to insert a torpedo in one of the main braces, or if these braces were in pairs, in the two pieces forming a pair. The destruction of these braces at one end, or on one side, was sufficient to wreck the bridge.

The importance of guarding a railroad, and of having a good construction corps thoroughly organized to repair the damages, was illustrated in the war of 1861-5. This war illustrated the uses of the systems of railroads already in existence for military purposes, and also the great advantages of temporary railroads to perform a given service.—See *Railway Communication.*

RAILWAY COMMUNICATION.—In looking for the quickest and simplest method to make a railway for military communications in a strange country, and for the most suitable material and plant to use in its construction, it is well to have a description of the various gauges of which railways are usually made; to study the powers and capacity of different locomotives and rolling stock for these lines; and to consider the time, labor, and cost of making a railway. Before commencing a study of these three subjects a statement will be given of what has been done in making railways in war time, excluding any account of their construction for the same purpose in civilized countries, such as the case of the Prussians, who made a railway round the fortress of Metz, and at the destroyed tunnel of Nanteuil; or the railways made by the Russians from Bender to Galatz, and from Fratesi to Zimnitza. After a season of great suffering to the troops engaged in the siege of Sebastopol, caused partly by the difficulty of communicating with their base at Balaclava, a railway was constructed of the ordinary gauge of 4 ft. 8½ in. About 21 miles of track were made of single line: civil engineers with a working staff of natives were employed in its construction. The rolling stock consisted of five locomotives of 12 to 18 tons weight, and about 40 ordinary side-tip ballast trucks; one of the locomotives was worked as a stationary engine to haul trains up a short incline. This railway never had the capacity for transporting all the supplies required by an army engaged in a siege. It did a fair amount of work at the re-embarkation of the troops on the conclusion of peace, but it would have been of no use if hostilities had been continued on a different line of operations.

It must not be attributed to any failing of the Army Works Corps that better results were not obtained from this line, for it was composed of a staff thoroughly practiced in railway construction; the mistake was in having only one line of rails instead of a double line, which is indispensable to insure uninterrupted traffic; and in the plant being cumbersome and quite unsuited for military requirements. For the Abyssinian campaign materials for a railway were collected in India from the public works and other sources, and a works corps of natives for laying the line was raised in Bombay. In the month of November, Government came to the decision of sending railway plant to Abyssinia; in the following January, work was commenced at the landing place in the Red Sea, at Zoulla; and about the end of March, 12 miles of the line were opened for traffic, giving a rate of progress in constructing of one mile a week. As the railway took so long to make it was not of much use to the expedition. The chief causes of delay in making this railway may be attributed to the materials having been shipped from India without any system, any transport vessel that could afford space being employed. The plant was all for the Indian standard gauge of 5 ft. 6 in., which was heavy and difficult to handle under unfavorable conditions of landing appliances; the rails were also of different sizes and weights, giving much additional labor and loss of time in laying. For rolling stock four contractors' tank locomotives, which had been much used, were supplied; half of them were constantly under repairs. The material for making bridges consisted of rolled-iron floor-joists for barrack buildings, which were procured from Aden. One great advantage of a railway at a point of debarkation was noticed on this occasion—the saving of labor that was effected by being able to run the trucks on rails into the water, so that boats with stores from the transport vessels could be unloaded directly into the trucks. For the war in Ashantee, where the objective was to force the troops over many miles of the wildest African bush country, some steam-sappers (road traction engines), adapted for running on rails, were sent from England, and light rails were shipped for making a railway of 4 ft. 8½ in. gauge. This plant could not be well utilized for the following reasons: It was difficult to land heavy stores on a beach that had a surf constantly rolling on it; the amount of labor required to clear a track for so wide a gauge through the bush would have been excessive; and the period of fair season at the disposal of the General for the accomplishment of his enterprise was too limited for making a field railway of the full gauge of 4 ft. 8½ in. A light portable surface tramway (such as is hereafter described), with light trucks that could have been pushed by manual labor, might have answered in Ashantee for transporting stores and provisions better than the swarms of carriers that had to be employed for supplying the force that went on to Coomassie. A tramway of this class could have been laid quite as fast as the troops cut their path through the bush. These are the attempts that have been made by England to construct and utilize railways for troops in the field. They have not been very successful, owing to the plant used for them being unsuited for military requirements and being hastily got together. The 4 ft. 8½ in. gauge of the ordinary permanent railways is adapted specially to heavy and rapid traffic; its carrying capacity is greatly in excess of what is likely to be required for a force operating in an enemy's country. The plant is heavy, and it takes a long time to make a line of this gauge, which must be well and truly laid to take the rolling stock adapted for it. The rails should be 78 lbs. to the yard; a mile of line of single rails weighs 272 tons, and costs about £1,700. The ordinary plate-laying gang of three superintendents, thirty plate-layers, and forty laborers, can only lay a mile of this track in thirty hours. A field railway is only a similar line to the above, with a very much lighter rail of about 42 lbs. to the yard; it weighs 131 tons and costs on an average of £737 to the mile. The same plate-laying party can make a mile of field railway in twelve hours. In its construction nearly the same curves of large radius are required, and the gradients cannot be made steeper, while the rate of traveling on it is much slower than on a permanent line of the same gauge. In India a meter-

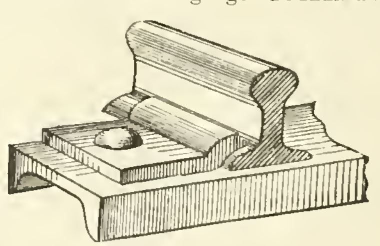


Fig. 1.

gauge has been adopted on some of the Government lines: it is 3 ft.3⅜ in. wide; rails of 36 lbs. to the yard may be used for it; the line weighs about 106 tons and costs £590 to the mile. Railways of this gauge are made for quick traffic, and require to be laid nearly as well as wider lines. The rolling-stock which is made in England and sent out to India, is of a heavy nature; the locomotives weigh 16 tons, and the carriages, which are iron-framed, weigh about 3½ tons. The United States have lately adopted the 3 ft. gauge in a great many lines, which answer their purposes just as well as the wider permanent railway. They can construct the lines with great rapidity, progressing as much as four miles in one day, including forming the earthwork. The Americans carry these light railways over the most difficult country, and up ravines and over mountain passes where it seems almost impracticable to make any sort of road. There are portable railways made in England as well as in France, which possess all the requirements of a military line. They are of various gauges, but the 2 ft. 6 in. wide has advantages over the narrower gauges—such as the power and speed of the locomotive, the capacity of rolling stock, and the great simplicity of parts. These seem to point to this gauge being more suitable for military purposes than the narrower ones. The rails are of steel, of 30 lbs. to the yard, fixed in lengths of 12 ft, to the sleepers; the sleepers are also of steel, made of various sections. The most convenient seems to be the U-shaped Fig. 1; these can be placed at any distance apart to suit the nature of soil. One section of rails of this tramway of 12 ft. weighs 310 lbs., and forms an easy load for four men to handle in laying the line, which is intended to be a surface line. It can be laid very fast by inexperienced men —about nine miles in a day. It is easily taken up, removed, and relaid in another situation. The plant for the track is complete in all its parts, such as curves, points, and crossings; it is also very compact for shipment. Some very narrow-gauge railways have been made in North Wales; the line to Festiniog is 1 ft. 11½ in. wide; passenger and mineral traffic have been running on it regularly for some time. This

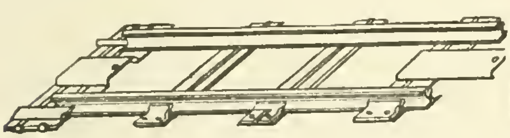

Fig. 2.

railway is 13¼ miles long and rises 700 ft. the gradients are from 1 in 70 to 1 in 180, and the curves of 2 to 30 chains radius; the locomotives, which are of Farlie's pattern, weigh about 8 tons, and can draw trains of 120 tons at an average speed of 12 miles an hour; the rails are 30 lbs. to the yard, and the sleepers are of wood. Railways are made of an even narrower gauge, 18 in.: they are much used in H. M. Dockyards and the Royal Arsenal. This gauge has been adopted in the service for a tramway to run along trenches and parallels to supply the artillery and engineer requirements of sieges. There are two types of this tramway—one with rails on wooden sleepers, and the other of a portable description. The first is that which has been taken for the service; it is designed for laying down without noise at night, this being a necessary requirement in making a tramway in siege trenches; the sleepers are of wood, 3 ft. 6 in. long, 7 in. wide, by 3 in. deep; the rails are fixed to these sleepers by T-headed coach-screws. With rails of 24 lbs. to the yard, 14 men can lay 100 yards of trench tramway *in the dark* in an hour. The other description of portable tramway of the same gauge is made of steel rails, 18 lbs. to the yard, secured in lengths of 10 ft. to steel-plate sleepers, Fig. 2, it is a handy line for laying on the surface of the ground, and is much used for agricultural and the numerous manufacturing purposes. Each section of 10 ft. of rails, with all the sleepers attached, weighs about 180 lbs., so that two men can very easily carry it; a party of 14 men can lay 400 yards of this nature of tramway in an hour. The end sleepers are made to lock, so that the joint at the rail ends is quite secure; with wooden sleepers, fishplates should be used to fasten the ends of the rails; this is very necessary on all roughly-laid lines. It would be thought that this gauge of tramway would be suitable for all military requirements besides siege work; but it is only applicable on very flat sites, and the engines for it have so little power that they would not be equal to the wants of keeping uninterrupted communication for an army. They answer perfectly in the Dockyards and the Arsenal, and are admirably adapted for laying in a trench; the engines would, however, fail in the event of a long line being required, or one over a rough country.

Systems of light tramways on structures raised from the ground have been suggested for the use of armies. One of these tramways, designed by Mr. Fell, Fig., 3, has been experimented with at Aldershot. It consists of rails on the edges of beams sup-

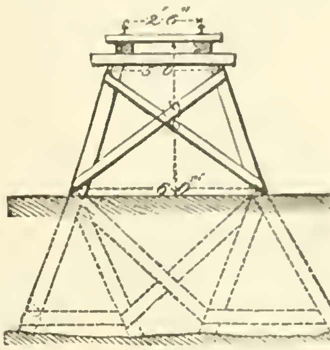

Fig. 3.

ported on trestles of various heights to overcome the inequalities of ground, the principle being to dispense with cuttings and embankments as far as possible, and to use trestles whenever the earthwork exceeds 3 or 4 feet in height. Mr. Fell has worked his scheme out still further, and suggests the adoption of iron lattice-girders on posts of a quite similar construction for raising the track over hollows, or those places wherever the rails cannot be laid on the surface of the ground. There are advantages in this method of making a railway; the raised portions of the work keep the line above the influence of rains, and make the least disturbance of natural watercourses. It requires time, however, to put together elevated iron or wooden structures, and a great deal of material is necessary; for instance, one mile of modern structure for this railway, with an average height of trestles of 3 ft. 9 in., takes 250 tons weight of material. The results of the trials of Mr. Fell's railway, which was erected at Aldershot, were as follows: An engine weighing 4½ tons, took 25 tons of load up an incline of 1 in 50; at a speed of 25 miles an hour trestles, 20 feet high, were quite steady. It was found that 500 soldiers could lay two miles of this class of tramway, after a little practice, in a day of 10 hours. Another style of raised tramway has been designed by Mr. Hadden, Fig. 4. The structure can be made of wood or iron; it consists of a single upper rail or beam, fixed on posts 7 feet high, let into the ground 3 feet; there are also lower or grip rails made of wood, which are halved and let into the posts. These have saw-cuts in them to admit of their bending to take curves in the line of 100 ft. radius. The breaking strength of the structure is estimated to be 20 tons. The materials for one mile of this tramway are stated to measure 40 cubic ft. and to weigh 80 tons. The rolling stock consists of pairs of boxes of panniers suspended on the upper rail or beam by means of central wheels or rollers with V-shaped tires; they also often have horizontal wheels acting on a lower or grip rail. These boxes are ingeniously contrived to take stores, horses, and passengers, and may be used as pontoons for taking loads across rivers. By employing long ropes, trains may be drawn by animals towing alongside of the raised tramway. The locomotives to be used on this raised tramway are reported by Mr. Hadden to be capable of drawing a load of 100 tons up an incline of 1 in 10; they are said to gain the necessary power by acting on the grip principle instead of by gravity and traction like ordinary locomotives. The driving machinery is located on a carriage by itself, and the power is very conveniently applied to one pair of the horizontal wheels on one side of the grip rail; the steam is generated in two boilers, placed in front and behind the engine truck. It is further stated by the inventor that an endless rope or chain attachment can be applied to all the wheels on one side of a train, giving continuous grip power for ascending gradients and break power for descending steep in-

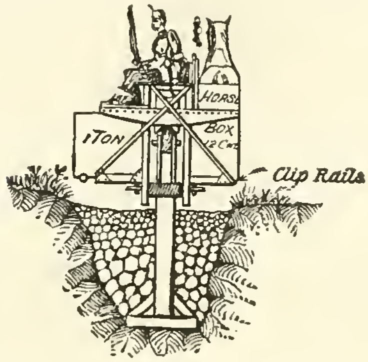

Fig. 4.

clines. The draw-bars connecting the trucks of a train are devised to work automatically on the driving action of the wheels, increasing or diminishing their grip or break power according as the strain on the draw-bar is augmented or decreased by variations in the gradients the train is traveling over. Whether the engine and the draw-bars can be perfected and made to perform these various duties remains to be proved by experiment. With regard to raised railways, it should be observed that they obstruct traffic crossing them—this is objectionable in a military point of view; they do not lend themselves to the drawing of loads by manual labor or by animal power as favorably as surface lines; sidings are not easily managed on raised structures; separate bridges are required for the passage of rivers when the carriages cannot be run on rails on the roadway of pontoon or other field bridges; they require a great deal of time to construct, and take much material; and they are not so easy to take up and relay as surface lines, and are more destructible.

In treating of lines of railway for military purposes, the use of locomotives upon them must be taken into consideration; for although the line may at first be worked by horse or by other means of draught, it must eventually be adapted to engines to make it of any use for keeping up the supplies of an army in the field. It will be advisable to look at the different natures of locomotives, and to see which appear to give the best results of work under the special conditions of service in a strange country.

Taking the ordinary passenger or goods engine of permanent lines, it will be seen to be a very heavy machine to handle, particularly in situations deficient of appliances for landing such engines. They possess great power and speed, but are too cumbersome to be used on a light line; they require the railway to be laid with care and to be nearly level, that is with gradients not exceeding 1 in 70; and they cannot work round sharp curves, 15 chains being the maximum that can be safely got round with engines of this class. The weight on each pair of driving wheels is so great, 10 to 15 tons, that the rails require to be heavy to stand the traffic. There are contractor's and tank engines which are very suitable to roughly-laid lines; they weigh about 16 or 18 tons; they seem, however, beyond the limit of weight that should be adopted for military lines. The same remarks apply to the class of engines that are used for the meter-gauge lines; they weigh about 16 tons, giving 6 tons on each pair of wheels, and, like the others, are constructed for quick speed; they are also not easy to handle under difficulties. The small engines made by Manning, Wardle & Co., and which are extensively used in H. M. Dockyards and the Royal Arsenal, are not powerful enough to take a load up a steep gradient; they are very well adapted for the 18-in. gauge of rails on level sites; they will take sharp curves and have good speed; but the lines of these locomotives must be well laid and almost level; that is the reason why such good results have been obtained from these engines in the dockyards and the arsenal, where the rails are generally cast in solid iron plates and the sites are perfectly level. The Royal Engineer Committee designed an engine for the 18-in. trench tramway, which has some advantages over the locomotives last described. It possesses the following characteristics: The working weight of the locomotive is 8 tons; the driving wheels are on a rigid base of only 3 ft., admitting of its traveling on very sharp curves; the engine is furnished with a "rail-clip" constructed on the Handyside principle, and has also a winding drum on the part, with 400 yds. of very strong steel-wire rope worked by a distinct pair of engines to the ones required for driving the locomotive; the last two appliances enable it to get up a very steep gradient; by sending the engine up by itself, and then, by clipping the rails, it can draw the train after it by means of the rope. In trials made with this locomotive, 25 tons were drawn on the level on a very roughly-laid surface line; up a slope 1 in 25, 7 tons could be drawn by the engine attached in the ordinary way; this incline had a curve in it of 25 ft. radius; the engine could just steam up a slope of 1 in 11, and draw 10 tons up the same by means of the "rail-clip" and the winding drum. There is another method of applying winding power to an engine; it is a suggestion of Mr. Russell Shaw, C. E., and consists of a chain securely fixed at the top of an incline, and the locomotive is furnished with a clip-drum that can catch up the chain. The steam-power generated in the boiler will serve to wind up a loaded train by means of this chain and drum, and, by reversing the action, the chain can be made to break the descent of the train down the same incline. It would be well to convert one of the Royal Engineer Committee locomotives to this system of haulage, so as to test the appliance.

To afford means of crossing wide rivers with a tramway, steel boats of the same description as were advocated by General Sir Lintorn Simmons, G. C. B., could be employed as pontoons for a floating bridge. The locomotives would have to be taken over the water on rafts made of these steel boats, for use with trains on the opposite side of the stream, as it is doubtful whether they could be steamed across a river on any sort of floating structure. As floating bridges for a double line of rails would have to remain some time in position, the steel pontoons advocated would be more suitable than the service pontoon bridge, and besides, the pontoon train would have their own functions to perform in the front with the troops. An idea of the sort of steel pontoon tramway wagon on bogies is given in Fig. 5. The boats are made to rest on the frame which forms the longitudinal bearers or superstructure of the bridge for the rails of the tramway; when the boats are not required to form a bridge, they would thus be available for freight wagons. Whatever kind of rolling stock is adopted for military service, it is absolutely necessary that every carriage should have its break to render perfectly safe the drawing of wagons individually by animal draught, and also to have complete control over a train descending inclines. The "Heberlein" continuous break is well suited for this purpose. It can be applied by the engine driver of the train or by the guard, and can also be put on by a person on the side of the wagons. It should be observed that, though the bogie-truck system is recommended for military rolling stock as being the safest to travel on roughly-laid lines, and as giving the power to make sharp curves on a railway, there is another plan of "flexible wheel base," invented by Mr. James Cleminson, which has all the advantages of bogies. By this method the defects of a rigid wheel base are overcome, the carriages travel smoothly and safely round sharp curves, and the rolling stock can be made much lighter in weight than ordinary railway carriages. They have been constructed to take ten passengers, or three tons to every ton weight of the carriage, giving about two tons on each pair of wheels on the rails. The rolling stock that has been approved for the trench tramway is on the same principle as is advocated for military railways; it consists of platform wagons 18 feet long Fig. 3, 6, and 7, which are well suited for transporting the requirements of troops at sieges, such as fascines, rails, and timber for gun platforms and splinter proofs. These platform wagons run on bogie trucks, they are easily drawn by men and by a horse pulling at the side of the wagon, and are made low so as not to be seen by the enemy over the earthwork of the parallels. Trucks for siege purposes have been made for the transport of artillery to the batteries; they are particularly suitable for this work, saving the very heavy labor to the artillery of arming their batteries by transporting the guns over the open country during the night. The weights of the siege guns of the present day would make this operation one of grêat difficulty if a tramway in the parallels were not available.

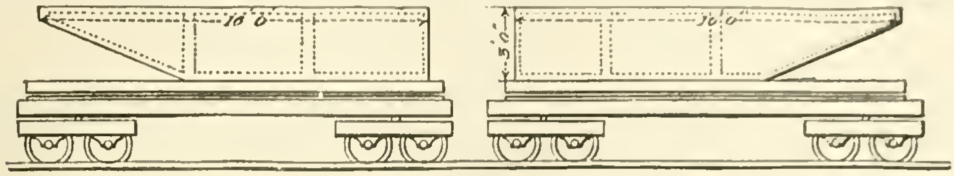

Fig. 5.

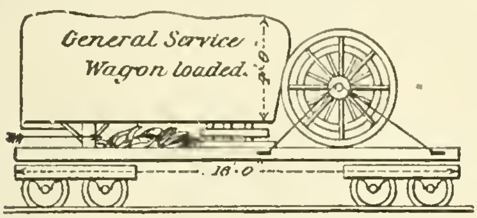

Fig. 6.

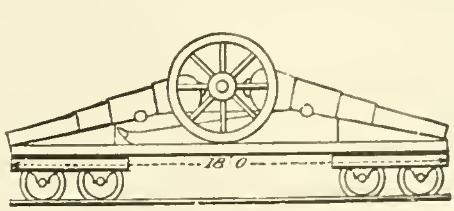

Fig. 7.

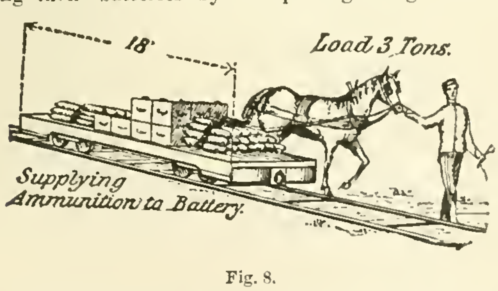

Fig. 8.

The ammunition, too, can be readily supplied to the magazines on these platform wagons; and now that the main artillery magazines have to be established at a much greater distance from a fortress than formerly was the case, a very great saving of labor is made by moving the heavy shot and shell on tram-trucks instead of the old trench cart, Fig. 8.

Wagons also for siege work have been designed that make ambulances for wounded men, and can take them from the trenches to the rear with ease and comfort, Fig. 9; the platforms that are used for general work are capable of being converted into ambulances so as to utilize the empty return trucks. These trench tramway wagons weigh only $1\frac{1}{2}$ ton, and are equal to a load of three tons. In making a comparison between transport by wheeled wagons and by means of a railway, the quantity of forage and fuel for the two systems must be taken into account. The conditions under which forage may be procured vary greatly with the different localities; but in most cases transport columns must move with a certain number of days' forage for the draught or pack animals employed, and in the same way a locomotive must take its fuel along with it. Taking, as an example, the transport of 100 tons of stores for 200 miles, the following table shows approximately the quantity of fuel, forage, and time that would be required. The calculations of this table are based upon the employment of general service wagons, taking $2\frac{1}{2}$ tons, 4 horses to draw, and 2 drivers to each wagon, with proportion of non-commissioned officers; for the pack animals the load is taken at 200 lbs. for the good horses, with one attendant to 6 horses, and non-commissioned officers in proportion. The trucks for the railway are loaded to 6 tons, and the road wagons of the "steam-sappers" to 4 tons.

Fig. 9.

The column of gross weight is estimated on the load of 100 tons with the weight of the wagons, the horses, the locomotives, the trucks, and the forage or fuel, according to the numbers and quantities in each case. To the railway means of transport has been added the weight of the plant that is necessary for making the railway; if 2 ft. 6 in. gauge is employed, the weight of 100 miles of single line will be 6,100 tons.

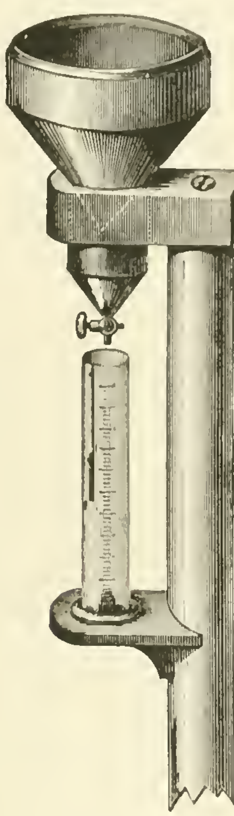
Means of Transport.	Horses or mules.	Drivers or attendants.	Wagons or trucks.	Time.			Weight of forage or fuel.	Gross weight.	Remarks.
				Day's march.	Halts.	No. of days.			
				Miles		*Total*	*Tons.*	*Tons*	
Horse draught............	180	80	40 G. S. wagons...	8	2	10	Forage, 30	252	25-mile march.
Pack animals......	1,200	220	....	10	3	13	Forage, 120.	820	20-mile march.
Steam traction on railways......	....	8	2 locomotives... 18 trucks	$\frac{2}{3}$	...	$\frac{2}{3}$	Steam coal, 5.	6,290	At 15 miles an hour.
Steam-sappers......	....	25	5 steam-sappers. 25 road wagons.	$2\frac{1}{2}$	...	$2\frac{1}{2}$	Steam coal, 20.	225	At 4 miles an hour.

See *Iron-clad Trains.*

RAILWAY STAFF VOLUNTEER CORPS.—A Corps whose object is to secure unity of action among the Railway Companies in time of war. It consists of three classes — namely, Eminent Civil Engineers, the General Managers of Railway Companies, and the leading Contractors. Their duty is to consider points relating to the transport of troops, the formation of lines of railway, etc., and to meet any exigency in time of war, all which information would prove of great value. In Germany the railways, as far as they are employed for military purposes, are under the control of the Great General Staff at Berlin, a special section of that department being entirely devoted to collect and arrange systematically all information on railways, at home and abroad, especially with regard to their capacity for carrying troops. This branch of the Staff works out the instructions given for the transport of troops and munitions of war, examines all projects of railways, and, lastly, prepares plans for the transport of German troops under different circumstances, so that in the event of war they can be concentrated with the greatest possible speed on any given point. The Railway Battalion, which was organized after the war of 1870-71, and which is now in full working order, is under the superintendence of this section. This Battalion is composed in time of peace of four companies, recruited from among the *employés* and officers of existing railways. The men are taught by very practical lessons how to construct and work a line, being employed, while learning the first duty, on the State Railways, and afterwards on a special line, called the "Military Railway," running from Berlin to the artillery practice ground at Zossen. On war breaking out, the Battalion is mobilized, and consists then of eight *constructing* and four *working* companies. The duties of the former are to make impromptu lines, and for that purpose each company is provided with a train of its own, containing all the necessary implements. The four working companies, taking up the line as it is made, will begin to put it in running order, manning it with drivers, guards, stokers, pointsmen, and telegraph clerks from their own number, and, after the service is regularly established, handing it over to the ordinary Civilian Staff, while they pass forward to make a fresh section on ahead. This Battalion includes three classes: Line, Reserve, and *Landwehr;* the two latter being at present supplemented by a list of ordinary railway servants, engaged for enrollment in time of need. In Russia, a system has been organized closely resembling that adopted by Germany. Every year picked men and officers are sent on all the Railway Lines, the former to study the theory of all that concerns the working and managing of railways, the latter to fulfill the duties of Station Masters. In 1871, after two years' practice, these men (432 and 8 officers), together with a division of infantry, and a battalion of engineers, constructed in seven days a line of 5 miles in length, with two stations and ten bridges, one of them of 54 yards span. The cost of the line was valued at £21,200, and was so well constructed that it has remained in use ever since. By an Imperial Ukase promulgated in 1870, all the Russian Railway Companies have to provide a certain number of carriages for the wounded, fitted up with litters, and well ventilated, and a number of carriges, wagons, and trucks, specially devised for military purposes. France has also introduced a Railway Battalion under her new military organization. The men of this Battalion will be in time of war associated with the Civil Railway Staff, and are classed in three categories: The first (two-thirds of annual Contingent) is incorporated in the Active Battalion, and instructed as sappers and miners, or as soldiers of the engineer train. The second (one-sixth of the Contingent) serves one year only in the Active Battalion; after which it is distributed among certain of the principal Railway Companies, in order to learn the working and managing of the lines, their construction, and restoration. The third (one-sixth of the Contingent) serves only one year in the Active Battalion, and is then transferred to the depots. This carries on operations with torpedoes, and is practiced generally in the destruction of railways, bridges, etc. A very similar organization of the Military Railway Department has been established in Italy.

RAIN GAUGE.—The use of rain-gauges is to ascertain the amount of rain which falls at any given place. They are of various constructions. The simplest is that which consists of a metallic cylinder, from the bottom of which a glass tube, divided into inches and parts of an inch, projects downwards. It is provided with a funnel, inserted within at the top, to prevent evaporation, and the rain-water is emptied out by means of a stop-cock at the bottom, or still simpler, by a hole pierced in the funnel at the top. As this form of gauge is objectionable on account of the frequent breakage of the glass-tube by frost, a float is used instead, which is raised by the water, and a scale is attached to it, to show the quantity of rain received. As this gauge does not admit of very nice readings, another sort is frequently employed, viz., a receiving-vessel and a glass measure of much smaller diameter, which thus admits of as nice graduation as may be desired. As, practically, there is often great difficulty or trouble experienced in replacing the glass measure when it chances to get broken, the late G. V. Jagga Ráo, a wealthy zemindar of Vizagapatam, proposed a gauge in the form of a funnel having a diameter of 4·697 inches, or an area of 17·33 square inches. As a fluid ounce contains 1·733 cubic inches, it follows that for every fluid ounce collected by this gauge, the tenth of an inch of rain has fallen. This measure can, of course, be graduated to any degree of nicety, and may be reproduced at pleasure. Self-registering rain-gauges have been invented by Osler, Crosley, and Beckly, but they are too expensive to come into very common use. The drawing represents the Continental Signal Service rain-gauge.

A most important point with regard to the rain-gauge is its height above the ground. Professor Phillips found the fall of rain at York, for 12 months in 1833-1834, to be 14·96 inches at a height of 213 feet from the ground; 19·85 inches at 44 feet; and 25·71 inches on the ground. This remarkable fact—viz., that different quantities are collected at different heights, the amount being always greater at the lower level, has been confirmed wherever the experiment has been made. No perfectly satisfactory account has yet been given of this singular phenomenon. The condensing of the vapor of the



atmosphere on the surface of raindrops as they fall—the rebound of the finer particles into which many of the drops break themselves as they strike with violence on the ground—and the eddies and currents which prevail most and strongest around isolated objects raised above the surface of the ground, to a large extent account for the phenomenon. Of these three, the greatest weight is to be given to the last two; and this is confirmed by the fact, that a gauge placed on the roof of a building that happens to be flat, of considerable area, and with few or no chimney-stalks to disturb the air-currents, collects an amount equal to that collected at the same time by a gauge on the ground. The proper size and shape of the rain-gauge, and its height above the ground, so as to measure with the greatest exactness possible the real quantity of rain that falls, about all of which much diversity of opinion exists, have been ably investigated by a series of extensive experiments conducted by Major Ward, Mr. Symons, Rev. Charles Griffith, and others, and the results have been published annually in Symons' *British Rainfall*.

RAIN OF FIRE.—A decoration for rockets, made with paper-cases $\frac{3}{10}$ inch in diameter, and 2 inches long, two thicknesses of paper being sufficient. The end of the case is closed, and it is charged and primed like that for a serpent, except the powder for a cracker. The composition is 16 parts of mealed powder and about 6 of charcoal. Another composition which shows in sparks, is made of 16 parts camphor, 8 of nitre, 8 of mealed powder, and 8 of tow

RAISING ARMIES.—Armies are *raised* in two ways: Either by voluntary engagements, or by lot or conscription. The Greek and Roman levies were the result of a rigid system of conscription. The Visigoths practiced a general conscription; poverty, old age and sickness were the only reasons admitted for *exemption*. Subsequently, the feudal military tenures had superseded that earlier system of public defense, which called upon every man, and especially upon every landholder, to protect his country. The relations of a vassal came in place of those of a subject and a citizen. This was the revolution of the 9th century. In the 12th and 13th another innovation rather more gradually prevailed, and marks the third period in the military history of Europe. Mercenary troops were substituted for the Feudal Militia. These military adventurers played a more remarkable part in Italy than in France, though not a little troublesome to the latter country. A necessary effect of the formation of Mercenaries was the centralization of authority. Money became the sinews of war. The invention of fire-arms caused it to be acknowledged that skill was no less essential for warlike operations than strength and valor. Towards the end of the Middle Ages, the power of Princes was calculated by the number and quality of paid troops they could support. France first set the example of keeping troops in time of peace. Charles VII., foreseeing the danger of invasion authorized the assemblage of Armed Mercenaries called *Compagnies d'Ordonnance*. Louis XI., dismissed these troops, but enrolled new troops composed of French, Swiss, and Scotch. Under Charles VIII., Germans were admitted in the French army, and the highest and most illustrious Nobles of France regarded it as an honor to serve in the *Gens d'Armes*. Moral qualifications not being exacted for admission to the ranks, the restraints of a barbarous discipline became necessary, and this discipline divided widely the soldier from the people. The French Revolution overturned this system. Now Mercenary Troops have completely disappeared from Continental Europe. England only now raises armies by the system of *Recruiters*. The last wars of Europe have been wars of the people and have been fought by nationalities. After peace armies remain national, for their elements are taken from the people, and are returned to the people by legal liberations. The institution of conscription is evidently the most important of modern times. Among other advantages, it has bridged the otherwise impassable gulf between the citizen and soldier, who, children of the same family, are now united in defense of their country. Permanent armies have ceased to be the personal guard of Kings, but their sympathies are always with the people, and their just title is that of skillful warriors maintained as a nucleus for the instruction of their countrymen in the highest school of art.

RAJA—RAJAH.—Originally a title which belonged to those princes of Hindu races who, either as independent Sovereigns or as Feudatories, governed a Territory; it then, however, became a title given by the native governments, and, in later times, by the British government to Hindus of rank, and it is now not uncommonly assumed by the Zemindars or Landholders; the title Mâharâjah, or "Great Rajah," being, in these days, generally reserved to the more or less independent native Princes. According to the ancient social system of India, the Rajah belonged to the Kshattriya or Military Caste; now, however, the title is given to, and assumed by, members also of an inferior Caste.

RAJPOOTS—RAJPUTS.—The name of various tribes in India which are of Aryan origin, and either descended from the old royal races of the Hindus, or from their Kshattriya or Warrior Caste. At all periods they seem to have played a conspicuous part in the history of India; and all over Hindustan there are many families who, rightly or wrongly, claim the title of Râjputs. At present they occupy chiefly the country known as Râjâsthan or Râjputana, including, among other States, those of Mewar, Marwar, Jeypur, Bikanir, Jessulmir, Kotah, and Bundi. Before the invasion of Mahmud the Ghiznevide, four great kingdoms were under the dominion of Râjput families—viz., Delhi, Kanoj, Mewar, and Anhulvarra; and all the Kings mentioned in the *Râjataranjinî* of Kalhana were of Râjput origin.

RAKE.—A term meaning to enfilade, or to fire in the direction of an enemy's ranks. To rake a ship is to bring guns to bear so as to fire them along her deck from end to end; this is the most disastrous thing that can happen to a vessel in action, and it is the object of all good seamanship to avoid it. When a ship is raked at short range, grape can be used with great and fatal effect.

RAM.—In fortification the act of compressing, by means of rammers, the loose earth used in building parapets and in filling gabions. Although a parapet of loose earth is less injured by shot than a rammed one, *ramming* is essential for the stability of the ramparts and parapets, as they might be seriously injured by a continuance of bad weather. *To ram* is also a term used in thrusting home the charge into a piece of ordnance. Hence "to ram home" a charge.

RAMMER.—1. The rod by which the charge of a small arm is forced home. 2. A staff having a cylindrical or conoidal head attached, used in cannon for the same purpose. The rammer-head is made of beech, maple, or other hard wood not easily split, and is bored for about two-thirds of its length to receive a tenon on the staff. For rifled guns, or for hollow projectiles, its face is countersunk. Rammers for large guns are technically termed *rammers* and *staves*. For field artillery, a sponge is attached to the other end of the staff, and the combined implement is called a *sponge and rammer*.

RAMMER HEAD.—An instrument employed in the inspection of cannon for ascertaining the interior position of the vent A head of well-seasoned wood, which fits the chamber, is attached to a wooden disc of the diameter of the main bore. The surface of the head corresponds with a longitudinal central section of the chamber; at the point where the projection of the vent would meet it a piece of hard wood is inserted. A central line drawn through its length, crossed at a right angle by another line at any known point from the smaller end, will afford convenient points to measure from. A stout wooden staff is attached to the axis of the head; at a distance equal to the length of the bore, the end is jogged into the center of a half-disc of wood, which is fitted to the bore. The whole is so constructed that the straight edge of the half-disc (or the chord) is in the same plane as a horizontal section of the head. A few holes are bored through the disc attached to the half-head, to allow the instrument to pass freely into the gun and out of it. A *wire* of untempered steel, of the size of the vent, with a sharp, well-centered point, and a small *spirit-level*, are required to use with this instrument.

The gun being leveled, and the instrument being pushed to the bottom of the bore, the upper edge of the half-disc near the outer end of the staff is then brought to a level. The surface of the half-head then corresponds with the horizontal central section of the chamber. The point of the wire being pushed gently to meet it, will show very accurately the interior position of the vent. See *Inspection of Ordnance*.

RAMMERS.—Large blocks of wood, very commonly used in military works, for the ramming of loose earth. The word *rammer* is also applied to the man employed in that duty.

RAMP.—In fortification, a gradual slope by which approach is had from the level of the town or interior area to the terreplein or general level of the fortifications behind the parapet. The width of ramps at top for the service of the artillery and other vehicles may be from 10 to 15 feet, and their inclination from $\frac{1}{6}$ to $\frac{1}{15}$, or less, depending on the difference of level to be overcome. They are usually placed in positions where they will occupy the least room of the parade. As a general rule, their side slopes are of earth; but where it is desirable to economize room on the parade the side slopes are replaced on one or both sides by a wall which sustains the earth of the ramp. When ramps serve for infantry alone their width may be reduced to 6 feet, and in some cases to 4 feet. See *Communications*.

RAMPANT.—In Heraldry, an epithet applied to a lion or other beast of prey when placed erect on the two hind-legs, with only one of the fore-legs elevated, the head being seen in profile. When the face is turned toward the spectator, the attitude is

Rampant.

called *rampant gardant*, and when the head is turned backwards, *rampant regardant*. A lion *counter-rampant* is one rampant towards the sinister, instead of towards the dexter, the usual attitude. Two lions rampant contrary-ways in saltier, are sometimes also said to be counter-rampant.

RAMPANT PLANE.—In the earlier methods of defilement, a line was taken, the position of which was determined by a series of trials, having for their object to obtain satisfactory results both as to the economy of the requisite embankments and the disposition of command of the various parts at, or in the rear of, the gorge of the work to be defiled; this position, coinciding with the natural surface, or being above or beneath it as the case required. Through this line a plane was passed tangent to the dangerous ground. This plane, termed a *Rampant Plane*, was taken as the artificial site of the work, in reference to which the relative command of all the parts was arranged upon a horizontal site. Or, in other words, the result was nearly the same as if the works had been arranged on a horizontal site, and then the whole combination turned around some fixed line of this site, until it was brought into the position of the required rampant plane. The defects of this method are evident at a glance. It preserves the relations of defense of the various works the same as in a horizontal site; but, to a great extent, it leaves out of consideration the bearing of the command on the exterior ground, and, in many cases, may lead to excessive excavations and embankments which the method now followed enable the engineer, for the most part, to avoid.

RAMPART.—A structure forming the substratum of every permanent fortification. It constitutes the enceinte, and is constructed immediately within the main ditch by throwing up the soil excavated from it. On the front of the rampart the parapet is raised, and width should be left behind it to allow of guns, wagons, and troops passing freely on the top of the rampart. The height of the rampart is dependent on the relief (height) of the buildings to be defended, and on the positions in the neighborhood which an enemy might assume. Also written *rampier*, and *rampire*. See *Permanent Fortification*.

RAMPART GRENADE.—Rampart grenades are intended to be rolled down the rampart of a work, to protect a breach against the attack of any storming column. Shells of any size will answer for this purpose, and particularly those which are unserviceable for ordinary purposes. Grenades are filled with a bursting charge, and are armed with a short fuse, which is lighted by a match in the hands of the grenadier immediately before it is thrown. They act by the force of their explosion alone. See *Grenade*, *Hand Grenade*, and *Projectiles*.

RAMPART GUN.—A large gun fitted for rampart use, and not used for field purposes.

RAMROD.—A long, slender piece of steel, employed in muzzle-loading arms, to push the charge to its proper place, and to wipe out the barrel. It is carried in a groove cut into the under side of the stock, and it is kept in its place by the pressure of the *swell* against the tip of the stock. The *head* of the rod is countersunk to fit the point of the projectile; and the *point* has a screw to receive the *wiper* and *ball-screw*—implements that are used to clean and remove obstructions from the bore. The temper of the ramrod may be tested by springing it in four directions, with the point resting on the floor. When the musket-rod is bent six inches out of line, it should spring back perfectly straight without setting. Its soundness may be tested by striking it with a piece of metal, or by bending it over the edge of a block of wood; in the first case the sound emitted should be clear, and in the second case the flaws or cracks will be opened. The screw on the point of the rod should be properly cut; it should bear properly in its groove, neither too light, nor too loose. The point should rest on the stop.

RAMROD CROSS-BOW.—A very heavy and comparatively useless weapon of the time of Louis XIV.

RAMSHORNS.—In fortification, are semicircular works of low profile in the ditch, which they sweep, being themselves commanded by the main works. They were invented by M. Belidor, a great French engineer, and, when used, take the place of tenailles.

RANCHEROS.—A name given in Mexico to a mixed breed of Spanish and Indian blood, who inhabit the country, and may almost be said to live in the saddle from their youth, are splendid riders and hunters, and form the bravest part of the Mexican army—its irregular cavalry. The importance of their services was seen in the wars with the United States. The Rancheros are lank in frame, with brown, weather-stained faces and muscular limbs, hardy, temperate, and always ready for the boldest enterprises.

RANCON.—The name of an old weapon, consisting of a long stake with a sharp iron point at one end, and two blades or wings bent backwards, and extremely keen.

RANDING.—In fortification, a kind of basket-work, formed in making gabions. One rod only is used, and an odd number of pickets, in forming the basket the rod being passed alternately inside and outside the pickets.

RANDOM.—Want of direction in firing a gun or musket; hence the expression, *to fire at random*. *A random shot* is a common expression when a fire-arm has been discharged without aiming in any particular direction.

RANGE.—In gunnery, the distance between a point on the ground vertically below the muzzle of the piece and the point on the same level at which the projectile touches in its descent. The point-blank range is when the piece is fired in a horizontal position; the range then increases with the elevation; and if the air did not oppose resistance, the greatest range would be attained with the piece elevated at an angle of 45°; but in practice this angle is found to be on an average a little over 30°. As the resistance of the atmosphere increases as the square of the velocity of the shot, being also in the direct ratio of its front section, while the momentum is as the velocity multiplied by the weight; it follows that a heavy shot should have a greater range than a light one; and that of two shots of the same weight, an elongated cylinder of small diameter will have a longer range than a spherical ball of greater diameter. On the other hand, from the rapid increase in a duplicate ratio of the resistance, as compared with the initial velocity, the range only increases to a certain point, in consequence of a more rapid flight of the projectile. The longest range yet attained has been by Sir Joseph Whitworth, with a 9-inch rifled gun, with which he sent a bolt a distance of 11,243 yards, or 6 miles and 683 yards. See *Gunnery*, and *Trajectory*.

RANGE BOARD.—This nature of board is intended for guns in fortresses, from the 7-inch caliber upwards; it is placed in a convenient position in the fortress where it can be seen and consulted. It has the distances painted on it of prominent objects within the range of the guns mounted on the works.

RANGE CURVE.—The ranges corresponding to the angles of elevation given in tables are determined by means of a *Range Curve*, which is constructed from the results of practice. Having traced the curve through several points determined by experiment, it is easy to find a series of ranges for intermediate angles and minutes.

RANGE-FINDER.—An instrument for determining ranges. There are several different principles which may be used. The distance may be measured 1st, by the visual angle subtended by objects of known height; 2d, by the velocity of sound; 3d, the instrument may furnish a base line in itself, and solve a triangle in which the base and two adjacent angles are given. The term is also applied to instruments used to solve a triangle, the base of which is obtained by outside means. The various *range-finders* are described under appropriate headings in this work. See *Watkins Range-finder*.

RANGE PLATES.—Plates of brass attached to the brackets of the English 16-pr and 9-pr. wrought-iron field carriages. They are marked with three columns of figures, showing the range in yards from 100 to 4,000 for 16-prs. and from 100 to 3,500 for 9prs., with the corresponding elevations and tenths of fuse.

RANGER.—One of a body of mounted troops, who were formerly armed with short muskets, and who ranged over the country, often fighting on foot.

RANGE-TABLES.—A properly constructed gauge-table for a particular piece contains the range and the time of flight for each elevation, charge of powder, and kind of projectile. Its object is to serve as a guide in pointing, without waste of time and ammunition, and also when the effect of the projectile cannot be seen. It aids in securing good practice. The Ordnance Instructions contain approximate range tables for the service cannon. It is with great difficulty that tables are constructed from results of the most careful experiments, owing to the different ranges and deflections obtained in firing projectiles, even from the same gun with similar charges and elevations. It must be remembered that any practice table will only serve as a general guide, and that small alterations in elevation or deflection are required, according to the force and direction of the wind the position of the piece with respect to the object, the quality of the powder, and several other circumstances.

RANK.—1. A line of soldiers drawn up side by side in one row; opposed to *file*. 2. The relative position, in the army, which officers and men hold with respect to each other, or to military things in general. In the English Army, *rank* is somewhat confusing from its varieties, and from the fact that the same officer may hold at once three different ranks. The first and only rank up to the grade of Captain is *regimental* or *substantative* rank. Above this, officers may advance in two ways: First up to rank of Lieutenant Colonel by substantative or regimental rank; second, up to Colonel by obtaining rank in the army, generally called *brevet rank*, and above that by army rank through the several grades of general officers. In his regiment, the officer holds only his regimental rank, whatever his brevet rank may be; but among officers of the army generally he takes precedence according to his brevet rank. In describing an officer who has brevet rank, his regimental rank is placed first— as, Captain and brevet Lieutenant Colonel Brown, which means that an officer named Brown, who holds rank in a regiment as Captain, has for his services been promoted in the army to be Lieutenant Colonel. Officers of the foot-guards have higher rank in the army. Another class of rank is relative rank, which attaches to certain officers. Thus Captain Brown aforesaid, in addition to regimental rank as Captain, and army rank as Lieutenant Colonel, may possibly hold a staff appointment which confers on him the relative rank of Colonel. *Local rank* is a common expedient for advancing comparatively junior officers to important duties, a higher rank than that properly held in the army being assigned to an individual within certain geographical limits, as in the East Indies, the Crimea, etc. *Temporary rank* is similarly limited by time, and is conferred usually for the period during which some appointment is held, as the officer acting as director of ordnance ranks as Major General while so employed. *Honorary rank* carries neither duty nor emolument; it is commonly given to the amount of one step to an officer who has served the time necessary for retirement; thus, a Captain, after thirty years' service, may retire (on the pay of Captain) with the honorary rank of Major. Officers who have quitted the army are also allowed to retain as honorary the last rank they held.

In the United States, officers of the Regular Army, of the Marine Corps, and of Volunteers, when commissioned or mustered into the service, being upon equal footing, take precedence in each grade by date of commission or appointment. Officers serving by commission from any State of the Union take rank next after officers of like grade by commission from the United States, except commissions issued by the President to officers of Volunteer regiments, which are considered the same as if issued by Governors of States. Militia officers, when employed in conjunction with the Regular or Volunteer forces of the United States, take rank next after all officers of like grade in those forces. In fixing relative rank between officers of the same grade and date of appointment and commission, the time which each may have actually served as a commissioned officer of the United States, whether continuously or at different periods, is taken into account. And in computing such time no distinction is to be made between service as a commissioned officer in the Regular Army and service since the 19th day of April, 1861, in the Volunteer forces, whether under appointment or commission from the President or from the governor of a State. Where periods of service are equal, precedence is determined between officers of the same regiment, corps, or department, by the order of appointment. Between officers of different regiments: 1st. Rank in actual service when appointed; 2d. Former rank in the Regular Army, in the Marine Corps, or in the Volunteer service; 3d. By lot among such as have not been in the military service of the United States. The rank of officers and non-commissioned officers in the service is as follows:—1. General. 2. Lieutenant General. 3. Major General. 4. Brigadier General. 5. Colonel. 6. Lieutenant Colonel. 7. Major. 8. Captain. 9. First Lieutenant. 10. Second Lieutenant. 11. Cadet. 12. Sergeant Major and Veterinary Surgeon. 13. Quartermaster and Saddler Sergeant (regimental). 14. Ordnance and Commissary Sergeant and Hospital Steward of the first class. 15. First Sergeant. 16. Sergeant and Company Quartermaster Sergeant. 17. Corporal. In each grade these rank by date of commission, appointment, or warrant. Chaplains have the rank of Captains of Infantry without command. On parade, or other occasions of ceremony, troops of different arms are arranged from right to left in the following order: first, Infantry; second, mounted Artillery; third, Cavalry. Artillery not mounted and Engineers serving as Infantry are posted as Infantry. Engineers serving as such are posted on the right of the Infantry. Marines and dismounted Cavalry are on the left of the Infantry. In the same arm, Regulars, Volunteers, and Militia are posted in line from right to left in the order named. On all other occasions troops of all classes are posted at the discretion of the General or senior Commander.

Questions as to the positive or relative rank of officers may often be of the greatest importance at law, in consequence of the rule, that every person who justifies his own acts on the ground of obedience to superior authority must establish, by clear evidence, the sufficiency of the authority on which he so relies. There may also be many occasions on which the propriety of an officer's assumption of command, or his exercise of particular functions, or his right to share with a particular class of officers in prize-money, bounties, grants, and other allowances, may depend on the correctness of the view taken by himself or others of his right to a specific rank or command; and an error in this respect may expose him to personal loss and damage in suits before the civil tribunals. The regulation of military rank is vested absolutely in Congress, which confers or varies it at pleasure. The will of Congress in this respect is signified by the creation of different grades of rank; by making rules of appointment and promotion; by other rules of government and regulation; or is by fair deduction to be inferred from the nature of the functions assigned to each officer; for every man who is intrusted with an employment, is presumed to be invested with all the powers necessary for the effective discharge of the duties annexed to his office. Rank and Grade are synonymous, and in their military acceptation indicate rights, powers, and duties determined by laws creating the different degrees of rank, and specifying fixed forms for passing from grade to grade; and when rank in one body shall give command in another body; and also when rank in the army at large shall not be exercised. Rank is a right of which an officer cannot be deprived, except through forms prescribed by law. When an officer is on DUTY, his rank itself indicates his relative position to other officers of the body in which it is created. It is not, however, a perpetual right to exercise command, because the President may, at any time relieve an officer from duty; or an officer may be so relieved by arrest duly made according to law; or by inability to perform duty from sickness, or by being placed by competent authority on some other duty. But whenever an officer is on duty his rank indicates his command. Struggle as commentators may, who desire to subject rank to executive caprice, rather than have its powers and duties defined by law, as the Constitution requires in giving to Congress the power to make rules for the government and *regulation* of the army, the rights of rank cannot, without usurpation, be varied at the will of the President. The law has created rank. Rank means a range of subordination in the particular body in which it is created. It is, therefore, effective in that body, without any further legislation, and its effect, when the officer is present for duty, is extended beyond that particular portion of the army in which the officer holds rank, or its exercise is restricted within a Corps only by legislation. Executive authority cannot make rank vary at will, but whatever authority the executive has over rank must be determined by law. A reference to the Articles of War will show that the President is given the authority to limit the discretion of Commanding Officers, in special cases, in respect to what is needful for the service, and also to relieve the senior officer from any command, so that the command may fall upon the next officer in the Line of the Army, Marine Corps, or Militia, "by commission there on duty or in quarters," or assign some senior to duty with troops, in order that such officer may become entitled to command. Any power of *assignment* claimed for the President beyond this is not and ought not to be sanctioned by law. The legislation on the subject of rank is thus complete. Officers, when serving only with their own regiment, serve according to their regimental rank; but when with other corps, the senior by commission in the line, whether by brevet or otherwise, is entitled to command. See *Command*.

RANK AND FILE.—The body of soldiers constituting the great mass of the Army, including Corporals, Bombardiers, and Privates. The *Rank and file* means literally the lines of men from side to side, and from front to back—a rank being a row of men standing side by side, and a file of soldiers a line of men standing one behind another. The strength of a force is reckoned by its *Rank and file*; the Non-commissioned and Commissioned Officers forming the supernumerary ranks charged with the direction of the mass.

RANKER.—A Non-commissioned Officer who rises to be a Commissioned Officer.

RANKS.—The order of common soldiers. Non-commissioned Officers are frequently reduced to the *ranks*. The term is variously applied.—*To fill the ranks* is to supply the authorized or competent number of men. *To take rank of* is to enjoy precedence over, or to have the right of taking a higher place.

RANSEUR.—A kind of *partizan*, well known in Germany during the 15th century. It came originally from Corsica, and has been called both *corseque* and *roncoul* by some authors.

RANSOM.—The price paid by a prisoner of war, or paid on his behalf, in consideration of his being granted liberty to return again to his own country. In early times, when armies received little or no regular pay, the soldier looked for his reward in the booty he might capture, and this booty included the bodies as well as the chattels of the vanquished. The conqueror had the option of slaying his prisoner; but for his profit, he would make him his slave, or sell him into slavery. The transition would be natural to accepting compensation from the prisoner himself, and setting him at liberty. In feudal warfare, the ransoms formed a large portion of a soldier's gains; those for persons of low degree belonging to the individual captors; but those for Princes or Great Nobles, to the King. Ransoms were sometimes of large amount, more than the immediate family of the captive could pay. His retainers were then required by feudal usage to contribute; as in the case of redeeming King Richard I. for £100,000, when twenty shillings was assessed on every Knight's Fee, and the Clergy subscribed liberally. David Bruce, of Scotland, was ransomed for 100,000 marks, and King John, of France, for £500,000, payable in instalments. In modern warfare, where the fighting is performed by professional soldiers, pecuniary ransoms are scarcely ever resorted to, freedom being granted to prisoners in exchange for others of corresponding rank captured on the opposite side.

RAPIDITY OF FIRE.—The rapidity with which cannon can be loaded and discharged depends on the size of the piece, the construction of the carriage, and the care required in aiming. Field-cannon can be discharged with careful aim, about twice per minute; in case of emergency, when closely pressed by the enemy, canister-shot may be discharged four times per minute. The 12-pdr. boat-howitzer of the Navy, with experienced gunners, can be discharged at the rate of sixteen times per minute. Siege-guns are generally discharged twelve times per hour; if necessary, they can be discharged as rapidly as twenty times per hour. Iron cannon can be fired more rapidly than bronze, as the latter metal is softened by heat, and the piece is liable to bend. Siege-mortars can be fired twelve times per hour, and more rapidly than this if the object be large, as a city. Siege-howitzers can be fired eight times in an hour. The fire of a sea-coast cannon depends much on the ease with which its carriage can be maneuvered. The heaviest, or 15-in. gun, mounted on the new iron carriage, can be loaded and fired in 1′ 10″ the time required in aiming depends on the angle through which the chassis is to be traversed, and piece elevated, or depressed; it can be traversed through an angle of 90° in 2′ 20″. Muzzle-loading small-arms can be discharged two or three times in a minute, and breech-loading arms about ten times; the revolver can be discharged much more rapidly for six shots. This quality of a military fire-arm should be carefully guarded, as it is found that soldiers are prone to discharge their pieces in the excitement of battle without taking proper aim, and consequently to waste their ammunition.

The calculations of the power of guns, by Colonel Maitland in his very valuable paper on "The Heavy Guns of 1884," lately read at the United Service Institution, are utterly misleading, as they leave out of account all consideration of rapidity and safety of firing; in fact, they give only the efficiency of the gun for a single round, thus placing a gun that could be fired only one round per hour on an equality with another gun firing a hundred similar rounds per hour. The Krupp gun is calculated to fire one round every ten minutes from his large guns on the practice ground at Meppen, and Captain Fitzgerald, R. N., stated in his lecture at the United Service Institution that the English 100-ton breech-loading gun could be fired only once in fifteen or twenty minutes. He institutes the following comparison to show the difference between a gun firing six shots an hour and an ideal gun ("Gun of 1886") supposed to fire 20 shots in the same time.

Data.	Elswick Gun of 1884.	Gun of 1886.
Diameter of bore	16.25	16.25
Weight of gun...	110 tons	120 tons.
" of charge..	900 lb.	900 lb.
" of pr'jectile	1,800 lb.	1,800 lb.
Muzzle velocity of projectile...	2,020 ft. per sec.	2,020 ft. per sec.
Muzzle energy of projectile.......	50,924 ft. tons.	50,924 ft. tons.
Muzzle energy of projectile per ton of gun......	513 ft. tons.	424.3 ft. tons.
No. of rounds fired per hour.	6	20
Total power of gun.............	305,544 ft. tons.	1,018,480 ft. tons.
Power per ton weight of gun.	2,777 ft. tons.	8,487.5 ft. tons.

The above shows that the more rapid firing gun, although not 10 per cent. heavier than the Elswick gun, is over 200 per cent. more powerful for destructive purposes. See *Ordnance*.

RAPIER.—This word is said to have had distinct meanings at different times, and in ancient fencing to have been a long cutting broadsword; but for the last century at least the rapier has been a light, highly-tempered, edgeless, thrusting weapon, finely pointed, and about 3 feet in length. It was for a long time the favorite weapon in dueling, and was worn by every gentleman. At present it is worn only on occasions of court ceremonial, and answers no other purpose than to incommode the wearer. In war a rapier could never have been of any service.

RAPPAREE.—A wild Irish plunderer, so called from his being generally armed with a *rapary*, or half-pike. The term was in common use in the 17th century. See *Notes and Queries*, August 17, 1861.

RAPPEL.—The beat of the drum to call soldiers to arms.

RASALDAR.—In the East Indies, the name applied to the Commander of Rasallah, which is 10,000 armed horsemen.

RASANTE.—A French term, applied to a style of fortification in which the command of the works over each other, and over the country, is kept very low, in order that the shot may more effectually sweep or graze the ground before them. Also written *Razant.*

RASP.—The rasp, like the file, is an abrading tool, but differs in that its surface is studded by protruding, isolated teeth, instead of chisel-cut teeth. The teeth of rasps are formed by a pointed tool called a *punch.* The point of this punch is generally of a triangular pyramidal form, whose triedral angles vary in size according to the effect required to be produced. The spaces between the teeth are, comparatively, wider than those for files. The apparently irregular intermingling of the teeth is such as will produce the smoothest surface for the number of teeth on the rasp.

The classification of rasps is very similar to that of files. Rasps have different degrees of coarseness, and the cuts are usually classed as—coarse, bastard, second-cut, and smooth. The coarse-cut is that used by horse-shoers; the bastard by machinists, carriage-makers, and wheelwrights; while the second cut is applied to shoe-rasps, and the smooth to cabinet-makers, etc. The rows of teeth range obliquely from left to right, or from right to left, and sometimes in circular arcs. The planes of the cutting faces of the teeth are generally placed at right angles to the axis of the file; but occasionally they are made with a slight obliquity, alternately to the right and left, for the purpose of allowing the teeth to clear themselves more freely from particles of stock. See *File.*

RATCHET.—A small piece of metal, so placed with one end on a pivot that the other can fall into the teeth of a wheel. Being perfectly free to move up and down, its own weight makes it drop into tooth after tooth as the wheel revolves.—But, from the peculiar shape of the teeth, which have the form of an inclined plane on one side, and a perpendicular face on the other, the wheel can only revolve in one direction.

RATCHET-POST.—A cast-iron post at the head of large Rodman guns to serve as a fulcrum for the bar used in elevating the gun.

RATCHET-SABOT. — A copper-cupped plate, attached to the base of a projectile, and firmly held in its place by radial grooves.

RATCHET-WHEEL.—A wheel with pointed and angular teeth, against which a ratchet abuts, used either for converting a reciprocating into a rotatory motion on the shaft to which it is fixed, or for admitting of its motion in one direction only. See *Mechanical Maneuvers.*

RATE-BOOK.—A priced vocabulary of government stores, by which officers and soldiers are debited for the loss of, or injury done to, government property under their charge, if committed through carelessness, etc.

RATION.—The established daily allowance of food for one person. For the United States Army it is now composed as follows: Twelve ounces of pork or bacon, or one pound and four ounces of fresh beef, or twenty-two ounces of salt beef; eighteen ounces of soft bread or of flour, or about sixteen ounces of hard-bread, or one pound and four ounces of corn meal. To every one hundred rations, fifteen pounds of beans or of peas, or ten pounds of rice or hominy; ten pounds of green coffee or about eight pounds of roasted (or roasted and ground) coffee, or about two pounds of tea; fifteen pounds of sugar; four quarts of vinegar; one pound and eight ounces of adamantine or star candles; four pounds of soap; four pounds of salt; four ounces of pepper; and to troops in the field, when necessary, four pounds of yeast-powder to the one hundred rations of flour.

Fresh mutton may be issued in lieu of, and at the same rate as, fresh beef, when the cost of the former does not exceed that of the latter. Fourteen ounces of dried fish, or eighteen ounces of pickled or fresh fish, may be issued in lieu of the meat components of a ration. Molasses or syrup may be issued in lieu of sugar, at the rate of two gallons to fifteen pounds of sugar. When it is impracticable for troops in the field or those traveling upon cars or transports, to draw or cook beans or rice, equivalents in money value of bread or meat may be issued; the value (in detail) of the stores not drawn, and those issued in lieu thereof, must be entered upon the abstract of issues. The following issues may be made to troops: Per 100 rations, in lieu of the usual meat portion of the ration, 75 pounds canned fresh beef; or about 75 pounds canned corn beef. Per 100 rations, in lieu of the dry-vegetable portion of the ration, 33 1-pound cans baked beans; or 20 2-pound cans baked beans; or 15 3-pound cans baked beans; or 5 1-gallon cans baked beans; or 25 pounds cheese. Six-pound cans of beef, and gallon or three-pound cans of beans should be issued in all cases when convenient; one and two pound cans of beans, and two and four pound cans of beef, to be issued only when it is inconvenient to issue the larger cans, or but small amounts are to be issued.

The army ration, in England, at home, is $\frac{3}{4}$ lb. of meat, and 1 lb. of bread ("best seconds") if in barracks, or $\frac{3}{4}$ lb. of meat with $1\frac{1}{4}$ lbs. of bread if in camp. If a grocery ration is also issued, $1\frac{1}{2}$d. for each such ration is deducted from the pay of the recipient. When men are not supplied with rations, an allowance of 6d. per diem is granted. Abroad, the Ration is 1 lb. of bread, or $\frac{3}{4}$ lb. of biscuit, and 1 lb. of fresh or salt meat, except at certain stations, where, for climatic reasons, a different Ration is specially provided. The bread ration may be increased during operations in the field, though not above $1\frac{1}{2}$ lbs. of bread or 1 lb. of biscuit. During active operations, the officer commanding may direct the issue, in addition to the above, of wine, spirits, or any other article of subsistence equivalent thereto. The stoppage for this foreign ration is 1d. The families of soldiers accompanying them abroad are allowed the following rations: the wife (married under regulation), half a ration: each legitimate child under 7, a quarter ration: from 7 to 14, a third part of a ration. When officers receive a colonial allowance in lieu of rations in kind, each is subjected to a daily stoppage of $2\frac{1}{2}$d. A Ration of forage at home consists of 10 lbs. of oats, 12 lbs. of hay, and 8 lbs. of straw for each horse. Cavalry soldiers receive this without stoppage; but their officers suffer a deduction of $8\frac{1}{2}$d. per ration. Staff officers and mounted officers of infantry provide their own forage, and are granted a pecuniary allowance of 1s. 10d. per day to enable them to do so. See *Food.*

RATION RETURNS.—The issues of subsistence are made to troops on ration returns, signed by their immediate Commander and approved by the commanding officer of the post or station. These returns call for only such limited quantity of stores as can be received and properly cared for by the troops drawing, and will, ordinarily, be made for a few days at a time. They are consolidated for the post or regiment when practicable, and embrace only the number of enlisted men, authorized laundresses, and hospital matrons actually present. At the end of the calender month, the Commissary enters on separate abstracts, for each class of troops, every return upon which he has issued provisions in that month; which abstracts the Commanding Officer compares with the original ration returns, and if correct, so certifies.

Ration-Return of —— Company —— Regiment of ——, stationed at —— for —— days, commencing the —— day of ——, 188— and ending the —— day of ——, 188—.

		Number of men.			Number of days.
		Number of women.			Number of rations.
		Total.	Total.		

Number of rations of — Remarks.

		Pork.			Peas.	
		Bacon.			Rice.	
		Salt Beef.			Hominy.	
		Fresh beef.			Cheese.	
		Mutton.			Coffee.	
		Fresh beef, canned.			Tea.	
		Corned beef, canned.			Sugar.	
		Fish, dried.			Vinegar.	
		Fish, pickled.			Adamantine candles.	
		Flour.			Soap.	
		Hard bread.			Salt.	
		Corn-meal.			Pepper.	
		Beans.			Yeast-powder.	
		Baked beans, canned.				

The A. A. C. S. will issue on the above return.

——*Regt. of*——, *Comd'g Post.* ——*Regt. of*——, *Comd'g Company.*

RATIOS.—There can be little doubt that Newton discovered by means of fluxions, of which he was in possession at a very early age, the greater part of that extraordinary series of theorems regarding motion, etc, which he first published in the *Principia.* He had, however, a great partiality for the synthetic form of demonstration employed with such success by the Greek geometers; and the consequence was that, in the *Principia*, he avoided entirely the use of analysis by fluxions, and invented for synthetical applications the closely allied method of Prime and Ultimate Ratios. The fundamental idea involved in fluxions, prime and ultimate ratios, and the differential calculus, is the same, that of a *Limit.* To give an idea of the nature, as well as to show the real origin of the name of the method, we may take a very simple case. Let a particle be projected in any direction; it will move uniformly in that direction forever, unless deflected from it by some external force. Suppose that gravity alone acts upon it, then it will describe a parabolic path, to which the original direction is the tangent at the origin; and the line which joins the disturbed and undisturbed positions of the particle at any instant is vertical. Now, the original and secondary distances of the particle from the origin are not, in general, equal, but they are more and more nearly equal as both are smaller; and, by taking each small enough, we may make the *percentage* of difference between them as small as we choose. In other words, their *prime ratio*, just at the origin, is unity. Again, the inscribed square is less than a circle; the octagon is greater than the square, but less than the circle; the regular polygon of 16 sides greater than the octagon, but less than the circle; and so on, constantly doubling the number of sides. But it can be shown that the difference of area between the polygon and the circle may be made as small a percentage of the area of the circle as we please, by making the sides of the polygon numerous enough. Hence, the *ultimate ratio* of the areas of the circle, and inscribed polygon with an indefinitely great number of equal sides, is unity. The basis of the method, which is implicitly involved in the foregoing illustrations, is Newton's *first lemma*, which is thus stated: "Quantities, and the ratios of quantities, which tend constantly to equality, and may be made to approximate to each other by less than any assignable difference, become ultimately equal." In other words, if we can make the *percentage* of difference of two quantities as small as we choose, we must produce ultimate equality. From this, in his second and third lemmas, Newton proves the fundamental principle of the integral calculus as applied to the determination of the areas of curves, by showing that if a set of parallelograms be inscribed in any curvilinear space, the percentage of difference between the sum of their areas and that of the curve may be made as small as we please by diminishing indefinitely the breadth of each parallelogram and increasing their number proportionally. Next, he shows how to compare two curvilinear spaces, by supposing them filled with such parallelograms, each of the first bearing to one of the second a constant ratio. Next, that the homologous sides of similar *curvilinear* figures are proportional. The sixth lemma is merely a definition of continuous curvature in a curve, as distinguished from abrupt change of direction. The seventh, eighth, and ninth lemmas are of very great importance. The general principle involved in their proof is this—to examine what always occurs in indefinitely small arcs, by drawing a magnified representation of them such as always to be on a finite scale, however small the arcs themselves may be. Thus, to show that the chord of a small arc is ultimately equal to the arc—of which we have in trigonometry, as a particular case, the ulti-

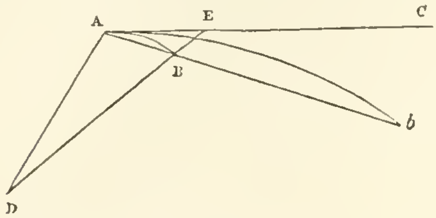


Fig. 1.

mate equality of an arc and its sine—he proceeds somewhat as follows: Let AB, (Fig. 1) be an arc of continued curvature, AC the tangent at A. Produce the chord AB till it has a *finite* length, A*b*. Describe on A*b*, as chord, an arc similar to AB. This, by a previous lemma, will touch AC at A. Now, as B moves up to A, let the same construction be perpetually made, then *b* will approximate more and more closely to AC (because the arc AB is one of continuous curvature), and the magnified arc will constantly lie between AC and A*b*. Hence, ultimately, when A*b* and AC coincide in direction, the arc A*b* (which is always between them) will coincide with A*b*. Similarly, AD being any line making a finite angle with AC, draw DBE cutting off a finite length from AD; this process enables us to prove that the triangles AED, and the rectilinear and curvilinear triangles ABD, are all ultimately equal. Finally (and this is the step of the greatest importance in the dynamical applications), if the lines AD, DE, D'E' (Fig. 2) be drawn under the above restrictions, the ultimate ratio of the curvilinear or rectili-

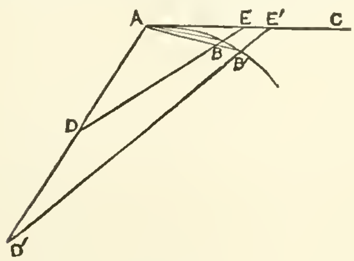

Fig. 2.

near triangles AEB, AE'B' is that of the squares of corresponding sides. From this, in the ninth and last lemma, it is easily shown that the spaces described under the action of a finite force have their prime ratios as the squares of the times: whence we pass at once to the ever-memorable investigations of the *Principia* regarding the orbits described under the action of various forces. The metho of prime and ultimate ratios is little used now (except in Cambridge, which does honor to itself in making part of the *Principia* a subject of study), as the differential and integral calculus help us to the required results with far greater ease. But to the true student of gunnery, the synthetic method of Newton is of very great value, as it shows him clearly at every step the nature of the process he is carrying out, which is too apt to be lost sight of entirely in the semi-mechanical procedures common to all forms of symbolical reasoning.

RAVELIN.—In fortification, a triangular work of less elevation than the main defenses, situated with its salient angle to the front before the curtain, which with the shoulders of the adjoining bastions it serves to protect. It is open at the rear, so as to be commanded by the curtain, if taken, and is separated from that work by the main ditch while in its own front the ditch of the ravelin intervenes between itself and the covered-way. The guns of the ravelin sweep the glacis, and perform a very important function in commanding the space immediately before the salient angles of the two next bastions, ground which the guns of the bastions themselves cannot cover. The bastions, on the other hand, flank the ravelin. In the fortifications of Alessandria, designed by Bousmard, in 1803, the ravelins are placed in front of the glacis. The original name of the ravelin was *rivellino*, which indicates a derivation from *vegliare*, to watch, the ravelin having probably been at first a watch-tower, answering to the still earlier barbacan.

RAVINE.—In field-fortification, any deep hollow, usually formed by a great flood, or a long-continued running water; frequently turned to advantage in the field. See *Divide*.

RAW HIDES.—Hides not tanned. They are used to cover the revetments of embrasures in fieldworks. The hides are doubled, the hair inwards, two to each cheek of the embrasure, and fixed by pickets driven through them.

RAW PIG.—The iron, as it comes from the smelting-furnace, is termed, "*Raw Pig*," and is a first fusion. The second-fusion iron (as understood by founders) is produced by a combination of raw pig and second-fusion, melted in an ordinary air-furnace, and then run out. These pigs are usually of a different shape than the raw pig, but to prevent confusion, and at the same time to distinguish different second-fusion irons one from another, each should be distinctly marked and piled separately. The object of using a second-fusion iron in a casting is to obtain greater density than can be produced from the raw pig alone; it moreover increases the tensile strength. In the casting of the XV-inch gun, the furnaces are charged as follows:

Bloomfield raw pig	21,143 lbs.
Bloomfield second-fusion (red-dot)	13,214 "
Bloomfield second-fusion (red-cross)	2,643 "
	37,000 "
Total in both furnaces	74,000 "

The second-fusion, marked "red-dot," consists of the following combinations, viz.:

Bloomfield raw pig	50,000 lbs.
Bloomfield second-fusion	19,575 "
Run into pigs and marked "red-dot"	69,575 "

The proportions of the other grade, marked "red-cross," are as follows, vis.:

Bloomfield raw pig	29,410 lbs.
Bloomfield second-fusion	32,590 "
Run into pigs and marked "red-cross"	62,000 "

The second-fusion iron used in these combinations is produced by melting two parts of raw pig with one of second fusion. See *Casting* and *Iron*.

RAW TROOPS.—Inexperienced soldiers or men who have been little accustomed to the use of arms.

RAZED.—A term applied to works or fortifications when they are totally demolished.

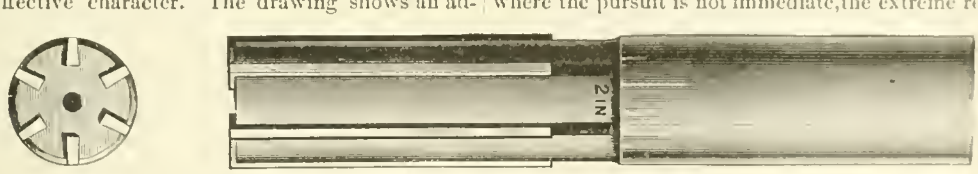
RAZZIA.—A plundering and destructive incursion.

REACTION.—A term used in reference to the political history of a Nation, to designate that tendency, often showing itself, to recoil from the effects of Reform or Revolution, and to seek a restoration of the previous state of things, or one still more antiquated and despotic. The causes that lead to reaction are various. Sometimes it springs, partly at least, from mere disappointment at the smallness of the *visible* results of those changes advocated with so much eloquence, and waited for with so much enthusiasm and hope. The inconsiderate imagination of the people expects a millenium to follow every important change; and when, after the event men find they are still in the old world of imperfections, hardships, and sorrows, they are prone to believe that they have been deluded, and are only too willing to lend an ear to the insidious misrepresentations of those who are opposed to progress. But more frequently political reaction springs from either immature or injudicious, or extravagant revolution The times are not yet ripe (as in the first Italian revolts), or the leaders are unfit (as in the German and Hungarian struggles of 1848-49), or excesses are committed (as in the great French outbreak of 1789), and so a revolution is nipped in the bud, or overthrown in the battle-field; or inflamed with sanguinary thirst for revenge, it goes mad in a "Reign of Terror," and exhausting itself in unprofitable frenzies, falls at last an easy prey to any bold and unscrupulous adventurer whom the crowd may elect out of desperation and disgust of anarchy, and whose rule is as absolute as any that preceded it. A reaction may thus, in certain cases, be useful, in so far as it teaches reformers and revolutionists the point beyond which nature forbids them to go; but its agents are almost invariably base in character, odious in their principles, and selfish in their projects. Religious reactions exhibit the same characteristics as political ones, and proceed from the same causes.

READINESS.—A state of alertness or preparation; thus, to *hold a corps in readiness*, is to have it prepared in consequence of some previous order to march at a moment's notice.

READY.—A word of command in the Manual of Arms, executed as follows: The Instructor commands—1. *Squad*, 2. Ready. Same as first motion of load, except that the muzzle is at the height of the chin, the right thumb on the head of the hammer, the fingers supported against the guard and small of the stock. (Two.) Cock the piece, and then grasp it at the small of the stock. The piece, after loading, may be brought to a *ready* by the commands: 1. *Squad*, 2. Ready. At which the piece is cocked. See *Manual of Arms, Fig.* 15.

REAMER.—A tool much used in the arsenal to enlarge a hole and bring it to a shape the counterpart of the tool, whether cylindrical or tapering. Instead of mere longitudinal fluting, the grooves in the tool may be made spiral, a right and a left hand, crossing obliquely so as to leave the surface in diamond-shaped portions. The flutings are then planed out and backed off, the result being a toothed reamer of effective character. The drawing shows an adjustable reamer, designed by the Betts Machine Company, Wilmington, Delaware. The shank of the reamer is made of steel, the blades are six in number and unevenly spaced; the blades are inserted in dove-tailed slots the bottoms of which are inclined planes; the shanks are ground to STANDARD SIZE (a thing impossible in a solid reamer, unless it reams much above standard size when new), and the blades made slightly above standard. It is plain that when the blades wear down, it is then only necessary to drive them further into the shank, and by that means again enlarge the diameter to standard size. This may be repeated until the blades are driven to the upper end of the slots, when new ones may be inserted. The solid reamer was a great advance when introduced, but the requirements of fine machine fitting call for a tool which makes solid reamers a thing of the past. The practice of *reaming out* guns, or *boring them up*, first took place in the British service in 1830; it was done with the view of increasing the weight of metal projected from such guns as were then on hand in the British service, at the time when the advantages of large-calibered ordnance were not absolutely decided on. It was therefore but a temporary expedient and for that particular purpose, reaming out has been abandoned. But in the conversion of smooth bore ordnance for the purpose of being rifled, the guns have still to be reamed out preparatory to being relined



REAR.—In the general acceptation of the word, anything situated or placed behind another. This term is variously used in military matters. *Rear of a body of troops* means the hindermost part of that body such as the *rear* of an army battalion, squadron, or company; *rear rank*, the rank which covers the front rank.

REAR ASSEMBLING BAR.—A component part of the caisson. It supports the spare-wheel axle, and has a slot for the pickaxe on the left of the middle-rail.

REAR BRACE.—The lower arm-plate of an arm-guard.

REAR CHOCK CARRIAGE.—A carriage similar in construction to the garrison standing carriage, except that it has only the two front trucks; and, instead of a rear axle tree, it has a block of wood which rests upon the platform.

REAR FRONT.—The rear rank of a body of troops when faced about and standing in that position.

REAR GUARD.—*A rear-guard* is a body of troops formed to protect the rear of an army when on the retreat; it corresponds to the advanced guard in a forward movement. A small rear-guard also follows an army on the advance, its duty being to pick up stragglers and prevent small bodies of the enemy's cavalry from making raids on the rear of the army to capture the baggage, etc. As regards its order of march, a rear-guard is described as an advanced-guard *reversed*. The principles of formation are identical in both, and the same rules generally guide both; with this difference, that the rear-guard retires before the enemy, while the advanced guard pushes against him. Consequently, although the distribution is the same as with the advanced-guard, the strength of the fractions of the rear-guard decreases instead increases from front to rear. The reserve is nearest the main body. The support is farther to the rear, in support of the rear party, which moves in several groups or in consolidated formations according to the country it passes over. In a fairly open country, where the pursuit is not immediate, the extreme rear will be formed of reconnoiterers, moving in a line thrown back at each end towards the flankers, until it assumes the semi-circular form in a manner more marked than it would in the advance. If the pursuit is active and attack imminent the rear-guard must maneuver; and here we may remark that the nature of the country affects not only the composition of the rear-guard, but the kind of action it must take with the troops at its command.

A change of base or position may have caused an army temporarily to make a retrograde movement, or the force may be retreating. In either case the mission of the rear-guard is to retard the pursuit of the enemy, and to interpose between him and the main body on the march. In carrying out this duty the rear-guard must often maintain a struggle at a disadvantage, and even, if necessary, sacrifice itself in order to enable the main force to get away in safety. No more honorable post can be assigned to an officer than that of commanding or serving with a rear-guard in such a case. The very best officers and the freshest troops should be selected for this service, especially if covering the retreat of a beaten army. In the latter case the position of a rear-guard is one of much difficulty, the enemy nearly always pursuing with activity, and also endeavoring by flank attacks to cut off the retreat. As regards the strength of the rear-guard in a retreat, it would ordinarily take the same proportion as would be allotted to the advanced-guard in a forward march. This proportion would commonly be about *one-sixth* of the whole marching strength. In exceptional cases it might even amount to *one-fourth* of the whole. It is not without reluctance on the part of a Commander that so large a rear-guard is detailed, as his first anxiety and care must naturally be to withdraw and place in safety the greatest number possible of his men. But if he neglects to cover his retreat by a sufficiently strong force the result will probably be that the rear-guard, unable to withstand the assaults of the enemy, will constantly be driven back upon the main column, and throw it into disorder. The demoralizing effect upon troops of the mere knowledge that they are in retreat is in itself very great. Should the rear-guard not be strong enough to enable the column to retire with due regularity, the feeling of depression will increase, the retreat will turn to a rout, and disaster will result. A skillful rear-guard Commander will endeavor by every means to obtain even small advantages over the enemy, in order to encourage his men and to obtain their *morale*, thus enabling them to endure with better spirit a harassing pursuit. With this view it appears desirable that the extreme rear and flanking detachments of the rear-guard should be sufficiently strong, to take all possible advantage of any imprudence on the part of the enemy's advanced troops. In the event of a retreat after an engagement something may also be done toward this end, by selecting for the rear-guard such troops as have not only suffered least during the day, but have themselves perhaps obtained some local advantage, which, insufficient to affect the general result, may yet be enough to prevent the men feeling down-hearted, and with little further stomach for action. The distance that a rear-guard should be from the main body depends upon the nature of the country, its numbers, and the manner in which the pursuit is conducted. If the pursuit is slack it can safely be a march in rear. Under all circumstances, however, constant communication should be maintained between it and the main body. It is difficult to prescribe any definite distance for the rear-guard to take up from the main body. The latter, as is natural in retreat, proceeds as fast as is convenient in the desired direction. The rear-guard has to interpose between the main body and the enemy, to check the advance of the pursuer, and to observe and reconnoiter him, in order to discover at the earliest moment any intention, on his part, of a flank or turning movement. Hence it happens that the distance of the rear-guard from the main column, in two or more cases, may vary considerably, in accordance with a great variety of circumstances; but under ordinary conditions the distances usually laid down for the advanced-guard in a forward movement would be approximately suitable for the rear-guard in retreat. A rear-guard does not require to reconnoiter in advance of its march, for the enemy cannot be there, and since the main column goes first over the ground, and investigates it thoroughly, reports and sketches of roads, bridges, and positions suitable for making a stand against the enemy, can be sent back to the rear-guard whenever it is likely to need them. In most cases the enemy, if following, is easily reconnoitered in the rear, as in the eagerness of pursuit he has little heed for concealment. On the flanks alone there is difficult and delicate work, of this particular nature, to be done. The most serious danger for a rear-guard is undoubtedly that of being turned or cut off, and not only is its own safety imperilled in such event, but its protective character as a guard to the rear of its own main column ceases to have effect. To be attacked upon its flanks is almost as dangerous as to be cut off, and against both of these contingencies the best precautionary measure is accurate and extensive reconnoissance to the flanks. The parties sent out upon this most important duty should in all possible cases be composed largely if not entirely of cavalry. As regards the composition of the rear-guard, in an open country cavalry is certainly necessary, not only for reconnoitering on the flanks, but also to meet the enemy's cavalry. But infantry is indispensable in more or less strength under all circumstances, in order to make a stand at suitable positions for defense, to form rallying points and protection for the cavalry if driven in, and to check the eager pursuit of the enemy's cavalry. If the force is of any magnitude, its rear-guard should be composed of the three arms, in proportions suited to the ground that is to be passed over. Cavalry, to meet and ward off the enemy's cavalry, which in open ground can hover round the rear and flanks, artillery, to take up favorable positions in retreat to bear on the heads of pursuing columns; and infantry, to bear the brunt of the enemy's attack and retard his advance at the chosen points of resistance. If guns are used with skill in a retreat they can often save deployment of their own infantry, by obliging the enemy, as he presses on in pursuit, to halt and deploy; the guns retreating rapidly as the enemy forms up. Artillery is thus of special value when added to a rear-guard.

As regards the action of the rear-guard generally, since the great object which it has to effect is to keep back the enemy without compromising the safety or delaying the retreat of the main body, it is evident that its duties can be best performed by very frequently occupying such natural positions as the country may possibly afford, thus absolutely forcing the enemy not only to deploy, but even to attack, and then getting safely away without serious fighting. The great art of rear-guards is that of being constantly able, without risk, and with but little trouble, to force an enemy to deploy for attack, and then to get safely away yourself without serious fighting; in other words, the rear-guard should, by frequent occupation of strong positions, be continually threatening to fight, as it is by so doing, and not by actual conflict, that it best fulfills its purpose. In a long retreat, when this course has been followed for a number of successive days, the general commanding the pursuit is apt to become reckless, and, neglecting to take all necessary precautions, may push on to attack with an insufficient force at hand, or in an irregular manner; it will then be for the rear-guard to pounce suddenly upon him, with all his available force, and having struck him a severe blow, at once resume the retreat. The officer commanding must not allow himself to be carried away by any partial success of this nature so as to forget his primary duty, for he should bear in mind that he cannot stop, except to retard the pursuit, and that every succeeding quarter of an hour brings his enemy re-enforcements. The length of time that a rear-guard can remain with safety in a position depends on its intrinsic strength, and the obstacles in the way of an enemy's turning it.

In the details of conflict the knowledge which it has of the ground is much to the advantage of the rear-guard, as it can decide what points to make a stand at, what to pass over as untenable. In this respect its position seems better than that of the advanced-guard in the forward march, but the apparent superiority is fleeting, for the conditions under which the rear-guard and advanced-guard fight are widely different. The advanced-guard can push on with the confidence fairly engendered by knowing its supports to be approaching from the rear in any required force; the rear-guard, on the other hand, cannot but feel that the longer the conflict is protracted the farther it gets from its main body. The rear-guard, therefore, has to consider a danger which does not exist for the advanced-guard, that of being cut off from its column should it remain too long in position and be successfully outflanked. If the rear-guard, however, can hold its ground long enough to cause the enemy first to reconnoiter, and then to form up for attack, its purpose and object as a delaying force will have been effected for the moment, and the commander, on his flanks being threatened, may well retire, again to occupy a farther selected position, and again to retard the progress of his pursuers. In a very close country every check thus given to the enemy obliges him to incur a considerable and serious delay; but the Commander of the rear-guard must not forget that he may be pursued by a column marching on a road to his flank, in addition to that immediately behind him. This is perhaps the greatest of all dangers against which he has to guard.

If the pursuit of a rear-guard, which has been actively carried on by the enemy up to a certain point, suddenly appears to cease, the Commander should send out strong cavalry patrols to ascertain the cause. The enemy, it will be found, has either stopped in his pursuit on the main route, or he has taken a different direction and is still advancing. In the latter case active reconnaissance by cavalry patrols should immediately be undertaken by the rear-guard, the main column being also advised of the route taken by the enemy, that it may send out flanking detachments to feel for him. An army retiring by more than one road, whose directions are generally parallel, would usually have a rear-guard upon each road under a separate commander, the rearmost groups being continued across the whole rear, and flankers only upon the outer flanks of the outer columns. The whole of these rear-guards would be included in one high command. The army would thus retire in as many columns as might be necessary, connection being kept up between the different main columns, and also between those of the rear-guards at every cross road, and wherever the country may allow of communication. No war material that could be useful to the enemy should be allowed in a retreat to fall into his hands. The rear-guard must destroy it if it cannot be removed. If hardly pressed, everything that could assist the enemy, such as standing corn and provisions, must be burnt, horses and wagons pressed and sent on to the main body. As an extreme measure, villages on the line of route must even be fired, if necessary to retard the pursuit.

REAR OPEN ORDER.—An *open order*, executed as follows: Being at a halt, the Captain commands: 1. *Rear open order*, 2. MARCH. 3. FRONT. At the first command, the right and left guides step briskly three yards to the rear, to mark the new alignment of the rear rank; the First and Second Lieutenants place themselves on the right and left of the front rank; the Third Lieutenant covers the second, in the rear rank; the Captain goes to the right flank, and sees that the guides are on a line parallel to the front rank.

At the command *march*, the Lieutenants place themselves opposite their places in line, three yards in front of the company; the front-rank men dress to the right; the rear-rank men cast their eyes to the right, step backward, halt a little in rear of the alignment, and then dress to the right on the line established by the guides. The file-closers step to the rear and place themselves three yards from the rear rank.

The Captain superintends the alignment of the officers, and the front rank, and the right guide that of the rear rank; the Captain verifies the alignment of the rear rank, and of the file-closers; the officers and file-closers cast their eyes to the front, as soon as their alignment is verified.

At the command *front*, the guides resume their places in the front rank, and the men cast their eyes to the front; the Captain places himself three yards in front of the right file.

REAR SIGHT. The *rear sight* is composed of a base, which is firmly secured to the barrel at a short distance from the breech, and a movable part capable of being adjusted for different elevations of the barrel. The sight originally affixed to the rifle musket had a single leaf, to which was attached a slide containing the sight notch, which could be adjusted

for all distances between 100 and 900 yards. By an order of the War Department, this was replaced by a sight which had three movable leaves, turning on a common axis, and bearing notches adjusted to 100, 300, and 500 yards, respectively. Aiming a fire-arm consists in bringing the top of the front sight, and the bottom of the notch of the rear sight, into the line, joining the eye and the object. A sight for a military arm should satisfy the following conditions, viz.: 1st. It should be easily adjusted for all distances within effective range; 2d. The form of the notch should permit the eye to catch the object quickly; 3d. It should not be easily deranged by the accidents of the service. The *globe* and *telescopic* sights are used for very accurate sporting-arms, but they are too delicate in their structure, and too slow in their operation, for general purposes. In the *absence* of a proper rear sight, the soldier of the line may be taught to point his piece by aiming over the center of the knuckle of his left thumb: the position of the thumb along the barrel determines the elevation of the piece. This method is practiced by certain French troops of the line, for distances less than 400 yards.

REBELLION.—The term rebellion is applied to an insurrection of large extent, and is usually a war between the legitimate government of a country and portions or provinces of the same who seek to throw off their allegiance to it, and set up a government of their own. When humanity induces the adoption of the rules of regular war toward rebels, whether the adoption is partial or entire, it does in no way whatever imply either a partial or complete acknowledgment of their government, if they have set up one, or of them, as either an independent or sovereign power. Neutrals have no right to make the adoption of the rules of war by the assailed government towards rebels the ground of their own acknowledgment of the revolted people as an independent power.

Treating captured rebels as prisoners of war, exchanging them, concluding of cartels, capitulations, or other warlike agreements with them; addressing officers of a rebel army by the rank they may have in the same; accepting flags of truce; or, on the other hand, proclaiming Martial Law in their territory, or levying war taxes or forced loans, or doing any other act sanctioned or demanded by the law and usages of public war between sovereign belligerents, neither proves nor establishes an acknowledgment of the rebellious people, or of the government which they may have erected, as a public or sovereign power. Nor does the adoption of the rules of war towards rebels imply an engagement with them extending beyond the limits of these rules. It is victory in the field that ends the strife and settles the future relations between the contending parties. Treating, in the field, the rebellious enemy according to the law and usages of war has never prevented the legitimate government from trying the leaders of the rebellion or chief rebels for high treason, and from treating them accordingly, unless they are included in a general amnesty.

All enemies in regular war are divided into two general classes; that is to say, into combatants and non-combatants, or unarmed citizens of the hostile government. The military commander of the legitimate government, in any war of rebellion, distinguishes between the loyal citizen in the revolted portion of the country and the disloyal citizen. The disloyal citizens may further be classified into those citizens known to sympathize with the rebellion, without positively aiding it, and those who, without taking up arms, give positive aid and comfort to the rebellious enemy, without being bodily forced thereto. Common justice and plain expediency require that the military commander protect the manifestly loyal citizens, in revolted territories, against the hardships of the war as much as the common misfortune of all war admits. The commander will throw the burden of the war, as much as lies within his power, on the disloyal citizens of the revolted portion or province, subjecting them to a stricter police than the non-combatant enemies have to suffer in regular war; and if he deems it appropriate, or if his government demands of him that every citizen shall, by an oath of allegiance, or by some other manifest act, declare his fidelity to the legitimate government, he may either expel, transfer, imprison, or fine the revolted citizens who refuse to pledge themselves anew as citizens obedient to the law and loyal to the government. Whether it is expedient to do so, and whether reliance can be placed upon such oaths, the commander or his government have the right to decide.

Armed or unarmed resistance by citizens of the United States against the lawful movements of their troops is levying war against the United States, and is therefore treason. See *Civil War*, *Insurrection*, and *Posse Comitatus*.

REBOUNDING LOCK.—A gun-lock in which the hammer rebounds to half-cock, after discharge, as a means of safety. The drawings show the action of the Parker *rebounding-lock*. The operation of the lock is very simple and renders all fire-arms using it safe from liability of a premature or accidental discharge. Fig. 1 shows the hammer down on the plunger, and Fig. 2 shows the lock at half-cock. When the gun is discharged, the main spring carries the hammer in the usual manner until the spring comes in contact with the stud in the plate and stops. The hammer by its own momentum now explodes the cap, and at this point is shown in Fig. 1, with the nose of the sear resting on the incline of the tumbler ready to force it back to half-cock as soon as the pressure is relieved from the trigger.

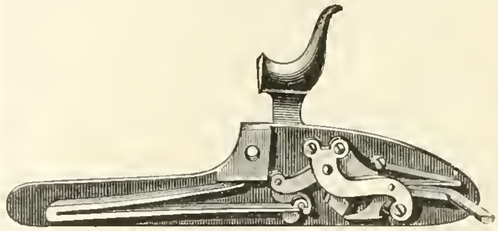


Fig. 1.

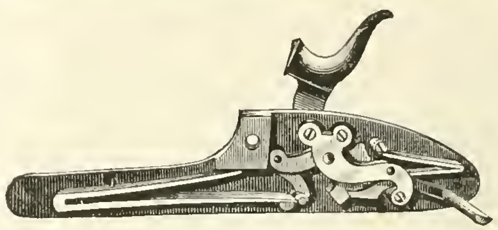

Fig. 2.

REBUFFO.—A bastard cannon, or a three-fourth Carthoun (Karthaune), a 36-pounder of 15 calibers long; according to Ufano, a 45-pounder.

RECALL.—A call on the trumpet, bugle, or drum, by which soldiers are recalled from duty, labor, etc.

RECEIPT.—A voucher or acknowledgment, which should always be given when official papers are received. When flags of truce are the bearers of a parcel or a letter, the officer commanding an outpost should give a receipt for it, and require the party to depart forthwith. The above is the form of a receipt used by Quartermasters.

Received at..,..this............day of............, 188 , from..

No. of packages.	Articles and quantities.	Cost. Dolls.	Cost. Cts.	Gross weight.

(Signed in duplicate.) *Quartermaster.*

RECHAUD.—A chafing-dish, or pan, used for various purposes, particularly during a siege. Rechauds are filled with burning materials, and hung in different parts of the walls, so as to throw light into the ditches, and to prevent surprises.

RECHUTE.—A term used in fortification to signify a greater elevation of the rampart in those parts where it is likely to be commanded.

RECIPROCAL DEFENSE.—A good flanking defense, to be found in permanent fortifications. In constructing works of this nature, the following are the objects aimed at: 1. To afford cover or protection to the guns, masonry, and bodies of the defenders from the effects of an enemy's fire of every description. 2. To arrange the covering works in such a manner that the defenders may use their weapons with facility, and that the enemy may be kept under fire from his first appearance within range of the heaviest guns to the moment even of his arrival at the crest of the defender's works, a condition which necessarily leads to the introduction of reciprocal or flanking defense, as it would, in many cases, be impossible that it could be fulfilled by means of direct fire alone, each work of defense, becoming a cover to the assailants against the fire of its defenders when they have advanced to its base, it being also evident that flanking fire is much more efficient than direct fire. The term "reciprocal" here used expresses more fully the character and object of such defense than the term "flanking," as it generalises the idea intended to be conveyed, by including reverse fire and every arrangement by which the ground not acted upon by direct fire of one part of a work is brought within the action of the fire of another part.

RECOIL.—When the charge of gunpowder contained in a gun is fired, the sudden expansion of the powder into many times its former bulk acts with equal force in every direction. The resistance offered by the ball, which moves more or less easily in the bore, being far less than that of the bulky and heavier gun and carriage, the ball is forced to a great distance; but the gun, with its carriage, must nevertheless feel the reaction, and is driven backward a certain space, ordinarily a few feet. This retrograde motion is called the recoil, and dangerous accidents sometimes take place from it. After the recoil, the gunners have to work the piece back to its former position for the next discharge. In the Armstrong naval gun, and some other modern cannon, the trunnions of the gun are mounted on an inclined plane, up which the recoil drives them, to run down again by their own weight. The gun and shot remaining the same, the recoil is proportionate to the charge. The recoil of small-arms is known as their "kick," and is felt on the shoulder of the marksman. The increase in the size of cannon and in the charges employed, has necessitated the introduction of some additional means for controlling the recoil. The following are used, viz: 1st. Pneumatic Buffers. 2d. Hydraulic Buffers. 3d. Friction Checks.

Pneumatic Buffers.—These are attached principally to carriages for 15-inch guns. They consist of two closed iron cylinders, placed between the rails at the front part of the chassis, secured thereto by iron straps; and of two piston-rods with heads, working air-tight through the iron heads that close the rear ends of the cylinders. The rear ends of the piston-rods are attached to a heavy iron plate projecting below the rear part of the gun carriage. A small hole in each end of the cylinders relieves the pressure of the air in front of each piston-head and prevents the formation of a vacuum in rear of it. When the recoil takes place, the piston-rods are drawn to the rear, compressing the air in the cylinders and checking, gradually, the motion of the system. Should vacuums be formed in front of the heads, the expansion of the air in rear would force the piece forward beyond the position for loading.

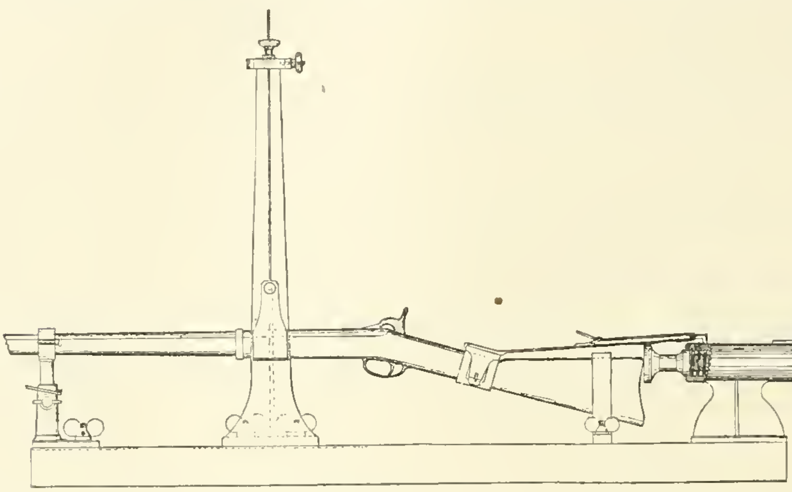
Hydraulic Buffers.—The hydraulic buffer is attached to carriages for 15-inch guns and for heavy rifles. Each consists of a cast-iron cylinder with head, and a piston-rod and heads the latter having perforations in it instead of being solid as in the previous system. A non-freezing liquid is placed in the cylinder. The motion given to the piston-rod by the recoil is arrested by the liquid which is forced to pass through the holes in the head. The amount of liquid, and the number and size of the holes, which are determined by experiment, regulate the amount of recoil. One cylinder may thus be sufficient for any sized gun, though with the largest cannon two are generally employed. The cylinder may be attached to the front or to the rear end of the chassis. In the first case, the piston-rod, connected with the rear of the top-carriage, is drawn out of the cylinder; in the second case, the rod secured to the front of the carriage is forced into the cylinder. Each has its advantages, the first is, however, the most rigid.

Friction Checks. These are found upon many of the carriages for heavy rifles. The simplest is the "Parrott" system. Two iron clamps actuated by screws are placed on the rails in rear of the top-carriage; their pressure on the rails is regulated by the screws. Part of the force of recoil is expended in moving the clamps on the rails; they may, before firing, be so placed as to allow free recoil over a certain distance, the motion being afterwards checked. The "Sinclair" *check* is now preferred. It consists of a box-clamp bearing against the front axle of the top-carriage; and of a broad wrought-iron rail slightly wedge-shaped, extending nearly the length of the chassis along its center line. Attached to the front of the chassis are two transom-plates between which the rail works, free to move to the front, but prevented by them from moving to the rear. The rail is secured to the rear of the chassis by a steel, or rubber spring. The clamp has two friction plates between which the rail passes, and on which they are tightened by means of a screw and handle. The friction of the clamp upon the rail checks the recoil, and when it ceases the reaction of the strain upon the rail, due to its elasticity would cause the rail to bend were it not free to move forward in the direction of its length, being retained only by the spring.

RECOIL DYNAMOMETER.—Three conditions, theoretically essential to obtaining a true record of recoils, can only be approximated to in practice: I. The recoiling mass should consist of *nothing but the gun.* II. The *entire recoil* should be expended on the *dynamometer.* III. The registration should be effected *without sensible motion* of the gun. The first condition would require that the gun should be suspended by an imponderable pendulum rod. This is approximated to by reducing the suspending apparatus to the minimum consistent with strength and convenience. The second condition would require that the gun should be stripped of all guides and restraints involving friction. This is effected by having guides near enough to the gun to prevent inconvenient derangements, but nowhere in actual contact. The third condition would require that the dynamometer should be set, in advance, at an initial tension exactly equal to the expected recoil. This condition can only be satisfied so far as to set the dynamometer at an initial tension not greater than the minimum recoil which the instrument can reasonably be expected to be called upon to measure. In the particular instrument, which forms the subject of this report, the spring stands at an initial tension of fifty pounds avoirdupois, which is, consequently, the minimum limit of its capacity for measuring recoils.

The accompanying drawing will give a general idea of the instrument, and enable it to be assembled. Being assembled the following sequence of adjustments has been found most convenient: 1. Open and depress the front guide; 2. Balance the piece, loaded, in the sling, at the elevation desired, having first attached the "bridle," described beyond. 3. Bring the butt-plate heel nearly into contact with the recoil-block, by shifting the pendulum column, and clamp it; 4. Complete the contact accurately by means of the horizontal screw at the head of the pendulum column; 5. Raise or lower the gun by means of the vertical screw, at the head of the pendulum column, until the point of contact is in the center of the circular face of the recoil-block. An assistant should now steady the butt in this position while the front adjustments are made; 6. Slide the front guide to a convenient point under the barrel and clamp it; 7. Raise the front guide until, when closed, the barrel hangs midway in it without touching: then, before clamping: 8. Rotate the front guide in a horizontal plane until the gun has the least perceptable lateral "inshake," at which position its vertical "inshake" also will be limited. Clamp the front guide in this position: 9. Bring the faces of the butt-guides nearly into contact with the butt. See that the butt-plate contact has not been deranged. Mark the position of the sling on the gun to facilitate readjustment. See that the index has been pushed back to 50: 10. Adjust the bridle.

The "bridle is not an essential element of the instrument, but only a convenient accessory. The return of the dynamometer spring inflicts a sharp blow on the gun, which would throw it forward and necessitate tedious readjustments after each shot. The bridle restrains this forward throw without materially interfering with the prime object of the instrument. Two forms of bridle accompany the instrument, one of which embraces the gun at the small of the stock by a leather collar, which is buckled back to a hook on the dynamometer by a leather strap; the other embraces the gun in front of the front sight by a metallic collar, similarly buckled back to the column of the front guide. The first form is the lighter and less objectionable, and can be used with all guns and carbines, except such as open by a lever, like the Sharp's arms. In a series of trials with the service rifle and ammunition the instrument gave a very uniform record of 98 pounds recoil. The pull of the trigger, in experiments for recoil, is canceled by the simple expedient of placing the thumb behind the guard-bow and *pinching together* the bow and the trigger while standing on the right of the gun.



RECOMMENDATIONS.—All members of any Court who concur in recommendations to mercy sign. The recommendation is introduced after the finding and sentence are closed and authenticated. The recommendation should distinctly set forth the reasons which prompt it.

RECONNOISSANCE.—There are no more important duties, which an officer may be called upon to perform, than those of collecting and arranging the information upon which either the general or daily operations of a campaign must be based. For the proper performance of the former, acquirements of a very high order, in the departments of geography and statistics, are indispensable requisites; to which must be added a minute acquaintance with topography, and a good *coup d'œil militaire* for that of the latter. However detailed and perfect may be a map, it can never convey all the information that will enable an officer to plan, even an ordinary march, with safety; still less, operations that necessarily depend, for their success, upon a far greater number of contingencies. To supply these deficiencies of maps, an examination of the ground must be made by the eye; and verbal information be gained on all the points connected with the operation over this ground. This examination and collection of facts is termed a *reconnoissance.*

From the services demanded of a reconnoitering officer, it is, in the first place, evident that he should possess acquirements of no ordinary character; but, in addition to these, he should be gifted by nature with certain traits, without which his acquisitions would be of little account in the discharge of the responsible duty in question. With clear and specific information before him, one-half of a General's difficulties, in planning his measures, are dissipated. In a letter from General Washington to Major Tallmadge, he remarks, in relation to reports made to him, on a certain occasion: "But these things, not being delivered with a certainty, rather perplex than form the judgment." It is in truth this feeling of certainty that constitutes all the difference; having it, the General makes his dispositions with confidence; without it, he acts hesitatingly; and thus communicates to others that want of confidence felt in his own mind. An officer, then, selected for the duty in question should be known to be cool-headed and *truthful;* one who sees things as they are, and tells clearly and precisely what he has seen. In making his report, whether verbally or in writing, the officer should study conciseness and precision of language. He must carefully separate what he knows, from his own observation, from that which he has learned from others; and add all the circumstances of place and time with accuracy.

The first thing to be done by an officer selected for any reconnoissance, is to ascertain *precisely* the duty required of him; and what further should be done in case of certain contingencies that may, from the nature of the duty, be naturally looked for. In the performance of the duty assigned him, and in making his report, the officer should keep always in mind the specific character of his mission, as his guide in both points. As the deed of a reconnoissance supposes a great deficiency in information upon the natural features of the country, the officer, detailed to make one, should provide himself with maps, a good telescope, such simple aids for judging of distances, and ascertaining the relative positions of objects, as he can himself readily make; writing materials; one or more good guides; and gain all the knowledge he can, from the inhabitants at hand, bearing upon his mission. The talent of judging of distances, and of the connection between the various features of a country within the field of vision, is partly a natural and partly an acquired one. Some individuals can never be brought to have any confidence in their own judgment on these points; others have a natural aptitude for them, which requires but little practice for their perfect development. The powers of the eye vary so greatly among civilized persons, that no general rules can be laid down as a guide for the matter in question. Among uncivilized hordes,used to a roaming life, there are found standards which are well understood by all, — the Arab, for instance, calling the distance a mile, at which a man is no longer distinguishable from a woman growing out of their habits. The first thing then to be done by an officer, in acquiring the *coup d'œil militaire*, is to learn, both from books and on the field, what space is taken up by a battalion and its intervals, by a squadron, and by a battery when in order of battle; how much when in column of march; and the average time required for certain movements, under given circumstances of the ground. This acquirement he may make by adopting some standard of his own: his ordinary pace, and that of a horse, serving for computing time and distance reciprocally. The next step is to acquire the habit of estimating, by the appearances of these different objects, from various points of view, how far off they are. This must be done practically. A very simple aid to it is the following: — Upon the stem of a lead-pencil, cut square, and held out at a uniform arm's length from the eye, by means of a thread attached to it and fastened to the top button-hole, let the officer mark off, on one of the edges, the length seen on it by holding the pencil upright between the eye, and a man placed successively at different distances from it, as 100, 150—1,000 yards. This will give one rough standard for practice.

Trustworthy guides are invaluable, but most rare, in an enemy's country. The best, from the information they acquire by their habits of life, are to be found among those classes whose avocations keep them much abroad, going from place to place within a certain sphere constantly; such as common carriers, hunters, smugglers, etc. Among the first things to be attended to by an officer,in taking post at any point, is to find out persons of this class, and to ascertain their whereabouts when wanted. Kind treatment, *douceurs*, and promises, should not be spared to enlist either their good will or their interests; and, if policy requires it, they may openly be treated with apparent harshness, to screen them from odium among their neighbors. If none of this class can be found, then resort must be had to a higher; local authorities being in preference selected, and if necessary forced to act. Here very careful treatment is requisite: when the necessity of the case is admitted by them, much may be gleaned by kindness, courtesy, and a certain deference, from such persons, that cannot be looked for from their inferiors.

Before starting on his mission, the officer should question his guide thoroughly; and if he has several, question each apart; like precautions should be taken with respect to other inhabitants. Care must be had to find out the usual beats of one taken as a guide, so as not to take him out of his own neighborhood. Should there be but one guide, he must necessarily be placed with the most advanced portion of the detachment accompanying the officer. It may be well to remark that guides are useful even in a country of easy communications; as, in case of a rencontre, they may point out by-ways convenient for retreat if necessary.

To designate all the objects to be embraced in a reconnoissance, would lead further than the limits of this article will allow; some general heads, which will serve as guides in all cases, will therefore be alone noticed. A general view of the ground to be examined must first be taken in, so as to obtain some notion of the forms of the parts, their connection, and relations to each other, before going into a detailed examination. To one possessed of some topographical knowledge, this study of what is before him will not demand much time. A level country, for example, he knows is usually well cultivated, and therefore has plenty of hedges, ditches, etc., which lend themselves well to affairs of light troops — may be not a little inconvenient to maneuvers of artillery — and frequently bring up cavalry very unexpectedly in full career. In a mountainous one, dangerous passes, narrow roads, torrents with rough beds, ugly sudden turns, etc., will necessarily be met with. Each and all of these demand a particular examination, and in his report their advantages and disadvantages should be clearly pointed out by the officer.

If the reconnoissance is for an onward movement; the distances from halt to halt, as well as all others, should be estimated in *hours of march*, the nature of the roads,and the obstacles along them be carefully detailed; the means that may be gathered along the line to facilitate the movement,as vehicles, men, and materials for removing obstacles, etc. The points where cross-roads are found, must be specified; the direction of these roads; their uses, etc. All local objects along the line, as villages, farm-houses, etc., should be carefully designated, both as to their position on the line, or on either side of it; and also as to their form, and color, etc., as "square white house on the right;" "round gray stone tower on hill to left." The names of localities, in the way in which the inhabitants pronounce them, should be carefully written, and called over several times, so as to be sure to get them as nearly as practicable right in sound; then the names, as written by an intelligent inhabitant, should be added. All halting points must be well looked to; their military capabilities, in case of attack; as well as their resources for accommodating the troops, be thoroughly gone into. If the halt is to take position for some time, to await or watch the enemy, then more care must be taken, the whole site be well studied as to its fulfilling the proposed end; the points of support on the flanks be designated, as well as others in front and rear, that may require to be occupied; the suitable localities to be chosen for parks, hospital, etc.; the communications to be opened or repaired, pointed out; and all the facilities either for an advance or a retrograde movement, be laid down. See *Armed Reconnoissance*, *Patrols*, and *Topographical Reconnoissance*.

RECORDER.— One who keeps a record; specifically, the officer who registers the proceedings of a Board or Minor Court.

RECORD OF FIRING.— A book is furnished to each post for the "*record of artillery*" and "*record of firing*." In the front of this book are printed instructions fully explaining how it is to be kept. Under appropriate headings, in the part set aside for record of artillery, each gun is described by its number and marks; when received and where from; whether mounted or dismounted; if mounted, in what part of the work, stating its platform number. The result of each inspection, made as hereinafter described, will be entered for each piece in this part of the book.

In the portion of the book devoted to record of firing, each piece has a separate page, which, when filled, is carried on to another. Each shot fired is duly recorded as to date of fire, kind and weight of projectile, kind and quantity of powder, elevation, time of flight, range, etc. When a piece is transferred from one post to another a complete record is sent with it, and the previous number of fires is entered in the book at the last post, so that the firing may not go beyond the limit prescribed as the endurance of the piece; this has been fixed at one thousand service rounds for cast-iron cannon.

RECORDS.—Official accounts or registers. All Military Records, such as files of public letters, letter-books, order-books, and other record-books, muster-rolls, etc., are the property of the Government, and are preserved for future reference in the settlement of claims against the Government and for other official purposes. Whenever posts, Districts, Geographical Departments, Divisions, and other commands, are discontinued, all such Records as are not required for use at the Department Headquarters in which the commands were included are immediately sent by express to the Adjutant General of the Army. Every person who wilfully destroys, or attempts to destroy, or with intent to steal or destroy, takes and carries away any Record, paper, or proceeding of a court of justice filed or deposited with any clerk or officer of such court, or any paper, or document, or Record filed or deposited in any public office; or with any judicial or public officer, without reference to the value of the Record, paper, document, or proceeding so taken, pays a fine of not more than two thousand dollars, or suffers imprisonment at hard labor, not more than three years, or both. Every officer having the custody of any Record, document, paper, or proceeding specified above who fraudulently takes away, or withdraws or destroys any such Record, document, paper, or proceeding filed in his office, or deposited with him, or in his custody, pays a fine of not more than two thousand dollars, or suffers imprisonment at hard labor not more than three years, or both; and moreover, forfeits his office, and is forever afterward disqualified from holding any office under the Government. The established printed forms and blanks of all muster-rolls and returns required from the Commanders of Divisions, Brigades Regiments, Corps, Companies, and Posts are furnished from the Adjutant General's Office on requistions made directly upon him. The receipt of these forms and blanks is immediately acknowledged. Officers keep these blanks under their own personal care, to guard against their being misapplied. The use of violet or other colored inks (except as carmine or red ink is used in annotation, indorsement, and ruling) is prohibited in the Records and correspondence of the army. Rules for keeping the principal Record-books at the different headquarters; forms for making rolls, returns, etc., lists of papers required from each command in the army, and of blank forms and books issued by the several Departments, are furnished the proper officers on application to the Adjutant General of the army. All officers and clerks on duty in the Bureaus of the War Department are prohibited from exhibiting any table, statement, or paper belonging to the official Records, or giving any information, copy, or extract from the same, or giving any information respecting the business of the Department to any person whatever not on duty in one of the offices of the Department, without, in each case, the authority, in writing, of the Chief of the Bureau concerned. A rigid compliance with this order is enforced, to prevent improper use of information irregularly obtained.

RECOVER.—In tactics, a word of command in firing, whereby the piece is brought from the position of *aim* to that of *ready*.

RECRUITING.—Formerly, in England, the task of raising recruits for the army was intrusted to the Colonels of Regiments, who employed civilian agents and others to persuade young men to join their standards; these agents often resorting to very illegal methods to entrap recruits. Subsequently, the duty was assigned to several Recruiting Corps, each known by the name of its Commanding Officer, but under this system, so many irregularities, and such difference of practice arose, that in 1802, for purposes of uniformity, economy, and proper control, it was decided to place the whole recruiting under the immediate direction of the Adjutant General. For this purpose, the country was divided into recruiting districts. At the head of each district was placed an Inspecting Field-officer, with the duty of superintending all recruiting parties in his district, and of approving the recruits brought. At the District Headquarters there was a Paymaster, responsible for all the financial concerns, and a Medical Officer, who examined the recruits in point of health and physical fitness. Recruiting parties used to consist of old Sergeants, who sought by every means to induce young men to enter the army; they frequented fairs, wakes, and country gatherings, endeavoring by beat of drum, smart uniforms, well-fed personal appearance, and persuasion—not always too truthful—to convince the rustics of the advantages of the Queen's Service; advantages which really existed, though not always to the extent depicted. The adoption in 1872-73 of the system of Regimental Localization changed all this. The United Kingdom is divided into 66 sub-districts, at the head of each of which is a Colonel, who commands the Brigade Depot, and the auxiliary and reserve forces of his subdistrict. He also controls the recruiting within his command, primarily, for the regiments composing the brigade; and secondly, for the rest of the Army. To preserve uniformity of action, the Colonels report on recruiting matters to the Inspector General of Recruiting, an official on the Staff at the War Office. On a would-be recruit presenting himself, the recruiter must ask him if he already belongs to the militia; if not, and he appear physically eligible, he is given a shilling, after which, should he abscond, he becomes a deserter. The Sergeant must then give the recruit 24 hours for consideration; afterward, but within 96 hours from his first enlistment, he must take him before a magistrate, when, if the recruit declare that he voluntarily enlists, the justice reads to him the Articles of War relative to desertion, and puts the questions detailed in the attestation. This done, the oath of allegiance is administered, and the man becomes definitely a soldier, receiving his free kit and bounty. The recruit may avow his dissent before the magistrate, when he must be forthwith discharged on returning the shilling, and paying twenty shillings as "smart" for the trouble he has given. False declarations as to age, previous service, health, etc., involve the recruit in various penalties. About 18,000 recruits are raised annually in time of peace for the British Army; but a larger number will be necessary, as enlistment for short service with the colors becomes more the rule.

In the United States, the recruiting service is conducted by the Adjutant General, under the direction of the Secretary of War and the Commander of the Army. Details for recruiting service are ordinarily for the period of two years. The Adjutant General details the field officers for Superintendents, and announces in Orders the number and grade of the company officers to be selected by the Commander of each regiment for the charge of recruiting parties. These officers are chosen irrespective of the roster, and with regard to their fitness for the duty. They are ordered by their Regimental Commanders to report in person to the Superintendents designated for their respective arms of service. Officers on the general recruiting service are not ordered on any other duty, except from the Adjutant General's Office. A recruiting party consists generally of one Lieutenant, one Non-commissioned officer, and not more than four privates. The parties are sent from the principal depots, and none but suitable men selected. The Adjutant General of the Army causes frequent inspections to be made of the recruiting depots and rendezvous, for the purpose of enforcing the regulations and orders governing enlistments, and especially to prevent the reception of men of bad character, and the illegal enlistment of minors into the service. Officers in charge of rendezvous will in no case absent themselves from their stations without authority from the Superintendent. Success in obtaining recruits depends much on the activity and *personal attention* of recruiting officers. They must not intrust to enlisted men the duties for which they alone are responsible, but must use every care to prevent the imposition of minors and bad men upon the service. Recruiting officers will not allow any man to be deceived or inveigled into the service by false representations, but will in person explain the nature of the service, the length of the term, the pay, clothing, rations, and other allowances to which a soldier is entitled by law, to every man before he signs the enlistment. See *Recruiting Depot*, *Recruits*, and *Superintendent of Recruiting Service*.

RECRUITING DEPOT.—A depot for the collection and instruction of recruits. These depots are established by orders from the Adjutant General's Office. To each *depot* there is assigned a suitable number of officers to command and instruct the recruits The recruits are *dressed in uniform* according to their respective arms, and are regularly mustered and inspected. They are well drilled in the Infantry Tactics, through the school of the soldier to that of the battalion, and in the exercise of field and garrison pieces. Duty is done according to the strict rules of service. Recruits are not put to any labor or work which would interfere with their instruction, nor are they employed otherwise than as soldiers, in the regular duties of garrison and camp. To give encouragement to the recruits, and hold out inducements to good conduct, the Commanding Officer of the Depot may promote such of them as exhibit the requisite qualifications to be *Lance Corporals* and *Lance Sergeants*, not exceeding the proper proportion to the number of recruits at the Depot. These appointments are announced in orders in the usual way, and are continued in force until they join their regiments, unless sooner revoked. No allowance of pay or emoluments is assigned to these appointments: they are only to be considered as recommendation to the Captains of companies and Colonels of regiments for the places in which the recruits may have acted; but such Non-commissioned officers are to be treated with all the respect and to have all the authority which belong to the stations of Sergeant and Corporal.

The General Superintendent causes such of the recruits as are found to possess a natural talent for music to be instructed (besides the drill of the soldier) on the fife, bugle, and drum, and other military instruments; and boys of sixteen years of age, and upward, may, under his direction, be enlisted for this purpose. Care is taken to enlist those only who have a natural talent for music, and, if practicable, they are taken on trial for some time before being enlisted. The posts used as Recruiting Depots are not to be made places of confinement for military prisoners. Whenever deserters from the Army are apprehended by, or come in custody of recruiting parties, they are sent to the depots, and thence, at the earliest opportunity, forwarded for trial to their regiments, where the witnesses in their cases should be. When trial by General Court-Martial of prisoners belonging to or under charge of the recruiting service becomes necessary, the charges are forwarded, through the Superintendent, to the Adjutant General of the Army, with a list of the officers available for duty on the Court. *Recruiting parties* and recruits are mustered, inspected, and paid in the same manner as are other soldiers. The number of recruits at depots to be assigned to each arm and regiment is directed from the Adjutant General's Office. As soon as a recruit joins any recruiting depot, regiment, or station, he is examined by the Medical Officer, and vaccinated when it is required.

The Boards of Inspection at recruiting depots reject any man found to have borne an unsatisfactory character on any previous enlistment, or who has shown such character since enlistment. In all cases of *rejection*, the reasons therefor are stated at large in a special *report*, made by the Board, which also shows when, where, and by whom the recruit was enlisted. This report, together with the Surgeon's certificate of disability for service, is forwarded by the Superintendent or Commandant, of the post direct to the Adjutant General. In all such cases the Commanding Officer causes the articles of clothing which may have been issued to the recruit, with the price of each article, to be indorsed on the certificates of disability. If the recommendation of the Board for the discharge of the recruit be approved, the authority therefor is indorsed on the certificate, which is sent back to be filled up and signed by the Commanding Officer, who returns the same to the Adjutant General's office. The Board states in the report whether the disability, or other cause of rejection, existed before his enlistment; and whether, with *proper care and examination*, it might not have been discovered. In all other cases the Superintendent or Commanding Officer causes an extract from the proceedings of the Board of Inspection to be furnished the officer making the enlistment. Upon receipt of this extract the officer promptly renders a special report in explanation to the Adjutant General.

An officer intrusted with the command of recruits ordered to regiments, on arriving at the place of destination, forwards the following papers: 1. To the *Adjutant General* and *Superintendent*, each, a discriptive roll and an account of clothing of such men as may have deserted, died, or been left on the route from any cause whatever, with date and place also, a special report of the date of his arrival at the post, the strength and condition of the party when turned over to the Commanding Officer, and all circumstances worthy of remark which may have occurred on the march. To the *Commanding Officer* of the regiment or post, the muster and descriptive roll furnished him at the time of setting out, properly signed and completed by recording the names of the recruits *present*, and by noting in the column for remarks, opposite the appropriate spaces, the time and place of death, desertion, apprehension, or other casualty that may have occurred on the route. See *Recruiting*, *Recruits*, and *Superintendent of Recruiting Service*.

RECRUITS.—Men raised for service in the army, to fill vacancies in regiments or to augment the strength of the Army. In the United States, any male person above the age of sixteen and under the age of thirty-five years, effective, able-bodied, sober, free from disease, of good character and habits, and with a competent knowledge of the English language, may be enlisted, due attention being given to the restrictions concerning minors. This regulation, so far as respects age, does not extend to soldiers who may re-enlist, or who have served honestly and faithfully a previous enlistment in the army. Men having the appearance of being hard drinkers are rejected, though they may not at the time be intoxicated. No man having a wife or minor child can be enlisted or re-enlisted without special authority from the Adjutant General's office. If minors present themselves, they are to be treated with great candor; the names and residences of their parents or guardians, if they have any, are ascertained, and these are informed of the minor's wish to enlist, that they may make objections or give their consent. No person under the age of twenty-one years can be enlisted or re-enlisted without the written consent of his parents or guardians, provided that such minor has parents or guardians entitled to his custody and control. Recruiting Officers are very particular in ascertaining the true age of the recruit. If *any doubt* exist as to the age of the applicant, his oath is not taken as the *sole* evidence of *legal* age; and if he cannot, in addition, furnish undoubted proof of the fact, he will not be accepted. The law forbids the enlistment of boys under sixteen years of age; of all insane or intoxicated persons; of deserters from the military or naval service of the United States; and of all persons who have been convicted of felony. Minors under eighteen years are not enlisted except for musicians, or to learn music, and then only under authority from the Superintendent. In every case of a recruit rejected, or discharged as a minor, when it appears that the enlistment was carelessly made in violation of Regulations, recommendation is made that the expenses incurred by the Government in consequence thereof shall be stopped against the pay of the Recruiting Officer.

After the nature of the service and terms of enlistment have been fairly explained to the recruit, the officer, before the enlistments are filled up, will read to him, and offer for his signature the annexed declaration, to be appended to each copy of his enlistment:

I, ——— ———, desiring to enlist in the Army of the United States for the period of five years, do declare that I am —— years and —— months of age; that I have neither wife nor child; that I have never been discharged from the United States service on account of disability, or by sentence of a Court-Martial, or by order before the expiration of a term of enlistment; and I know of no impediment to my serving honestly and faithfully as a soldier for five years. ——— ———.

Witness:

——— ———

If the recruit be a minor, his parents or guardian must sign a consent to his enlisting, which is added to the preceding declaration, in the following form:

I, ——— ———, do certify that I am the (*father, only surviving parent, or guardian, as the case may be*) of ——— ———: that the said ——— ——— is ——— years of age; and I do hereby freely give my consent to his enlisting as a soldier in the Army of the United States for the period of five years.

——— ———.

Witness:

——— ———

The forms of declaration, and of consent in case of a minor, having been signed and witnessed, the recruit is then duly examined by the Recruiting Officer and Surgeon, if one be present, and, if accepted, the 47th and 103d Articles of war are read to him: after which he is allowed time to consider the subject until his mind appears to be fully made up before the oath is administered to him.

As soon as practicable, and at least within six days after his enlistment, the following oath is administered to the recruit:

STATE OF———,
Town of———, *ss:*

I,——— ———born in———,in the State of———, and by occupation a———,do hereby acknowledge to have voluntarily enlisted [or re-enlisted] this—— day of———, 18—, as a soldier in the Army of the United States of America for the period of ——— years, unless sooner discharged by proper authority, and do also agree to accept from the United States such bounty, pay, rations, and clothing as are or may be established by law; and I do solemnly swear that I am ——— years and ——— months of age, and know of no impediment to my serving honestly and faithfully as a soldier for ——— years, under this enlistment contract with the United States. And I, ——— ———, do solemnly swear (or affirm) that I will bear true faith and allegiance to the United States of America; that I will serve them honestly and faithfully against all their enemies whomsoever; and that I will obey the orders of the President of the United States, and the orders of the officers appointed over me, according to the Rules and Articles of War.

——— ———. [SEAL.]

Subscribed and sworn to before me this —— day of ———, 18—.

———,
———,
Recruiting Officer.

This oath may be administered by any Commissioned Officer of the army.

The Medical Officer (when one is provided) next examines the recruit. When there is no Medical Officer, the Recruiting Officer personally makes this examination. The recruit is examined stripped, to see that he has free use of all his limbs; that his chest is ample; that his hearing, vision, and speech are perfect; that he has no tumors or ulcerated or extensively cicatrized legs; no rupture or chronic cutaneous affection; that he has not received any contusion, or wound of the head, that may impair his faculties; that he is not a drunkard; is not subject to convulsions; and has no infectious disorder, nor any other that may unfit him for military service.

In accepting recruits at rendezvous, the following instructions govern in examining the eye:

1. No recruit shall be enlisted who cannot see well, at six hundred yards' distance, a black centre three feet in diameter on a white ground. The test will be made by means of cards, prepared under the direction of the Surgeon General of the army; the black spots on the cards will be circular, four-tenths of an inch in diameter, and the recruit must be able to count them with facility at twenty feet distance.

2. *Anomalies in the refraction of the eye.*—The principal anomalies in the refraction of the eye are myopia, hypermetropia, and astigmatism. These anomalies, if unaccompanied by disease of the eye, are not to be regarded as a cause for the rejection of a recruit, unless they impair the vision to such a degree as to prevent him from counting the test-spots described in the last paragraph at the distance named. *Myopia* (near-sightedness) is a refractive defect of the eye in which parallel rays falling upon the cornea are brought to a focus before they reach the retina. *Hypermetropia* (over-sightedness)is a refractive defect of the eye in which parallel rays falling upon the cornea are not yet brought to a focus when they reach the retina. *Astigmatism* is a refractive defect in which when parallel rays fall upon the cornea they are not brought to a focus in the same plane for all the meridians of the eye. The character and approximately the degree of these defects can be ascertained by the spectacles and test-types which will be issued for this purpose by the Surgeon General of the army, on requisition from the Medical Officers.

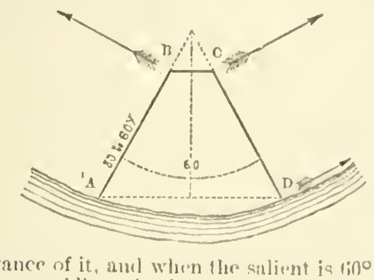
3. *Presbyopia* is not a refractive anomaly, but a condition due to a diminution in the accommodation of the eye, resulting from advancing age Vision for distant objects remains normal, while that for near objects is impaired. This defect is not of itself a cause for the rejection of a recruit, but those in whom it exists are usually over age. The existence of the defect can be ascertained by the test-types referred to in the preceding paragraph.

4. *Color-blindness.*—At the principal recruiting depots all the accepted recruits are examined for color-blindness by the Medical Officers on duty. Any defect observed is noted on the descriptive list of the soldier, but does not of itself constitute a cause of rejection, except in the case of enlistments for the Signal Corps. The examination for this defect is made by the method of Holmgren. Test-wools for the purpose, accompanied by printed directions for their use, are issued to the principal recruiting depots by the Surgeon General. See *Recruiting, Recruiting Depot*, and *Superintendent of Recruiting Service.*

RECURSANT.—In Heraldry, moving or coursing backward; said—of an eagle displayed with the back towards the spectator's face.

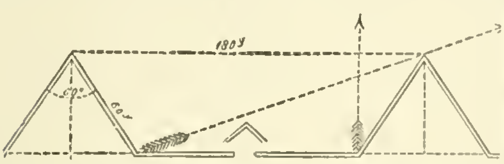
REDAN.—The simplest work in Field Fortification. It consists of two parapets whose faces join in forming a salient angle toward the enemy, like a letter V, in which the apex is to the front. Regarded by itself, the redan is a work of very little strength, since there is no flanking fire to protect its faces, and nothing to prevent an enemy from forcing an entrance at the gorge; but redans are useful in many positions, and the rapidity with which they may be constructed, render them favorites with engineers and generals. A row of redans along an exposed front of an army adds much to its strength,the troops behind protecting the gorge, and the redans flanking each other. It forms an excellent defense for a bridge-head, the gorge being covered by the river. Redans figured largely in Wellington's works for defending Lisbon in 1810. The redan of Sebastopol in 1855 was the principal point of the English attack, and the scene of two bloody repulses by the Russians in June and September.

The faces of the redan should receive direction such as to sweep the approaches to the flanks of the position. From the angular point but a single line of direct fire can be brought to bear on the sector



in advance of it, and when the salient is 60° or less, only a very oblique fire from the faces can be brought upon this sector, which becomes thus a sector without fire for the assailed. To remedy this, a portion of the salient is filled in so as to form a short defensive line perpendicular to the capital. This line is termed a *pan-coupée*, and gives a direct fire in the direction of the capital prolonged outwards. See *Field-works*.

REDAN LINE.—The simplest arrangement for a continued line consists in a series of redans connected by straight curtains. The faces of the redans are sixty yards in length; their salient angles 60°; and the distance between their capitals 180 yards. This combination will place the salients at 160 yards from the



collateral reenterings. An inspection of this system shows that the ditches are not flanked; that the salients are not well protected, owing to the cross-fire leaving a considerable sector without fire in front of them; that the curtains, which, from their position, are the strongest points, are the best defended, and in turn they afford no protection to the faces. All these defects become more sensible as the redans are placed further apart. See *Lines*.

RED COAT.—An English soldier, or a soldier who wears a red coat.

RED FLAG.—A flag used by Revolutionists as an emblem of defiance. It is used in the United States service as a danger-signal at target practice, and on a man-of-war as a signal that the ship is receiving or discharging her powder. See *Flags*.

RED HAND.—In Heraldry, a sinister hand erect, open, and couped or, the wrist gules, being the arms of the province of Ulster, was granted to the baronets of England and of Ireland as their distinguishing badge on the institution of that order in 1611, and is borne by the baronets of Great Britain and of the United Kingdom. It is assumed into the armorial coat, and may be borne upon a canton, or on an escutcheon, which may be placed either in the middle chief or in the fess point, so as least to interfere with the charges composing the family arms.

RED-HOT SHOT. Cannon-balls heated to redness, and fired from cannon at shipping, magazines, wooden buildings, etc., to combine destruction by fire with battering by concussion. In the great bombardment of Gibraltar, on Sept. 13 and 14, 1782, red-hot shot was used with great effect by the defenders under the Governor General Elliott, the attacking squadron being completely silenced and a large number of ships set on fire.

REDOUBT.—A small fort of varying shape constructed for a temporary purpose, and usually without flanking defenses. The term is vague in its acceptation, being applied equally to detached posts and to a strong position within another fortress. Redoubts are made square, pentagonal, and even circular. Each redoubt has parapet, ditch, scarps, banquette, etc., as in regular fortifications; but it is commonly rather roughly constructed, haste and unprofessional labor precluding mathematical accuracy. The entrance may be by a cutting through the parapet, the cutting being covered within by a traverse, or preferably, by an excavated gallery leading into the ditch, and thence by a ramp through the counterscarp. For the sake of flanking the ditch, and preventing an assaulting party from forming in it, caponnieres of timber, loopholed, are sometimes formed; or, if the soil be stiff or chalky, a gallery may be cut behind the counterscarp and loopholed toward the ditch. In some modern redoubts the line of each side is broken to afford flanking defense. Redoubts have the weak feature of not defending their own ditches, and of being approached at their salient angles with comparative impunity. They are therefore not adapted to a protracted defense, but as temporary field works, or in a war of posts, they are often of incalculable importance. Troops whose stability in the open field is doubtful are especially strengthened by redoubts in their line. Redoubts are particularly useful in fortifying the tops of hills, or commanding passes, or where the object is to occupy a hostile territory, or to feel the way gradually through a wooded country. The size to be given to a redoubt, or generally to any inclosed work, will depend upon the number of men available for its defense, taking it as an established rule that it is better to have a force concentrated than too much distributed, and therefore injudicious to make works of a greater extent than can be well manned and vigorously defended. The number of men will depend upon the particular circumstances of the case; as, for instance, its situation with regard to distance from the enemy; whether it is likely to be attacked by a powerful force or only by raiding parties; whether it is of such vital importance as to require it to be held at all hazards, and its distance from supporting force.

In permanent fortification, the term redoubt, or *reduit*, is applied to the outworks placed within other outworks; their object being to strengthen the defense of the principal work. A work of this class is usually placed within the demi-lune, and is termed the *demi-lune redoubt*. Small works of this kind are also placed in the salient and re-entering places-of-arms of the covered-way, and are termed the *redoubt of the salient, or re-entering place-of-arms*. These redoubts are in some cases simple earthen works; in others they are revetted; and in others casemated both for the service of artillery and small-arms. See *Inclosed Works*, and *Outworks*.

REDOUBT OF THE RE-ENTERING PLACE OF ARMS. The object of this redoubt is to strengthen the covered-way and sweep with its fire the enemy's establishments on the glacis of the demi-lune. The redoubt being directly in front of the bastion-face, its relief should be reduced that the fire of this face may not be too much masked. To effect this, we commence by establishing the bottom of its ditch, so that the point of it nearest the bastion may just be seen by the musketry fire of the face; we then adopt nearly a minimum relief of scarp wall; finally, we arrange the interior crest of one face, so as to allow no exterior slope at one extremity and make the other at the salient 2 feet higher. This slope of 2 feet, and the direction given to the scale of declivity of the interior crest, determine a plane of defilement for the redoubt, the prolongation of which will pass at about 3 feet above the salients of the two demi-lunes, which are symmetrically situated with respect to the bastion capital. This is done in accordance with a principle generally adopted, that when one work is less advanced than another, and commanded by it, the plane of its interior crest prolonged should pass 3 feet above the points which the enemy can occupy on the advanced work—which, from the nature of the attack, must first fall into his possession—so that he may not have a plunging fire into the retired work, from his establishments, which are generally about 3 feet above the parapet of the work occupied.

On account of the ditch between the tenaille and the enceinte flank, a breach might be opened in the curtain, by means of a battery, established on the glacis of the re-entering place-of-arms, if there was no mask beeween the ditch referred to and this glacis. By placing the angle of the redoubt on the line drawn through the extremity of the curtain and the extreme of the dem-lune, it is readily seen that these two works so combined cover the opening left by the ditch. The means here resorted to is of frequent use in fortification; and the problem may be thus stated: a line being given, which is partially covered by an existing mass, from fires in a given direction, to interpose another mass, which combined with the first, shall entirely mask the given line. See *Noizet System of Fortification.*

REDRESSING WRONGS.—If any officer shall think himself wronged by his Colonel, or the Commanding Officer of the Regiment, and shall, upon due application being made to him, be refused redress, he may complain to the General, commanding in the State or Territory where such Regiment shall be stationed, in order to obtain justice; who is required to examine into the said complaint, and take proper measures for redressing the wrong complained of, and transmit, as soon as possible, to the Department of War, a true state of such complaint, with the proceedings had thereon. If any inferior officer or soldier shall think himself wronged by his Captain or other officer, he is to complain thereof to the Commanding Officer of the Regiment, who is required to summon a Regimental Court-Martial for the doing of justice to the complainant: from which Regimental Court-Martial, either party may, if he thinks himself still aggrieved, appeal to a general Court-Martial. But if, upon a second hearing, the appeal shall appear vexatious and groundless, the person so appealing, shall be punished at the discretion of the said Court-Martial.

RED SHORT IRON.—Iron which is difficult to weld and is brittle when heated is said to be *red-short* or *hot-short.* This defect is due to the presence of sulphur.

RED TAPE.—The tape used in Public Offices for tying up documents, etc.: hence, official formality.

REDUCE. This term is used in various military senses. *To reduce a place*, is to oblige the commander to surrender it to the besiegers, by capitulation. *To reduce the square*, is to restore or bring back a battalion or battalions, which have been formed in a hollow or oblong square, to their natural situation in line or column. *To reduce to the ranks*, is to degrade, for misconduct, to the station of a private soldier. *Reduced*, in its ordinary sense, is to be taken off the establishment, and to cease to receive pay as soldiers. When a regiment is reduced, the officers are generally put upon half-pay. Sometimes the corps are reduced, and the officers remain upon full pay. This happens at the close of a war, when the standing army of the country is confined to a certain number of battalions. Hence is derived the expression *in* and *out* of the *break.*

REDUIT. In fortification, a central or retired work within any other work, intended to afford the garrison a last retreat, whence they may capitulate. It is commonly of masonry, loopholed, and often circular. Many engineers doubt the use of reduits altogether, as blocking up the working space, being themselves inconvenient for the men, and incapable of protracted defense, while they frequently mask the fire of other works more to the rear.

REDUCTION OF METALS.—A metal is said to be reduced to its metallic state when it is separated from the condition of a chemical compound in which it exists as an ore. This is generally effected either by the direct action of heat, or by heating the compound along with a *reducing agent.* Thus, when oxide of mercury is simply heated, the oxygen is given off as gas, and mercury or quicksilver appears as metal. Again, when sulphuret of lead is heated with iron, sulphuret of iron is formed, and the lead is reduced to its metallic state. In this case the iron is the reducing agent. The principal reducing agent employed in metallurgy is carbon, or rather the gas carbonic oxide, which is formed under certain conditions when carbon is burned. See *Iron*, and *Metallurgy.*

RE-ENLISTMENT.—A renewed enlistment. In the United States Army, any Non-commissioned Officer, musician or private, who re-enlists within one month after the date of discharge from first enlistment, receives $2 per month in addition to the monthly pay he was receiving prior to discharge; and also $1 per month additional after each subsequent re-enlistment so long as he shall remain continnonsly in the army.

RE-ENTERING ANGLE.—In fortification, an angle in the line of works of which the apex points away from the front. As an example, the flanks of a bastion make re-entering angles with the adjoining curtains. Advantage is commonly taken of the comparatively sheltered position of these angles to form *Places d'Armes* for the assembly of troops. See *Angle.*

RE-ENTERING ORDER OF BATTLE.—An order of battle, the front of the army forming a re-entering or inclosing angle, and the reverse of the salient formation. This order presents many advantages, as it can inclose the enemy, and shake morally and physically the troops which form the angle of the salient, by their rear being threatened and their retreat cut off.

RE-ENTERING PLACE OF ARMS.—Enlargements in the covered-way, at the re-entering angles of the counterscarp; this space is formed by setting off demi-gorges of 30 yards (more or less), and making the spaces form angles of 100° with the adjoining branches of the covered way.

REEVE.—A word used in speaking of ropes, signifies the passing of a rope through any hole, dead-eye, block, or pulley, in conjunction with which it is to be used. See *Cordage.*

REFINING OF METALS.—The last operation connected with the smelting of copper, tin, lead, and some other metals, is usually called the refining process. With copper, for example, the impure or blister copper, containing from 95 to 98 per cent. of the metal, alloyed usually with small quantities of iron, tin, antimony, etc., is melted in a refining furnace, and exposed to the oxidizing influence of the air. By this means, the foreign metals present become oxidized, and rise to the surface as slag, which is skimmed off; the oxide of copper, formed during the process, being afterwards reduced by throwing coal on the surface of the melted metal, and stirring with a pole of green wood. The disengagement of gases from the wood during the "poling" causes the metal to splash about, and so expose every portion of it to the reducing action of the coal; thus the oxide of copper is deprived of its oxygen, and the copper rendered nearly pure. Tin is also refined by throwing billets of green wood into it while in a melted state, which has the effect of bringing impurities to the surface as froth, in a somewhat similar way to the oxidizing of foreign metals in copper. Lead is purified from antimony and tin by an analogous mode of oxidation, and silver is separated from it by a special process. The refining of iron is a name applied to the process for partially separating the carbon from cast-iron, and is described under IRON. Of the less important metals used in the arts, zinc, antimony, and mercury do not usually undergo any special refining process; aluminium, it is said, will not afterwards purify when once reduced to the metallic state; and nickel, of which German silver is largely composed, is refined by a process or processes kept strictly secret by manufacturers. We may state here that no metal is ever quite pure in its commercial state, even though it has gone through the usual operation of refining, but all are to a certain extent alloyed with certain others. For the great majority of purposes, it is not necessary that metals should be chemically pure, and when it is, they can only be made so by refined chemical processes. It will be readily understood, however, that it is always necessary to carry the refining of gold and silver further than the less valuable metals. To render gold sufficiently pure for manufacture into coin, an ingenious process has, within the last few years, been proposed, by which fused gold is mixed with about 10 per cent. of black oxide of copper, and then stirred so as to oxidize any foreign metals which happen to be present. The oxide of copper does not fuse, but is disseminated through the melted metal, and oxidizes any tin, antimony, or arsenic, and causes them to rise to the surface, so that they may be skimmed off. Perfectly pure gold is prepared by dissolving the metal in aqua-regia—a mixture of nitric and hydrochloric acids—and precipitating silver (with which it is almost always alloyed) as well as any other foreign metals by chemicals which have no action on the solution of gold. The metallic gold is afterwards precipitated as a finely-divided powder, by a salt of iron, and is then fused and cast into bars. Silver is rendered pure by dissolving it in nitric acid, filtering the solution, and then precipitating the metal with common salt as a chloride of silver. This is afterwards mixed with sulphuric acid, and then, by introducing bars of zinc, a chloride of zinc is formed, whilst the silver is readily reduced to the metallic state.

REFLECTING SIGHTS.—Guns are laid with *reflecting sights* when the size of the port in a casemate is not large enough to use the ordinary sights, or when it is desirable to protect the men employed in aligning the sights from the enemy's fire. Several methods of using them are employed.

In the first plan, the sights are very similar to those usually employed, but they are both placed on the thinner part of the gun in front of the trunnions. And as there is not room for a man's head to be placed behind the tangent scale, on account of the coils of the gun, a small mirror on a moveable socket is placed just behind the tangent scale notch, and the man who lays the gun stands at some convenient position at the side of the muzzle, and aligns the sights in the mirror exactly as he would do in laying direct. He is well protected from the enemy's fire.

In the second plan, which is adopted in Moncrieff's protected barbette system, in addition to a set of direct sights, a mirror at the breech, set at an angle, with a cross cut on it is used in conjunction with a notch, which slides in a graduated vertical groove at the trunnions. The trunnion notch is first adjusted to the required elevation, and a man below then looks up at the mirror, and the gun is moved until by reflection the distant and the trunnion-sight notch coincide with the intersection of the lines cut on the glass.

Another plan is to have one mirror set at an angle attached to a trunnion, so that the distant object is reflected on to another mirror, which slides under cover in a graduated slot in the side of the elevator. The gun is laid by sliding the lower mirror to a certain graduation (required by the range) on the slot, and then moving the gun till the distant object is seen reflected in the lower mirror covering the intersection of cross-lines, which are cut on both the mirrors.

Reflecting sights have the disadvantage of a limited field of view, which may cause delay in finding the object in the mirror, even when the gun is approximately brought into the correct line before using these sights; and reflection, especially when double causes indistinctness, particularly at long ranges.

REFORMADO.—An officer, formerly so called, who for some disgrace was deprived of his command, but retained his rank, and perhaps his pay.

REFORMED.—In a military sense, after some maneuver or evolution, to bring a line to its natural order, by aligning it on some given point. Also, to restore order among broken troops.

REFORMED OFFICER.—In the British Army, one whose troops or company being broken up, is continued on full or half-pay. He preserves the right of seniority, and continues in the way of preferment by brevet.

REFUSE.—A military term, signifying to throw back, or to keep back out of the regular alignment which is formed when troops are upon the point of engaging the enemy. Thus it is said in the oblique order of battle, that if the right flank attacks, the left must be *refused*.

REGALIA.—The ensigns of royalty, including more particularly the apparatus of a coronation. The regalia of England were, prior to the Reformation, in the keeping of the Monks of Westminster Abbey, and they are still presented to the Sovereign at the coronation by the Dean and Prebendaries of that Church. During the Civil War the Crown and most of the regalia fell victims to Puritan zeal; and on the restoration of the Royal Family, new ensigns had to be made for the coronation of Charles II., which, with occasional alterations and repairs, have continued in use down to the present day. The regalia, strictly so called, consist of the crown, the scepter with the cross, the verge or rod with the dove, the so-called staff of Edward the Confessor (made in reality for Charles II.,) the blunt sword of mercy called Curtana, the two sharp swords of justice, spiritual and temporal, the ampulla or receptacle for the coronation oil, the anointing spoon (probably the only existing relic of the old regalia), the armillae or bracelets, the spurs of chivalry, and various royal vestments. All these, with the exception of the vestments, are now exhibited in the jewel-room in the Tower of London, in which are also a smaller crown, scepter, and orb for the coronation of a Queen Consort, two other Queen Consorts scepters—one of ivory, made for Marie d'Este; and the state crown of silver and diamonds, which was used at the coronation of Queen Victoria, containing a large ruby and sapphire, the former said to have been worn by Edward the Black Prince. The Prince of Wales' crown of gold, which is without stones, is modern.

The proper regalia of Scotland consist of the crown, the scepter, and the sword of state. The crown probably belongs to the time of Robert Bruce, and is adorned with crosses and fleurs de lis alternately. It was originally an open crown, but two concentric arches were added in the reign of James V., surmounted at the point of intersection by a mound of gold and a large cross patée. The scepter is of the time of James V.; the sword was a present from Pope Julius II. to James IV. in 1507. During the Civil War the regalia were removed by the Earl Marischal for safe custody from the crown-room of Edinburgh Castle, their usual place of deposit, to his Castle of Dunnottar; and while Dunnottar was besieged by the parliamentary army, the regalia were preserved by being conveyed by stratagem to the Manse of Kinneff, by the wife of Ogilvy of Barras, the Lieutenant Governor, and the wife of the Minister of Kinneff. From the restoration to the union the regalia continued to be kept in the crown-room as formerly; at the beginning of each session they were delivered to the Earl Marischal or his Deputy, in whose custody they remained while Parliament was sitting, and were afterward restored to the charge of the Treasurer. William, ninth Earl Marischal, who opposed the Treaty of Union in all its stages, declined to witness its consummation, but appeared by his Deputy, who took a written protest that the regalia should not be removed from the Castle of Edinburgh without warning given to him or his successor in office. From that time till 1818, the regalia remained locked in a chest in the crown-room, away from public gaze. On Feb. 4, 1818, an order being obtained by warrant under the sign-manual of George IV., then the Prince Regent, the chest was broken open, and the crown, sword, and scepter were found as they had been deposited at the union, along with a silver rod of office, supposed to be that of the Lord High Treasurer. They are now in the charge of the Officers of State for Scotland, as commissioners for the custody of regalia, and are exhibited in the crown-room, along with a ruby ring set with diamonds, worn by Charles I. at his coronation at Holyrood in 1633; the golden collar of the garter, sent by Elizabeth to James VI.; the St. George and dragon, or badge of the order of the garter; and the badge of the order of the thistle, with figures of St. Andrew and Anne of Denmark, set in diamonds. These latter insignia were bequeathed by Cardinal York, the last of the Stuarts, to George IV., and sent to Edinburgh Castle in 1830 by the special order of William IV

REGAN CARTRIDGE-BELT.—This belt is intended to carry from thirty-five to forty cartridges, arranged so as to have five in each division. The thimbles are sewed to the belt. Between each division of five cartridges is a space of about half an inch, designed to allow the covers to project a little beyond the extreme cartridges in each division. In one of these spaces is a little oblong pocket, like a spectacle-case, for screw-driver. In the second space, on either side of the front of the belt, is a buckle, which is riveted to the belt, and designed to fasten the cross-belts. On each side of the center division of thimbles on the back part of the belt are two other buckles, to fasten the cross-belts on behind. To each division of five cartridges is arranged a little cover for the cartridges, to prevent them from being lost by dropping out, fastened by a small brass knob, adjusted to the center thimble of each division of cartridges. A strap and buckle, to support the bayonet scabbard, is sewed on inside of the belt on the left side. Cross-belts are attached to the waist-belt, to remove the weight from the waist, and these are so arranged as to carry a blanket and a change of underclothing.

REGARDANT.—A term used in Heraldry with reference to an animal whose head is turned backward. See *Passant* and *Rampant*.

REGIMENT. In all modern armies, a regiment is a Colonel's command, and the largest *permanent* association of soldiers. Regiments may be combined into brigades, brigades into divisions, and divisions into armies; but these combinations are but temporary, while in the regiment the same officers serve continually, and in command of the same body of men. The strength of a regiment may vary greatly even in the same army, as each may comprise any number of battalions. French and Austrian regiments have ordinarily 4 to 6 battalions. Among British infantry, the smallest regiments are those numbered from the 26th upward (except the 60th), which have 600 men each, composing one battalion. The 60th and rifle brigade comprise each 4 battalions. The whole artillery force is comprised in one regiment. The strength of a regiment is changed from time to time; usually by the addition or withdrawal of private soldiers. The present plan would be, in case of war, to raise the skeleton regiment to war strength by calling in men from the army reserve.

The regimental system could only exist where standing armies are maintained. Accordingly, the Macedonian syntagmata and the Roman cohorts were evidently regiments in a strict sense. During the Middle Ages, feudal organization precluded the system, and its first reappearance was in France. Francis I. formed legions of 6,000 men each, which were divided into independent companies, the latter being, in fact, battalions, and each legion a regiment. The word regiment began to be applied to bodies of British troops in Elizabeth's reign; regiments are spoken of at the time of the Armada, 1588, and as composing the force in Ireland in 1598. From that time forward, the army and militia of Britain have been organized into regiments. Charles I. and the parliament each raised regiments, all of which were disbanded at the restoration, with the exception of the Lord General's Regiment of Foot, and his Life-Guard of Horse. These two were re-engaged (1661), and form the present Coldstream Guards and Royal Horse-Guards. In the same year, a Scotch corps of 1700 men, which had taken service in France in the time of James I., returned to England, and was included in the British Army as the 1st foot. Other regiments of infantry were gradually raised as required. In 1693 was raised the first troop of horse Grenadier Guards, and the 2d troop in 1702. These were disbanded in 1782, and reformed as the 1st and 2d Life-Guards, which still exist. Besides Cavalry and Infantry, the British Army comprises the Regiment of Artillery, and the Corps of Royal Engineers, and military train.

The total Regiments of the British Army for the year 1876-77 (and substantially the same at present) were:

		Regiments.	Officers and Men.
Life Guards		2	868
Horse-Guards (Blues)		1	434
Cavalry of the Line—			
Dragoon Guards	7		
Dragoons	3	28	15,973
Hussars	13		
Lancers	5		
Horse Artillery		1	5,633 in 6 brigades.
Foot Artillery			29,291 in 26 brigades.
Royal Engineers		1	5,710
Foot Guards		3	5,950 in 7 battalions.
Infantry of the Line		110	119,483 in 141 battalions.
Army Hospital Corps		1	1,574
Army Service Corps		1	3,014
West India Regiments (black troops)		2	1,832 in 2 battalions.
Colonial Corps		1	649 in 1 battalion.
Total		151	190,411

Each regiment is nominally commanded by a Colonel, who is an old General Officer, and whose office is merely a sinecure. The real command, however rests with the Lieutenant Colonel, in each battalion, who is assisted by a Major and has for a Staff an Adjutant, one Quartermaster, one Paymaster, and one Surgeon. The regiment or battallion is divided into companies in the Infantry, Engineers, and Army Service Corps; and into troops in the Cavalry. The Artillery is divided into 30 brigades, each of which is as large as an ordinary regiment. The brigade is subdivided into batteries, which are the working units. The working officers are Captain and two Lieutenants to each infantry company or cavalry troop; Major, Captain, three Lieutenants per battery of artillery.

The following is the present organization of regiments and companies in the United States Army:

		Colonel.	Lieutenant Colonel.	Majors.	Adjutant (Extra Lieutenant).	Regimental Quartermaster (Extra Lieutenant).	Battalion Adjutant.	Battalion Quartermaster.	Captains.	First Lieutenants.	Second Lieutenants.	Chaplain.	Sergeant Major.	Quartermaster Sergeant.	Total enlisted.	Aggregate.
1	Ten Regiments of Cavalry—each	1	1	3	1	1	...	...	12	12	12	1	1	1	797	841
2	Troop of Cavalry	...	...	...	...	...	...	...	1	1	1	...	...	...	66	69
3	Five regiments of Artillery—each	1	1	3	1	1	...	...	12	24	13	...	1	1	525	581
4	Light battery of Artillery	...	...	...	...	...	...	...	1	2	2	...	...	...	80	85
5	Battery of Artillery	...	...	...	...	...	...	...	1	2	1	...	...	...	40	44
6	Twenty-five Regiments of Infantry—each	1	1	1	1	1	...	...	10	10	10	1	1	1	505	541
7	Company of Infantry	...	...	...	...	...	...	...	1	1	1	...	...	...	50	53
8	Engineer Battalion	...	1	...	...	...	1	1	5	5	5	...	...	...	200	216
9	Two Companies—each	...	...	...	...	...	...	...	1	1	1	...	...	...	50	53
10	Two Companies—each	...	...	...	...	...	...	...	1	1	1	...	...	...	49	52

On the organization of a regiment, the batteries of artillery, companies of infantry, and troops of cavalry are permanently designated by letters in alphabetical order. Officers in the first instance are assigned to these subdivisions, and afterward succeed thereto as promoted to fill vacancies. Battalion and parade formations are regulated by the Tactics. The field officers are assigned by their Department Commanders wherever their services are most required, provided the assignment is with troops of their own regiments. Regiments are furnished with field music on the requisitions of the commanders, made, from time to time, direct on the Adjutant General; and, when requested by regimental commanders, the Adjutant General endeavors to have suitable men selected from the recruits, or enlisted, for the regimental bands.

Each regiment is supplied with a Regimental Order Book, a Regimental Letter Book, a book of the Letters Received, and a Descriptive Book, to contain a list of the officers of the regiment, with their rank, and dates of appointment, and promotions, transfers, leaves of absence, and places and dates of birth.

REGIMENTAL COURT-MARTIAL.—A legal tribunal, composed of three Members and a Judge-Advocate, convened for the punishment of offenders in the army. See *Courts-Martial*, *Judge-Advocate*, and *Trial*.

REGIMENTAL FUND.—Councils of Administration at posts occupied by companies of the same regiment at regular meetings, set aside and cause to be paid over to the regimental treasurer fifty per cent. of the amount accruing to the post fund during the preceding two months after deducting the expenses of the bakery. This amount constitutes the *Regimental Fund*. If private contributions toward the support of the band are made, the sums so received are not taken up in the account current of the Regimental Fund.

The Adjutant is Treasurer of the Fund for his regiment, which he disburses on warrants drawn by the Colonel or Commanding Officer, under specific resolves of the Regimental Council of Administration. He renders, through the Colonel, periodical returns of the state of the Fund and of the property purchased therefrom, in the same manner as prescribed for the Post Treasurer, and his accounts are always open to the inspection of the Colonel and Regimental Council.

The musical instruments and everything pertaining to the band are kept by the Adjutant. The Colonel or Commanding Officer, who approves the appropriations of the Council, is held accountable for all expenditures of the fund not made in accordance with the Regulations.

The following are the objects to which the Regimental Fund is appropriated exclusively:

1. The maintenance of a band.
2. When not needed for the band, it may be transferred to the companies of the regiment as company fund. See *Company Fund*, and *Post Fund*.

REGIMENTAL HOSPITAL.—In Great Britain, each regiment has a Hospital for the reception of the sick belonging to it. This Hospital is under the immediate care of the Regimental Surgeon, who is subordinate to the general Medical Board. See *Hospitals*.

REGIMENTAL ORDERS.—Such orders as are issued by the officer commanding a regiment for the information of the officers and regiment generally.

Regimental orders follow up all orders issued by the officer commanding the brigade, garrison, station, etc., having reference to the regiment.

REGIMENTAL RECRUITING SERVICE.—The Commander of a regiment is the Superintendent of the Recruiting Service for his regiment. When men are enlisted by Regimental Recruiting Officers, the principles governing the general service in regard to qualifications of recruits are observed. As a rule, recruiting funds are not furnished for the regimental service. When special authority is given to open a temporary rendezvous, or detach a party to recruit companies which have become reduced, requisition for funds may be made by the Regimental Commander upon the Adjutant General.

To prevent deserters at large and men who have been discharged with bad character from imposing themselves again upon the service, no enlistments are made by company officers, or at posts, without special authority in each case, except when the man has been honorably discharged from the same company or post within one month previous to his application, so that his character is known. In all other cases, application is made to the Adjutant General for authority to enlist the man—naming him—and, if a discharged soldier, giving his last company and regiment, and such evidence of good character as can be obtained. Enlistments, when made under such conditions, may bear the date of the application.

REGIMENTALS.—The uniform clothing of officers and men in the military service, as prescribed for each regiment and department.

REGIMENTAL SCHOOLS.—In the British Army, the Schools for Adults, and Boys above eight years of age, under the School-master, and the Infant and Industrial Schools under the School-mistress, for girls and little boys. In the first, plain subjects are taught to soldiers who voluntarily attend, or to soldiers' children. The education is wholly secular, the only theological teaching being exposition of a portion of Scripture during the first half-hour of morning school; but even at this, attendance is at the option of the parents. The Infant School is conducted on similar principles. The Industrial School is to fit girls for the occupations of life, and to render them capable of entering domestic service; a grant of money is made by Government for the provision of materials. There is a school of each sort in every battalion of infantry or regiment of cavalry, the total cost of which amounts, for 1873-74, to £36,253. Adult soldiers are admitted gratuitously; for children, there is a nominal charge of 1d. each a month. The orphans of soldiers and the children of soldiers serving abroad are received at any neighboring school without payment; those of pensioners, contractors, etc., at 3d. a month; and the children of officers at 5s. a month. It is forbidden that any difference should be made in the schools in the treatment of these different classes of pupils.

REGULAR APPROACHES.—The term *Regular Approaches* is applied to the means employed by a besieging force to reduce a fortified position which is too strong to be carried by the usual mode of an open assault. These means consist in approaching the position under the cover of the ordinary trench

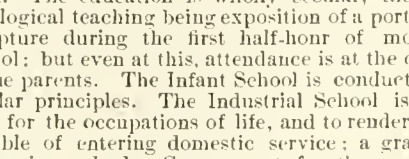


Fig. 1. Profile of Approach by the Simple Trench.

bordered by a parapet, which is gradually pushed forward in the most favorable directions to shelter the troops placed in it from both enfilading and plunging fires. In the construction of the trenches various articles are required to give speedy and safe cover, besides the usual trenching tools. These are termed *Trench Materials*, and consist of—1. *Tracing Tape or Cord;* 2. *Tracing Pickets;* 3. *Ordinary Pickets;* 4. *Fascines;* 5. *Sap Fagots;* 4. *Gabions;* 5. *Sap-rollers;* 6. *Sand-bags;* 7. *Blindage Frames;* 8. *Gallery Frames* and *Sheeting*. The tracing tape is a strong white tape or cord usually 150 feet long, and divided off into spaces of 6 feet, a piece of tape 6 inches long being sewed to each point of division. At each end of the tracing tape a short piece of cord is attached to tie the tape to two tracing pickets. The tracing tape, for convenience, is rolled up into a ball. The tracing pickets are 18 inches long and one inch in diameter. For ordinary use they are tied up in bundles with their bark on; but for setting out night work the bark should be stripped off to make them more readily seen. Those used for securing fascines are from 2′ to 4′ long, and from 1¼″ to 1¾″ thick; those for setting out or tracing the works are 18″ long and 1″ diameter. The fascines are usually made 18′ long, and 9″ in diameter, and are afterwards cut into suitable lengths for the purposes to which they are to be applied. Sap-fagots are made, like fascines, of straight brush-wood at least 1″ in diameter. They are 2′ 9″ long, and 5″ in diameter. The center stake should be from 1½″ to 2″ in diameter, and project 9″ inches beyond one end of the sap-fagot; this projecting portion is sharpened, to enable the sap-fagot to be planted firmly in the ground in an upright position. The exterior diameter of the gabions is 2′, and the height of wattling 2′ 9″. They are made with seven, or nine stakes, which project 6″ above the wattling at top, and are pointed. The ordinary trench gabion and the gabion for revetting batteries receive the same dimensions; the latter is more strongly made and of the heaviest brush wood. At the siege of Sebastopol the want of brush wood for the wattling of gabions led to the introduction of the common hoop-iron for this purpose, which had served to secure the bales of hay. The number of pickets employed for each gabion was usually thirteen. It was found that these gabions could be constructed more readily than the ordinary kind; that they were not much heavier, were more durable, and in all other respects as serviceable. The sap-roller is a large gabion 7 feet 6 inches in length, and 4 feet 4 inches exterior diameter. It requires for its construction fifteen stakes, each from 1¼ inches to 2 inches in diameter. After it is completed, it is stuffed compactly with fascines 7 feet 6 inches long. The sap-roller is sometimes made of two concentric gabions, the diameter of the smaller 2 feet 6 inches. The space between the two is well stuffed with fascines. The sand-bag, for the revetment of batteries, when empty and laid flat, is 2 feet 8 inches long, and 1 foot 4 inches wide; those used in the construction of the trenches are 2 feet long and 12 inches wide.

The trenches are divided into two principal classes; *approaches* or *boyaux*, and *parallels*. The approaches serve simply as covered communications which lead to and connect the parallels, and are usually directed towards the points of the defenses upon which the attack of the besiegers is made. The approaches are run in a zigzag, or in a straight line, towards one or several of these points. The trenches of the approaches are 8 feet wide at bottom; 3 feet 6 inches deep in front, and 4 feet at the rear. The reverse receives a slope of 45°. The front is usually made with a slope of 2 feet base. The earth from the trench is thrown to the front to form a parapet. The general height of this parapet is nearly 5 feet; its width at the base about 18 feet. The parallels are designed as stations for troops to guard the besiegers' works and the workmen employed in their execution from the sorties of the garrison. The general direction of the parallels is parallel to, or concentric with, a line connecting the most salient points of that portion of the defenses attacked. The trenches of the parallels receive a width at bottom of 10 feet; their depth in front is 3 feet, and in rear, 3 feet 6 inches. Two steps, each 18 inches high and 18 wide, lead from near the bottom of the trench, on the front side, up to the natural ground. The reverse of the trench receives a slope of 45°; or else, is also cut into two steps. The steps in front are alone revetted with fascines.

When the parapet is formed of earth alone as is represented in Fig. 1, the trench is termed a *Simple*

Trench. In this case the earth of the parapet is allowed to take its natural slope towards the trench. The step, or berm of 18 inches between the parapet and the trench in the parallel, serves as a banquette. Portions of the parallels, from 20 to 30 yards in length, are arranged with steps, revetted with fascines, leading from the trench over the parapet, to enable the troops in the parallel to move from it to repel a sortie of the besieged, Fig 2. The direction of the simple trench is laid out by the tracing-tape and pickets. The trench is executed by soldiers of the line; each man being furnished with a pick and shovel, with which he places himself speedily under

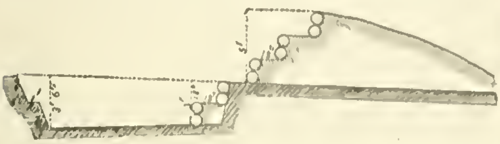

Fig. 2. Profile of a Parallel of a Simple Trench with Steps for Sorties.

cover, by digging a hole and throwing the earth in front of him; continuing his labor until he has excavated 6 feet in length of the trench, and as much of it to the rear as may be assigned to the relief, or working party, to which he belongs. After the trench has received its general width and depth, the slopes and steps are finished off under the direction of the engineer troops. See *Siege*

REGULARS.—Those troops whose conditions of enrollment are not limited to time or place, in contradistinction to militia or volunteer corps; troops permanently in service. France first set the example of keeping troops in peace. Charles VII, forseeing the danger of invasion,authorized the assemblage of armed mercenaries, or Compagnies D'ordonnance. Louis XI. dismissed these troops but enrolled new ones,composed of French,Swiss and Scotch. Under Charles VIII.,Germans were admitted in the French army, and the highest and most illustrious nobles of France regarded it as an honor to serve in the Gens D'armes. Moral qualifications not being exacted for admission to the army the restraints of a barbarous discipline became necessary,and this discipline divided widely the soldier from the people. The French Revolution overturned this system; now no mercenary troops are to be found in continental Europe. England only now raises armies by the system of *Recruiters.* The last wars of Europe have been wars of the people and have been fought by nationalities. After peace,armies remain national,for their elements are taken from the people by legal liberations.

REGULATION PRICE. This phrase as applied to an Officer's Commission, was the regulated price paid by Officers for each step of rank (according to a fixed scale), other than death vacancies, vacancies caused by augmenting a regiment, or vacancies resulting from the promotions of Colonels to be Major Generals. When an Officer of any rank, from a Lieutenant Colonel downwards, was desirous of retiring from the service, he was entitled to sell his commission for the price stipulated by the regulations. Sometimes, he received more than the regulation sum. Purchase being no longer permitted in the army, the sale of commissions mentioned has only reference to Officers who entered the army before November 1,1871.

REGULATIONS.—Under the Constitution of the United States,rules for the government and *regulation* of the army must be made by Congress. Regulation implies *regularity.* It signifies fixed forms: a certain order; method: precise determination of functions, rights and duties. Rules of Regulation also embrace, besides rules for the administrative service, systems of tactics, and the regulation of service in campaign, garrison, and quarters. In the case of the Staff Departments, legislative authority has been delegated *jointly* to the President and Secretary of War. But in relation to the powers, rights, and duties of officers and soldiers in campaign, garrison, and quarters, Congress has not delegated its authority to the President, nor have such matters been *precisely* determined by military laws. Even rights of rank, command, and pay, concerning which Congress has legislated, are subjects of dispute, and variable expositions of laws regulating those essentials of good government have been given by different executives, with an increasing tendency to invalidate rank created by Congress. There can be no remedy for these encroachments, unless Congress should pass a law to enable cases to be brought before the Federal Civil Courts, in order that the true exposition of military statutes and authorities in dispute may be determined. With such a remedy, laws, however defective they may be, would at least be known, and rights, powers, and duties established by law would be well determined.

But it may be said in relation to such rules of regulation, how can a body like Congress determine upon systems of tactics, etc.? Their constitutional duty might easily be performed as follows: 1. By clearly declaring, in a manner not to be misunderstood, that the General-in-Chief is charged with the discipline and military control of the army under the rules made by Congress and the orders of the President. 2. The Secretary of War is charged with the administrative service of the army under the rules made by Congress and the orders of the President. 3. By directing the General-in-Chief, with the advice of properly constituted Military Boards, to report to the President rules for the government and regulation of the army in campaign, garrison, or quarters, including systems of tactics for the different arms of the service. 4. By directing the Secretary of War, with the advice of properly constituted Boards, to report to the President rules for raising and supporting armies: including regulations for the administrative service. 5. By directing the President to submit the rules made in accordance with provisions 3 and 4, to another board organized by the President, with directions to harmonize the details of the several reports; which last report shall be submitted to Congress for confirmation or orders in the case. 6. By directing that each year, previous to the meeting of Congress, the following Boards be assembled under the orders of the General-in-chief, viz.: a Board of General Staff Officers; a Board of Artillery Officers; a Board of Cavalry Officers; and a Board of Infantry Officers. The Secretary of war to assemble all the following Boards, viz.: a Board of Engineer Officers; a Board of Ordnance Officers; a Board of Medical Officers; and a Board of Quartermasters, Commissaries and Paymasters. Each of the Boards so assembled to report to the General-in-Chief or Secretary of War, such suggestions of improvements in their respective services as it may be desirable to adopt. 7. The repeal of all laws delegating legislative authority to the President and Secretary of War.

REGULATORS.—1. The popular name of a party in North Carolina, which arose in 1768 and had for its object the forcible redress of public grievances. 2. Contrivances designed to render the power and resistance proportionate to each other. Regulators generally act upon that point of the machine which commands the supply of the power by means of some mechanical contrivances, which check the quantity of the moving principle conveyed to the machine whenever the motion becomes accelerated, and increase the supply whenever it becomes retarded. For example, this is accomplished in a steam-engine by acting on a valve called the throttle valve, placed in the main pipe.

REGULUS.—A term in metallurgy, which is now used in a generic sense for metals in different stages of purity, but which still retain, to a greater or less extent, the impurities they contained in the state of ore. When, for example, the ore known as the sulphuret of copper is smelted, the product of the different furnaces through which it passes is called regulus until it is nearly pure copper. The name, which signifies "Little King," was first given by the alchemists to the metal antimony, on account of its power to render gold brittle.

REIGN OF TERROR.—The name given to that period in the history of France when the Revolutionary Government, under the guidance of Maximilien Robespierre, supported itself by the pure operation of terror, exterminating with the guillotine all the enemies, or supposed enemies, of the Democratic Dictatorship. In the year 1793 the Convention vested the Government in a "Committee of Public Safety", a body belonging to the Party of the Mountain, and of which Robespierre, Couthon, and St. Just became the Triumvirate. This Committee, to which every other authority in the country was subjected, deliberated in secret, and the convention sanctioned all its decrees. Louis XVI. had already been brought to the scaffold; and on Oct. 16 his Queen, Marie Antoinette, after being subjected to every possible indignity, was beheaded; the Princess Elizabeth sharing the same fate on May 10, 1794. The execution of the Girondists followed, and that of the Duke of Orleans. The guillotine became the only instrument of Government: a look or a gesture might excite suspicion, and suspicion was death. The Calendar was remodeled, and all religious rites suppressed. When the power of the Committee had attained its climax, a decree was passed abrogating every delay or usage calculated to protect an accused person; but from that moment a reaction began. A section of the Mountain Party were satiated with blood, and, had become impatient of the control of Robespierre. On July 28, 1794, he was denounced in the Convention for his barbarities, and his death brought to a close this sanguinary era in French history.

REIN.—A term applied to a crack or vein in a musket barrel.

REINFORCE.—The cylinder of a cannon is usually divided into two portions, called the *first* and *second reinforce*. The first reinforce extends from the base-ring to the seat of the ball, and is the thickest part of the piece, for the reason that the pressure of the powder is found, both by experiment and calculation, to be greatest before the projectile is moved far from its place. The shape of this reinforce was formerly made slightly conical, under the impression that the pressure was greater at the vent than at the seat of the projectile; but it is now made cylindrical throughout. For bronze cannon, the thickness of this part is approximately given by the empirical formula

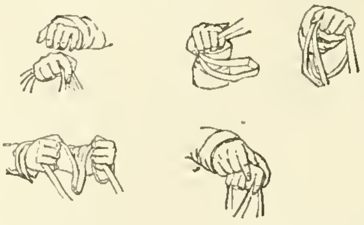
$E = D\sqrt{\frac{C}{\frac{1}{2}P}}$, in which D represents the diameter of a solid cast-iron shot suited to the bore: C the proof charge; and P the real weight of the projectile. For cast-iron cannon, E should be multiplied by the coefficient 1.17. In general terms, the thickness of a bronze gun, at the seat of the charge, is a little less, and of a cast-iron gun a little greater, than the diameter of the bore. These dimensions exceed those determined by calculation, but are necessary to enable the piece to resist the shocks of the projectile, etc. The second reinforce connects the first reinforce with the chase. It is made considerably thicker than necessary to resist the pressure of the powder, in order to serve as a proper point of support for the trunnions, and to compensate for certain defects of metal liable to occur in the vicinity of the trunnions of all cast cannon, arising from the crystalline arrangement, and unequal cooling of the different parts. See *Cannon*.

REINFORCE-BAND.—In ordnance a band at the junction of the first and second reinforce.

REINFORCEMENTS.—Additional forces; especially those troops intended to augment the strength of an army. History proves that battles have been decided by reinforcements, and that victory is commonly the prize of the General who is the last to bring his reinforcements into action. It was to the proper employment of reserves that Napoleon owed so much of his success; and the barren victory of Borodino and his complete defeat at Waterloo are by many attributed, in the one case to his holding back the guard altogether, and in the other to his delay in using it. Jomini and other writers lay down that reinforcements being the last argument on the battle-field should always be composed of troops of a superior kind, but the experience of recent wars shows that, on account of the new tactics which have been adopted since the introduction of arms of precision, all troops, so far as they have not come into action, are reserves to the leader. Reinforcements should be placed near enough to support the troops in action, but they must be kept out of sight, and their position concealed from the enemy. Their distance from the second line depends entirely upon the nature of the ground, as well as upon the extent of the ground covered by the line from right to left; and their strength should consist of about one-fourth or one-fifth of the whole force in cavalry and infantry, and of about one-third of the guns. The reserve batteries may either be kept with the main reserve, or concentrated on any point where their united fire may help to shake the enemy previous to the final attack. In the attack of the fortress, no assault should be attempted without a sufficient reserve, which should be well placed for following the supports of the escalading parties: its strength should never be less than three-fourths of the garrison of the work assaulted.

REINFORCE-RING.—In ordnance, a flat molding at the breech end of the reinforce.

REINS.—The straps of a bridle, fastened to the curb or snaffle on each side, by which the rider or driver restrains and governs the horse. They serve to prepare the horse for the movements, to guide and halt him; their action should be gradual and in harmony with that of the legs. In using them the arms should be moved with ease, and from the wrist to the shoulder. The rein-hold will vary with the design of the rider and the propensities of the horse. The drawing shows the usual manner of holding and shifting the reins. In holding them separately, one passes into each hand, between the third and the fourth fingers, and out over the fore-



finger, where it is held down by the thumb. Usually the reins are held in the left hand, as when first taken up. Here the left rein passes under the little finger, and the right under the third, both passing through the hand, and the superfluous rein hanging over the first joint of the fore-finger, the thumb securing it. Sometimes, the right rein enters the hand over the fore-finger from above and crosses the left rein in the palm, where the fingers close upon them. The loop, formed of the residue, hangs down between the hand and body.

The reins should be shifted quickly and expertly without breaking the time or altering the pace.

To shift the reins from the left hand: Turn the thumbs well towards each other and carry the right hand over the left; place the fore-finger of the right hand downward, in the place of the little finger of the left hand, between the reins; and pass the reins through the right hand, placing the thumb upon the left rein, near the second joint of the fore-finger.

To return them to the left hand: Carry the left hand over the right and place the little finger of the left hand downward between the reins; then carry them smoothly upward through the hand, and let the ends hang over the fore-finger.

REIS EFFENDI.—A title formerly given to an Officer of State in the Ottoman Empire. He was the Chancellor of the Empire, and Minister of Foreign Affairs. His duty in the first-mentioned capacity was to confer with the Grand Vizier regarding the orders and instructions to be sent to the different Provinces, and regarding the proper decision on any subject affecting the Empire, whether internal or external; and in the latter capacity he had the sole and exclusive charge of the relations of the Porte with Foreign Courts.

REITRES.—A body of armed horsemen, who came out of Germany and entered the French service during the reign of Henry III. They were incorporated with the carabineers.

REJOINDER.—In military law, the defendant's answer to the plaintiff's replication. The weight of authority is against permitting a rejoinder on the part of the prisoner, unless evidence has been adduced in the reply of the prosecutor. But such evidence should not be permitted in reply, and there should be no rejoinder.

RELAIS.—A term used in fortification to signify a space, containing some feet in breadth, which is between the foot of the rampart and the scarp of the fosse. It serves as a convenient receptacle for the earth that occasionally crumbles off.

RELATIVE RANK.—The precedence which certain Non-combatant Officers and others are entitled to take among their combatant brethren; for instance a Commissary General in the English Army has the rank of Major General. Relative rank carries with it all precedence and advantages attaching to the military rank with which it corresponds, except command, and regulates rates of lodging, money, number of servants, rations of fuel and light (or allowance in their stead), detention and prize money. Relative rank does not entitle the holder to salutes from ships or fortresses, nor to the turning out of guard. It has lately been determined that the Assistant Military Secretary at the Horse Guards is to have the relative rank of Colonel.

The following is the relative rank of the English Navy and Army:

Navy	*Army*
Admiral of the Fleet	Field Marshal.
Admirals	Generals.
Vice Admirals	Lieutenant Generals
Rear Admirals	Major Generals.
Captains of the Fleet; Commodores, 1st and 2d class	Brigadier Generals.
Captains over three years' service	Colonels.
Captains under three years' service	Lieutenant Colonels.
Commanders	Lieutenant Colonels.
Lieutenants of 8 years' standing	Majors.
Lieutenants under 8 years' standing	Captains.
Sub-Lieutenants	Lieutenants.
Midshipmen	Sub-Lieutenants.

In the United States Army and Navy the relative rank of officers is as follows:

Army	*Navy*
Second Lieutenant	Ensign.
First Lieutenant	Master.
Captain	Lieutenant.
Major	Lieut't Commander.
Lieutenant Colonel	Commander.
Colonel	Captain
Brigadier General	Commodore.
Major General	Rear Admiral
Lieutenant General	Vice Admiral.
General	Admiral.

The officers in the Marine Corps rank with those bearing the same titles in the army. See *Rank*.

RELEASE OF PRISONERS.—The Articles of War provide that any officer who presumes, without proper authority, to release any prisoner committed to his charge, or suffers any prisoner so committed to escape, shall be punished as a Court Martial may direct.

RELEVANCY.—In law, the condition of a plea which is well founded in point of law, provided it be true in fact. An objection to the relevancy corresponds in many respects to a demurrer in English.

RELIEF.—In fortification, the general height to which the works are raised; if the works be generally high and commanding, they are said to have a *bold relief;* if the reverse, a *low relief*. The term *relief* is also given to a party of soldiers detached from a guard, who relieve sentries off their post on the expiration of their term on duty.

RELIEVER.—An iron ring fixed to a handle, by means of a socket, so as to be at right angles to it. It serves to disengage the searcher of a gun, when one of its points is retained in a hole, and cannot be extracted otherwise.

RELIEVING THE ENEMY.—Whosoever relieves the enemy with money, victuals, or ammunition, or knowingly harbors or protects an enemy, suffers death, or such other punishment as a Court-Martial may direct.

RELOADING CARTRIDGES.—In 1866, when the manufacture of the service-cartridge was commenced at Frankford Arsenal, Philadelphia, Pa., little or nothing was known as to how a good reliable military cartridge could be made. To explain the difficulties which had to be overcome at every step, the machines to be invented to do the work uniformly, accurately, and economically, would fill a large volume. It can be said, however, that through the combined efforts of the officers in command of Frankford Arsenal, Philadelphia, and the National Armory, Springfield, Mass., a cartridge was produced which would reflect credit upon any nation. Up to the present time this cartridge, perfected and slightly modified, has been the service-cartridge for breech-loading small-arms and machine guns. With the invention and adoption of breech-loading small-arms and metallic cartridge shells, heavier and more uniform charges of powder were introduced, giving greater range and accuracy. This was followed by a desire and necessity for soldiers becoming trained marksmen. To meet economically the demand for an increased expenditure of ammunition thus produced, reloading shells were used. Until this demand came such shells had not been made to any extent at Frankford Arsenal, although a plan for making them had been worked up at that post, which has since been quite generally adopted by all manufacturers, of reloading shells in this country, and also abroad by several nations, viz., making a pocket in the head of the shell formed in the continuous metal from which it is drawn, and into which a primer could be inserted from the exterior. Reloading shells have generally been made of brass, and are now so made to a great extent. This metal possesses sufficient elasticity, but is wanting in durability, as experience has proved. The service non-reloading shell is made of copper with a small percentage of spelter, and has shown durability equal in years to those longest made.

The reloading cartridges now furnished to the army are the following:—Frankford Arsenal, solid head; Lowell, solid head; Winchester, solid head; Berdan, folded head. The Frankford Arsenal, Lowell, and

Winchester cartridges have a central vent in the primer pocket, which admits of the exploded primer being driven out of the pocket from the empty shell by a punch. The Berdan, having no central vent, requires a special tool, applied on the outside, to remove the exploded primer.

The materials required for reloading comprise lubricated bullets, musket powder, and cartridge primers adapted to the shells to be reloaded. The following comprises a set of Frankfort Arsenal hand tools for reloading cartridges:

Name.	Cost price.
1 brush wiper	$0 10
1 charger	05
1 die, crimping	1 00
1 die, reloading	75
1 die, resizing	1 75
1 drift	05
1 extractor, primer	1 00
1 funnel	10
1 mallet	15
1 oil cup	25
1 priming tool	1 00
1 punch, primer	25
1 punch, reloading die	25
1 punch, resizing die	25
1 safety socket	25
1 scraper, shell	10
1 setter, primer	1 25
1 wiping rod	10
1 box containing set	35
Total cost of set	$ 9 00

The first operation of reloading is the removal of the exploded primer. For central-vent cartridges this is done by inserting the extractor in the shell and resting the head of the latter in the recess for it on the safety-socket, then driving out the primer with

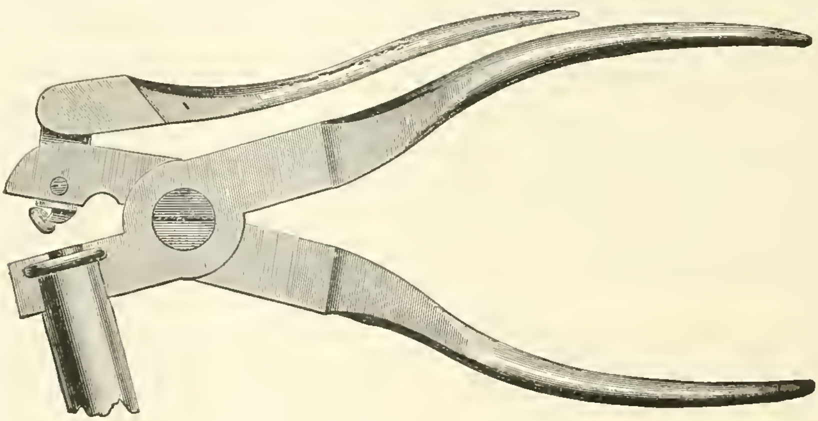


Fig. 1.

the mallet. The Bridgeport tool for exterior extraction, shown in Fig. 1, and specially adapted to the "Berdan" shells, may be used for all cartridges; but the primer punch for central-vent shells is the more simple and positive in its action. If the wire of the extractor should break, extra ones are supplied with each set of tools, and are put in by unscrewing the plug in the head of the extractor, driving out the broken pin with the new one in the direction of the head, the hole being tapered, dropping in the new pin at the head, and replacing the screw plug.

The shells, whether old or recently fired, should always, if possible, be cleaned of the powder residue, etc., by immersion and agitation in hot water. Cold water will clean them, but hot water is a better solvent, and the shells dry more quickly when taken out of it. When circumstances render it impossible or inconvenient to use water, the brush wiper may be used for brushing out the residuum left in the shell by the combustion of powder and fulminate. After cleaning, examine the shell to ascertain if it shows signs of rupture. These may generally be seen at the head, the mouth, or as transverse or longitudi-

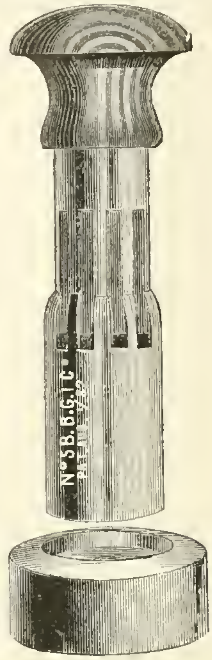

Fig. 2.

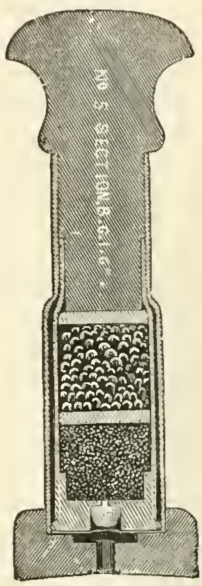

Fig. 3.

nal marks on the body. The shell is next forced into the die for resizing, using the mallet if necessary, striking fairly and squarely on the head of the shell, so as to avoid bending or distorting its flange. The outside of the shell or inside of the die should be oiled to facilitate the entrance of the shell and prevent abrasion. It is driven out by means of the punch inserted in the die and shell. This last operation is likely to cause a bur on the mouth of the shell, which would deface the bullet if not removed. For this purpose the scraper is supplied. Insert it about 0".5 into the shell, held in left hand, scraper in right; give the shell and scraper a half-turn in opposite directions, bearing with the scraper *only hard enough* to take off the bur. The handle of scraper and axis of shell should be kept nearly parallel to each other to avoid thinning the mouth of the shell. Although the shell may be fired several times without resizing, this operation is considered *necessary after each round*, otherwise the shell will be unduly expanded by successive rounds, and eventually fail to enter the gun-chamber; after which the extra force required to resize it might prove injurious to the metal.

The shell is next inserted in the loading die, the primer entered into the pocket, and the safety socket placed over it, large end down; the primer may then be driven home with the primer-punch and mallet. Considerable loss of primers by premature explosion in this operation has occurred, and a tool is supplied for setting primers by pressure, which is used as follows: The shell is placed in the tool for inserting primers—the primer having been previously just entered in the pocket—and the primer pressed home by means of the lever and screw. The end of the screw is so formed as to insure the primer being below the surface of the head at least 0″.005. It should be slightly lubricated to avoid wear of the projection on the end and abrasion of the primer. The Bridgeport tool, shown in Fig. 2, may also be used to set the primers of all shells but the "Lowell," which has, intentionally, a primer to fit the pocket tightly, and requires considerable force for its proper insertion. The screw tool will set the "Frankford Arsenal," "Berdan," "Lowell," and "Winchester" primers equally well. The shell is now ready for reloading. It is inserted in the loaded die, the latter into the safety-socket, and the powder-funnel into the mouth of the die. A level measureful of powder is then poured into the shell through the funnel, after which the bullet, or shot, is inserted and driven home with the punch and mallet until the shoulder of the punch touches the end of the die, as shown in Fig. 3. This insures proper and uniform length of cartridge.

The reloading die may be used as a gauge for determining whether cartridges are of the proper dimensions for entering the chambers of guns. As a rule, any cartridge that will enter the reloading die will enter the chamber of the gun freely. It is, in fact, a combined reloading die and gauge for cartridges. To use it as a gauge insert the punch in the small end and the cartridge in the opposite end. If the cartridge enters fully without moving the punch, it is of proper length and diameter.

When shells are reloaded for immediate use they may be fired after the foregoing operation. But if loaded for storage for any length of time, the crimping die should be used to secure the bullet in position. To perform this operation, insert the loaded cartridge into the die, then set the head in the recess of the safety-socket, the latter resting on a bench or table, and drive the cartridge in with the blows of the mallet on top of the die. The safety-socket has a central hole concentric with the counter-bore. In extracting the primers it supports the head of the case and forms a receptacle for exploded primers. It also supports the head of the shell on opposite ends in the operations of loading and crimping, and the central hole protects the primer from severe shocks in driving home the bullet, and it also guides the punch in setting the primers. Fig. 4 shows the Bridgeport crimping apparatus. The wiping rod serves to clean out the bore of the dies, etc., by means of cotton waste or a rag drawn through the slot in its end. Particular care should be taken to free the exterior of the shell from grit or dirt before resizing, to protect the die and shell from scratches; also, that neither water nor oil gets into the case or primer, as either will injure or destroy the powder or fulminate. No *excess* of oil should be left in the chamber of the gun or on the cartridge, as it would tend to rupture the case in firing and also temporarily disable the gun. A slight amount of lubricant on the cartridge or chamber throughout their length seems to prolong the life of reloaded shells. The tendency of the shells to tear apart appears to be due to their unequal expansion in the chamber; the front end being thin is more quickly expanded, and in the absence of the lubricant is held by pressure and friction against the walls of the chamber, while the thick rear end of the shell is forced backward by the pressure of the gases. As a rule, sufficient lubricant from the bullet finds its way into the chamber to answer all purposes. These tools are made as simple and strong as possible. Some of them, particularly the dies and punches, require to be used with great care, so as not to injure their surfaces or alter their dimensions, where such would affect the cartridge. They are cheap, durable, and quite rapid in operation if the work be divided among several operators or be done by one person performing each operation separately on a number of shells. Special tools employed in the operations of loading, other than those required for the service cartridges, are noticed under specific headings. See *Cartridge*, *Cartridge-loading Implements*, and *Center-fire Metallic-case Cartridge*.

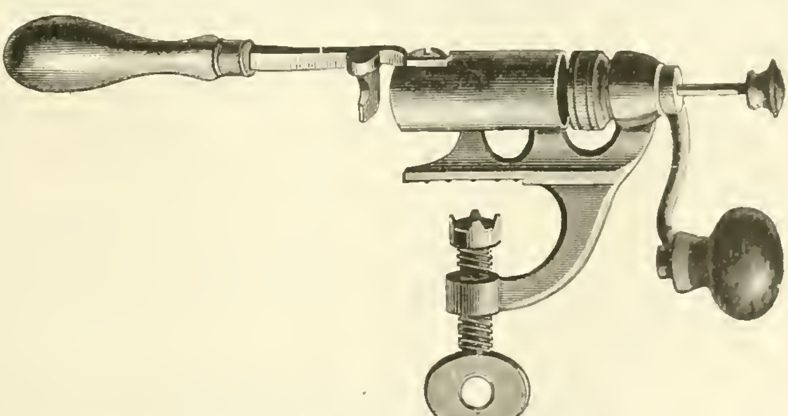

Fig. 4.

REMARKS.—Army Returns, Regimental Returns, Guard Reports, etc., have a column allotted for observations relative to extraordinary occurrences, headed "Remarks." The voucher to Abstract B, page 660, used by Quartermasters, may be noticed as an example.

REMBLAI.—The quantity of earth in the mass of rampart, parapet and banquette. In well constructed works, the equality between the *deblai* and *remblai* is indispensable for every part, nay, for every face. For works not defiladed, and having therefore their crests horizontal, the following method of calculation may be employed, whenever expedition is required. Supposing the parapet and the ditch to have the same length and equal profiles, their volumes will be equal and the problem becomes thus simplified: knowing the area of the profile of the covering mass, to calculate the dimensions of the ditch so as to make the surface of its section equal to that of the remblai. Let S represent the area of

——— Quartermaster———

the section of the remblai. When earth is excavated, it increases in bulk, and whatever care be taken in ramming it in, the volume it occupies in the remblai will be greater than the space it filled in the deblai this increase of bulk, called *foisonnement*, is $\frac{1}{8}$ in strong soil, $\frac{1}{12}$ in ordinary soil, and $\frac{1}{20}$ in sand. Represent it by $1 \div F$ and let the area of the profile of the ditch $= S'$; then, we have

$$S = S' + \frac{S'}{F}, \text{ whence } S' = \frac{S.\ F}{1+F}.$$

When the work is defiladed by an increase of command at the salients, it becomes necessary to obtain the mean profile; this is done by calculating the areas of the profiles at the salient and at the extremity of the face, and taking their mean

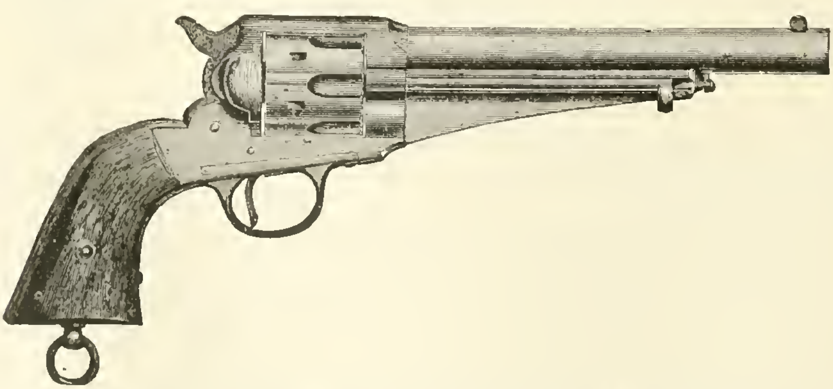
REMINGTON-LEE MAGAZINE-GUN.—This arm is the same in principle as the one previously described in this work, under the head of *Lee Magazine-gun.* Since E. Remington & Sons have secured the exclusive right to manufacture and sell the Lee Magazine-gun they have introduced several valuable improvements, among which may be mentioned the change of the handle of the bolt from the middle position to the rear end. This greatly facilitates the rapidity with which the arm can be fired, as the hand can keep its hold on the bolt-handle at the same time that the trigger is pulled. By referring to the *Frontispiece* we can see that when the bolt is closed the position of the handle is directly above the trigger. The bolt has also a removable front end or "head." This allows the firing-pin and main-spring to be put into it from the front end, so that the rear end where the handle is now attached is very much stronger than the old bolt, as no cutting has to be made for the key-sleeve, F, shown and described on page 192 of this volume, that piece being now discarded.

A different method is also employed in fastening the firing-pin, C, to the thumb-piece or cocking-piece, E, by a locking-nut, T.

The magazine is made of one piece of metal, in the sides of which are depressions having certain curvatures and angles, which form projections on the inside for the guidance of the follower upon which the cartridges rest, so that they shall each be presented in their turn to the center of the bore of the barrel. The lugs on the rear end of the top of the magazine are extended forward a sufficient distance to prevent the cartridge from rising above the bore, and also prevents their escape from the magazine when it is detached from the piece. The quadruple-leafed spring, N, shown on page 192, is substituted for a coiled one, which is much simpler and more effective.

By the use of this improved magazine, that part of the receiver which projects above and in the rear of the chamber known as the "overhang," is removed, making a larger opening for the introduction of a cartridge, when the arm is used as a single breech-loader. See *Lee Magazine-gun.*

REMINGTON REVOLVER.—This revolver is a modification of the Colt revolver. As the hammer is cocked a hand, which is pivoted to its lower portion, rises and engages the ratchet on the base of the cylinder and causes it to revolve. A stop-bolt engages the stop notches in the surface of the cylinder to prevent the momentum of the cylinder from carrying it past the firing point. It disengages from them under the action of a hammer cam, which, rising during the cocking of the hammer, presses up the rear end of the bolt and liberates its front end from the notch. When the revolution is about complete, the beveled lower surface of the hammer cam comes opposite the point of contact on the bolt. At this moment the tail of the bolt (being slit so as to have a lateral spring, and the head being pressed upward by a flat spring, slides down over the inclined surface of the cam, and the head engages the stop-notch in the cylinder. The spring is slit and bent so as to act upon both the bolt and the trigger. The drawing shows the general appearance of the Remington revolver, as at present made. The very numerous advantages or improvements claimed for the Remington revolver, as compared with the Colt arm are the use of a light base pin, which can be withdrawn by loosening its catch, and thus allowing the removal of the cylinder; the introduction of the ejector frame, fastening to the barrel by a small

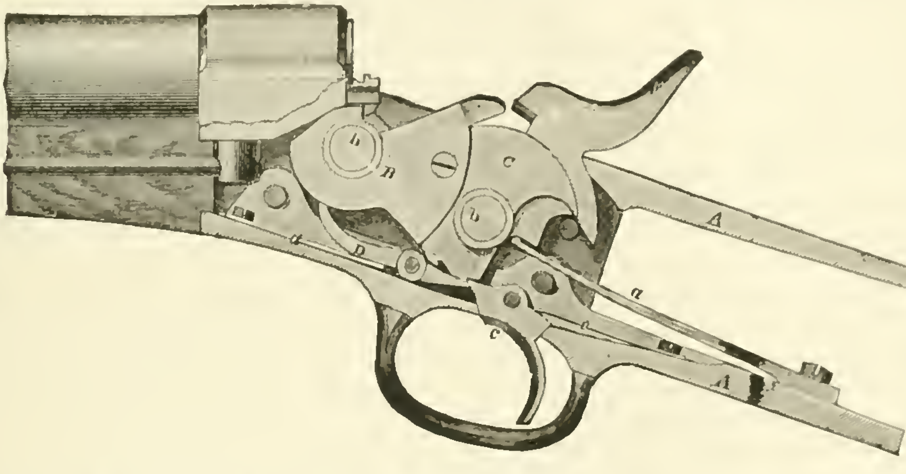


screw and to the frame by a dowel-pin, lessening the liability of accidentally tearing the ejecting system from the barrel; the coiling of the ejector spring around the base-pin instead of around the ejector; the fact that the butt of the Remington is forged solid with the pistol frame. It is also claimed that the pistol has a neater appearance than the Colt. See *Colt Revolver.*

REMINGTON RIFLE. The mechanical construction of the breech-system of the Remington arm is plainly shown in the accompanying drawing, exhibiting the system with breech-block and hammer open and in position for loading. The simplicity of the system, the largeness of its parts, and their peculiarly natural operation, it is thought, avoid the necessity of more elaborate and distinct illustration. The receiver, composed of frame and guard-strap (AA), is a substantial housing of wrought-iron, case-hardened, the sides of which are .28 inch in thickness. This frame, containing the lock and action, is closed at the bottom by the guard-strap, which is firmly secured in its place by two screws. The butt-stock is mortised for the reception of the end of the guard-strap (lower A), and tang of frame (upper A), tenoned into the receiver, and fastened by a tang-screw passing through the stock vertically from tang to guard-strap. The front part of the receiver is the chamber, $1\frac{1}{2}$ inches in length, into which the barrel is screwed. The fore-stock is secured to the barrel by a recoil-stud upon the under side of the latter. The constituent parts of the action are the breech-block (B) and pin (b); hammer (C) and pin (b); main-spring (a) and screw; trigger (C), trigger-spring (c) and screw; locking-lever (D), locking-lever spring (d), and screw; firing pin and screw. The extractor engages in a slot in the shoulder of the breech-block. The end of the ramrod screws into a ramrod-stud. The breech-block and hammer are solid pieces of fine steel, 69-100 of an inch thick, pivoted upon pins of the same material 46-100 in diameter. These pins pass entirely through the sides of the frame, and are held in place by the button screwed on to its left exterior side. The main-spring, trigger-spring, locking-lever, and the locking-lever spring are all of the very finest quality of refined steel, the springs having the simplest possible curves, and the action of the main-spring upon the hammer being direct. The function of the locking-lever is two-fold, one of its offices being to lock the trigger, so that it cannot escape from its notch in the tumbler, when the breech-block is opened, and a second to secure the breech-block when closed by the force, directly transmitted, of the lever-spring (d). It should be remarked that the whole of the lock work of this system, with the exception of the hammer, is attached to the guard-strap, which is thus, by a very ingenious construction, made to subserve the double purpose of guard-strap and lock-plate.

The extractor works in a recess cut in the left interior of the chamber, and is operated by means of a projection on its lower face, which engages with the shoulder of the breech-block, so that the act of swinging back the block very readily withdraws the empty cartridge-case by an entirely positive motion, independent of spring or indirect agent, a mode of extraction distinguished for its simplicity, smoothness, and certainty of operation. The firing-pin works through the breech-block. It is forced against the primer by the sudden shock of the hammer, which is imparted through the direct action of the strong and very slightly-curved main-spring, so that a misfire is impossible with cartridges properly made and fitted to the chamber.

The operation of this arm is especially simple. To load the piece, the hammer is first brought to full cock, and the breech-piece swung back by pressing the thumb-piece with the thumb of the right hand. The backward motion of the breech-block withdraws the discharged shell from the chamber, and if this motion is executed quickly,



with the muzzle of the arm slightly elevated, the case will fall out without necessitating the use of the fingers. The fresh cartridge is then inserted, and the breech closed in one continuous motion. The arm is then ready to fire. See *Hepburn-Remington Rifle* and *Keene-Remington Magazine-gun.*

REMINGTON THREE BARRELLED RIFLE. A gun, recently designed by Mr. G. R. Remington and tested with very satisfactory results. It has a fixed chamber closed by a movable breech-block, which rotates about a horizontal axis at 90° to the axis of the barrel, lying below the axis of the barrel and in front. The locks complete are contained in the breech-block, which being lowered out of the way by the tang on its lower end, permits the insertion of the cartridges into the chambers through a perforated extractor plate. This plate being moved by the arm on the pivot of the breech-block, withdraws the empty shells when the block is fully opened. A weak spring-catch in the stock holds up the tang of the breech-block when the piece is closed, and affords the only means of locking it.

REMISSION. Abatement; forgiveness. Remission of punishment, as regards a soldier tried by a Court-Martial, is in the power of the confirming authority, and he can at any time remit any portion of the sentence at discretion. The periodical visitors of military prisons have the power of recommending remission of punishment. When a prisoner confined in a military prison is recommended for a remission of punishment by his commanding officer, the recommendation should be submitted for the approval of the periodical visitors.

Though a soldier's punishment may have been wholly remitted, there is to be no remission of any penalty consequent on his conviction, such as forfeiture of service, good-conduct pay, etc.

REMONSTRATE.—To urge strong reasons against the instructions given by superior authority. If an officer or soldier considers himself aggrieved on any point, he is permitted to represent his case, but it must be done in a respectful manner through his commanding officer to higher authority; at the same time, where the duty of the service may require it, that duty must be first carried out with cheerfulness and alacrity.

REMOUNT.—To furnish the cavalry with horses in the room of those which have been killed, disabled, or cast.

REMOUNTS.—The name given to horses that are passed into the government service by purchase for artillery or cavalry purposes, or which are reared in a stud, as in India. The general age of remounts varies from 3 to 5 years old.

RENDEZVOUS.—A place appointed for a meeting; especially for the assembling of troops. The term commonly denotes a place for enlistment.

RENEGADE.—A term applied to one who deserts from a military or naval post.

RENNEN.—A kind of tilt. A description of tournament practiced at the close of the 12th century.

REPAIR OF ARMS.—The keeping in constant good order the different fire-arms belonging to a troop or company, such as rifles, etc. In the British Army a half-yearly allowance is made to Captains of troops and companies for this purpose. In the United States service the cost of repairs of damage done to arms, equipments, etc., through negligence of an officer or soldier, is deducted from the pay of said officer or soldier.

REPEATER.—Any fire-arm that may be discharged many times in quick succession; especially a form of fire-arm so constructed that the charges may be successively introduced, by an action of the lock, from a chamber containing them, into the breech, and fired, or are discharged from a revolving chamber at the breech. See *Magazine-gun*, and *Revolver*.

REPLEADER.—In English law, a right to plead again, or deliver a fresh pleading in consequence of the issue which had been joined not meeting or exhausting the real point in dispute. This right is much abridged, in consequence of the liberality now used in amending the record.

REPLEVIN.—In English law, a form of action by which goods which have been seized under an illegal distress are taken back (security being given to the amount for which the goods were distrained), and the action of replevin commenced, to try the legality of the seizure.

REPLICATION.—In common law, the pleading of the plaintiff in answer to the defendant's plea. The plaintiff's first pleading is the declaration, which is answered by the defendant's plea, and which in turn is answered by the plaintiff's replication.

REPLY.—It is the duty of a Court to prevent new matter from being introduced into the prosecution or defense, but a prisoner may urge in his defense mitigating circumstances, or examine witnesses as to character or services, and produce testimonials of such facts, without its being considered new matter. If any point of law be raised, or any matter requiring explanation, the Judge Advocate may explain. No other reply is to be admitted.

REPORT.—1. A loud noise, such as that made by the discharge of a cannon or musket. The distance at which cannon can be heard depends on the wind and the state of the atmosphere, also whether conveyed over water, which considerably increases the distance to which sound can reach. During the Sutlej campaign in 1845–46, the report of the guns at the battle of Sobraon was very distinctly heard at Loodianah, a distance of 80 miles. But the report of cannon, it is stated, has been heard at far greater distances.

2. A statement of facts when any officer or soldier is accused of a breach of military discipline. A report is usually made by stating on paper, in official form, by the officer making the report, the nature of the case, for the information of the Commanding Officer. In a regiment this is done through the Adjutant.

REPORTS.—Specific statements of any particular occurrences. Officers or men making written reports are required to sign them, specifying the regiment to which they belong, and their rank. All field officers not serving at the headquarters of their regiments make monthly reports to their regimental Commanders. These reports embrace everything essential to a correct record of their services. The number, date, and source of authority of every order affecting their duties is stated, with the date of its receipt, their execution of its requirements, and the time they were so employed. The date of departure of a field officer from his post or station, whether on leave or on duty, as well as the date of his return to his post, is in all cases specified.

Officers on detached duty report, monthly, to the Commanders of their Posts, of their Regiments, or Corps, and to the Adjutant General, their stations, the nature of their duties, and the authority placing them thereon—likewise each *change* of *address*. All officers doing duty in the Quartermaster's Department are required to make out and forward to the Quartermaster General, on the first day of each month, a personal report, giving their post-office address, and a statement of the duty on which they have been employed, since their last report. On the first day of each month the officers of the Subsistence Department report by letter to the Commissary General their stations and duties during the preceding month. This letter is required from Commissaries of Subsistence only, and not from officers acting as such. Every Medical Officer reports to the Surgeon General and to the Medical Director the date when he arrives at a station, or when he leaves it, and the orders under which he acts. At the end of each month he sends a personal report to the Surgeon General, giving his post-office address for the next month, and a statement of the duty upon which he has been employed, or if on leave of absence, since his last report.

Company, Post, and also Regimental Commanders make a report annually, on the first day of July, through the usual military channel, of any officers under their command who, by special aptitude or study, are notably well fitted for any branch of service, science, or art, either civil or military. Such reports give full particulars of qualifications and preparation. This information is useful to the General of the Army in making details and selections for duty. The date of appointment, of detail, and of removal of all Staff officers, or of officers selected for duty in Staff Departments, which may entitle them to receive additional pay, is immediately reported by the officer making such appointment, detail, or removal, to the Adjutant General, and to the Paymaster of the Department, or command to which such officers belong. Whenever a change takes place in the position or location of troops, the fact is immediately reported by the Commanding Officer to General, Division, or Department Headquarters, specifying the date of departure of the whole or any part of the troops, or of the arrival of any detachment, as well as all other circumstances connected with such changes in the command. These special reports are always accompanied by an exact *return* of the troops according to the established printed forms. A similar report is noted on the next monthly return of the Post or Station.

REPOSITORY.—A museum, or place of deposit of musters or the samples of the different arms, tools, stores, etc., used in the service. The repository at Woolwich forms a school of instruction for both officers and men on first joining the artillery, and is interesting and instructive to all ranks in the regiment.

REPRIEVE.—The suspension of punishment for a crime, and is used chiefly in connection with capital crimes. The power of suspending all sentences at any time is vested in the Crown at discretion. There are also several grounds on which the Judge or a Court reprieves the sentence. The President of the United States has power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment.

REPRIMAND.—rebuke, which is included in the army under the head of punishments. Courts-Martial only inflict it on officers, in which case it may be either a simple reprimand or a severe reprimand, and may, at the discretion of the Confirming Officer, be administered privately or publicly.

REPRISAL.—The retaking, from an enemy, goods which he has seized, or the capture from him of other goods, as an equivalent for the damage he has wrought. A *reprise* is a ship captured from an enemy or pirate. If recaptured within 24 hours of the hostile seizure, she must be wholly restored to her owners; if later, she becomes the lawful prize of her recaptors. Reprisals form the worst features of warfare, and are seldom resorted to in conflicts between civilized nations, or, at least, should not be.

REPROACHFUL, OR PROVOKING SPEECHES.—The Articles of War declare that no officer or soldier shall use any reproachful or provoking speeches or gestures to another. Any officer who so offends shall be put in arrest. Any soldier who so offends shall be confined, and required to ask pardon of the party offended, in the presence of his Commanding Officer.

REPUBLIC.—A political community in which the sovereign power is lodged, not in a hereditary chief, but either in certain privileged members of the community, or in the whole community. According to the constitution of a governing body, a Republic may therefore vary from the most exclusive Oligarchy to a pure Democracy. The several Republics of Greece, and that of Rome were, at the outset at least, aristocratic communities. The Mediæval Republics of Venice, Genoa, and the other Italian towns, were also more or less aristocratic. The sovereign power was held to be vested in the franchised citizens, and every function—legislative, executive, or judicial—not exercised directly by that body could only be exercised by parties deriving their authority from it. But the extent of the franchise, and the mode of exercising it, varied much in these civic communities; and the most prosperous and long-lived was Venice which was moreover the most aristocratic of them all. In the 16th century the seven Provinces of the Netherlands, on their revolt from Spain, adopted a Republican form of Government, as did Switzerland on becoming independent of the German Empire. Great Britain was nominally a Republic for eleven years (from 1649 to 1660). France was a Republic from 1793 to 1805, and from 1848 to 1853; and the Republic was again proclaimed Sept. 4, 1870. Such government as Spain had between Feb. 1873, and Dec. 31, 1874, was of a true Republican form. Switzerland is also a Republic; since 1848 more democratic than formerly. The other Republics of Europe are the diminutive States of San Marino and Andorra, and, in certain respects, the free cities of Hamburg, Bremen, and Lübeck. The most important of modern Republics is that of the United States of America—dating from its separation from Great Britain—where pure Democracy has been tried on a scale unknown elsewhere. Except during the short-lived Empire from 1863-67, Mexico has been a Republic since 1824. Nine Republics at present exist in South America—Peru, Chili, Paraguay, Bolivia, Colombia or new Granada, Venezuela, Ecuador, Uraguay, and the Argentine Confederation. In the Republics of the ancient world, the franchised classes exercised their power directly without any system of delegation or representation. The same was at first the case in the Swiss Cantons where, however, representative government has been gradually introduced. Modern Republics have been founded on the representative, not the direct, system, which can hardly exist except in a community that is very small and concentrated as to space. Switzerland and the United States of America are Federal Republics, consisting of a number of separate States bound together by a treaty, so as to present to the external world the appearance of one State with a central Government, which has the power of enacting laws and issuing orders which are directly binding on the individual citizens.

REQUA BATTERY.—A kind of mitrailleur, having twenty-five barrels arranged horizontally. It was used at the siege of Charleston in 1863. Its weight complete is 1,382 pounds.

REQUEST COURT.—A local Court assembled periodically in India for the recovery of small debts not exceeding 400 rupees. In each military cantonment, a Court of Request is assembled monthly, and all persons are amenable to it except soldiers in the ranks. Not less than three officers, all military men should form the Court.

REQUISITION. 1. This term, in international law, besides meaning the demand made by the Authorities of one Nation or State upon those of another for the

Requisition for Stationery for ______ stationed at ______ for the ______ commencing on the ______ day of ______, 188__, and ending on the ______ day of ______, 188__.

Quires of foolscap paper.	Quires of letter paper.	Quires of folio-post paper.	Quires of envelope paper.	Sheets of blotting paper.	Official envelopes.	Letter envelopes.	Two-quire blank books.	Three-quire blank books.	Bottles of black ink.	Bottles of red ink.	Ounces of wafers.	Ounces of sealing-wax.	Steel pens.	Quills.	Lead pencils.	Office tape.	Bottles of mucilage.	Pieces of rubber.		

I certify that the above requisition is correct, and that I have not drawn stationery for any part of the time specified.

____

____

rendering up (or extradition) of an alleged criminal, is used also in the rules of war as nearly synonymous with the word "Contribution." The distinction made is that a Requisition is a demand upon the people of an invaded country to furnish such things as provisions, forage, transportation, or even labor; while a Contribution is a payment in money to provide for the needs of the military or civil government established. The former term, however, is generally used to cover all demands upon the people of the conquered country. It is now well settled that the rights of private citizens should be respected and their property secured from pillage. It is the rule of most civilized nations that supplies or labor demanded should be paid for after the war, and receipts given at the time. This is the principle laid down in the *Instructions for the Armies of the United States in the Field*. It was formerly the usual practice to inflict severe requisitions in the way of fines on an offending district or town as a penalty. It is now generally agreed that such measures are rarely justifiable, and are of little practical benefit to those who employ them. 2. Forms prescribed for the demand of certain allowances. On page 663 will be seen the form of Requisition for Stationery.

REREWARD.—The part of an army that marches in the rear, usually the guard; the rear-guard.

RESERVE.—The reserve of a Nation is that force upon which the national defense is thrown, when its regular armies have failed in securing its safety. This reserve may be the *levée en masse* of the whole adult male population, or it may consist of a smaller section of the people duly trained to arms. The latter is, of course, the preferable system, when the arms of scientific modern warfare are to be brought into action. In different countries the reserves are organized on very different principles. In Great Britain they comprise the Army Reserve, the Enrolled Pensioners—both of which consist of soldiers who have served in the army—the Militia, Yeomanry, Volunteers, and trained Constabulary. The numbers of the reserve forces provided for in the Army Estimates of 1876–77 were as follows:

Militia	139,619
Yeomanry Cavalry	15,078
Volunteers	168,750
Army Reserve force (including Enrolled Pensioners) first-class	10,000
second-class	21,000
	354,447

Of the volunteers, 31,823 were Artillery Volunteers, 366 Light Horse, 6,295 Engineers, 139 Mounted Rifles, 1,458 Permanent Staff, and 128,669 Rifle Volunteers.

The scheme of army reorganization, which has been carried out during the past few years, has had a very important bearing on the reserve forces. In 1870 it was attempted, by modifying somewhat the conditions of enlistment into the regular army, to make the provisions for securing and maintaining a numerically strong Army Reserve more efficient than they had hitherto been. Enlistment continued as before to be for twelve years; but service in regiments going abroad was to be for six years, while the remaining six years' service was to be in the Reserve, the men being liable to be called out like the Naval Reserve, and receiving a pay of 4d. a day. In 1876 men commenced to pass from the Colors into the Reserve, which is expected ultimately to reach about 80,000 men. By an Order in Council of March 31, 1871, the power of the Lord Lieutenant ceases, and the management of the Reserve Forces in counties is vested in the Ministers of the Crown.

One of the objects chiefly kept in view in the comprehensive scheme of 1872 for the reorganization of the army was the bringing of the Auxiliary Forces into closer and more mutually helpful relations with the regular army. The main feature of that scheme is the localization of the combined military forces in certain territorial districts, so that there shall belong to each such district two Line Battalions, two Militia Battalions, and Volunteers, formed into an Administrative Brigade, the whole to rest on the Brigade Depot as center. Arrangements were made to secure that a larger number of officers of the line regiments should pass into the Militia and the Yeomanry, and that the efficiency of the Reserve should increase. The aim of the measure was "To unite the spontaneity and all the other advantages of the Auxiliary Forces with the highest amount of training that the Regular Army could furnish to any other body of men."

RESERVE AMMUNITION.—This term is applied to the supply of war ammunition carried in rear of an army for replenishing men and guns with fresh ammunition in case the first supply fails.

The *reserve ammunition* of a regiment is carried in carts, one for the cavalry and three for the infantry. These carts can carry 9,600 rounds each of Martini-Henry or 8,960 rounds of Snider. In the artillery, there are three reserves of ammunition. The first (108 rounds per 9-pr. and 72 per 16-pr. gun) is that contained in the second line of wagons of each battery; the second(44 per 9-pr. and 108 per 16-pr. gun) is conveyed in the artillery general service wagons, and should be always up with the army, but kept from under fire The third reserve is carried by the transport, and contains 200 rounds per 9-pr. gun and 200 per 16-pr. gun, and remains at one or two days march in rear of the army. The above number of rounds, with those with the battery, makes up 500 rounds per 9-pr. gun, and 480 rounds per 16-pr. gun.

RESERVE MILITIA.—A portion of the Militia. A certain number not exceeding the fourth part of the quota of the privates of the Militia for England, Scotland, and Ireland, respectively, may volunteer to join this force. They may volunteer to be trained for 56 days in each year with the regular army, and in case of national danger or great emergency are liable to general service in the regular army.

RESIGN.—To resign an appointment or commission, an officer must send in his resignation through the prescribed channels. Non-commissioned officers can resign their appointments, when they find themselves unequal to the performance of the duties of their rank, with the consent of their Commanding Officer. Enlisted men are not permitted to resign, and can only quit the service after having been properly discharged.

In the United States service, no officer is considered out of service on the tender of his resignation, until it shall have been duly accepted by the proper authority. Any officer who, having tendered his resignation, prior to due notice of the acceptance of the same by the proper authority, and without leave, quits his post or proper duties with the intent to remain permanently absent therefrom is registered as a deserter, and punished as such. The resignations of officers appointed by the President can be accepted by him alone.

Before approving tenders of resignation of disbursing officers, Commanding Generals cause all public moneys or property in their hands to be turned over to the officer designated to receive the same. This action is indorsed on the resignation, and promptly reported to the War Department. Resignations tendered under charges, when forwarded by any commander, are always accompanied by a copy of the charges; or, in the absence of written charges, by a report of the case, for the information of the Secretary of War. Before final payments are made to an officer whose resignation has been accepted, he is required to exhibit a certificate of non-indebtedness to the United States from the proper accounting officers of the Treasury.

In time of war, or with an army in the field, resignations take effect within thirty days from the date of the order of acceptance. Leaves of absence are not granted by commanding officers to officers on tendering their resignation, unless the resignation be unconditional and immediate. Any officer of the army who accepts or holds any appointment in the diplomatic or consular service of the Government is considered as having resigned his place in the army. This applies to officers on the Active List, and to all retired officers, excepting those exempted by law.

RESISTANCE OF THE AIR. A body moving in the air experiences a resistance which diminishes the velocity with which it is animated. That the retarding effect of the air, on projectiles moving with high velocities, is very great, is seen by comparing the actual ranges of projectiles with those computed under the supposition that they move in vacuo. Thus it has been shown that certain cannon-balls do not range one-eighth as far in the air as they would if they did not meet with this resistance to their motion, and small-arm projectiles, which have but little mass, are still more affected by it.

Incompressible fluid.—The resistance experienced by a plane surface moving parallel to itself through an incompressible fluid, is equal to the pressure of a column of the fluid, the base of which is the moving surface, and its height that due to the velocity with which the surface is moved through the fluid, or, from the law of falling bodies, $h=\frac{v^2}{2g}$; in which h is the height, v the velocity, and g the force of gravity. The resistance on a given area is therefore proportional to the square of the velocity, and the density of the fluid medium.

Let d, S, and v represent the density or weight of a unit of volume of fluid, the area pressed upon, and the velocity of the moving surface, respectively, and Q the resistance in terms of the unit of weight, and we have,

$$Q=kdS\frac{v^2}{2g};$$

in which k is a coefficient to be determined by experiment.

Compressible fluid.—If the medium be formed of compressible gases, as the atmosphere, the density in front of the moving body will be greater than that behind it; and it will be readily seen that the body will meet with a resistance which increases more rapidly than the square of the velocity, in such a manner that the coefficient, k, or the density of the medium, d, should be increased by a quantity which is a function of the velocity itself, or, what is the same thing, by adding another term to the resistance which shall be proportional to the cube of the velocity. In examining the table of resistances, obtained by Hutton by firing a one-pound ball into a ballistic pendulum, at different distances, with velocities varying from 300 to 1,900 feet, Piobert found, that if v^2 in the foregoing expression be replaced by the binomial term, $\left(v^2+\frac{v^3}{r}\right)$, in which $\frac{1}{r}=\frac{1}{1427\text{ ft.}}$, the expression would nearly satisfy the results of experiments. Calling $A=\frac{kd}{2g}$, and πR^2 the area of the cross section of a projectile, the general expression for the resistance in air becomes,

$$Q=A\pi R^2\left(1+\frac{v}{r}\right)v^2.$$

In this expression, A is the resistance, in pounds, on a square foot of the cross-section of a projectile moving with a velocity of one foot; r is a linear quantity depending on the velocity of the projectile. For all service spherical projectiles, $A=.000514$; and for all service velocities $r=1,427$ feet. The value of A for the rifle-musket bullet has been determined at the Washington Arsenal, and found equal to 0.000358. This shows that the resistance of the air is about one-third less on the *ogeval* than on the spherical form of projectile. This value has been found to answer well for calculating the ranges of rifle-cannon projectiles. The coefficient A, being a function of the density of the air, its value depends on the temperature, pressure, and hygrometric condition; in the above value the weight of a cubic foot of air = .075 lb., at a temperature of 60° Fahr., and for a barometrical pressure of 29.5 inches. If the surface of the projectile be rough or irregular, the value of this coefficient will be slightly too small.

The motion of a body falling through the air, will be accelerated by its weight, and retarded by the buoyant effort of the air, and the resistance which the air offers to motion. As the resistance of the air increases more rapidly than the velocity, it follows that there is a point where the retarding and accelerating forces will be equal, and that beyond this, the body will move with a uniform velocity equal to that which it had acquired down to this point. The buoyant effort of the air is equal to the weight of the volume displaced, or $P\frac{d}{D}$; in which P is the weight and D the density of the projectile, and d the density of the air. When the projectile meets with a resistance equal to its weight, we shall have,

$$P\left(1-\frac{d}{D}\right)=A\pi R^2v^2\left(1+\frac{v}{r}\right).$$

in which the weight of the displaced air is transferred to the first member of the equation. As the density of the air is very slight compared to that of lead or iron, the materials of which projectiles are made, $\frac{d}{D}$ may be neglected. Making this change, and substituting for P, $\frac{4}{3}\pi R^3D$ (g having been divided out of the second member, should be omitted in the first), the expression for the *final velocity* reduces to

$$v^2\left(1+\frac{v}{r}\right)=\frac{4\ RD}{3\ A}$$

The resistance on the entire projectile for a velocity of 1 foot, is $A\pi R^2$; dividing this by $\frac{P}{g}$, or the mass, we get the resistance on a unit of mass. Calling this $\frac{1}{2c}$, we have,

$$\frac{1}{2c}=\frac{A\pi R^2}{\frac{P}{g}},\text{ or }2gc=\frac{P}{A\pi R^2}.$$

Substituting for P its value in the equation of vertical descent, we have,

$$2gc=v^2\left(1+\frac{v}{r}\right);$$

from which we see that v depends only on c; but

$$c=\frac{2\ RD}{3\ gA};$$

hence, the final velocity of a projectile falling in the air is directly proportioned to the product of its diameter and density, and inversely proportional to the density of the air, which is a factor of A. The expression for the value of (c) shows, that the retarding effect of the air is less on the larger and denser projectiles. To adapt it to an oblong projectile of the pointed form, the value of D should be increased, (inasmuch as its weight is increased in proportion to its cross section), while that of A should be diminished. It follows, therefore, that for the same caliber an oblong projectile will be less retarded by the air than one of spherical form, and consequently with an equal and perhaps less initial velocity its range will be greater. The value of (c) for service projectiles will be found ready calculated in the Tables of Fire. For the purpose of determining the velocity which a projectile loses by the resistance of the air, in moving through a certain distance, x, the force of gravity may be disregarded; in which case the trajectory described will be a right line.

Let V be the initial velocity, and v the remaining velocity at the end of the distance x.

The expression for the resistance of the air is, as we have seen,

$$Q = A\pi R^2\left(1+\frac{v}{r}\right)v^2.$$

But we know that the retarding force of the air is equal to the mass of the projectile against which it acts, multiplied by the first differential coefficient of the velocity, regarded as a function of the time, with its sign changed, and that $\frac{P}{g}$ is the mass of the projectile. We have, therefore,

$$\frac{Qg}{P} = -\frac{dv}{dt} = \frac{g}{P}A\pi R^2\left(1+\frac{v}{r}\right)v^2.$$

Recollecting that $P = \frac{4}{3}\pi R^3 D$, and that $2c = \frac{4}{3}\frac{RD}{gA}$, the equation reduces to,

$$\frac{dv}{dt} = -\frac{v^2}{2c}\left(1+\frac{v}{r}\right).$$

Integrating this equation between the limits 0 and x, which correspond to V and v, we have,

$$t = 2c\left(\frac{1}{v}-\frac{1}{V}\right) - \frac{2c}{r}\log.\frac{1+\frac{r}{v}}{1+\frac{r}{V}}$$

To obtain a relation between the space and velocity; we have $v = \frac{dx}{dt}$, or $dt = \frac{dx}{v}$; substituting this in the equation for the intensity of the retarding force, and reducing, we have,

$$dx = -2c\frac{dv}{v\left(1+\frac{v}{r}\right)}$$

Integrating between the same limits as in the preceding case, we have,

$$x = 2c\log.\frac{1+\frac{r}{v}}{1+\frac{r}{V}} \text{ or } 1+\frac{r}{v} = \left(1+\frac{r}{V}\right)e^{\frac{x}{2c}} \quad \ldots(1).$$

Solving this equation with reference to v, we have,

$$v = \frac{r}{\left(1+\frac{r}{V}\right)e^{\frac{x}{2c}}-1} \quad \ldots\ldots\ldots(2).$$

Substituting in the above equations we have,

$$t = 2c\left(\frac{1}{v}-\frac{1}{V}\right) - \frac{x}{r} \quad \ldots\ldots(3).$$

The logarithms in the above equations belong to the Napierian system, and are obtained by multiplying the corresponding common logarithm by $2.3026 \cdot e = 2.713$.

Equation (1) gives the space passed over by a certain projectile when the velocities at the commencement and end of the flight, are known.

Equation (2) gives the remaining velocity when the initial velocity and the space passed over are known.

Equation (3) gives the time of flight when the velocities at the beginning and end and the space passed over are known.

The distance at which the velocity V is reduced to v, and the duration of the trajectory, being proportional to c, are directly proportional to the product of the diameter and density of the projectile, and inversely proportional to the density of the air. This fact shows the great advantage, in point of range, to be derived from using large projectiles over small ones, of solid projectiles over hollow ones, of leaden projectiles over iron ones, and of oblong projectiles over round ones. See *Didion's Formulas*, *Equations of Motion of Projectiles* and *Trajectory*.

RES JUDICATA.—In law, a term meaning that the subject matter of an action has been already decided by a court of competent jurisdiction, and if so, a plea setting up the *res judicata* is a sufficient defense. In order to be binding, however, the suit in the former case mast have been between the same parties.

RESPECTANT.—In Heraldry, a term employed to describe two animals borne face to face. Beasts of prey rampant when so borne, are, however, said to be *rampant combatant*. Also written *Respecting*.

RESSAIRDAR.—In the East Indies, a native officer in a native cavalry regiment who commands the left troop of a squadron.

RESSALAH.—The Indian term for a squadron of native cavalry.

RESSALDAR.—In the East Indies, a native officer in a native cavalry regiment. He commands the right troop of a squadron, and on parade leads the squadron. *Ressaldar Major* is the native commandant of a native cavalry regiment.

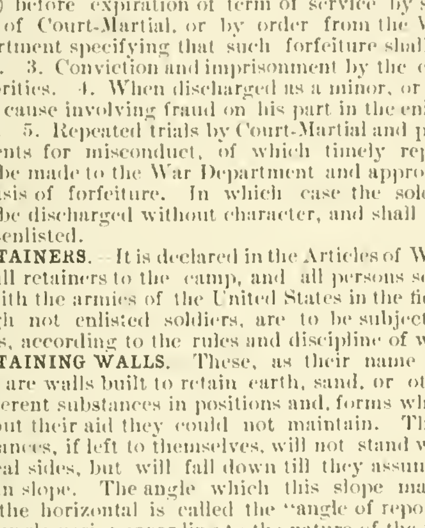
REST.—1. In tactics, a word of command, whereby the men are brought to a position of rest; as parade rest in place rest, etc. 2. A support for the muzzle of a gun in aiming and firing. The Arbalest or cross-bow, and the earlier hand fire-arms were always thus supported, and the long guns of the Moors and Arabs are still universally provided with a device of this kind. In civilized countries the rest is employed by the sharp-shooters and in practice-firing. It may consist of a stake or picket, whose pointed end is driven in the ground, the gun resting in a crotch at the upper extremity; or, as in some of the European armies, of a device having a screw-point, by which it may be attached to a tree or other support. 3. In a lathe, a piece of iron for holding the turning tool, fixed at the end of a slide by a set-screw; the slide can be moved at right angles to the bar of the lathe, and the whole can be fixed at any part of the bed between the centers. 4. In Heraldry, the name usually given to a charge, varying considerably in the different representations. It appears at too early a date to be what it is often said to be—a spear rest. It is sometimes called an organ-rest, and in old rolls, a clarion—and is most likely a representation of some musical instrument like the pandean pipe. It was a rebus badge of the Clares.

REST ON ARMS.—A position in the Manual of Arms, executed as follows: Being at a carry, the Instructor commands: 1. *Rest on*, 2. ARMS. Raise the piece vertically with the right hand, advancing it slightly, grasp it with the left hand at the lower band, the forearm horizontal; reverse it with both hands, the muzzle dropping to the front, the butt passing between the breast and the right forearm; place the muzzle upon the left toe, the barrel to the right, the left hand slipping up the stock, the back to the left. (Two.) Carry the right foot three inches to the rear; at the same time place the hands upon the butt, the right hand uppermost, the left knee slightly bent. (THREE.) Incline the head toward the hands. 1. *Carry*, 2. ARMS. Grasp the small of the stock with the right hand, back to the right; carry the piece with the right hand opposite the right shoulder, barrel to the front and vertical, forearm horizontal; grasp the piece at the lower band with the left hand, back to the left, the thumb pointing downward; bring the right foot by the side of the left. (Two). Reverse the piece with both hands, the butt passing between the breast and right forearm; resume the carry with the right hand. (THREE.) Drop the left hand by the side. See *Manual of Arms*, *Fig.* 13.

RETAINED PAY. In the United States service, this pay is retained from the soldier until the expiration of his term of service, and is forfeited unless he shall have served honestly and faithfully to the date of discharge, or for any of the following causes: 1. Desertion during the period of enlistment. 2. When discharged (by way of punishment for an offense) before expiration of term of service by sentence of Court-Martial, or by order from the War Department specifying that such forfeiture shall be made. 3. Conviction and imprisonment by the civil authorities. 4. When discharged as a minor, or for other cause involving fraud on his part in the enlistment. 5. Repeated trials by Court-Martial and punishments for misconduct, of which timely report shall be made to the War Department and approved as basis of forfeiture. In which case the soldier shall be discharged without character, and shall not be re-enlisted.

RETAINERS.—It is declared in the Articles of War, that all retainers to the camp, and all persons serving with the armies of the United States in the field, though not enlisted soldiers, are to be subject to orders, according to the rules and discipline of war.

RETAINING WALLS. These, as their name implies, are walls built to retain earth, sand, or other incoherent substances in positions and forms which without their aid they could not maintain. These substances, if left to themselves, will not stand with vertical sides, but will fall down till they assume a certain slope. The angle which this slope makes with the horizontal is called the "angle of repose." This angle varies according to the nature of the material; for example, that of moist soil is about 45°,



ac, revetment; b, bottom of ditch, level of ground within the work; de, top of rampart; fgh, parapet; ik, banquette; kle, mass of earth supported by revetment; m, center of gravity of mass; n, point of greatest pressure on revetment.

while fine sand assumes an angle of about 30°. The drawing shows a retaining wall of masonry built in permanent fortification. Prior to Vauban's time the scarp revetment or retaining wall was commonly raised to the top of the parapet; but as in this case the artillery of a besieger played on the top of the wall, and ruined it soon after the siege commenced, that engineer adopted the principle—thenceforth followed—of raising it no higher than the crest of the glacis, or about 7 feet above the natural ground, leaving the parapet above of sloped earth only. When the main ditch is 24 feet deep, the scarp revetment will be about 30 feet high. Additional strength is imparted to the revetment wall by massive buttresses at every 15 feet, called *counterforts*, and these, again, are sometimes connected and strengthened by masonry arches outside the revetment. The revetment forms a terrible barrier to an assaulting party.

In estimating the requisite thickness of the wall, it must be taken into account that the wall may give way in various manners; it may be overturned, or it may slide as a whole along its base DB, or the upper parts may give way, while the base remains. From these data, mathematical formulæ have been worked out, which determine the thickness requisite for different situations and materials, such as that given by M. Poncelet for ordinary materials, and within ordinary limits:

$$x = .285(H + h).$$

Where H, the height of the wall, and h, the additional height of the bank above the top of the wall, being given, x, the thickness of the wall, can be found. These formulæ, however, are not of much practical value, on account of the varying nature of the data on which they are founded, and of the excess of strength requisite in all such constructions, to allow for causes of failure which cannot be foreseen or provided for in the calculations. Practical experience is found to be the only safe guide in all such considerations. In the construction of a retaining wall, a great desideratum is, that the earth behind it be well drained; for if water be allowed to accumulate behind the wall, the earth gets into a semi-fluid state, in which it gives a very much increased pressure on the wall. For this purpose, holes are left through the wall called "weeping holes;" these holes are about 9 inches high and 2 inches wide, and are generally placed about 1 for every 36 sq. ft. of wall. Also stones without mortar are frequently built up behind the wall, so forming an open stratum, into which the water drains, and is thence carried off through the weeping-holes.

RETALIATION.—War is not carried on by arms alone. It is lawful to starve the hostile belligerent, armed or unarmed, so that it leads to the speedier subjection of the enemy. When the commander of a besieged place expels the non-combatants, in order to lessen the number of those who consume his stock of provisions, it is lawful, though an extreme measure, to drive them back, so as to hasten on the surrender. Commanders, whenever admissible, inform the enemy of their intention to bombard a place, so that the non-combatants, and especially the women and children, may be removed before the bombardment commences. But it is no infraction of the common law of war to omit thus to inform the enemy. Surprise may be a necessity. Public war is a state of armed hostility between sovereign nations or governments. It is a law and requisite of civilized existence that men live in political, continuous societies, forming organized units, called states or nations, whose constituents bear, enjoy, and suffer, advance and retrograde together, in peace and in war.

The citizen or native of a hostile country is thus an enemy, as one of the constituents of the hostile state or nation, and as such is subjected to the hardships of the war. Nevertheless as civilization has advanced during the last centuries, so has likewise steadily advanced, especially in war on land, the distinction between the private individual belonging to a hostile country and the hostile country itself, with its men in arms. The principle has been more and more acknowledged that the unarmed citizen is to be spared in person, property, and honor as much as the exigences of war will admit. Private citizens are no longer murdered, enslaved, or carried off to distant parts, and the inoffensive individual is as little disturbed in his private relations as the commander of the hostile troops can afford to grant in the overruling demands of a vigorous war.

The almost universal rule in remote times was, and continues to be with barbarous armies, that the private individual of the hostile country is destined to suffer every privation of liberty and protection, and every disruption of family ties. Protection was, and still is with uncivilized people, the exception. In modern regular wars of the Europeans, and their descendants in other portions of the globe, protection of the inoffensive citizen of the hostile country is the rule; privation and disturbance of private relations are the exceptions.

Commanding Generals may cause the magistrates and civil officers of the hostile country to take the oath of temporary allegiance or an oath of fidelity to their own victorious government or rulers, and they may expel every one who declines to do so. But whether they do so or not, the people and their civil officers owe strict obedience to them as long as they hold sway over the district or country, at the peril of their lives. The law of war can no more wholly dispense with retaliation than can the law of nations, of which it is branch. Yet, civilized nations acknowledge retaliation as the sternest feature of war. A reckless enemy often leaves to his opponent no other means of securing himself against the repetition of barbarous outrage.

Retaliation will, therefore, never be resorted to as a measure of mere revenge, but only as a means of protective retribution, and, moreover, cautiously and unavoidably; that is to say, retaliation shall only be resorted to after careful inquiry into the real occurrence, and the character of the misdeeds that may demand retribution. Unjust or inconsiderate retaliation removes the belligerents further and further from the mitigating rules of a regular war, and by rapid steps leads them nearer to the internecine war of savages.

Modern times are distinguished from earlier ages by the existence, at one and the same time, of very many nations and great governments related to one another in close intercourse. Peace is their normal condition; war is the exception. The ultimate object of all modern war is a renewed state of peace. The more vigorously wars are pursued, the better it is for humanity. Sharp wars are brief.

Ever since the formation and coexistence of modern nations, and ever since wars have become great national wars, war has come to be acknowledged not to be its own end, but the means to obtain great ends of state, or to consist in defense against wrong; and no conventional restriction of the modes adopted to injure the enemy is any longer admitted; but the law of war imposes many limitations and restrictions on principles of justice, faith, and honor.

RETARDATION.—The velocity a ball loses in consequence of a resisting medium is termed *retardation*. This varies with the degree of resistance, and the weight of the ball. In case of ordinary spherical projectiles retardation will vary as $\frac{d^2\ v^3}{d^3}$ (d=the diameter of the ball, and v=its velocity). If two shot of different diameters, but of equal density, be fired under similar circumstances, it appears from this that the shot of the larger diameter will range to a greater distance than the other; consequently for equal ranges, the elevation of the piece from which the larger shot is fired may be reduced, and the chances of its striking the object fired at, will be greater, the trajectory being less curved.

The effect of a pressure or resistance (R) acting on a projectile or other body is to cause acceleration or retardation (f) in velocity, and the amount of it is known from the elementary law in dynamics expressed by the proportion, $R : w :: -f : g$, where w is the weight of the projectile in pounds; or retardation (f) $= -\frac{R}{w}g$. Here we notice that *retardation* varies inversely as the weight of the projectile. Retardation is negative acceleration. It is subject to the same laws, but is the opposite to it in sign. Hence, the minus sign in the proportion above.

RETIARIUS.—A kind of gladiator who fought in the amphitheater during the time of the Romans. He was dressed in a short coat, having a *fuscina*, or trident, in his left hand, and a net, from which he derived his name, in his right. With this he endeavored to entangle his adversary, that he might then with his trident easily dispatch him. On his head he wore only a hat tied under his chin with a broad ribbon.

RETINUE.—The body of retainers who follow a prince or other distinguished person; a train of attendants.

RETIRADE.—In fortification, a retrenchment, which is generally made with two faces, forming a re-entrant angle, and is thrown up in the body of a work, for the purpose of receiving troops, who may dispute the ground inch by inch.

RETIRE.—A bugle-sound intimating to skirmishers that they are to fall back. In the United States service, this call is termed "to the rear."

RETIRED FLANKS.—In fortification, those made behind the line which joins the extremity of the face and the curtain towards the capital of the bastion.

RETIRED LIST.—The list of officers retired from an Army. To maintain a reasonably low age among the officers actively employed, it is essential that an army should have some fixed scale for the retirement of the old and enfeebled officers. In the British Army, this matter is well regulated, and in most instances the retiring officer is allowed a step of honorary rank; which higher rank, however, does not carry present nor prospective advantage.

In the United States service, the whole number of officers of the Army on the Retired List can not at any time exceed four hundred, and any less number to be allowed thereon may be fixed by the President at his descretion. Retired officers of the Army may be assigned to duty at the Soldiers' Home, upon a selection by the commissioners of that institution, approved by the Secretary of War; and a retired officer is not assignable to any other duty. Any retired officer may, on his own application, be detailed to serve as professor in any college; but while so serving, such officer is allowed no additional compensation. Upon the application of any college, university, or institution of learning incorporated under the laws of any State within the United States, having capacity at the same time to educate not less than one hundred and fifty male students, the President may detail an officer of the Army on the Retired List to act as president, superintendent, or professor thereof; and such officer may receive from the institution to which he may be detailed the difference between his retired and full pay, but will not receive any additional pay or allowance from the United States.

When any officer has served forty-five years as a commissioned officer, or is sixty-four years old, he may be retired from active service at the discretion of the President. And all such are retired upon the actual rank held by them at the date of retirement; but are withdrawn from command and from the line of promotion, as are all officers on the Retired List. They are entitled to wear the uniform of the rank on which they may be retired. They continue to be borne on the Army Register, and are subject to the Rules and Articles of War, and to trial by General Court-Martial for any breach thereof. The pay of officers on the Retired List is ¾ of the pay of the rank upon which they are retired. When wholly retired from the service, they are entitled to receive, upon retirement, one year's pay and allowances of the highest rank held by them, whether by staff or regimental commission, at the time of their retirement.

RETIREMENT.—In the British Army, a Royal Warrant, introducing and regulating compulsory retirement from the army was issued in 1877. Voluntary retirement on half pay is allowed to officers after not less than 12 years' service. Officers below the rank of Major, who have served in their present rank for seven years without promotion, are to be placed on half-pay after a total service of 20 years; Majors after 27 years, and higher officers after varying periods. As to age, a Colonel, who has not retired on other grounds, must, unless special exception be made, retire at the age of 63 years, Lieutenant Colonel at 60 years, Major at 58 years, and officers of lower rank at 55 years—the pension varying according to circumstances. In 1878 there were 370 officers on retired full-pay, costing £132,000, and 1,578 on half-pay, costing £280,000; but these numbers include nearly all Staff Officers, and many on temporary half-pay on account of sickness, private affairs, etc.

In the United States service, Department Commanders, from time to time, report to the Adjutant General of the army the names of officers belonging to their Departments who are incapacitated for active service or command, with a view to their being brought before a Retiring Board. The reports in each separate case contain a specific statement of facts, and the names of witnesses to prove them. Habitual intemperance, gambling, low company, or other vices that tend to corrupt an officer and lower the professional standard, are causes sufficient to bring an officer before a Board, to be wholly retired. When ample testimony establishes the fact that an officer has, through vicious indulgences, slighted or neglected his ordinary duties to such a degree as to make it evidently unsafe to intrust him with a command or responsibility that rightfully belongs to his grade, and when it is shown that such habits have continued for such length of time as to make a permanent reformation improbable, this fact, rather than the present condition of the officer when he appears before the Board, weighs in the verdict as to his incapacity for active duty. Officers on the Retired List are amenable to the Rules and Articles of War, and subject to trial by Court-Martial for a violation thereof. It is made the duty of all officers of the army who may become cognizant of flagrant violations of military law by any retired officer to report the same to the Adjutant General of the army for the action of the General. See *Discharge*, *Pension*, *Retired List*, *Retiring Board*, and *Superannuation*.

RETIRING BOARD.—The Secretary of War, under the direction of the President, from time to time, assembles an Army Retiring Board, consisting of not more than nine nor less than five officers, two-fifths of whom are selected from the Medical Corps. The Board, excepting the officers selected from the Medical Corps, is composed, as far as may be, of seniors in rank to the officer whose disability is inquired of. The members of the Board are sworn in every case to discharge their duties honestly and impartially.

A Retiring Board may inquire into and determine the facts touching the nature and occasion of the disability of any officer who appears to be incapable of performing the duties of his office, and has such powers of a Court-Martial and of a Court of Inquiry as may be necessary for that purpose.

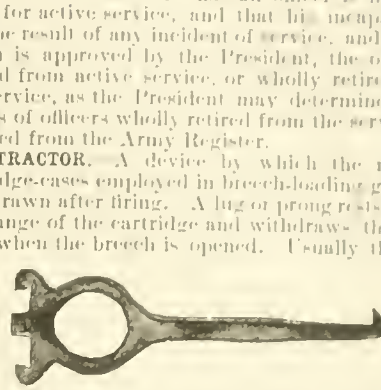
When the Board finds an officer incapacitated for active service, it finds and reports the cause which, in its judgment, has produced his incapacity, and whether such cause is an incident of service.

The proceedings and decision of the Board are transmitted to the Secretary of War, and are laid by him before the President for his approval or disapproval and orders in the case.

When a Retiring Board finds that an officer is incapacitated for active service, and that his incapacity is the result of an incident of service, and such decision is approved by the President, said officer is retired from active service and placed on the list of retired officers.

When the Board finds that an officer is incapacitated for active service, and that his incapacity is not the result of any incident of service, and its decision is approved by the President, the officer is retired from active service, or wholly retired from the service, as the President may determine. The names of officers wholly retired from the service are omitted from the Army Register.

RETRACTOR. A device by which the metallic cartridge-cases employed in breech-loading guns are withdrawn after firing. A lug or prong rests behind the flange of the cartridge and withdraws the spent shell when the breech is opened. Usually the posi-



tive movement of the notched extractor-plate loosens the shell from the bore, and after passing a certain point a spring comes into play, and gives a sudden impulse to the shell, which throws it clear of the fire-arm. The drawing represents the Bridgeport tool, worked by hand, which is quite effective, and avoids the possibility of failure to act.

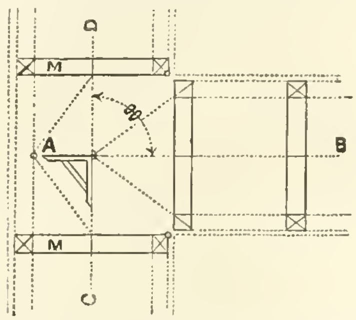
RETREAT. A retrograde movement of a force, with the intention of avoiding an encounter with a hostile body in the front. The greatest exertion of talent is requisite in a General to conduct an able retreat, more depending on arrangement and coolness than even in the preliminaries of a battle. When the enemy pursue, if the retreat is not to degenerate into a rout, the retreating army must be covered by a powerful rear-guard, which from time to time must hold the pursuers at bay, while the artillery-train and baggage pass defiles, cross streams, and overcome other special obstacles. A strong retreat is made when the rear is formed by a line of solid battalions, of which alternate masses retreat, while those intervening face about and oppose the enemy; the latter afterward retreating between and to the rear of those which retreated in the first instance. The retreat is thus continued by alternate halting and falling back on the part of each corps.

RETRENCHMENT. In fortification, a defensive work, comprising at least ditch and parapet within some other work of a fortress, and intended as a place of retreat for the defenders, whence they may prolong the defense, or capitulate after the faces of the work itself have fallen into the enemy's hands. The retrenchment bears a considerable resemblance to the *réduit* except that it is almost always of earth. Retrenchments are made in ravelins, and the re-entering *places d'armes* at the time of constructing those works. A retrenchment is thrown across the gorge of a redan or bastion, or from shoulder to shoulder, when it is apprehended that the salient angle will fall into the possession of the besiegers; these retrenchments are usually made when wanted. Such a retrenchment across the interior of the Redan at Sebastopol caused the sanguinary repulse of the British on Sept. 8, 1855.

RETURN GALLERY.—In fortification, a gallery which leads from another gallery. The line, C D, in the drawing, is the axis of a gallery of departure, and A B that of the return. The line A B is the interior line of the gallery frames; C D the interior line of the same; E F that of the sheeting. The corresponding lines for the remaining half of the gallery of departure, and those of the return, will be readily recognized. The frames M and M bound the entrances or *Landings* to the returns.

The frames M, M', of the landing, in the gallery of departure, are put so far apart that, were the return gallery all of one piece, it could be shoved in or out between them. The same idea also regulates the relative positions of the landing frames of the gallery of departure, and the return gallery in all other cases.

In oblique returns, where the angle between the axes of the two galleries is 45° or greater, the return is run directly from the main gallery. The first frame of the return being an oblique one, having its stanchions and sills cut with a suitable obliquity, so that, when the frame is placed along side of the main gallery, the outside of its stanchions will lie parallel to the axis of the return. The position of the land-



ing frames M, M′, is so determined that one of the exterior lines of the sheeting of the return will intersect the exterior edge of the stanchion of M at o, and the other the interior edgn of M′ at o′. When the angle between the axes is less than 45°, it would give too wide a landing in the gallery of departure to run the return directly from it. A short rectangular return must first be made to serve as a landing to the oblique return. To determine the position of the rectangular return, so that it shall be the shortest practicable, set off the lines of the gallery of departure and of the oblique return in the usual manner, draw a line parallel to the axis C D, and at the thickness of the gallery frame of the reetangular return from the exterior line of the sheeting; the point where this line cuts the exterior line of the sheeting of the oblique return, will be the position of the interior edge of the stanchion of the gallery frame of the rectangular return: having next drawn the lines of this return, the position of the other frame, will be at the point, where the outside line of the stanchions of the rectangular cuts the outside line of the sheeting of the oblique return. See *Gallery*.

RETURNS.—The official accounts, reports, or statements, rendered to Superior Officers. Commanders of Departments, Regiments, Corps, and Posts make to the Adjutant General's Office in Washington monthly *Returns* of their respective commands on the forms furnished, and according to the directions printed on them. In like manner Captains make monthly *Returns* of their companies to Regimental Headquarters. Regimental *Returns* are made in the name of the Colonel, and those of the company in the name of the Captain, whether those officers be present or absent. Monthly returns of Military Departments are sent direct to the Adjutant General of the Army and to Division Headquarters. Every Commander of a separate body of troops—either Division, Brigade, Regiment, or Detachment—whether engaged in campaign, field-service, or occupying a temporary camp, or simply in transit from one post to another, makes the monthly Returns required by the Regulations. Any detachment so far separated from the main body to which it belongs as to render it impracticable for the Commander of the main body to make the muster and inspection enjoined by Regulations, is a separate command within the meaning and for the purpose of the law. These Returns exhibit separately the several Regiments and Detachments, and Staff Corps, and the strength of each garrison within the command.

After any action or affair a Return of the killed, wounded, and missing is made, in which the name, rank, and regiment of each officer and soldier is specified, with such remarks and explanations as may be requisite for the Records of the Department of War to establish the just claims of any individual who may have been wounded, or of the heirs and representatives of any killed in action. The *nature of the wound*, the *time* and *place* of its occurrence, the Company, Regiment, or Corps, and the name of the Captain, Colonel, or other Commanding Officer, should always be carefully stated. A copy of this return is promptly forwarded *direct* to the Adjutant General of the army. After every battle, skirmish, or other engagement, Commanding Officers of Regiments, or detached portions thereof, forward direct to the Adjutant General of the army duplicates of the Returns, to be transmitted through intermediate Commanders, of killed, wounded, and missing A Return of all property captured is made by the Commanding Officer of the troops by whom such capture was made to the Adjutant General, at Washington, that the property may be disposed of according to the orders of the War Department.

REVEILLE.—The beat of the drum about break of day, to give notice that it is time fo rthe soldiers to rise, and for the sentinels to forbear challenging. The *reveille-gun* is fired just before the first note of reveille is sounded.

REVEIL MATIN.—An ancient French 96-pounder, double cannon.

REVERBERATORY FURNACE.—A furnace so constructed that matter may be heated in it without coming in direct contact with the fuel. It consists essentially of three parts, viz., a fire-place at one end; in the middle, a flat bed or sole, on which the material to be heated is placed; and at the other end a chimney to carry off the smoke or fume. Between the fire-place and the bed, a low partition-wall, called a fire-bridge, is placed, and the whole built over with a flat arch, dipping toward the chimney. The flame plays over the fire-bridge, and is reflected, or *reverberated*, on the material beneath; hence the name.

REVERONI SYSTEM OF FORTIFICATION.—The enceinte of this system consists of a bastion front casemated on a peculiar principle. The guns are placed on a "bascule," and are only exposed when actually firing. Their recoil lowers them and closes the embrasure. In rear is an earthen retrenchment, while earthen counterguards in front are defended by the casemated flank of a ravelin. The reduit of this work is also casemated.

REVERSE.—1. A change for the worse, or partial defeat. 2. A movement by which an artillery carriage is placed on the same ground, but facing in the opposite direction. To execute the *reverse*, the lead-driver, after gaining seven yards in that direction, moves his horses toward the left, so that the extreme part of the curve described by the off horse will be fourteen yards from the *line of departure* (or line occupied by the heads of the leaders at the beginning of the movement), and that, after passing three yards to the left of the original left flank of the team and carriage, they will return to the ground occupied by the carriage at the beginning of the movement. The swing-driver follows the lead-driver. The wheel-driver directs his horses so that the right limber-wheel describes a loop, which, extending seven yards to the right and eleven to the front of the line of departure, passes a little to the left of the original left flank and then returns, bringing the hind-wheels in such a position that the rear of the carriage occupies the line of departure. The pairs in front move according to their distances from the pole, and must keep out of the way of the wheelers, who control the carriage. On the completion of the reverse, the drivers move off their horses in the new direction. In reversing at a *trot*, or *gallop*, the loop is opened a little, and the gait moderated so as not to incur the risk of upsetting the carriage. *This rule is general.* If the carriage have but two pairs of horses, the lead-driver moves as above prescribed for the swing-driver; if but a single pair, the driver moves as prescribed for the wheel-driver. See *Countermarch*.

REVERSE ARMS.—That position in the Manual of Arms, executed as follows: The Instructor commands 1. *Reverse*, 2. ARMS. Raise the piece vertically with the right hand, while advancing it slightly; grasp it with the left hand at the lower band, the forearm horizontal; at the same time grasp the gun at the small of the stock with the right hand. (Two.) Reverse the piece, the muzzle dropping to the front, the butt passing between the breast and right forearm; the right hand grasping the small of the stock at the height of the shoulder, the barrel to the front and vertical; the fingers of the left hand extended, and joined in front of the barrel, the little finger at the lower band. (THREE.) Press the muzzle to the rear with the left hand, the piece inclined at an angle of forty-five degrees; steady it in this position by pressure of the right elbow against the body; carry the left hand behind the back and grasp the piece between the bands.

1. *Carry*, 2, ARMS. Let go the piece with the left hand, and regrasp it in front at the lower band, back of the hand to the left, the thumb pointing downward, the right forearm horizontal, the barrel vertical. (Two.) Reverse the piece with both hands, the butt passing between the breast and right forearm; quickly resume the carry with the right hand. (THREE.) Drop the left hand by the side.

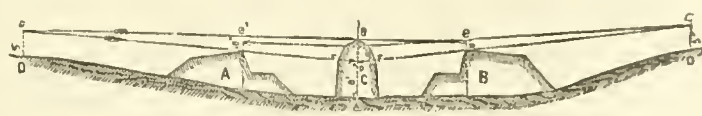
When necessary to march long distances with arms reversed, the piece may be changed to a corresponding position under the left arm by the commands: 1. *Left Reverse*, 2. ARMS. The piece is placed under the left arm with the right hand, the left hand carried to the small of the stock, and the right hand behind the back.

The piece is similarly restored by the commands: 1. *Reverse*, 2. ARMS. See *Manual of Arms*, Fig. 12.

REVERSED.—In Heraldry, the term applied to a charge turned upside down.

REVERSE DEFILEMENT.—When a work is placed in a hollow formed by two eminences, and is exposed to both a direct and reverse fire from them, it cannot be defiled by direct means, without giving it a relief generally too great for field works. To avoid this, the method of reverse defilement must be resorted to.

Suppose the work defiled, and a section be made by vertical planes passing through the highest points, O and O'. If in this plane a vertical A B, be drawn, corresponding to the capital of the work, and eight feet be set off on this vertical from the point, A, and two verticals be drawn through the points, O and O', and five feet be set off on each of them; and then the points C' and C, be joined with D, it is obvious that the interior crest of the parapet, A, being placed on the line, C D, will screen all the ground in the rear of it, as far as the capital, from the direct fire from O. The parapet, B, being regulated in a similar manner, will screen all the ground behind it as far as the same line. But the fire from O' would take the parapet A in reverse, and that from O the parapet B; to prevent this, a *traverse* must be erected on the line of the capital, and a sufficient height be given to it to screen both A and B from a reverse fire. To effect this, let eighteen inches be set off above the interior crests of A and B; the point, E, being joined with C', and the point E' with C; it is here also obvious, that if the top of the traverse be placed on the line C E', it will effectually screen both the parapets from all reverse fire; because every shot that strikes the top of it will pass at least eighteen inches above the two parapets, and, since the banquettes are four feet three inches below the interior crests, the shot must pass five feet nine inches above the banquettes which will be quite sufficient to clear the head of the men when on the banquettes. This illustration explains the spirit of the method of reverse defilement.



The traverse is finished on top like the roof of a house, with a slight pitch; its thickness at the top should seldom exceed ten feet, and will be regulated by the means the enemy can bring to the attack; its sides are made with the natural slope of the earth; but, when the height of the traverse is considerable, the base of the side slopes would occupy a large portion of the interior space: to remedy this, in some measure, the portion of the sides which are below the planes of direct defilement, may be made steeper than the natural slope; the earth being retained by a facing of sods, etc.

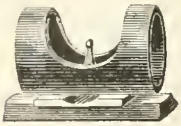
When the salient of the work is to be arranged for defense, the traverse cannot then be extended to the salient angle; it is however usual to change its direction within some yards of the salient, and unite it with the face most exposed. Traverses are also used to cover faces exposed to an enfilade fire; for this purpose they are placed perpendicular to the face to be covered. If several are required, they may be placed twenty or thirty yards apart; each traverse should be about twenty-four feet long, and thick enough to be cannon proof. As the traverses require a large quantity of earth, and much time and labor for their construction, their length should not be greater than is indispensably requisite to form a good screen. This may be determined by drawing lines from the dangerous points to the furthest point of the line to be screened; the one which intersects the line of the traverse furthest from the salient will give the best length of the required traverse. The lines drawn from O and O' to E and A, cut the line of traverse at A and C, thus requiring the traverse to be run back to *a* to cover each face and flank. The difficulty of defilement, owing to the great relief that may be required for the parapets, the labor of erecting the traverses and the room which they occupy within the work, which is frequently wanted for the defense, restricts its application mostly to enclosed works, which are to remain occupied during some time, and whose position, from some point to be defended, cannot be shifted.

The case of defilement here examined is that of works open at the gorge; the same principles, and similar methods, would be applied to enclosed works. After the plan of the work has been regulated, the arrangement of the traverses next demands the attention: the only rule that can be laid down is, to place them in the most favorable position to intercept the reverse and enfilading fire of the enemy: and if there should be a choice with respect to several positions, to select the one which will give the lowest traverse. If it is not even probable that a commanding eminence will be occupied by the enemy, nevertheless should the defense be not impaired, it will be better to place the work beyond the cannon range of the eminence. See *Defilement*, and *Plane of Defilement*.

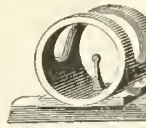
REVERSE FIRE.—In gunnery, when the shot strikes the interior slope of the parapet at an angle greater than 30°, it is called *reverse fire*.

REVERSE FLANK. The extremity of the division furthest from the pivot flank. See *Outward Flank*.

REVERSIBLE SIGHT. A front sight recently introduced by the Winchester Arms Company. The drawing shows the manner of its construction and use. By revolving the sight on its base, 90° horizontally, it changes in appearance from an open sight to a globe sight. It thus permits the marks-



As Open.



As Closed.

man to use either form of sight at will. It may be readily detached from the barrel and replaced by a sight of any other form.

REVETMENT.—The interior slopes of the parapets of permanent and field-works, as well as in some cases the sides of the ditches of the latter, require revetments to enable them to stand at that slope which is necessary, and to endure the action of the weather. The materials made use of in the construction of field-revetments are: fascines, gabions, hurdles, sod, sand-bags, and timber. In siege operations, and in fact in all operations in active warfare, vast quantities of these materials are required, and are daily consumed, in the construction of breastworks, parapets, batteries, magazines, and a variety of miscellaneous purposes. Large quantities, then, must be prepared or manufactured by the ordinary troops of the line, superintended by their own officers, who should be acquainted with all the details necessary for their production.

In permanent fortifications, the revetments are retaining walls of masonry built for the purpose of holding back the earth of which the works are composed. The most ordinary position of such revetments is for the escarp and counterscarp of the ditch. The more important of these two is the escarp, which has to hold back the great mass of earth represented by the rampart, parapet, banquette, etc. It is usually of solid brickwork or stone, 5 feet thick at the top, and sloping outward as it descends (on the ditch-side only) to the extent of 1 in 6. Prior to Vauban's time, the escarp revetment was commonly raised to the top of the parapet: but as in this case the artillery of a besieger played on the top of the wall, and ruined it soon after the siege commenced, that engineer adopted the principle—thenceforth followed —of raising it no higher than the crest of the glacis, or about 7 feet above the natural ground, leaving the parapet above of sloped earth only. When the main ditch is 24 feet deep, the scarp revetment will be about 30 feet high. Additional strength is imparted to the revetment wall by massive buttresses at every 15 feet called *counterforts*, and these, again, are sometimes connected and strengthened by masonry arches outside the revetment. The revetment forms a terrible barrier to an assaulting party. See *Fascine Revetment, Gabion Revetment, Hurdle Revetment, Pisa Revetment, Plank Revetment, Sand-bag Revetment, Scarp Revetment, Sod Revetment,* and *Timber Revetment.*

REVIEW.—In military parlance, a review is the inspection by some staff-officer of any body of troops in parade order. Reviews always comprise a march past the inspecting-officer in column, and a general salute in line; to these is frequently added a mock-battle, for the amusement of spectators, and the practicing of the troops themselves in warlike maneuvers. The following is the manner of reviewing a battalion of the United Sates Army:

Dismounted Troops.—The reviewing officer takes his post in front of the center of the battalion, the point being indicated by a marker or camp-color previously established by the Adjutant; the Adjutant also posts markers at the points where the column will have to change direction in order that the right flank, in passing, shall be at six or eight yards from the reviewing officer. The battalion being in line, bayonets fixed, the Colonel in front of and facing the center commands: 1. *Prepare for review*, 2. *Rear open order*. 3 MARCH. At the third command. the ranks are opened; and the Colonel superintends the alignment of the company officers and the front rank; the Leutenant Colonel the rear rank, and the Adjutant the line of file-closers. The Colonel, seeing the ranks aligned, returns to the right of the line of company officers, faces to the left, commands: FRONT, and, passing in front of the company officers to the center, places himself, facing to the front, six yards in front of the line of Field Officers, opposite the center of the battalion. The reviewing officer now approaches a few yards toward the Colonel and halts, when the Colonel faces about and commands: 1. *Present*, 2, ARMS. At the second command, the officers and men present arms; the color also salutes, should the rank of the reviewing officer entitle him to it, in which case the band, trumpeters, or field-music sound a march, flourishes, or ruffles, according to his rank; arms having been presented, the Colonel faces about and salutes. The reviewing officer acknowledges the salute by touching or raising his hat, after which the Colonel faces about and brings the battalion to carry arms. The Colonel then joins the reviewing officer, who proceeds to the right of the band, and, passing in front of the company officers to the left of the line, returns to the right, passing in rear of the file-closers.

While the reviewing officer is going around the battallion, the band plays, ceasing when he leaves the right of the band to return to his station; the Colonel returns to his post in front of the center, and commands: 1. *Close order*, 2. MARCH. At the command *march*, the company officers return to their places in line; the field, staff, and non-commissioned staff, remain in their places. The reviewing officer having taken his position, the Colonel commands: 1. *Companies right wheel*, 2. MARCH. At the second command, the battalion breaks into column of companies; the staff (excepting the Adjutant) place themselves in the order of rank from right to left, on a line equal to the front of the column, six yards in front of the leading Captain; the Lieutenant-colonel on a line with the leading company, the Major on a line with the rear company, the Adjutant on a line with the second company from the front, the Sergeant-major on a line with the second company from the rear, each six yards from the left flank of the column; the non-commissioned staff, excepting the Sergeant-major, place themselves, in the order of rank from right to left, on a line equal to the front of the column, six yards in rear of the file-closers of the rear company; the band wheels to the right and takes post twelve yards in front of the staff. The Colonel then commands: 1. *Pass in review*, 2. *Forward*, 3. *Guide right*, 4. MARCH. At the fourth command, the column steps off, the officers remaining in the positions above prescribed, the band playing; the column changes direction, without command from the Colonel, at the points indicated, the Colonel taking his place six yards in front of the staff immediately after the second change; the band having passed the reviewing officer, wheels to the left out of the column, and takes post in front of, and facing, the reviewing officer, where it remains till the rear of the column has passed, when it countermarches and returns to its place before the review, ceasing to play as the battalion approaches its original position. The Colonel and staff, except the Adjutant, salute together when the Colonel is at six yards from the reviewing officer, and return to the carry together when the Colonel has marched six yards behind him. The other officers, and the non-commissioned staff, salute and return to the carry at the points prescribed for the Colonel. In saluting, all officers turn the head, and look toward the reviewing officer. Non-commissioned officers in command of subdivisions salute as prescribed for a Sergeant. Staff and non-commissioned staff officers without swords do not salute.

If entitled to a salute from the color, the color salutes when at six yards from the reviewing officer, and is raised when six yards beyond him; as the colors salute, the trumpeters or field-music sound a march, flourishes, or ruffles, according to his rank, the band continuing to play. The reviewing officer acknowledges only the salute of the Colonel and the color. The Colonel having saluted, places himself on the right of the reviewing officer, where he remains till the rear of the battalion has passed, when he rejoins the battalion. The head of the column having executed a second change of direction to the left, after having passed the reviewing officer, the Colonel commands: *Guide left;* and when it arrives on the original ground wheels it into line to the left, opens the ranks as in the previous case, presents arms, and salutes; the salute being acknowledged by the reviewing officer, terminates the review. Should it be desirable to march past the reviewing officer again, and in double time, instead of changing the guide and forming line as above, the Colonel commands: 1. *Double time*, 2. MARCH; and, at the second change of direction, places himself at the head of the column. The band, previously notified, remains in its position opposite the reviewing officer, and plays in double time. In passing in review in double time, there is no saluting; the Colonel having passed the reviewing officer, places himself on his right, and the review is concluded as already explained. After the review, the Colonel causes the battalion to perform such maneuvers as the reviewing officer may direct. When desirable that a battalion should be reviewed before an Inspector junior in rank to the Commanding Officer, the Commanding Officer will receive the review, and will be accompanied by the Inspector.

Mounted Troops.—The reviewing officer takes his post in front of the center of the battalion, the point being clearly indicated by a guidon, previously established by the Adjutant; the Adjutant also posts principal guides at the points where the column will have to change direction in order that the right flank in passing, shall be at six or eight yards from the reviewing officer. The battalion being in line, the Major in front of and facing the center, commands: 1. *Prepare for Review*, 2. *Rear Open Order*, 3. MARCH. At the *third command, the battalion* takes open order as prescribed. The reviewing officer now approaches a few yards toward the major, and halts when the Major faces about and commands: 1. *Draw*, 2. SABER, 3. *Present*, 4. SABER. At the fourth command, the officers and men present saber; the standard also salutes, should the rank of the reviewing officer entitle him to it, in which case the band or trumpeters sound a march, or the flourishes, according to his rank: sabers having been presented, the Major faces about and salutes. The reviewing officer acknowledges the salute by touching or raising his hat, after which the Major faces about and commands: 1. *Carry*, 2. SABER. The Major then joins the reviewing officer, who proceeds to the right of the band, and, passing in front of the officers to the left of the line, returns to the right, passing in rear of the file-closers.

While the reviewing officer is going around the battalion, the band plays, ceasing when he leaves the right of the band to return to his station; the Major returns to his post in front of the center, and commands: 1. *Close order*, 2. MARCH. At the command *march*, the company officers return to their places in line; the field, staff, and non-commissioned staff, remain in their places. The reviewing officer having taken his position, the Major breaks the battalion into column of companies or platoons, right in front. At the command *march* for breaking into column, the staff (excepting the Adjutant) place themselves in the order of rank from right to left, on a line equal to the front of the column, six yards in front of the chief of the leading sub-division. The Field Officers, Adjutant, and the Sergeant-major, take post as prescribed in column; the non-commissioned staff, excepting the Sergeant major place themselves in the order of rank, from right to left, on a line equal to the front of the column, six yards in rear of the file closers of the rear subdivision; the band takes post fifteen yards in front of the staff. The Major then commands: 1. *Pass in review*, 2. *Forward*, 3. *Guide right*, 4. MARCH. At the third command, the field officers, Adjutant, and Sergeant-major, remain on the left flank of the column. At the fourth command, the column steps off, the band playing; the column changes direction, at the points indicated, without command from the Major, the major takes his place six yards in front of the staff immediately after the second change of direction; the band, having passed the reviewing officer, wheels to the left out of the column and takes post in front of and facing the reviewing officer, where it remains till the rear of the column has passed, when it returns to its place before the review, ceasing to play as the battalion approaches its original position. The Major and staff, except the Adjutant, salute together, when the major is at six yards from the reviewing officer, and return to the carry together when the Major has marched six yards beyond him. The other officers, and the non-commissioned staff, salute and return to the carry at the points prescribed for the major. In saluting, all officers turn the head, and look straight toward the reviewing officer. Non-commissioned officers in command of subdivisions, salute as prescribed in the School of the Soldier Dismounted. If entitled to a salute from the standard, the standard salutes when at six yards from the reviewing officer, and is raised when six yards beyond him; as the standard salutes, the trumpeters sound a march, or the flourishes, according to his rank, the band continuing to play. The reviewing officer acknowledges only the salute of the Major and of the standard. The Major, having saluted, places himself on the right of the reviewing officer, where he remains till the rear of the battalion has passed, when he rejoins the battalion. The head of the column having executed second change of direction to the left, after having passed the reviewing officer, the Major commands: *Guide left*; and when the battalion arrives on the original ground, the Major wheels it into line to the left, opens the ranks, presents saber, and salutes as before: the salute having been acknowledged by the reviewing officer, the review is ended. Instead of changing the guide and wheeling into line, the Major may command, 1. *Companies* (or *platoons*), 2. *Right forward*, 3. *Fours right*, 4. MARCH; and form the line, by wheeling by fours to the left.

Artillery.—The battalion being in line, its commander executes a left about and commands: 1. *Prepare for review*. At this command, each captain adds: 2. *Action*, 3. FRONT, 4. *Right*, 5. DRESS, 6. FRONT, 7. *Draw*, 8. SABER, which are executed as prescribed for the review of a battery. The Captains having taken their posts, the battalion Commander faces to the front. The reviewing officer now approaches the battalion Commander, and halts at thirty yards from him to receive the salute. The battalion Commander then faces toward the line and commands: 1. *Present*, 2. SABER. Sabers being presented, the battalion Commander executes a left about and salutes. The reviewing officer having acknowledged the salute, the battalion Commander faces toward the line and commands: 1. *Carry*, 2. SABER. He then joins the reviewing officer, who proceeds to the right of the trumpeters, and, passing in front of the officers to the left of the line, returns to the right, passing in rear of the Chiefs of caisson. The trumpets are sounded while the reviewing officer is going round the battalion, until he leaves the right to return to his station; the battalion commander returns to his post in front of the center and commands: 1. *Limber*, 2. FRONT, 3. *Platoons*, 4. *Right wheel*, 5. MARCH, 6. *Battalion*, 7. HALT. Executed in each battery; each Captain, at the command *halt*, causes his cannoneers to mount, and then places himself with the croup of his horse four yard sin front of the head of the horse of the chief of his leading platoon; the Adjutant and Sergeant-major place themselves fourteen yards from the left flank of the column, the former abreast of the leaders of the leading carriage of the column, the latter abreast of the leaders of the rear carriage of the column; the trumpeters take post, with the croups of the rear-rank horses fourteen yards in front of the head of the horse of the Captain of the leading battery. The battalion Commander then commands: 1. *Pass in review*, 2. *Forward*, 3 *Guide right*, 4. MARCH. At the third command, the Adjutant and Sergeant-major remain on the left flank of the column. At the command *march*, the column passes in review according to the principles prescribed for the review of a battery, except that each Captain remains at the head of his battery after saluting the reviewing officer; the battalion Commander, immediately after the second change of direction, places himself with the croup of his horse four yards in front of the head of the horse of the Captain of the leading battery, and, having passed the reviewing officer, places himself on his right, where he remains until the rear battery has passed, when he rejoins the battalion. The trumpeters begin to sound when at forty yards from the reviewing officer, and wheel out of the column as previously explained. The head of the column having executed a second change of direction to the left, after passing the reviewing officer, the battalion Commander commands: *Guide left;* and, when the battalion arrives on the original ground, he wheels it into line to the left, prepares it for review as before, presents saber, and salutes; the acknowledgment of the salute by the reviewing officer terminates the review.

The following general rules are observed for reviews of brigades and larger bodies of troops: All mounted officers remain mounted. A camp-color is planted to indicate the post of the reviewing officer while the troops are passing in review. Another camp-color is planted fifty yards from the first, to indicate the point where each battalion is brought to a carry before passing the reviewing officer. The staff of the reviewing officer is in single rank, six yards in his rear; the flag and orderlies place themselves three yards in rear of the staff. When other officers and personages accompany the reviewing officer, they place themselves on the left of the staff of the reviewing officer; their own staffs and orderlies place themselves in their rear. The trumpeters, or field-music, of each brigade, if there be no regimental bands, are consolidated on the right, in rear of the brigade band. Brigades are arranged in line from right to left according to the rank of brigade commanders, the senior on the right; if in three lines, the senior Commander is in front. Divisions are arranged in the same manner. When more than one brigade is to be reviewed, the staff-officers, after the reviewing officer passes along the front of each brigade, may remain near its left, while the reviewing officer goes to receive the salute from the next brigade; on his return they rejoin him and accompany him as before. The staff-officers in passing around the troops, ride in one or more ranks, according to the number. The troops pass in review in quick time. Before the head of the column approaches the post of the reviewing officer, he goes wherever he can best observe the movements of the troops. The Colonels repeat commands as prescribed in brigade revolutions. Whenever the General of brigade faces toward the line to give commands, the Colonels face about at the same time; they also resume their front at the same time with the general. While the troops are on the march, the Colonels cause the arms to be carried at a *right shoulder*, *support*, or *carry*. The arms of each battalion are brought to a *carry* when the leading company arrives at fifty yards from the reviewing officer. Generals of divisions and corps, and their staff-officers, draw their swords when they take their places in column before passing in review; the swords are returned immediately after placing themselves on the right of the reviewing officer. In reviews of divisions and corps, each battalion, after its rear has passed the reviewing officer thirty yards, takes the double time for one hundred yards in order not to interfere with the march of the column in rear. The troops having passed the reviewing officer, return to their camps by the most practicable route, being careful not to delay the march of the troops in their rear.

When reviewing a brigade in line, each Colonel takes his post, facing the front, thirty yards in front of the center of his battalion: the General takes post, facing to the front, thirty yards in advance of the line of Colonels, opposite the center, his staff takes post in single rank six yards in his rear, the orderlies three yards in rear of the staff. The line being formed, the General faces about and commands: 1. *Prepare for review*, 2. MARCH. At the first command, the Colonels add: *Rear open order*. At the command *march*, each battalion executes the movement as prescribed for the review of a battalion; the Colonel after commanding *front* returns to his post, thirty yards in front of the center of his battalion. The Colonels having resumed their posts, the General faces to the front. The ranks being open, the reviewing officer, accompanied by his staff, approaches the General, and halts at thirty yards in front of him to receive the salute. The General then faces to the left about and commands: 1. *Present*, 2. ARMS. The arms being presented, the General and Colonels face to the left about and salute. The reviewing officer having acknowledged the salute, the General faces about, and commands: 1. *Carry*, 2. ARMS, and resumes his front. The General and staff then return their swords, and join the reviewing officer, the General placing himself on his right, the staff place themselves on the right of the staff of the reviewing officer. The reviewing officer then goes to the right of the line, passes in rear of the line of Colonels to the left, and returns in rear of the file-closers to the right, whence he proceeds to his post, in front of the center of the brigade. While the reviewing officer is passing in front and in rear of each battalion, it stands at *carry arms*, the remainder of the time the Colonel causes it to stand at *parade rest*. The battalions are brought to the carry at the signal *attention* from the General given after the reviewing officer leaves the right of the line. While the reviewing officer is passing around the line, the brigade band plays. If there be regimental bands, instead of a brigade band, each plays while the reviewing officer is passing in front and in rear of its battalion. When the reviewing officer leaves the right of the line after passing around the troops, the General returns to his post and draws his sword; the staff draw their swords at the same time. The General then faces about and commands; 1. *Close order*, 2. MARCH. The reviewing officer having taken his post, the General commands: 1. *Companies* (or *divisions*) *right wheel*, 2. MARCH. At the second command each battalion forms in column of companies or divisions, in the order prescribed for review of a battalion, and each Colonel brings his battalion to *right shoulder arms*; the pioneers promptly place themselves twelve yards in front of the Colonel of the leading battalion, the brigade band twelve yards in front of the pioneers; the General is thirty yards in front of the band, his staff in single rank, six yards in his rear, his orderlies three yards in rear of the staff. The General then commands: 1. *Pass in review*. 2. *Forward*, 3. *Guide right*, 4. MARCH. The column passes in review according to the principles prescribed for the review of a battalion. The General having saluted, places himself on the right of the reviewing officer, his staff at the same time place themselves in single rank on the right of the staff of the reviewing officer, the orderlies place themselves in rear of the staff. The band wheels out of the column, places itself opposite the reviewing officer, and continues to play till the rear has passed, when it follows the rear battalion; the trumpeters, or field-music, sound the march, flourishes, or ruffles, as the color of each battalion salutes. If there be regimental bands, each wheels out of the column after passing the reviewing officer, and ceases to play as soon as the rear company of its battalion has passed. The band then marches on the flank of the battalion and places itself in its rear after the band of the battalion next in rear has wheeled out of the column. The rear of the column having passed the reviewing officer, the battalions, unless otherwise directed, return to their quarters, and the General and staff salute the reviewing officers. The salute being acknowledged, terminates the review.

When reviewing a brigade in line of masses, the General and staff face to the front. The reviewing officer having halted at thirty yards from the General, the latter faces about and commands: 1. *Present*, 2. ARMS. The salute being acknowledged, arms are carried; the reviewing officer then passes around the brigade as before, the battalions remaining at a *carry;* if there be regimental bands, but one plays while the reviewing officer is passing around the troops. The reviewing officer having taken his post, the General commands: 1. *Battalions*, 2. *Change direction by the left flank*, 3. MARCH, 4. *Guides*, 5. POSTS. The General then commands: 1. *Pass in review*, 2. *Forward*, 3. *Guide right*. 4. MARCH. At the third command, the Colonel of the first commands: 1. *Take wheeling distance*, 2. *Guide right*. At the command *march*, the leading battalion takes wheeling distance; the other battalions, by command of their Colonels, take wheeling distance in time to follow the battalion preceding in the order prescribed for review. If the General commands: 1. *In column of companies, pass in review*, each Colonel, as soon as his battalion has taken wheeling distance, commands: 1. *Right by companies*, 2. MARCH, 3. *Guide right*.

When reviewing a division in line, the brigades are formed in line as prescribed for the review of a brigade, with an interval of sixty yards between brigades. On the arrival of the reviewing officer, the Major General commanding the division causes his trumpeter to sound the *attention;* at this signal, repeated in each brigade, the brigade Commanders prepare the brigades for review, after which the Commanders of the center and left brigades bring them to *order arms* and *parade rest*. The reviewing officer and General of division then go to a point thirty yards in front of the General of the right brigade and halt, when the General of brigade commands: 1. *Present*, 2. ARMS. The salute being acknowledged by the reviewing officer, the General commands, 1. *Carry*, 2. ARMS. The reviewing officer accompanied by the General of division, then goes to the right of the right brigade, passes along its front to its left, and proceeds in front of the General of the center brigade to receive the salute. The General of the centre brigade causes the *attention* to be sounded when the reviewing officer approaches its right, and *presents arms* as before explained. Having received the salute, the reviewing officer goes to the right of the center brigade, passes along its front to the left, and then proceeds to a point thirty yards in front of the General of the left brigade, which brigade is presented as explained for the second. The General having passed along the front of the left brigade, returns to the right of the division, passing in rear of the line. The band of each brigade plays as the reviewing officer passes along the front of the brigade, and also while he is passing in its rear. If there be regimental bands instead of a brigade band, each plays while the reviewing officer is passing in front and rear of its battalion. When the reviewing officer passes the right of the division from the rear, the General of the division causes the *attention* to be sounded. At this signal the brigade Commanders close the ranks, wheel into column of companies or divisions to the right and command: 1. *Pass in review*, 2. *Forward*, 3. *Guide right*. The General of division orders the *forward* sounded, which being repeated, the division marches in review, conforming to the principles prescribed for the review of a brigade. When the column is formed the staff of the General of division, except the Adjutant General and Aides-de-camp, place themselves in single rank thirty yards in front of the General of the leading brigade, the division flag and orderlies in their rear. While the troops are approaching the reviewing officer, the General of division, and Generals of brigades, accompanied by their Adjutants General and Aides-de-camp, go where they can best observe the march, each placing himself in front of his staff, when the head of his column arrives at fifty yards from the reviewing officer. The General of division having saluted, places himself on the right of the reviewing officer; his flag, staff, and orderlies, at the same time promptly place themselves on the right of the staff and the orderlies of the reviewing officer.

Each brigade Commander having saluted, places himself on the right of the General of division; his staff, flag, and orderlies, at the same time arrange themselves on the right of the staff and orderlies of the division. The band of each brigade ceases to play as soon as the colors of the rear battalion have saluted the reviewing officer.

When reviewing a division of infantry in three lines, each brigade is in line, the distance between brigades being one hundred yards. The division is prepared for review at the signal *attention ;* the brigades are successively presented to the reviewing officer, as previously explained, except that the reviewing officer passes around each brigade, in front and rear, before proceeding to receive the salute of the brigade next in rear. Having passed around the rear brigade, the General of division causes the *attention* to be sounded. At this signal, which is repeated, each brigade commander closes ranks and wheels into column of companies or divisions to the right. The General of the leading brigade gives the commands for passing in review; the Generals of the center and rear brigades bring them to *order arms* and *parade rest* or *in place rest*. At the signal *forward*, repeated in the leading brigade, the brigade moves forward; the Generals of the other brigades give the commands for marching in review, causing them to change direction to the left, or half left, in time to follow at sixty yards in rear of the brigade preceding. The review is completed as previously explained.

When reviewing a division in line of masses, each brigade is formed as prescribed for review in line of masses. The arms are presented, and the reviewing officer passes around the brigades, as prescribed for the review of the division in line. Each brigade, while the reviewing officer is passing in its front and rear, stands at *carry arms*, the remainder of the time the General causes it to stand at *parade rest*. The reviewing officer having passed around the troops, the signal *attention* is given, at which the Generals of brigade cause their battalions to change direction by the left flank; the General of the leading brigade gives the commands for passing in review in column of companies or divisions; the Generals of the other brigades bring them to *order arms* and *parade rest* or *in place rest*. At the signal *forward*, repeated in the leading brigade, the brigade moves forward, the battalions executing the movement successively as explained in the review of a brigade in line of masses. The Generals of the center and rear brigades give the commands for marching in review in time to follow the brigade preceding at the distance of sixty yards. In passing around the division, the reviewing officer may pass between the different battalions from front to rear, and from rear to front.

A corps of infantry, in line of masses, or in three lines of masses with a distance of one hundred yards between divisions, is reviewed as follows: On the arrival of the reviewing officer, the General commanding the corps causes the *attention* to be sounded, which is repeated by the trumpeters of the Generals of division; each division is presented by brigade, as explained for the review of a divison in line of masses; the General of division, accompanied by his staff, joins the reviewing officer and corps commander, in front of his right brigade, and accompanies them to receive the salutes from the brigades, and while passing in front and in rear of his division; he then remains near the right of his division. The reviewing officer having passed around the troops, the General commanding the corps causes the *attention* to be sounded, which being repeated by the trumpeters of division and brigade commanders, each brigade is formed in column of masses to the right. The General commanding the corps then causes the *forward* to be sounded, which being repeated by the trumpeters of the first division, the first division executes the movement, as previously explained; the other divisions stand *in place rest*, the Generals causing the *forward* to be sounded in time to follow the divison preceding at a distance of one hundred yards. The troops may march in review in column of masses. If there be regimental bands only, the one at the head of each brigade wheels out of the column, when opposite the reviewing officer. While on the march and passing in review, but one band in each brigade plays at a time. On approaching the reviewing officer, the General commanding the corps places himself about fifty yards in front of the General of the first division; his staff place themselves in single rank six yards in his rear, the flag and orderlies three yards in rear of the staff. The General having saluted, places himself on the right of the reviewing officer: the staff, followed by the flag and orderlies, place themselves on the right of the staff and orderlies of the reviewing officer. The Generals of division, while their divisions are passing in review, place themselves on the right of the corps commander: each brigade commander, in like manner, places himself on the right of the division commander; their staffs, followed by their flags and orderlies, place themselves on the right of the staff and orderlies of corps or division commanders. When more than one corps is to be reviewed, the reviewing officer does not go to the front of each brigade commander to receive the salute. The Generals of brigade facing the line present arms and salute as the reviewing officer arrives opposite his right; he then causes arms to be carried and resumes his front. The march in review is conducted as explained for a corps. When troops of different arms are reviewed in line they are arranged from right to left in the following order: one, infantry; two, mounted artillery; third, cavalry. In the same arm, regulars, volunteers, and militia are posted in line from right to left in the order named.

REVISION.—A re-examination for any correction. Where an officer, who orders a Court-Martial, does not approve their proceedings, he may, by the custom of war, return them to the Court for *Revision*, and no additional evidence can be taken on such *Revision*.

When a record is returned to the Court for *Revision*, the subsequent proceedings thereon should be recorded as follows:

REVISION.

——— BARRACKS,

———, — ——,

——, 188 .

The Court reconvened with closed doors, pursuant to the following order, at ten o'clock A. M.:

(*Here insert copy of order.*)

PRESENT:

* * *

ABSENT.

* * * *

The communication from the Commanding General, Department of the ———, of date ———, 188 . or memorandum) containing the instructions to the Court, and the reasons of the reviewing authority for requiring a reconsideration of the findings (or sentence, or correction of the record), was then read to the Court by the Judge Advocate, and is attached to the record and marked "———."

The Court then maturely deliberated upon and considered the said communication, and the reasons set forth for revision; and, on motion, (*a.*) now revoke the foregoing findings, and having maturely considered the evidence adduced, find, etc., etc.; *or* (*b.*) now revoke the foregoing sentence, and do sentence, etc., etc., *or*, (*c.*) respectfully adheres to the foregoing findings and sentence, ———; *or*, (*d.*) corrects the record by, etc., etc.

——— ———,
Colonel, —— *U. S. Artillery*,
President.

——— ———,
1st Lieutenant —— *U. S. Artillery*,
Judge Advocate.

It is always proper for the Court, should it so desire, to give the reasons for adhering to its original findings and sentence.

No witnesses, not previously called, can legally be examined before a reconvened Court.

When, however, a Court has erred in its rulings in the rejection of a witness for supposed incompetency, or in rejecting offered documentary evidence, or in not permitting a proper and legal question to be put to a witness, or in refusing to summon a certain material witness asked for by the prisoner, and the reviewing authority has reconvened the Court for a reconsideration of its action, the Court may, should it concur in the views submitted, proceed to remedy such error by revoking its findings and *sentence*, and correct the record by permitting the introduction of the excluded testimony. Before the Court thus proceeds to correct the record, the prisoner and his counsel must resume their seats and the record so state. In consequence of receiving such excluded testimony, the other party may have to call witnesses in rebuttal, which is authorized. See *Courts-Martial*.

REVOLUTION.—Any extensive change in the Constitution of a country suddenly brought about. The two most important events in modern history known under this name are the English Revolution of the 17th century, and the French Revolution of the 18th. The former began in the early part of the reign of Charles I., with the struggle between that King and his Parliament. In 1642 the struggle became a civil war, in which the Parliament obtained the ascendency, and brought Charles to the block in 1649. A Republic followed, under the Protectorate of Oliver Cromwell, which was succeeded in 1660 by the restoration of Monarchy in the person of Charles II.; but the arbitrary rule of James II. brought the King and the people again into antagonism; and, James having fled the country, William III. was called to the throne under such conditions and safe-guards as secured the Balance of the Constitution. The French Revolution was a violent reaction against that Absolutism which had come in the course of time to supplant the old feudal institutions of the country. It began with an outbreak of insurrectionary movements at Paris in July, 1789, including the destruction of the Bastille. On January 21, 1793, King Louis XVI. was beheaded. The Christian religion was deposed, the sacredness of the republic and worship of reason solemnized, and a disastrous reign of blood and terror followed; which was brought to an end in 1794, when Robespierre himself suffered on the guillotine the fate to which he had condemned countless multitudes of his countrymen. Among other important revolutions in the modern world are the American Revolution of 1775, by which the United States threw off their dependence on Great Britain; the French Revolution of

1830, which drove Charles X. into exile, and raised Louis Philippe, Duke of Orleans to the throne by the will of the people; as also the Revolution of 1848, when France rose against Louis Philippe, and adopted for a time a republican form of government, the revolutionary contagion spreading temporarily over most of Continental Europe. By the Italian Revolution of 1859-60, the various minor Sovereigns of Italy were driven into exile, and the whole of the peninsula became, with the incorporation of the Roman Territories in 1870, subject to Victor Emmanuel. The following observations, in 1869, prior to the third French Republic, are pertinent.

The French Revolution is an event so extraordinary that it must needs be the starting-point in any series of considerations on the affairs of our own time. Nothing of importance happens in France that is not a direct consequence of this capital fact, which has thoroughly changed the whole condition of life in that country. Like all that is great, heroic, bold, like everything which exceeds the common measure of human strength, the French Revolution will continue to be for centuries the subject about which the world will talk, upon which they will divide, which will be the occasion of their friendships and their hatreds, which will furnish the subject of dramas and novels. In one sense, the French Revolution is the glory of France, the French epopee, par excellence; but, almost always, nations who have in their history an extraordinary event, expiate it by long suffering, and often by the loss of their national existence. It was thus with Judaea, with Greece, and with Italy. For having created things which are unique, by which the world lives and thrives, these countries have passed through centuries of humiliation and national death. National life is something limited, mediocre, confined. To do what is extraordinary, of universal interest, these narrow trammels must be rent asunder; but in rending them the nation itself is rent; for the nation is but an assemblage of prejudices and stationary ideas which mankind as a whole would refuse to accept. The nations which created religion, art, science, empire, the church, the papacy (all things universal and not national), were more than nations; but at the same time less than nations in the sense that they were the victims of their work. We think that the Revolution will have for France analogous consequences, but less durable, because the work of France was less great and universal than the work of Judæa, Greece, and Italy. The exact parallel of the present situation of that country seems to be that of Germany in the seventeenth century. In the sixteenth century, Germany accomplished for mankind a work of the first order—the Reformation. She expiated it in the seventeenth by an extreme political abasement. It is probable that the nineteenth century will in like manner be considered in the history of France as the expiation of the Revolution. Neither nations nor individuals can with impunity deviate from the middle course, of feasibility and practical good sense.

If the Revolution has given to France a poetic and romantic position of the first order, it is certain, on the other hand, that, in view merely of the requirements of ordinary statesmanship, it has led her into a strange path. The end which France sought to reach by the Revolution was that which all modern nations pursue: a frame of society just, honest, humane, guaranteeing the rights and the liberty of all with the least possible sacrifice of the rights and the liberty of each. France is to-day, after shedding rivers of blood, still very far from this end; while England, which has not proceeded by the way of revolutions, has almost reached it. France, in other words, offers the strange spectacle of a country tardily striving to come up with the nations she once scorned as laggards, and learning in the school of the peoples to whom she had claimed to give lessons,—painfully striving to accomplish by imitation the work in which she fancied she displayed a high degree of originality. The cause of this historic singularity is very simple. In spite of the extraordinary ardor which animated her, France, at the end of the eighteenth century, was very ignorant of the conditions upon which it is possible for a nation and mankind itself to exist. Her prodigious undertaking implied many errors; she utterly misunderstood the laws of modern liberty. Whether we regret it or rejoice at it, modern liberty is by no means the liberty of antiquity nor that of the republics of the Middle Ages. It is much more real, but much less brilliant. Thucydides and Machiavelli would not in the least understand it; and yet a subject of Queen Victoria is a thousand times more free than was ever any citizen of Sparta, of Athens, of Venice, or of Florence. No more of those feverish republican agitations full of grandeur and danger; no more of those cities filled with a refined, active, and aristocratic population; but in their stead, great inert masses, where intelligence is confined to the few, but which give a powerful help to civilization, in putting at the service of the State, by means of taxation and the conscription, a marvellous treasure of abnegation, docility, and goodwill. Of this form of social life, which is assuredly that which least consumes a nation and best preserves its strength, England has given us the model. England has arrived at the most liberal form of government which the world has yet known, solely by the development of the institutions she possessed in the Middle Ages, and not by revolutions. Liberty in England is not derived from Cromwell, nor from the republicans of 1649. It is the result of her entire history; it springs from her equal respect for the rights of the King, the rights of the nobility, the rights of the commons, and of corporations of every kind. France followed the opposite course. The King had long since made a clean sweep of the rights of nobles and commons,—the nation made a clean sweep of the rights of the King. She proceeded philosophically in a matter where she should have proceeded historically; she thought liberty was to be established by the sovereignty of the people and in the name of a central authority, whereas liberty is only to be won by successive petty, local conquests, by slow reforms. England, who does not pride herself upon any philosophy; England, who has never broken with her traditions, except in a single moment of temporary aberration, followed by a prompt repentance; England, who, instead of the absolute dogma of the sovereignty of the people, admits only the more moderate principle that there can be no government without the people nor against the people—England is to-day a thousand times freer than France, who once so proudly raised the philosophic banner of the rights of man. The truth is, that popular sovereignty is not the foundation of constitutional government. A State so established, after the French fashion, is too strong; while far from guaranteeing all liberties, it absorbs all of them; and its form is either the popular convention, or else despotism. The natural result of the Revolution could not, after all, have been anything very different from the Consulate and the Empire; the natural result of such a conception of society could not have been anything else than a system of administration, a net-work of prefects, a narrow civil code, a machine for squeezing the nation, a swaddling-band in which it was impossible for it to live and grow. Nothing is more unjust than the hatred with which the French radical school regard the work of Napoleon. The work of Napoleon, if we except some errors which were personal to that extraordinary man, is, in fine, nothing more than the revolutionary programme realized in its possible parts. Had Napoleon never existed, the final constitution of the Republic would not have differed essentially from the constitution of the year VIII. A very false idea, in many respects, of human society is in fact at the bottom of all French revolutionary attempts. The original error was at first hidden under the magnificent outburst of enthusiasm for liberty and the right which filled the first years of the Revolution; but this fine enthusiasm once spent, there remained a social theory which was dominant under the Directory, the Consulate, and the Empire, and marked its impress deep upon all the creative efforts of the time. According to this theory, which we may well qualify as materialism in politics, society has nothing of a sacred or religious character. It has only one end, which is, that the individuals composing it may enjoy the greatest possible sum of well-being, without concerning themselves about the ideal destiny of mankind. Why talk about elevating and ennobling the human conscience? The only question is how to satisfy the greatest number, to assure to all a sort of happiness, vulgar and relative only it must assuredly be, for a generous mind would disdain such happiness, and would revolt against the social system which aimed to secure it. In view of an enlightened philosophy, society is a great providential fact; it is established, not by man, but by nature itself, in order that intellectual and moral life may be developed on the surface of our planet. There is no such thing in political philosophy as man isolated from all companionship. Human society, the mother of every ideal, is the direct product of the supreme will, which has decreed that the good, the true, the beautiful, shall have their contemplators in the universe. This transcendent function of humanity is not performed by means of the simple coexistence of individuals. Society is a hierarchy. Every individual composing it is noble and sacred, every being (even the animal) has its rights; but all are not equal; all are members of a vast body, parts of an immense organism, which is accomplishing a divine work. The negation of this divine work is the error into which French democracy easily falls. Considering the only object of society to be the satisfaction of the individual, they are led to disregard the rights of ideas, the supremacy of mind. Not comprehending, moreover, the inequality of races, because ethnographical differences have in fact disappeared within her limits from time immemorial, France has learned to conceive of social perfection as a kind of universal mediocrity.

If man did not assume the right of making the animal kingdom subordinate to his needs, human life would become impossible. It would be scarcely more possible were we to hold to the abstract conception which makes us regard all men as bringing with them into the world equal rights to wealth and social rank. Such a state of things, though just in appearance, would be the end of all virtue; there would be, inevitably, war and hatred between the two sexes, since nature has created here, in the very heart of the human species, an undeniable difference in the part to be played by each. The well-to-do citizen thinks it right that, after destroying royalty and hereditary nobility, we should stop at hereditary wealth. The working man thinks it right that, having abolished hereditary wealth, we should stop at the inequality of the sexes, and even, if he be a person of some sense, at the inequality of strength and capacity. The most ardent utopian, having suppressed, in imagination, all inequality among men, still admits man's right to make use of animals according to his needs. And yet, it is no more just that one man should be born rich, than it is that another should be born with a social distinction; neither the one nor the other has earned his position by his own labor. Nobility, it is always argued, has its origin in merit; and as it is perfectly clear that merit is not hereditary, it is easy to show that hereditary nobility is an absurdity. The fallacy of this reasoning consists in the everlasting error of making the state the arbiter of a sort of distributive justice. The object of rank, regarded as an institution of public utility, was not to reward, but to stimulate merit; to render certain kinds of merit possible, and even easy. Had it no other effect than to show that justice is not to be looked for in the official constitution of society, it would not be altogether useless. The device "To the most worthy," rarely applies in politics.

The middle class is somewhat self deceived, therefore, in thinking to establish society on a just basis, by means of its system of competitive examinations, special schools, and regular promotion. A man of the people can easily demonstrate that a child born of poor parents is excluded from these competitions, and he will maintain that perfect justice will not be done until all are placed from their birth in identically the same conditions. In other words, if the notion of distributive justice for each individual be rigorously carried out, no organized society is possible. A nation which should follow out such a programme would condemn itself to incurable weakness. Suppressing the right of inheritance and thereby destroying the family, or leaving it optional, it would soon be got the better of, either by those portions of its own people who still adhered to the old order of things, or by foreign nations who still retained these ancient principles. The race which triumphs is always that in which the family and property are most strongly organized. Humanity is a mysterious ladder, a series of resulting forces proceeding one from the other. The many laborious generations of very hard working common people and peasants render possible the existence of a well-to-do and frugal middle class, which in its turn renders possible the man exempt from material labor, and devoted wholly to matters of universal interest. Each in his station is the guardian of traditional usages which are of importance to the progress of civilization. There is but one morality, there is but one knowledge, there is only one education. There is a single intellectual and moral whole, one glorious work of the human mind to which all, except the egoist, contribute, however small a part, and in which, in different degrees, all share. We ignore human nature unless we admit that whole classes of men must live by the glory and the enjoyments of others. The democrat regards as a dupe the peasant of the old regime, who works for his noble masters, loves them, and rejoices in the high estate maintained by others at the expense of his own toil. Doubtless all this is absurd, where life is narrow and confined, where everything is done within closed doors, as in our time. In the present state of society, the advantages that one man has over another have become things personal and exclusive: to enjoy the pleasure or the rank of another seems mere foolishness: but it has not always been so. When Gubbio or Assisi saw the wedding cavalcade of its young Lord file past, no one was jealous. Then all shared the life of all: the poor man enjoyed the wealth of the rich man, the monk the pleasures of the worldling, the worldling the prayers of the monk; for all, there was art, poetry, religion. Can the cold considerations of the economist supply the place of all this? Will any such considerations suffice to bridle the arrogance of a democracy confident in its strength, and which, not having been stopped by the fact of royalty, is very likely not to be stopped by the fact of property? Will there be voices eloquent enough to make youths of eighteen accept the reasoning of the aged, to persuade whole classes—young, ardent, believing in pleasure, and upon whom enjoyment has not yet palled—that it is not possible for all to enjoy, for all to be well-bred, delicate, virtuous even, in a refined sense, but that there must of necessity be learned, well-bred, refined, virtuous people of leisure, in whom and by whom the rest have their enjoyment and their taste of the ideal? Events will show. The superiority of the church, and the strength which still assures her a future, lies in the fact that she alone understands this, and makes others understand it. The church well knows that the best men are often the victims of the superiority of the so-called higher classes; but she knows also that nature has intended that human life should have many stages. She knows and she confesses that it is the ignorance of many that makes possible the education of one; that it is the toil of many that permits the noble life of a small number: but she does not call these privileged, nor those wronged, for the work mankind has to do is, in her eyes, one and indivisible. Abrogate this great law, assign to each individual the same rank, with equal rights, with no bound of subordination to a common task; you have egoism, mediocrity, isolation, hardness of heart, an impossibility of true living, something like the life of our day, the saddest life ever lived, even for the man of the people. Looking only at the rights of individuals, it is unjust that one man should be sacrificed to another man; but it is not unjust that all should be brought into subjection to the one great purpose which mankind is working out. It is for religion to explain these mysteries, and to offer in the ideal world superabundant consolations for all the sacrifices made here below.

This is what the Revolution, after it had lost the grand and sacred enthusiasm of its earlier days, did not sufficiently understand. The Revolution became finally irreligious and atheistic. The society men dreamed of in those sad days following the fever fit when they were striving to collect their scattered senses, was a sort of regiment composed of materialists, and in which discipline held the place of virtue. The wholly negative basis which the hard and unimaginative men of that day assigned to French society can only produce a surly and ill-mannered people: their code, the offspring of distrust, lays down as a first principle that the value of everything may be estimated in money, that is to say in pleasure. The whole moral theory of these so-called founders of our laws may be summed up in jealousy. Now jealousy is the foundation of equality, but not of liberty; putting man constantly on his guard against the encroachments of his neighbors, it renders courtesy between the several classes impossible. There can be no society without affection, without traditions, without respect, without mutual amenity. With its false notion of virtue which it confounds with the stern vindication of what each one regards as his right, the democratic school fails to see that a nation's great virtue consists in submitting to traditional inequalities. For this school the most virtuous race is not the race which practices self-sacrifice, devotion to duty, idealism in all its forms, but the most turbulent, that which makes the most revolutions. The most intelligent democrats are much surprised when they are told that there really are virtuous races still in the world—the Lithuanians, for example, the Ditmarschers, the Pomeranians—races that are still feudal, full of vigorous reserved strength, understanding duty like Kant, and for whom the word revolution has no meaning. The first result of this ill-natured and superficial philosophy, too soon substituted for that of the Montesquieus and the Turgots, was the suppression of royalty. To minds imbued with a materialistic philosophy, royalty necessarily seemed an anomaly. Very few persons, in 1792, understood that the continuance of good things requires to be guarded by institutions which are, if you please, a privilege for some but which are organs of national life, without which certain needs must necessarily suffer. These little fortresses, in which were deposited for safe-keeping treasures belonging to society, seemed feudal castles. All the time-honored subordinations of rank, all historic covenants, all symbols were repudiated. Royalty was the first of these covenants, a covenant dating back a thousand years, a symbol which the puerile philosophy of history, then in vogue, could not comprehend. No nation has ever created a legend more complete than that of this grand Capetian monarchy, a sort of religion, born at St. Denis, consecrated at Rheims by the assembly of bishops, having its rights, its liturgy, its holy ampulla, its oriflamme.

To every nationality there is a corresponding dynasty, in which are incarnated the genius and the interests of the nation; a national consciousness is never fixed and firm until it has contracted an indissoluble alliance with a family which binds itself by the contract to have no interest distinct from that of the nation. Never was this identification so perfect as between France and the house of Capet. It was more than a monarchy, it was a priesthood. Priest and King, like David, the King of France wears the cope and holds the sword. God enlightens him in his judgments. The King of England troubles himself little about justice—he defends his right against his Barons; and the Emperor of Germany cares still less—he is forevermore hunting among his Tyrolese mountains, the round world, meanwhile, rolling on as it may; but the King of France! he is just, surrounded by his valiant men and his solemn clerks, wielding his hand of justice, he is like Solomon. His coronation, imitated from that of the kings of Israel, was something so strange and unique. France had instituted an eighth sacrament, administered only at Rheims, the sacrament of royalty. The consecrated King performs miracles; he is invested with an "order"; he is an ecclesiastical personage of the first rank. To the Pope, who summons him to answer in the name of God, he replies, pointing to his sacred unction, "I, too, am of God." He allows himself unparalleled liberties with the successor of St. Peter: once he causes him to be buffeted and declared a heretic; at another time he threatens to have him burned alive; backed by his experienced doctors of the Sorbonne, he reprimands him, he deposes him. His most perfect type, notwithstanding, is a canonized saint, Saint Louis, so pure, so humble, so simple and so strong. He has his mystic adorers; the good Jean Darc makes no distinction between him and St. Michael or St. Catherine: this poor girl literally lived upon the religion of Rheims. Incomparable legend! sacred fable! And yet the vulgar knife designed for striking off the heads of criminals was lifted against it! The murder of the 21st of January, is, from the idealist's point of view, the most hideous act of materialism, the most shameful avowal of ingratitude and baseness, of ignoble meanness and forgetfulness of the past, that was ever made.

Do we mean to say that the old dynasty, whose very memory the newly-organized society sought to obliterate with that peculiar rancor which is only felt by the parvenu toward the great noble to whom he owes everything—do we mean to say that this ancient dynasty was not guilty of serious errors? Certainly it was, and if we were now writing a general philosophy of French history, we should show that the King, the nobles, the clergy, the parliaments, the cities, the universities of ancient France, had all of them failed in their duty, and that the revolutionists of 1793 merely set their seal to a series of faults, whose consequences still weigh heavily. Greatness must always be expiated. France had conceived of her monarchy as something unlimited. A King after the English fashion, a sort of stadtholder, paid and armed to defend the nation and maintain certain rights, was for her an absurdity. From the 13th century, the King of England, constantly at strife with his subjects, and hampered by charters, is to French poets an object of derision: he is not powerful enough. The French Monarchy was too sacred a thing; the anointed of the Lord is not to be controlled. Bossuet was logical in making the theory of the King of France square with the Holy Scriptures. Had the King of England possessed this tincture of mysticism, the barons and commons would not have succeeded in checkmating him. The French Monarchy, to produce that brilliant meteor, the reign of Louis XIV., absorbed all the powers of the nation. When once the State had been constituted into this powerful unity, under the hand of one man, it was inevitable that France should look upon herself as being what the great King had made her,—an all-powerful central authority, with liberties destroyed; and, regarding the King as a superfetation, should treat him like the mold which becomes useless when once the statue is cast. Thus Richelieu and Louis XIV. were the great revolutionists, the true founders of the Republic. The exact pendant to the colossal royalty of Louis XIV. is the Republic of 1793, with its frightful concentration of power, an unheard-of monster, the like of which had never been seen. Examples of republics are not rare in history; but these republics are cities, or small confederated states. A centralized republic of thirty millions of souls is absolutely without precedent. Given up for four or five years to the vacillations of drunken men, like a Great Eastern in danger of shipwreck, the enormous machine sank into its natural place, into the hands of a powerful despot, who, at first, with prodigious skill, succeeded in organizing the new movement, but who ended like all despots. Become insane with pride, he brought upon the country, which had put itself at his mercy, the most cruel humiliation that a nation can endure, and brought about the return of that dynasty which France had expelled with the most degrading insults.

The analogy of such a course of events with what took place in England in the seventeenth century is easily perceived. Every one was struck by it in 1830, when a national movement substituted for the legitimate branch of the Bourbons, a collateral branch more disposed to recognize the new needs. Louis Philippe must have seemed a William III., and it was natural to hope that the final result of so many convulsions would be the peaceable establishment of constitutional government in France. With this consoling thought, a sort of peace, a little quiet and oblivion of the past, stole over the poor, troubled French mind; there was a general amnesty, even for follies and crimes. It was a great mistake; a surprise, the most inconceivable known in history, was successful; a band of mad-caps whom a constable's staff should have sufficed to restrain, overturned a dynasty upon which the sensible part of the nation had based all their political faith and all their hopes. An hour's want of reflection on the one hand, and an hour of weakness on the other, sufficed to sweep away a theory conceived by the best minds, with, apparently, the most tempting chances of success. Why this singular disaster? Why did not what happened in England also happen in France? Why was not Louis Philippe a William III., the glorious founder of a new era in the history of the country? Will it be said that it was the fault of Louis Philippe? That would be unjust. Louis Philippe made mistakes; but then all governments must be permitted to make them. Whoever should undertake the conduct of human affairs on condition of being infallible and impeccable, would not reign a day. At all events, if Louis Philippe deserved to be dethroned, William III. deserved it much more. What Louis Philippe was chiefly reproached with—unpopularity, inability to make himself loved, a taste for personal power, indifference to external pomp, relapses toward the legitimist party to the detriment of the party which had made him King; attempts to re-establish the royal prerogative—might have been still more strongly urged against William III. Why, then, were the results so different? Doubtless it was owing to the difference of time and country. Events, historically important, make take place among a serious and heavy people, firm believers in hereditary right, and who have an invincible repugnance to driving their sovereign to extremities, which would be impossible at an epoch of intellectual levity and reasoning folly. Besides, the republican movement of 1649 was infinitely less deep than that of 1792. The English movement of 1649 did not go so far as to establish an imperial authority. Cromwell was no Napoleon. Finally, the English republican party had no second generation. Crushed under the restoration of the Stuarts, decimated by persecution or taking refuge in America, it ceased to have any considerable influence upon public affairs in England. In the eighteenth century, England seems to have made a business of expiating, by a sort of exaggerated loyalty and orthodoxy, her momentary lapses in the middle of the sixteenth. More than a hundred and fifty years had to pass away before the death of Charles I. ceased to weigh upon politics, and men could venture to think freely, without feeling obliged to affect an unbounded attachment to legitimacy. Things would have taken nearly the same course in France if the royalist reaction of 1796 and 1797 had carried the day. The Restoration would then have been accomplished much more frankly, and the Republic would have been in the history of France only what it is in that of England, an incident without consequences. Napoleon, by his genius, aided by the marvelous resources of France, saved the Revolution, gave it a form, an organization, an unprecedented military prestige. The weak and unintelligent restoration of 1814 could by no means uproot an idea which had been deeply seated in the national mind, and which had enlisted the sympathies of a whole, energetic generation. France, under the Restoration, and under Louis Philippe, continued to live on the memories of the Empire and the Republic. Whilst in England, from the date of the restoration of Charles II., and after 1688, the republic was the object of unceasing execration, and a man was ill-thought of in society who spoke of Charles I. without calling him the martyr King, or of Cromwell without adding the epithet usurper—in France it became the rule to write histories of the Revolution in a strain of apology and admiration. It was unfortunate that the father of the new King had taken a considerable part in the Revolution; people accustomed themselves to consider the new dynasty as a compromise with the Revolution, not as the heir by substitution of a lawful inheritance. A new republican party, rallying around a few old patriarchs, survivors of 1793, came into existence. This party, which had played an important part in July, 1830, but since then had failed to give prevalence to its absolute theoretical ideas, made incessant attacks upon the new government. The change in England, in 1688, was not in the least revolutionary, in the sense in which we understand the word: the change was not brought about by the people; it violated no right, unless it were that of the dethroned king. With the French, on the contrary, 1830 unchained the forces of anarchy, and deeply humiliated the legitimist party. That party, comprising, in many respects, the most solid and the most moral portions of the community, made cruel war upon the new dynasty, either by keeping altogether aloof from it, thus preventing its being settled upon the sole basis upon which a dynasty is founded—the solidly conservative element; or else by its connivance with the republican party. Thus the government of the house of Orleans failed to obtain a firm foundation; a breath overturned it. Everything had been pardoned to William III., nothing was pardoned to Louis Philippe. The monarchical principle was strong enough in England to undergo a transformation: it was not so in France. Certainly if the republican party had had in England, under William III., the importance which it had in France under Louis Philippe—if that party had had the support of the Stuart faction—the constitutional establishment of England would have been short-lived. Here England profited by the immense advantage she has in her aptitude for colonization. America was the waste-weir of the republican party; without that, this party would have remained as a virus in the mother country, and would have prevented the establishment of constitutional government. Nothing that is strong and sincere is lost in the world. These republican exiles were the fathers of the men who, in the latter part of the eighteenth century, carried on the War of Independence. The revolutionary element in England, instead of being a dissolvent, thus became creative; English radicalism, instead of tearing the mother country in pieces, produced America. If France had been a colonizing, instead of a military nation; if the bold and enterprising element, which in other countries furnishes colonists, were with the French capable of anything besides conspiracies and fighting for abstract principles we should have had no Napoleon: the republican party, expelled by the reaction, would have emigrated about the year 1798, and would have founded, far away, a new France, which, in accordance with the law of colonies, would now doubtless be an independent republic.

A gross error of historical philosophy contributed to warp the national judgment upon this grave question of the forms of government; it was this very example of America The republican school were forever citing this example as good and easy to follow. Nothing could be more superficial. That colonies accustomed to govern themselves in an independent fashion should break the ties which bind them to the mother country, and these ties broken, should dispense with royalty and provide for their common safety by a federative pact, there is nothing in this but what is natural. For a colony to sever itself from the throne in this way, as a cutting is severed from a tree, carrying its own germ of life with it, is in accordance with the immutable principles of colonization principles which are among the conditions of human progress, of that of the Aryan race in particular. Virginia and Carolina were republics before the war of independence. That war changed in no respect the internal constitution of the States; instead it only cut the cord, now grown irksome, which bound them to Europe, and substituted for it a federal union. Here was no revolutionary work. There was at the bottom of this great movement an eminently conservative conception of right, an aristocratic and law-abiding spirit of provincial liberty. In like manner, whenever the slight tie which binds Canada and Australia to England shall be broken, those countries, accustomed to govern themselves, will continue their independent existence almost without perceiving the change. If France had undertaken in earnest the colonization of Algeria, Algeria would have had a chance of becoming a republic sooner than France. Colonies, formed of persons who find themselves cramped in their native land, and who seek a greater liberty than they have at home, are always nearer a republic than the mother country, tied by her old habits and her ancient prejudices. Thus, there has continued to exist in France a party which does not permit the development of constitutional royalty, the radical republican party. The situation of France was very different from that of England; side by side with the Right, the Left, and the Center, there was an irreconcilable party, utterly refusing to accept the existing government; not saying to the government, "Do such a thing and we are with you;" but giving it to understand: "Whatever you do, we shall be against you." The republic is in a sense the final goal of every human society; but we can conceive of two very different methods of reaching it. To establish the republic with a high hand, by destroying every obstacle, is the dream of ardent minds. There is another way, less violent and more sure; to preserve the old royal families as precious monuments and souvenirs of the past, is not merely the foolish fancy of an antiquary; dynasties thus preserved become in certain critical moments extremely convenient wheels in the machinery of constitutional government. Will the countries which, like England, have followed this course, ever attain to the perfect republic, with no hereditary dynasty and with universal suffrage? As well ask if the hyperbola ever touches its asymptotes. What matters it, since it comes so near that the distance is inappreciable to the eye? This is what the French republican party does not understand. For the form of a republic it sacrifices the substance. Rather than follow a high road already laid out, with, to be sure, some windings, it prefers to plunge over precipices and through bogs. Rarely do we see so little political tact and so little discernment joined to so much honesty. The year 1848 laid bare the ulcer, and established to the satisfaction of every disciplined mind the fundamental principle of the philosophy of French history. The revolution of 1848 was not an effect without a cause (such an assertion would be absurd; it was an effect entirely out of proportion to its apparent cause. The shock was nothing, the ruin was immense. There happened in 1848 what would have happened in England, if William III. had been swept away by one of those fits of strong dissatisfaction which his government excited. In that case the history of England would have been turned upside down. In England, the people's attachment to legitimacy, and their dread of the republic, were sufficiently strong to enable the new dynasty to get over momentary difficulties. In France, on the other hand, the moral degeneracy of the nation, its want of faith in royalty, together with the very great energy of the republican party, sufficed to overturn a throne which had but a ruinous foundation. Then it was that the disastrous situation in which France has remained ever since the Revolution became apparent. If the Revolution and the Republic had taken root less deeply in France, the house of Orleans, and with it parliamentary government, would have been securely consolidated; had the republican idea been dominant, it would, after divers alternations of action and reaction, have carried the country, and the Republic would have been founded. Neither the one nor the other of these two suppositions were realized. The republican spirit was strong enough to prevent the permanent establishment of constitutional royalty; it was not strong enough to establish the Republic. Hence, a false and singular position, and one calculated to prepare the way for a melancholy downfall. What happened in 1848 might happen many times again; let us endeavor to discover the secret law, the hidden reason of this.

When we see a man die of a cold, we conclude, not that a cold is a mortal malady, but that the man was consumptive. The disease which occasioned the death of the government of July was in like manner so slight, that we must admit the patient's constitution to have been of the frailest. The slight agitation about the banquets was one of those which a government ought to be able to support, if it have any capacity of life in it. Why, with every appearance of health, was the government of July so feeble? It was because it had not that which gives to a government good lungs, a sound heart, and a healthy stomach; we mean the serious adherence of the influential portions of the community. The thoroughly humane feeling which restrained Louis Philippe from giving battle, while its indulgence implies a distrust of his own right, does not suffice to explain his fall. The republican party which effected the revolution was an imperceptible minority. In a country where the government was less centralized, and where opinions were less divided, the majority would have resisted: but the provinces had as yet no idea of opposing a movement emanating from Paris; besides, if the faction which took part in the movement of the 24th of February, 1848, was insignificant, the number of those who might have defended the vanquished dynasty was not great. The legitimist party were the victors, and without building barricades, had, on that day, their revenge. The Orleans dynasty, in spite of its thorough uprightness, and its rare honesty, had not known how to speak to the heart of the nation, nor to make itself loved. In presence of this revolution thus brought about by a turbulent minority, what was France to do? A country which has no unanimously accepted dynasty is always a little awkward and embarrassed in its movements. France yielded: she accepted the Republic insincerely, not believing in it, and fully decided to be false to it. The opportunity was not wanting. The vote of the 10th of December was a plain repudiation of the Republic. The party which made the revolution of February was subjected to the law of retaliation. If we may be allowed to use a vulgar expression, they had played France a very scurvy trick; France played them a scurvy trick in return. She was much like some honest citizen whom the most mischievious boys should lay hold of on any day of great riot, and should clap the red cap of liberty upon his head; and the worthy man would let them do as they pleased for the sake of peace, but would probably cherish some resentment. The surprise of the ballot responded to the surprise of the uprising. Assuredly, the conduct of France would have been more dignified and more loyal, if, on the announcement of the revolution, she had openly resisted, politely arrested the functionaries of the provisional government at the very outset, and convoked in all the departments some sort of general council which would have re-established the monarchy. But several reasons, too readily apparent to be in much need of explanation, rendered this course impossible at that time. Besides, a nation which has been granted universal suffrage always becomes somewhat given to dissembling. It has in its hands an all-powerful weapon, which renders civil wars needless. When we are sure that the enemy will be obliged to pass through a defile of which we are the masters, and where he will be forced to receive our fire without returning it, we do not go out of our way to attack him. France waited, and, in December, 1848, inflicted a disastrous repulse on the republican party. If February had proved that France was not much attached to the constitutional monarchy of the house of Orleans, the vote of the 10th of December proved that she cared no more for the Republic. The political weakness of this great country was shown in the strongest light. What shall we say of what happened afterward? We do not like *coups d'etat* any more than we do revolutions; we do not like revolutions, for the very reason that they always lead to *coups d'etat*. We cannot, however plausible it may appear, admit the fundamental pretension of the party of 1848. That party in the name of we know not what divine right, arrogates to itself a power which it accords to no other, claiming to have made itself so absolutely the master of France that the illegalities committed in order to break the fetters with which it had bound the country, ought to be considered as crimes, whilst its own revolution of February is only a glorious deed. This is inadmissible. *Quis, tulerit Gracchos de seditione querentes?* He who uses the sword shall perish by the sword. If the muskets aimed at M. Sauzet and the Duchess of Orleans, on the 24th of February, 1848, were innocent, the bayonets which invaded the chamber on the 2d of December, 1851, were not guilty. In our view, each of these acts of violence was a dagger-stroke aimed at the country—a wound reaching to the most vital parts of her constitution, one step further into a labyrinth that has no issue.

The Emperor Napoleon III., and the little group of men who shared his confidence, brought to the government of France a programme which, though not founded upon history, was not wanting in originality: namely, to revive the traditions of the Empire, turn to account its glorious legend, still so well preserved among the people, give voice to the popular sentiment on this subject by means of universal suffrage, obtain by this suffrage a delegation of powers binding on the future and establishing hereditary right, and, in accordance with a cherished idea of the French nation, call for a dynastic election; at home, the personal government of the Emperor, with a show of parliamentary government skillfully reduced to a nullity; abroad, a brilliant and active policy, restoring gradually to France by war and diplomacy, the place in the front among the nations of Europe, which she held sixty years ago, and which she lost in 1814. France, for seventeen years, has allowed this experiment to be tried, with a patience which might be called exemplary, if it were ever good for a nation to carry forbearance too far when her destinies are at stake. How has the experiment succeeded? What have been its results? Can it be said, in the first place, that the new Napoleonic house has been founded; that is to say, has it rallied around it those sentiments of affection and personal devotion which alone give strength to a dynasty? We must not deceive ourselves in this matter. Selfishness, scepticism, indifference toward its rulers, the persuasion that no gratitude is due to them, have totally withered the heart of the nation. The question has become one of self-interest. The wealth of the community having greatly increased, if the question were proposed in these terms: *revolution—no revolution*, the second proposition would obtain an immense majority; but often a country which has no desire for a revolution does all that is needed to produce one. At all events those sentiments of tender affection and fidelity with which the nation once regarded her kings, are no longer to be thought of. The persons having for the Napoleonic dynasty the same sentiments that a royalist of the Restoration had for the royal family, might easily be counted. There are almost no Napoleonic legitimists; this is a fact with which the government cannot be too deeply impressed. That part of the programme of the Emperor Napoleon III. which relates to the military glory and the preponderant position of France, was not without grandeur; and those who, looking to the general interests of civilization, are grateful to the Emperor for the war of the Crimea and that of Italy, cannot judge with severity the whole foreign policy of the second empire; but it is clear that France as a nation, is by no means in harmony with such views. If it were possible to submit it to the universal suffrage, the plebiscite, *no war*, would obtain a much greater majority even than *no revolution*. The France of to-day is, beyond all doubt, no more heroic than she is sentimental. The preponderance of one European nation over the rest has, moreover, become impossible in the present state of society. The threatening intentions imprudently expressed on the French side of the Rhine (and it is not the government which has been in this respect the most culpable, or the most wanting in tact) have kindled a feeling among the Germanic nations, which will subside the moment they shall be reassured with regard to the ambition they may have attributed to the French. From that moment, the influence of Prussia in the Germanic body will cease—an influence which has no other plea for its existence than the fear of France. From that moment, also, will probably cease the desire for political unity,—a desire so little in conformity with the Germanic spirit, and which has never been among the Germans anything but an impatiently tolerated defensive measure against a strongly organized neighbor. The change of this single point in the original plan of the Emperor Napoleon III. would suffice to modify everything connected with the internal government of the country. The Emperor Napoleon III., never even imagined that he could carry on the government without an elective chamber; he sincerely hoped that he might for a long time, if not permanently, control the elections. It was a scheme which could only be realized by the aid of constant wars and constant victories. Personal government can only be maintained on condition of being always and everywhere glorious and successful. How could it be expected.

unless the country were kept constantly dazzled by a marked prosperity, that it would go on forever casting into the ballot-box the vote which the administration put into its hand? It was inevitable that, one day or another, France would wish to use the powerful weapon that had been left in her hands, and that she should take a responsible part in her affairs. In politics, we cannot long play with appearances. It was to be expected that the semblance of parliamentary government which the Emperor Napoleon III. had always kept up, would become a serious reality. The elections of 1869 transferred this supposition into the domain of established facts. The elections of May and June, 1869, showed that the law of French society cannot be that of Roman Cæsarism. Roman Cæsarism was equally in the beginning a despotism, surrounded by republican fictions; the despotism destroyed the fictions: with France on the contrary, the representative fictions destroyed the despotism. This did not occur under the first empire, because the mode of electing the legislative body was then completely illusory. Nothing proves more clearly than the events of those months of 1869 how surely the ideal of government originated by England imposes itself, of necessity, upon every state. It is often said that France is not fitted for such a government. France has certainly shown that she thinks otherwise; at all events, if that were true, we should say there is no hope for France. A liberal form of government is an absolute necessity for every modern nation. Those which cannot accommodate themselves to it, will perish. In the first place, the liberal regime will give to the nations which have adopted it an immense superiority over those which cannot adapt themselves to it. A nation which is not qualified for liberty of the press, nor for the liberty of holding meetings, nor for political liberty, will certainly be surpassed and vanquished by the nations which are fit to be trusted with these liberties. These last will always be better uniformed, better taught, more thoughtful, better governed.

There is still another reason why, if France be condemned to the fatal alternative of anarchy, or despotism, her destruction is inevitable. There is no issue from anarchy except through a great military state, which, besides ruining and exhausting the nation, can only maintain its ascendancy on condition of being constantly victorious abroad. The rule of military restraint at home leads inevitably to foreign war. A vanquished and humiliated army cannot exercise that restraint energetically. Now, in the presente state of Europe, a nation which is systematically obliged to engage in foreign wars, is a nation lost. Such a nation will be constantly provoking against itself coalitions and invasions. This is why the unstable condition of the internal government of France was for her an external danger, and made her a warlike nation, notwithstanding that the general sentiment of her people is very pacific. The equilibrium of Europe requires that all the nations of the continent should have nearly the same political constitution. An *ebrius inter sobrios* cannot be allowed to disturb this harmony. Thus, from whatever point we set out, we arrive at this conclusion, that France must enter without delay upon the path of representative government. A preliminary question naturally suggests itself here: Will the Emperor resign himself to this change? Will he so far modify a programme which is for him, not a mere ambitious calculation, but a faith, an enthusiasm, the religious belief which explains his whole life? After having cherished, to the verge of fanaticism, an ideal which alone he holds to be noble and grand, but which France has rejected, will he not feel an invincible disgust for that government of peace, of economy, of small ministerial battles, which has always appeared to him the personification of decadence, and which is associated in his mind with the memory of a dynasty held by him in small esteem? Will he venture outside of that circle of second-rate counsellors and ministers in which he seems to take delight? Can a sovereign, invested by the popular vote with the plenitude of popular rights, be a parliamentary monarch? Is not the *plebiscite* a rejection of constitutional monarchy? Has such a government ever resulted from a *coup d'etat*? Can it coexist with universal suffrage? The respect due to the person of the sovereign prohibits the examination of these questions. Considerations of race and blood, which were formerly decisive in history, have lost much of their force. Substitutions which would have been impossible under the ancient may have become possible. Family characteristics, which were formerly inflexible, so that a Bourbon, for example, was only suited to play a particular part, are now susceptible of much modification. The historic *role* and the race are no longer inseparable things. That an heir of Napoleon I. should accomplish a work antagonistic to Napoleon I. is not a thing absolutely inadmissible. Public opinion has become so thoroughly the sovereign master that names and men are only what it makes them. The *a priori* objections raised by certain persons against the possibility of a constitutional future with the Bonaparte family are consequently not decisive. The Capet family, which became well and truly the representative of French nationality, and of the third estate (*tiers état*), was in the beginning ultra-Germanic, ultra-feudal. As architecture forms a style out of faults and the mistakes of inexperience, so a nation may, if it pleases, turn to advantage its own misdeeds. We enjoy the benefits of royalty, though royalty was established by a series of crimes; we profit by the results of the Revolution, though the Revolution was a tissue of atrocities. It is a sad law of human life that we become wise only when we are worn out. We have been too difficult to please, we have rejected excellence; we rest satisfied with mediocrity through fear of something worse. The coquette who has refused the most brilliant offers of marriage often ends by accepting the most commonplace. Those who have dreamed of a republic without republicans, please themselves in like manner with imagining a reign of the Bonaparte family without Bonapartists a condition of things in which that family, freed from the compromising companionship of those who enthusiastically prepared the way for its second accession, would find its best supporters, its safest counsellors, among those who have not helped to make it what it is, but have accepted it, as a thing desired by France, and as capable of opening some issue out of the strange perplexity into which fate has led. It is very true that there is no example of a constitutional dynasty resulting from a *coup d'etat*. The Viscontis, the Sforzas, tyrants born of republican discords, are not the stuff of which legitimate monarchies are made. Such monarchies are founded only by the peculiar sternness and hauteur of the Germanic race in barbarous and ignorant ages, when oblivion is possible, and when mankind lives in that mysterious darkness which is the foundation of respect. *Fata viam invenient*. . . . The strange defiance which France has shown to all the laws of history compels us to great reserve in such inductions. Let us go higher; and, neglecting whatever the accident of to-morrow may disconcert, let us inquire what reasons exist in the nation why one should have a constitutional monarchy, what grounds there are for hoping for its success, what fears may be entertained in regard to its permanent establishment.

We have seen that the peculiar feature of France, a feature which widely separates her from England and the other European states (Italy and Spain, up to a certain point excepted), is, that the republican party constitutes a considerable element of her population. This party, which was strong enough to overturn Louis Philippe, and to impose its theory on the country for a few months, was, after the 2d of December, the object of a sort of proscription. Has it consequently disappeared? No, indeed! The progress it has made in these last thirty years has been very perceptible. Not only has it kept possession of the majority in Paris and the large cities, but it has gained whole districts of country besides; the entire circuit of the environs of Paris now belongs to it. The democratic spirit, such as we know it in Paris, with its rigidity, its dogmatic tone, the deceptive simplicity of its ideas, its petty suspicions, its ingratitude, has conquered certain rural cantons in a surprising manner. In many a village the relations of farmers and farm servants are exactly those of workmen and employers in a manufacturing town; peasants will talk their surly, radical, jealous politics to you with as much assurance as the workmen of Belleville, or of the Faubourg Saint Antoine. The idea of equal rights for all, a way of considering the government as a mere public service which is paid for, and to which neither respect nor gratitude is due, a sort of American impertinence, the pretension to be as wise as the best statesmen, and to reduce politics to the mere consultation of the wishes of the majority—such is the spirit which gains ground more and more, even in the country. Will, however, the republican party ever succeed in becoming the majority, and in securing the triumph of American institutions in France? It is essential to that party to be always in the minority. If they were finally to effect a social revolution, they might create new classes, but these classes would become monarchical the moment they became wealthy. The most pressing interests of France, the character of her mind, her good qualities and her defects, make royalty a necessity to her. The very moment a radical party shall have overturned a monarchy, the journalists, the literary men, the artists, the men of intellect, the men of the world, the women, will conspire together to establish another; for the monarchy corresponds to the deeply-felt needs of the nation. Our amiability alone suffices to make us bad republicans. The charming exaggerations of the old French politeness, the courtesy which "places us at the feet" of those with whom we have intercourse, is the very opposite of that stiff, rough, dry manner which the ever-present consciousness of his rights gives to the democrat. France excels only in the exquisite; she loves only what is elegant; she can only be aristocratic. They are a race of gentlemen; their ideal has been created by gentlemen, not, like that of America, by honest citizens and serious men of business. People habituated to such things as these are only satisfied with a high-bred society, a court and princes of the blood. To hope that great and fine French works will continue to be produced in a democratic community (*dans un monde bourgeois*) where no inequality is admitted but that of wealth, is a delusion. The generous and imaginative people who expend the most fervor upon the republican utopia are the very persons who would be the least able to accommodate themselves to such a state of society. They who pursue so eagerly the American ideal forget that the American race has not a very brilliant past; that it has never had a nobility; that it is occupied exclusively in business and the pursuit of wealth. Our ideal can only be realized under a government shedding splendor upon all that approaches it, and creating distinctions outside of wealth. A society where a man's merit and his superiority over another can only be shown in industrial pursuits and in commerce, is antipathetic; not that industrial pursuits and commerce do not seem to us honorable, but because we see plainly that the best things (for example, the functions of priest, magistrate, scholar, artist, and man of letters) are the inverse of the commercial and industrial spirit; for the first duty of those who undertake these functions is not to seek to enrich themselves, and never to consider the commercial value of what they do. The republican party may therefore prevent the establishment of any liberal government whatsoever, for it will always have it in its power, by inciting seditions, to force any government to arm itself with repressive laws, to restrict the liberties of the people, and to strengthen the military element. Whether it be capable of establishing itself, is doubtful. The hatred between it and the peaceable portion of the community will continue to grow more and more envenomed, for more and more it will seem to the whole country to be a perpetual marplot. It will succeed, we fear, only in provoking a kind of periodical crisis, followed by violent expulsions, which the conservative party will maintain to be purifications, but will in truth be debilitations, and which will, in any case, wear upon the constitution of France in a deplorable manner. In these convulsive vomitings, excellent elements, essential to the life of a nation, will be thrown out, together with the impure elements. As it happened after 1848, liberal ideas will suffer from their inevitable association with a party which, being full of generous illusions, has great attractions for youthful imaginations, and which, besides, holds a great part of its programme in common with the liberal school. It is to be feared that long-standing habits of mind, a certain rigidity, a great deal of routine, and the custom of judging everything by the Parisian standard (a custom easy to be understood in a party which was at the outset essentially Parisian), will lead that party to believe that revolutions like those of 1830 and 1848 may be repeated. Nothing could be more fatal. The time for Parisian revolutions is over. We found this opinion less upon the material changes which have taken place in Paris, than upon two causes which, it seems to us, will have an enormous influence upon the destinies of the future.

One is the establishment of universal suffrage. A people in possession of this suffrage will allow no revolutions to be made by its capital. If a revolution should take place in Paris (a thing which is fortunately impossible), we are persuaded that the departments would not accept it; that barricades would rise across the railways to stay the spread of the conflagration, and to prevent provisions from reaching the capital; and that the disturbance at Paris, soon reduced to starvation, would be but short lived. The emancipation of the provinces has made great progress since 1848. Another fact, moreover, ought to be taken into great consideration. The whole philosophy of history is governed by the question of armament. Nothing has so much contributed to the triumph of the modern spirit as the invention of gun powder. Artillery has destroyed chivalry and feudalism, given strength to monarchs and to States, definitively checkmated barbarism, rendered impossible those strange cyclones of the Tartar hordes, which, gathering in the heart of Asia, came shaking Europe to its foundations, and terrifying the Christian world. The nice application of science to the art of war in our day will lead to revolutions almost as grave. War will become more and more a scientific and mechanical problem; the richest, the most scientific, the most ingenious nation will have the advantage. If we examine the effects of this change upon the internal affairs of States, it is clear that the application, on a large scale, of science to armaments will be to the sole profit of governments. The effect of artillery was to destroy, one after the other, all feudal castles; one discharge of some improved engine will stop a revolution. At epochs when arms are imperfect, a citizen is almost the equal of a soldier; but as soon as the aggressive process becomes a learned matter, requiring exact instruments and demanding a special education, the soldier has an immense superiority over the unarmed multitude. There is every reason, therefore, to believe that revolutions begun by citizens, will henceforth be crushed in the bud. The Jesuits, with their usual sagacity, understand this, as is seen by their getting possession of the avenues to the School of St. Cyr and to the Polytechnic School. They foresee the future of those who know how to handle dexterous weapons and disciplined forces, and they perceive, very clearly, that the advantage in this respect is with the old aristocracy, less absorbed than the citizen class by industrial pursuits, or by lucrative civil positions, and therefore more capable of abnegation. France, then, seems destined for a long time still to escape the republic, even if the republican party should have the numerical majority. There is in the nation a constantly increasing mass of people destitute of any religious ideal, and rejecting every social principle superior to the will of the individual. The remaining mass, not yet converted to these egotistical views, is daily diminished, by means of the primary school, and by the use of universal suffrage; but against this rising tide of aggressive ideas, which, being young and inexperienced, make no account of difficulties, higher interests and needs array themselves, and demand that society be organized and directed by a principle of reason and knowledge distinct from the will of the individual. The democrat ever imagines that the mind of the nation is clearly made up; he does not allow that there can possibly be anything in the least obscure, hesitating, or contradictory in public opinion; to count the votes and to do the will of the majority, seem to him very simple things: but these are delusions. For a long time to come, public opinion will have to be guessed at, foreseen, supposed, and, up to a certain point, guided. Hence, there are monarchical interests which, the moment a republic is established, become formidable, even in the opinion of those who have set up, or allowed others to set up, the republic. The movement which is going on in the popular classes, tending to give to each individual a more and more precise consciousness of his rights, is a fact so evident that it would be sheer madness to wish to oppose it. The true policy is to provide for it, and to accommodate ourselves to it. The men of science have never sought means to arrest the tide; they have done better; they have so well determined the laws of this phenomenon, that the navigator knows, from minute to minute, the state of the sea, and profits greatly by it. To prevent the rising tide from carrying away the necessary embankments, and causing, as it retires, fatal reactions, is the essential thing. Now, judging from appearances, this is just what will happen, so long as the French democracy shall be led by that acrimonious, quarrelsome, conceited Jacobism which agitates the country, sometimes, even, gives it an impulse, but will never guide it to a settled constitution. That party may make a revolution, but it will not reign more than two months afterward. Even if it should succeed in obtaining a majority of votes, which is not very probable, it would still establish nothing, for the elements at its disposal, though excellent for purposes of agitation, are unstable, easily disunited, and totally incapable of furnishing the solid materials of a construction. Its strength, though great, is partly a strength of circumstance. It has happened to us a dozen times, during an electoral campaign, to hear the following dialogue: "We are not satisfied with the government; it costs too much; it governs for the benefit of those who do not think as we do; we shall vote for the most radical opposition candidate." "Then you are revolutionists?" "Not at all; we only want to make an impression on the government; to force it to change its course; to hold it vigorously in check." "But if the chamber is composed of revolutionists, the government is upset." "No; there will only be twenty or thirty of them; and then the government is so strong! It has the chassepots!" This naive reasoning shows how much the radical party deceives itself when it imagines that the country desires it for its own sake. A great part of the country uses it as a rod with which to chastise the established authorities, not as a staff upon which to lean. "They elect us, therefore they like us," would be, on the part of the honorable members of the so-called advanced opposition, the most dangerous of conclusions. They are elected in order to give the government a lesson, and with the conviction that the government is strong enough to bear the lesson. But when this shall no longer be the case, when it shall be perceived that the existence of the government has been endangered, there will be a counter movement; so that the radical party is subject to this strange law, that its hour of victory is the beginning of its defeat. Its triumph is its end: often those who have voted for it, and urged it on, themselves applaud its proscription.

The maintenance of order has, in fact, become in European communities so imperious a condition, that long civil wars are impossible. The example is often quoted of those famous Greek and Italian republics which created an admirable civilization in the midst of a political state, very analogous to the Reign of Terror; but no conclusions can thence be drawn applicable to a society like ours, whose machinery is much more complicated. Spain, the Spanish republics of America, even Italy, can endure a greater degree of anarchy than France, because these are countries where life is easier, where there are fewer sources of wealth, where material interests and credit have been less developed. The Reign of Terror at the end of the last century was the suspension of life. In our day it would be still worse. As a being of simple structure can exist under many very different conditions, whilst animals finely organized, like man, have such restricted limits that slight changes in their habits produce death, so our complicated civilizations cannot support crises. They have, if we may say so, a delicate temperament; a degree, more or less, kills them. A week of anarchy would cause incalculable losses: at the end of a month, perhaps, the railway trains would cease running. We have created mechanisms of infinite precisions, tools and engines whose motive power is confidence, and which all presuppose a profound public tranquility, a government firmly established and at the same time thoroughly controlled. We know that in the United States matters are managed otherwise; there, a degree of disorder is endured, which would in France excite cries of alarm. This comes from the fact that the constitutional foundations of the United States are never really in danger. These little-governed American States resemble those European countries where the dynasty is not brought in question. They respect the law and the constitution, which to them represent the European doctrine of legitimacy. To compare countries like ours, having socialistic tendencies, and where so many people look to a revolution as to a means of improving their condition, with such States as these, completely exempt from socialism, and where men, wholly occupied with their private affairs, ask very little protection from the government, is the greatest mistake in philosophical history that can be committed.

The need of order felt by old European societies, coinciding with the improvements in arms, will, on the whole, give to the governments as much strength as they are daily losing through the progress of revolutionary ideas. Like religion, the cause of order will have its fanatics. Modern societies have this peculiarity, that they are extremely placable so long as their existence is not in danger, but become pitiless so soon as they begin to have doubts of their own stability. A community that has been frightened is like a man that has been frightened: it has lost something of its moral courage. The means employed by the Catholic Church in the 13th and in the 16th centuries, to defend its threatened existence, will be resorted to by modern society under more expeditious and less cruel, but not less terrible, forms. If the old dynasties be powerless here, or if, as is probable, they refuse to accept power under conditions unworthy of them, recourse will be had to the Italian *paciers* and *podestas* of the Middle Ages, to whom will be entrusted the entire business of reconstructing society in accordance with a bloody programme drawn up beforehand. Chance dictators, analogous to the Generals of Spanish America, will alone undertake such tasks. As, however, the European races have a fund of fidelity which they never part with, and as, moreover, there will remain for a long time to come survivors of the ancient dynasties, there will probably be a return to legitimacy after each of these cruel dictatorships. More than once again in the future, the traditional rulers will be entreated to resume their task, and to restore, at whatever cost, to the nations which of old made covenants with their ancestors, a little peace, good faith, and honor. Perhaps they will require much solicitation, and will make conditions about which there will be no dispute. In view of certain occurrences like those which have recently taken place in Greece, in Mexico, and in Spain, the democratic party sometimes says, with a smile, "There are no more kings to be found" A return of barbarians, that is to say, a new triumph of the least intelligent and least civilized portions of mankind over the more intelligent and more civilized, seems at the first glance impossible. Let us have a clear understanding upon this point. There still exists in the world a reservoir of barbaric forces, almost wholly under the control of Russia. So long as the civilized nations retain their powerful organization, the part which this barbarism has to play is reduced almost to nothing; but if (which Heaven forbid!) the leprosy of egoism and anarchy should cause the destruction of the Western States, barbarism would assuredly resume its proper function, which is to restore the manhood of corrupt civilizations; to bring about a vivifying return to instinct, when reflection has put an end to subordination; to show that the spirit which leads men to devote themselves freely to death, through fidelity to a chief (a thing which the democrat holds to be base and foolish), is that which makes a people strong, and gives them the earth for a possession. We must not, therefore, shut our eyes to the truth that the democratic theories, carried out to their furthest limit, would result in utter weakness. A nation which should follow this plan, repudiating all idea of glory, of social *eclat*, of individual superiority—having for its sole object the contentment of the materialistic desires of the masses—that is to say, aiming only to procure the satisfaction of the greatest number, would lay itself completely open to conquest, and endanger its very existence. How shall we prevent these sad results, which we have sought to point out as possibilities, and not as things distinctly feared? By the reactionary plan? By restraining, extinguishing, crushing, governing more and more? No, a thousand times no! That policy has been the origin of the whole evil; it would be the means of utter ruin. The liberal programme is at the same time the truly conservative plan. Beyond all doubt a constitutional monarchy, limited and controlled; decentralization; less government; an exceedingly strong organization of the commune, the canton, and the department; a strong impulse given to individual activity in art, intellect, science, trade, manufactures and colonization; a policy decidedly pacific; an abandonment of all projects of territorial aggrandizement in Europe; the development of a good system of primary instruction, and of a superior instruction, capable of giving to the morals of the educated class the basis of a sound philosophy; the formation of an upper legislative chamber, chosen by many various modes of election, and providing, together with the simple numerical representation of all the citizens, for the representation of divers interests, functions, specialties and aptitudes; in social questions, government neutrality; entire liberty of association; gradual separation of church and state, an all-important condition in the opinion of the religious world;—such is the dream of those who seek by the aid of calm reflection, unblinded by an intemperate patriotism, a practicable pathway. In some respects, this is a policy of penitence, implying the confession that, for the moment, it concerns us less to continue the Revolution than to correct it. It often seems that France is passing through a period of fasting, a sort of political regimen, during which the attitude which best becomes Frenchmen is that of the sensible man who is expiating the errors of his youth; or rather that of the mistaken traveller, finally obliged to take the long way round the hill he had at first attempted to scale. Revolutions, like civil wars, are strengthening, if we come out of them; they kill if they last.

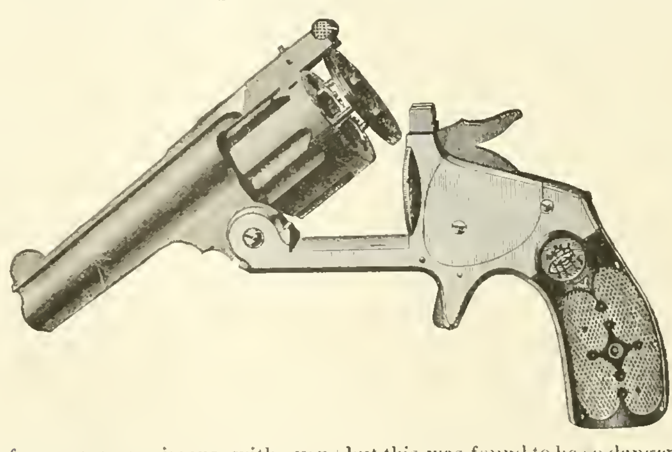
In general, the mistake of the French liberal party is in not understanding that every political construction should have a conservative basis. In England parliamentary government was not possible until after the exclusion of the radical party, an exclusion which was effected with a sort of frenzy of legitimacy. Nothing is assured in politics until the heavy and solid parts of the nation, which are its ballast, have been enlisted in the cause of progress. The liberal party of 1830 were too ready to believe they could carry their purpose by main force, in direct opposition to the legitimists. The estrangement or the hostility of the latter party is still the great misfortune of France. Withdrawn from common life, the legitimate aristocracy refuses to society what it justly owes—patronage, examples and lessons of noble living, of grave and dignified manners. The vulgarity, the total want of education, the great ignorance of the art of living, the ennui, the absence of respect, and the puerile parsimony of provincial life, which prevail in France, are all owing to the fact that those who ought to furnish the country with the type of the gentleman, fulfilling public duties with universally recognized authority, fly from society, and more and more give themselves up to a solitary and retired life. The legitimist party is in one sense the indispensable substructure of every political foundation amongst the French; even the United States have, after their manner, this essential basis of all society, in their religious souvenirs, heroic in their way, and in that class of moral, high-toned, grave, and weighty citizens who are the stonds with which the edifice of the State is built. The rest is but sand; nothing durable is made of it, whatever talent, whatever warmth of heart, even, is brought to the work. This provincial party which is day by day becoming conscious of its strength, what does it think? what does it wish? Never were views more clearly defined. This party is liberal, not revolutionary; constitutional, not republican; it wishes the control of authority, not its destruction; the end of personal government, not the overthrow of the dynasty. We do not doubt that if, in time past, the government had taken a positive stand, had given up the system of official candidates, the artificial subdivision of districts (*circonscriptions*), and allowed the elections to be made spontaneously by the nation, the result would have been to return a chamber decidedly imbued with these principles, and which, being considered by the nation as representing its wishes, would have had sufficient strength to get safely over the most difficult crises. The day will inevitably come when it will be as hard to understand why the Emperor Napoleon III. did not seize this means of obtaining from the country a second signature to his marriage contract with the state, and of dividing with the nation the responsibility of a doubtful future, as it is to comprehend why Louis Philippe did not see in the co-operation of men of capacity a means of enlarging the bases of his dynasty. The provinces, in fact, take the elections much more seriously than Paris. Having no political life except once in every six years, they give to the elections an importance which Paris, with her habitual levity, does not accord to them. Paris, only intent on making her radical protest, sees in the elections, not a choice of grave delegates, but an opportunity for ironical manifestations. The provinces do not understand such finessing; their deputies are really their representatives, and they firmly adhere to them. A chamber freely elected without interference from the administration, would it have been dangerous for the dynasty? Would the radical opposition have been represented in it by an increased number of deputies? We think just the contrary. In a great number of cases the election of hostile, or even abusive candidates, has been a sort of protest against the official or obsequious candidate. The system of official candidates completely disturbs the working of elections and impairs their trustworthiness, not only by the direct pressure exerted by the administration in favor of its own candidates, but especially by the false position in which it places the independent voter. The aim of the latter is, in general, no longer to surely choose the candidate who best represents his various opinions, or whom he thinks the most capable of serving the country, but to set well aside, at whatever cost, the official candidate. Consequently, no more shades of opinion, no more personal preferences. Since extreme opinions find an assured favor with the mass, with whom bold assertions and noisy declamation have greater force than more moderate views; and as the democratic party has also the control of a genuine fanaticism, and an organization which no other party has the liberals fall in with the current, and adopt, in spite of their repugnance, the radical candidate. It is a very wide-spread error in France, to think that we must ask more to obtain less; and that the radical opposition is the instrument of progress, the impelling force of the government. This is true of the moderate opposition, but not of the radical party, which is an obstacle to progress, an impediment to concessions, owing to the terror it inspires and the repressive measures it occasions. Now, more than ever, the aim of politics should be, not to solve questions, but to leave them to time. The life of nations, like that of individuals, is a compromise between contradictions. Of how many things we must say, that we cannot live with them or without them, and yet we still live! Prince Napoleon wittily said, a few years since, to those who would postpone the enjoyment of liberty till there are no longer in France either rival dynasties or a revolutionary party: "You will wait a long time." History will not blame the policy of those who, in such a state of things, shall resign themselves to live by expedients. Suppose that a member of the elder or of the younger branch of the Bourbon family should one day reign in France, it will not be because a majority of the French nation have become legitimists or Orleanists, but because a turn in fortune's wheel has made some member of the house of Bourbon the useful man of the moment.

France has allowed her dynastic attachments so completely to die out, that even legitimacy could only be restored by accident, and with a transitory title. The positivism to-day has so done away with all metaphysics, that one of the narrowest of ideas is gaining credence; namely, that the more recent a popular vote is, the greater its force; so that, after the lapse of some fifteen years, this strange kind of reasoning is held: "The generation which voted such a plebiscite has in part died; the vote has lost its validity, and needs to be renewed." This is contrary to the idea of the Middle Ages, according to which, the older an agreement the more binding it was. It is in one sense the negation of the national principle; for the national principle, like religion, supposes compacts independent of the will of the individual, compacts transmitted and received from father to son as a heritage. By refusing to the nation the power to bind the future, all contracts are reduced to life, or rather, we should say, to time contracts; the more ardent republicans would, we think, like them even to be annual, at least until they get what they call direct government, when the national will would be no more than the caprice of an hour. With such political notions, what becomes of the integrity of the nation? How deny the right to the succession when all is made to depend upon the material fact of the momentary will of the citizens? The truth is, that a nation is something different from the collection of units of which it is composed; that it cannot be in any measure dependent upon a mere vote; that it is, in its way, an idea, an abstract thing, superior to the will of individuals. Nor can the art of governing be reduced to a simple consultation of universal suffrage, that is to say, to the ascertaining and executing what the greater number considers to be for its interest. This materialistic conception contains at bottom an appeal to strife. In proclaiming itself the *ultima ratio*, universal suffrage starts from the idea that a majority in numbers is an indication of strength, and that if the minority does not give way to the views of the majority, they will run every risk of being beaten. But this reasoning is not exact, for the minority may be more energetic and better versed in the management of arms than the majority. "We are twenty, you are one," says universal suffrage; "yield, or we will force you to it!" "You are twenty, but I am in the right; and, though but one, I can force you to yield," will reply the armed man. *Fata viam invenient!* Happy he who, like Boethius, can, amid the ruins of a world, write his *Consolation of Philosophy*. The future of France is a mystery which baffles all sagacity. Other countries, indeed, are occupied with grave problems: England, with a calm which we cannot sufficiently admire, is solving bold questions which with us are thought to be the exclusive province of utopianism; but the discussion is everywhere circumscribed everywhere there are closed lists, laws of combat, heralds and judges. In France, the constitution itself, the form and even to a certain extent the very existence of society, are continually at stake. Can any country bear up under such a state of things? We are reassured by the reflection that a great nation is, like the human body, a machine most admirably constructed, carefully weighted and balanced; also that it creates for itself the organs it needs; and that, if it has lost them, it supplies itself with new ones. It may be, that in our revolutionary ardor we have carried amputation too far; that, thinking only to drive away diseased superfluities, we have touched some organ essential to life, so that the patient's obstinacy in not recovering may arise from some lesion we have made in his vital parts. This is a reason for being more cautious in future, and for allowing the patient, robust after all, though dangerously ill, to heal his internal wounds, and return to the normal conditions of life. But let us make haste to admit that faults as brilliant as those of France have their redeeming side. France has not lost the scepter of intellect, of taste, of refined art, of atticism; for a long time to come she will still engage the attention of the civilized world, and will be to the public of Europe the subject of bets and wagers. The affairs of France are of such a nature that foreigners become interested in them and quarrel about them, as much and often more than they do with regard to the affairs of their own countries. The most troublesome thing about her political condition is the element of the unforeseen; but the unforeseen has two aspects; by the side of the bad chances are the good ones, and we should be by no means surprised if, after a series of sad misfortunes, France were to enjoy years of singular splendor. If, weary at last of astonishing the world, she would make up her mind to a sort of political appeasement, what an ample and glorious compensation she might find in the paths of private enterprise. How she might rival England in the peaceful conquest of the globe, and in the subjection of all inferior races to the sway of her civilization! France is very capable of everything except mediocrity. Wharever she suffers, she suffers it, after all, for having attempted too great impossibilities. Whatever misfortune the future may reserve for her, and were her fate one day to excite the pity of the world, the world will not forget that she tried bold experiments by which all profit; that she loved justice to the verge of folly; and that her crime, if of crime she be guilty, was to have believed, with a generous imprudence, in an ideal incompatible with human infirmities.

REVOLUTIONARY TRIBUNAL.—The name specially given to the infamous Court of Judgment—the most extreme republican will scarcely affirm that it was a Court of Justice—instituted by the French Convention in March, 1793, on a motion made by Danton, who considered that such a Court had become necessary, inasmuch as the recent disasters that had befallen the national armies on the frontiers had led to dangerous conspiracies against the Revolutionary Government. Its members were chosen from the various Departments, and their appointment was ratified by the Convention. Their function was to sit in judgment on all persons accused of crimes against the State, and from their sentence, delivered with appalling promptitude, there was no appeal. During the "Reign of Terror," when Fouquier-Tinville was "Public Accuser," it acquired a horrible notoriety, abolishing soon almost all forms of justice, neither hearing witnesses on behalf of the accused, nor allowing him an opportunity of defense, but blindly executing the orders of the "Committee of Public Safety," which was merely a tool in the hands of Robespierre. In the Provinces, similar Tribunals, under the name of "Revolutionary Committees," were established, the Commissaries General of which, as, for instance, Carrier, shot or drowned *Suspects* in crowds.

REVOLVER.—A weapon which, by means of a revolving breech or revolving barrels, can be made to fire more than once without reloading. The invention is very far from new, specimens, with even the present system of rotation, being still in existence, which were manufactured at the beginning of the 17th century. Probably the first revolver to suggest itself was one in which several barrels were mounted on an axis, and made to revolve by the action of the trigger, so that their powder-pans came successively under the action of the lock. This principle was never entirely abandoned, and in the reign of George IV. was produced a pistol called the "Mariette," which had from four to twenty-four small barrels bored in a solid mass of metal, made to revolve as the trigger was drawn back. At close quarters, such a pistol would doubtless have been useful; but its great weight and cumbrous mechanism rendered aim extremely unsteady. Contemporaneously from the first with the revolving barrels, went forth the formation of a revolving chamber or breech, pierced with several cylindrical apertures to receive the charges. Being made to revolve, each motion brought a chamber into line with the one barrel, common to all, whereupon the weapon was ready for use. Numerous patents for this principle have been taken out, including one by the celebrated Marquis of Worcester in 1661. Various improvements were made, especially in the mode of causing revolution, an American, by the name of Elisha H. Collier, patenting such a weapon in the United States and England about 1818. In 1835 Colonel Samuel Colt brought to a conclusion experiments of some years' standing, and patented his world-renowned Colt's revolver, which was a great advance on all previous attempts, and is substantially still in use. Colt's revolver consists of one rifled barrel of considerable strength, and a massive chamber perforated with six or seven barrels, which are brought into a line with the barrel by action of the trigger. Each chamber has its nipple for a cap, which is brought under the hammer by the motion which brings the chamber or breech-piece round. In the most recent form of this revolver, the capped nipple disappears, the cap being contained within the cartridge. The hammer is discharged by the trigger, and acts nearly horizontally in a forward direction. Under the pistol is a fixed lever-ramrod, which is used in loading the chambers. Besides all this, by withdrawing a bolt, which can be done in a moment, the entire breech-piece can be taken out, and replaced by another ready charged, so that by carrying a spare breech-piece, a person may fire twelve shots in less time than another could fire three if he had to load between the shots. Colt's revolvers are now extensively used in the naval and military services of America and Europe.

The principal rivals of Colt's revolver have been the Deane and Adams, and Smith and Wesson revolvers, although many more of various sorts have been patented in the interval. The Deane differed in that it could be fired by merely pulling the trigger without also raising the hammer with the finger, as in Colt's; but this was found to be so dangerous in practice that the inventors soon substituted an arrangement under which it could be fired either by the trigger or by raising the hammer; and lastly, they introduced the great improvement of a spur behind the trigger, which must be pressed by the middle finger, while the forefinger discharges the piece through the trigger. The drawing represents the American Arms Co.'s extracting revolver, using Smith and Wesson's cartridges, caliber 38. This revolver is very simple, performing its office in a satisfactory manner, with little liability of getting out of order, and is easily taken apart by the most unskillful. Its operation is as follows: After firing the cartridges, open the arm as in Smith & Wesson's, and, by turning it over, a quick movement will throw out the empty shells; or, turning it half-way over and pulling the extractor



ring quickly back with the fingers, the shells fall into the hand or on the ground. The revolver principle has also been successfully applied to the manufacture of a kind of revolving guns for small projectiles, which are really aggregates of small-arms. The Gatling gun, a revolver of this class, in which the several barrels turned round a common axis, was used during the American civil war. But the best known gun of this description is the French *mitrailleuse* or *mitrailleur*, of which so much was heard during the Franco-German war. That most commonly used had a group of 25 barrels, surrounded by a bronze sheathing, and movable breech-piece; it was fired by means of a crooked handle or winch at the right-hand side. The range of such guns in a level plain is not great; but among fortifications, or in a narrow valley, they may be used with very deadly effect. See *Colt Revolver, Hotchkiss Revolving Cannon, Remington Revolver, Schofield-Smith & Wesson Revolver*, and *Smith & Wesson Revolver*.

REVOLVING-GEAR.—The mechanism or gearing, in machine guns, by which the shaft is revolved. It consists of a toothed wheel, fastened to the shaft, and worked by an endless screw, on a small axle, which passes transversely through the case at right angles to the shaft, and is furnished outside the case with a hand-crank: and thus the lock-cylinder, carrier, and barrels are revolved. See *Gatling Gun*, and *Traversing-gear*.

REVOLVING GUN. A breech-loading machine devised for fog-signaling, to avoid the labor of sponging and ramming home, as in the common guns formerly used for that purpose. The fore part consists of a barrel open at both ends; the breech front abuts in a close-fitting joint against the mouth of a chamber, formed in a horizontal wheel containing five chambers. A passage communicates through the top of the breech-carrier with the rear of the chamber next to the barrel. This passage is so arranged by means of a catch-spring that the communication is interrupted, except when a chamber is exactly fitted to the barrel, and then only can the gun be fired. This gun is not adapted to warfare, being constructed merely to fire blank cartridge. The weight of the gun is 35 cwt.

REVOLVING TARGET. A very cheap and simple construction designed by General George W. Wingate, and used to some extent by the United States Army. To construct this target a pit is first dug about 15 feet long, 8 feet deep, and 6 feet wide for targets of the third class, and of proportionate dimensions for targets of the second and first classes. A stout upright post is placed in the ground and firmly braced, its upper end being level with the top of the pit. An iron pin, at the suitable height, projects from this upright post, and serves as the axis upon which the target revolves. Two targets are connected by a cross-piece, through the center of which the pin or pivot passes. When the upper or exposed target is hit, the marker raises a disc denoting the value of the shot, and places it for a moment over the point struck; he then pushes the other target laterally and up to the perpendicular, patches the bullet-hole just made, and stands ready to repeat as soon as the target then up is hit.

REWARD.—A recompense given for good service. Rewards are either *honorary* or *pecuniary*. Of the former, titles, orders, and crosses are conferred on officers and men as marks of distinction for gallantry and good conduct and services rendered to the country. The most recent reward for military merit is the Victoria Cross. Of the latter is the Good Service Pension. This reward is an annuity generally of £100, and is granted to General or Field Officers who have passed a distinguished military career either in the field or in good service to the State. It can be enjoyed by the recipient, in addition to his regular pension, until he succeeds to the Colonel's allowance. In the Indian Army, an officer receiving an enhanced pension, in addition to his regular pension, would not be allowed to retain the reward for distinguished service if the aggregate sums received by him exceeded £1,000 a year. Meritorious Non-commissioned Officers receive the Good-conduct Rewards in the shape of annuities of £10, £15, or £20 each.

RHANA SYSTEM OF FORTIFICATION. The singular features of this system point out the absurdity of abstract calculations applied to the *art of fortification*. The bow and arrow, the sword, shield, and lance are combined in this outline.

RIBADOQUIN.—An ancient 1 or 1¼ pounder gun. Also a powerful cross-bow for throwing darts.

RIBANDS. Scantlings of wood about 15 feet long and 4 inches square, and used in rack-lashing gun platforms to keep the platform secure; they are also used for mortar platforms. Two ribands accompany each platform.

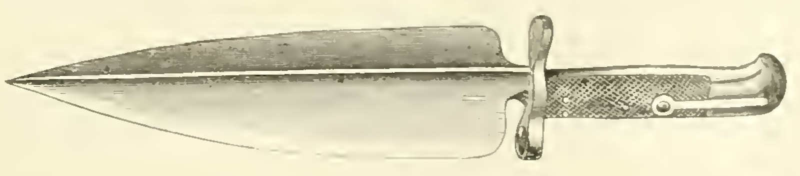
RIBAUD.—A soldier of the Foot-Guards of Philip Augustus of France; afterwards this term was applied only to the most infamous characters. *Ribaudaille* was a term of reproach formerly applied to cowardly soldiers. Philip of Valois thus called his Genoese mercenaries, who he thought had betrayed him.

RIBAUDEQUIN.—1. A chariot bristling with spears, used in the fourteenth century for the defense of camps, having small cannon fixed on the framework of the car. *Ribaudequins* were usually placed on two-wheeled carriages and used as a check against a cavalry charge. 2. The name given to *organ guns*, which consisted of a number of tubes placed in a row like those of an organ, evidently the forerunners of the modern *mitrailleurs*. 3. A warlike machine in the form of a bow, containing 10 or 15 feet in its curve. It was fixed upon the wall of a fortified town, for the purpose of casting out a prodigious javelin, which sometimes killed several men at once.

RIBBON.—In Heraldry a diminutive of the ordinary called the bend, of which it is one-eighth in width.

RIBBON COCKADES.—In the British service, the cockades which are given to recruits, and are commonly called the *colors*.

RICE TROWEL BAYONET. This bayonet, the invention of Colonel Edmund Rice, United States Army, consists of the ordinary musket-bayonet, the blade of which is shortened and welded to a thin curved triangular plate of steel. It is intended to be used as a trowel for intrenching purposes, being then detached from the musket; the loop connecting the shank and base of the blade serves as a stiffening brace, and also to guard the fingers from abrasion in the act of digging. A similar blade can be affixed to the ordinary sword-bayonet handle, which, though heavier than that first described, affords a more convenient grasp to the hand.



The soldier should never be separated from an intrenching tool of some description. Many are the instances recorded where it was impossible to forward the *intrenching tools* to the front until after the exigency for their use had passed and the men were compelled to use tin plates, tin cans, fragments of canteens, knives, sticks, etc., in order to get temporary shelter from the enemy's most galling fire.

The writer is a firm advocate of the *trowel bayonet*, having given it numerous practical tests on the Western Prairies in engagements with hostile Indians, and when it was necessary to make cover while open to the fire of sharp-shooters.

General Miles indorses its usefulness as follows: "I am fully satisfied that its utility and value are as well established as that of any article carried by the soldier; that it would increase the efficiency of any army; and that it should be universally adopted by the entire army. If the opinion of officers commanding troops in the field is considered of value, I believe that opinion is decidedly in favor of its adoption."

The art of utilizing cover is of importance, and the soldier who carries in compact form the means of erecting cover at will, possesses advantages over an enemy not so provided; and if the instrument used for this purpose is also available as an offensive weapon, his advantage becomes still more apparent.

In future operations of armies, hasty field entrenchments must play a most important part. The best authorities, from Napoleon I. down to the most scientific soldier of this day, all agree in the opinion that each soldier should carry his own intrenching tool. By giving each soldier a trowel-bayonet, he is supplied with a light, strong, and serviceable intrenching tool; no addition is made to the weight he is obliged to carry; and he is provided with a weapon as formidable as the triangular or sword bayonet.

The *trowel bayonet* requires the digger to work on his knees. This is but a slight drawback when the work is of short duration, and it is even an advantage when it is being carried out under the enemy's fire, as a man offers in this position a smaller mark for bullets and shrapnel.

Although but little used to earth-works, infantry soldiers will soon attain a great rapidity of execution, for it will be to their interest to get quickly under cover. See *Clitz Intrenching-tool* and *Farrow Knife-trowel and Tent-peg.*

AT WORK.

RICOCHET.—In gunnery, the bounding of a shot along the ground, which takes place when a gun is fired low. Ricochet firing is found extremely useful both in its actual and moral effect in clearing the face of a ravelin, bastion, or other rather long line of fortification. If well directed the ricochet shot bounding along will dismount guns, scatter the gunners, and greatly intimidate the garrison. Vauban first introduced ricochet firing at the siege of Philipsburg in 1688. The defense against this sort of attack consists in earthen traverses along the threatened line, or in a bonnet at the point of parapet nearest the enemy. In the field, ricochet, where the shot or shell is made to bound forward at least ten times, produces most disastrous and demoralizing effects on masses of cavalry and infantry, whom it hews down in long lines. Spherical projectiles are more certain of ricochet than those of elongated form; with the latter the first graze usually causes them to *tumble*, after which their motion is both feeble and erratic. The pieces principally employed for ricochet firing are the 8-inch howitzer and the 8 and 10 inch siege mortars. The first two may be used when the angle of fall is less than ten degrees.

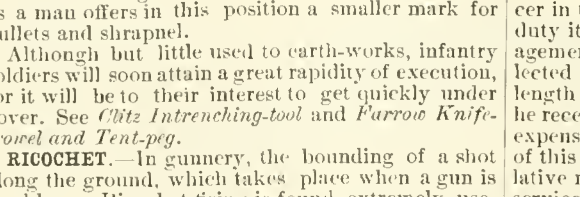
RIDEAU.—A rising ground or eminence, commanding a plain, sometimes almost parallel to the works of a place. It is a great disadvantage to have rideaus near a fortification, which terminate on the counterscarp, especially when the enemy fire from afar; they not only command the place, but facilitate the enemy's approaches.

RIDER.—In artillery carriages, a piece of wood, which has more height than breadth; the length being equal to that of the body of the axle-tree, upon which the side-pieces rest in a four-wheel carriage, such as the ammunition wagon, block-carriage, and sling-wagon.

RIDGE.—In fortification, the highest part of the glacis proceeding from the salient angle of the covered-way.

RIDING ESTABLISHMENT.—The School at Woolwich, established for the instruction of the men of the artillery in riding. It was formed on the organization of the horse artillery under the Duke of Richmond, when Master General. It continued, as a mixed department, with the Royal Artillery until the year 1809, when it was made into a separate and distinct establishment. It consists of 7 officers, 218 men, and 144 horses.

RIDING-MASTER.—In the British service, an officer in the cavalry, military train, and artillery, whose duty it is to instruct the officers and men in the management of their horses. He is most commonly selected from the ranks; his pay is 9s. a day, rising by length of service to 10s. 6d. and 12s.; besides which he receives £7 per troop per annum for riding-house expenses; and he is believed to make some profit out of this allowance. The Riding-master has the relative rank of Lieutenant, and, after an aggregate service of 30 years, including at least 15 years as Riding-master, he has the right to retire on 10s. a day, with the honorary rank of Captain. See *Rough Rider*.



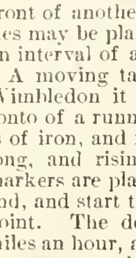
RIDING-SCHOOL.—To perfect the troopers in managing their horses and in using their arms, they are exercised in running at the *heads* and *rings*. This is done in the riding-school. For this exercise, four posts—two, 5 feet 6 inches high, and two, 2 feet 6 inches high called *head-posts*, are used; also, two posts called *ring-posts*, so made that the upper part, which supports a horizontal arm, may be raised and lowered; from the arm which extends over the center of the track is suspended an iron ring 4 in. in diameter, so arranged that it can be easily carried away with the saber. These posts are placed along the sides of the track, on the inside, in the following order: twenty yards from one end a tall head-post, two yards from the track; forty yards farther, a ring-post; twenty yards farther and twenty yards from the other end, one yard from the track, a short head-post. The posts are arranged on the other side of the track in a similar manner, the tall post being opposite the first short post, and the short post opposite the first tall post. On each of the four head-posts, and on the ground on each side, half-way between the tall head-post and the ring-post, one yard from the track, is placed a canvass or leather *head* stuffed with hay.

Each trooper, when he comes near the first tall head-post, brings down his pistol, fires at the head with blank cartridge, and continuing on the track, returns pistol draws saber, taking the position of guard, and, when on the opposite side of the school, takes the head on the tall post by a *right* or *front cut;* the head on the ground *against infantry, right cut;* the ring at *tierce point*, and the head on the short post, *against infantry, right point.* The heads may be also taken by executing *right point*, and in *quarte point*, at the head on the tall post; *against infantry right point* at the head on the ground; and against *infantry front point* at the head on the short post. After the troopers become skillful in the use of their sabers to the right, the exercises may be repeated to the left; then with stirrups crossed, and finally with the horses bare back. Hurdles and bars may also be placed on the track. See *Horsemanship.*

RIDING THE WOODEN HORSE. A punishment formerly resorted to, not only in the British Army, but in the armies of other nations. The horse is described as made of plank, roughly nailed together, forming a sharp ridge to represent the back of the horse; it was then supported by posts to serve as the legs of the animal, about 6 or 7 feet long, the whole being placed on a movable truck. When a soldier or soldiers had to undergo punishment, they were placed on this horse, with their hands tied behind their back, and frequently muskets were tied to their legs, to prevent the horse, as was humorously observed, from kicking off.

RIFLE ASSOCIATIONS. General instructions for the formation of rifle associations in different localities, together with a form of by-laws, will be found annexed to the Annual Report of the National Rifle Association for the years 1874 and 1875. Those Associations should confine their attention, in the main, to practice with military rifles, not only on account of the advantages to be obtained from training the National Guard and the public to the use of military weapons, but because the number of those using long-range rifles will of necessity be limited. It will be found advantageous for such association to employ markers by the month, and for the members using them to be charged a certain sum an hour. When not occupied in marking these men can be used in improving the range. Boys should never be allowed to serve as markers. Care should be exercised in the selection of score-keepers in matches. Unless reliable men are employed, the danger of incorrect scoring, through fraud or carelessness, will be very great, and accidents are apt to occur. Volunteer scorers may be relied on for a short match, but not for a meeting lasting several days. In all competitions, the prizes should be more numerous than valuable, and a number provided from which previous winners of prizes should be excluded. In this way young shots may be encouraged, and the danger of having all the prizes carried off by a few men avoided. In matches each man, upon entering, should receive a register ticket, 3×4 inches. The tickets for the different matches, as well as for different distances in the same match, are designated by different colors. Each one should be numbered and contain blanks for the name of the marksman, the target, and hour at which he is to shoot, and his score, having a coupon attached containing similar blanks. The assignments of the targets should be made by lot, after all the entries are received, and be at once posted upon the bulletin board (which should be placed in a central position), directing numbers so and so to shoot at such and such targets. Teams should be kept together. Competitors should then proceed to the targets to which they find they are assigned, and hand their tickets to the score-keepers, who should place them in a tin frame holding ten. The men should be called up in twos (except in long-range competitions, when they fire in succession), who fire alternately till they have fired their sighting and scoring shots. As each man's shot is signalled, the scorer should call his name and the value of the shot, as "Brown—four," at the same time entering it upon his ticket. When the score is completed, he should add it up, and announce the aggregate "Smith—ten," etc. and tear off the coupon (which is a duplicate of the ticket, and give it to the man), retaining the ticket, which he should hand to the Superintendent, who should take it into headquarters. Any alteration on the ticket should always be required to be initialed. Any man delaying the match should be passed, and any one acting discreditably disqualified from competing in other matches. The latter regulation should be rigidly enforced in all cases. Communications with the competitors, during a match, should be by notices posted upon the bulletin board. This they should be required to watch, and their neglect to do so never be accepted as an excuse. In order to secure an equality, target rifles, unless handicapped, should not be permitted in military matches. Interesting matches are frequently made by permitting them to be used at longer distances, as at 800 yards as against military rifles at 500 yards. Special military rifles, with small bores and heavy charges, should be discriminated against in a similar manner. The best way to sort out the tickets is to have a board provided with nails, each of which is numbered from the highest possible score downwards. By having each ticket punched with a hole the size of the nail, it can be placed upon the one bearing a number corresponding to the score entered on it, and all confusion in arranging them avoided. The entries for each match should be kept in a separate book. If not, delay and inconvenience will be inevitable, as they have of necessity constantly to be referred to. The general arrangements for a match should be placed in the hands of the Executive Committee or Officer, who should attend to all details. They should carefully watch both markers and scorers. The knowledge that this is being done will do much to prevent carelessness in the marking. Protests and complaints not having a substantial foundation should be discouraged. All protests should be heard and decided upon the spot, whenever practicable. If delayed, it is difficult to ascertain the facts in regard to them. While every endeavor should be made to insure fairness in making a decision, when once made it should be firmly adhered to. The greatest benefit in developing good shots and building up an interest in rifle practice will be found to result from badges offered for competition monthly, not to become the property of the winner until won a certain number of times. The longer the struggle for these, badges continues the more their possession is valued The securing of a proper range is the main obstacle with which a new rifle association has to contend. The land should be purchased, if practicable; if not, it may be leased. Its location is most important. If not easy of access, it will not be successful. Beyond the erection of the necessary butts and targets, no buildings, with the exception of a small storehouse, are necessary. If, however, a building should be provided for the residence of the range-keeper and the storing of the rifles, etc., of the members, it will form a great convenience. The question of laying out the range and the targets should be fully understood. If iron targets are used, twelve will be sufficient for an ordinary range. This will allow three third-class targets and two second-class, to be used together, and permit of their being converted into two first-class targets, for long-range matches. These can be put up in different manner upon different days, so as to permit the members to practice at any distance by coming at a certain time. Whether the targets should be placed in pairs or upon a line depends upon the ground, and also how it is to be used. If the range is to be used for military class-firing, the targets should be so placed as to allow of their being used simultaneously at the same distances, without one firing party being in front of another. For other practice the firing parties may be placed in front of one another, provided an interval of at least 150 feet is preserved.

A moving target adds interest to the range. At Wimbledon it consists of a running deer; at Toronto of a running man. In both cases the target is of iron, and runs upon a railway about 60 feet long, and rising at each end about 5 feet. The markers are placed behind a shot-proof butt at each end, and start the figure at a signal from the firing-point. The descent gives it a speed of about 5 miles an hour, and it must be hit while moving. To shoot at a mark of this description with success requires the best qualities of a rifleman, and much experience. See *National Rifle Association.*



RIFLE-CANISTER.—These are very similar in general appearance to those used in smooth-bore cannon. As shown in the drawing, the case is of sheet-iron or tin, with fringed ends which are turned over and soldered or riveted to iron or zinc discs. The balls are of iron or zinc packed in rozin or coal-dust, sometimes in discs of wood. They are fitted with solder studs or rings of lead on the outside to take the rifling, or with an expanding cup. See *Canister-shot, Case-shot*, and *Projectiles.*

RIFLE-CANNON.—The general adoption of rifled small-arms necessitated the introduction of rifled cannon. It is plain that the principle has application to all sizes of projectiles, and would therefore be used for the heaviest ordnance as well as for the smallest. Contemporaneous attempts so to adapt it have not been wanting, but they are in many cases isolated in point of time and connection. The first persevering and rational efforts to apply the rifle principle to cannon were initiated some twenty years since; and the names of Wahrendorff, Cavalli, Lancaster, and others, are identified with the first efforts to overcome the difficulties—of no ordinary character—that beset the question. The yielding nature of lead renders the application of the rifle principle of easy accomplishment in the case of small-arms; but such is not the case with rifle-cannon, where the projectiles are made of iron. The application of this principle to cannon also required an increase of strength in the piece. The greater the weight and the length of a projectile, the greater is the opposition from inertia and friction which it offers in the bore to the expansion of the ignited charge, and this opposition is considerably augmented if the projectile is constrained to travel through the bore in a spiral course. Hence it is not difficult to comprehend why a rifled gun must be of a stronger, tougher, and more elastic material than is necessary for a smooth-bore gun in which the spherical projectile yields promptly to the first impulse of the powder-gas to which it presents half its surface, and bounds freely forward through the bore, almost unimpeded by friction; while the strain on the gun is immensely relieved by the comparatively great windage. Again, as the explosive power of a cartridge, and the inertia and friction of a projectile, increase as the cubes of their respective weights, while the surface of the chamber and the base of the projectile against which the powder-gas acts increases only as the squares, it follows that the larger the charge and the heavier the projectile, the harder and stronger must be the inner barrel.

The progress of the art of war depends essentially upon that of the sciences and manufactures, for the manner of fighting depends upon the character of the arms which we possess. These will be more effective, as their mode of construction is more perfect, and as the means employed in their manufacture produce greater strength and precision. This is particularly the case with reference to cannon, in evidence of which we have only to call to mind the great revolution in warfare which has taken place since their introduction, and which is continually taking place as the means of perfecting cannon increase. It is only in recent years that our knowledge of the metallurgy of iron, and also our ability to manufacture and handle, with any degree of skill, large masses of that metal, have rendered possible the fabrication of the enormous pieces of the present day. But now the great improvements which have been introduced in the manufacture of iron, in the fabrication of cannon, and in the facilities for the transportation and handling of heavy guns, render possible the success of cannon of mammoth proportions. In designing rifle-cannon, the practicability of manufacture and the durability of structure must be ascertained. The weight, caliber, length, system of rifling, weight and shape of projectile, etc., etc., must be all scientifically calculated so as to insure excellence in range, accuracy, and penetration; and then each and all of these constructional details are liable to alteration, should the thorough trial of a specimen gun render any amendment advisable. The first comprehensive experiment with rifled cannon appears, from all accounts, to have been made in Russia, about 1836, on the invention of a Belgian, but did not prove successful. In 1845, Cavalli, a Sardinian officer, experimented with a breech-loading cannon which was rifled with two grooves, for a plain iron projectile, adapted to fit them. In the next year, Wahrendorff, of Sweden, fitted heavy projectiles to take the rifling by affixing lead to their elongated sides by means of grooves cut in them. And not long after this, Timmerhaus, of Belgium, invented an expanding *sabot*, which, being fitted to the base of the projectile, was forced into the rifle-grooves, and thus gave rotation. In these early experiments we find the germs of the leading systems of the present day. The solid projectile, fitted to enter the grooves of the gun; the compression of a soft covering on the projectile by the lands of the gun; and the expansion of the rear of the projectile by the pressure of the powder to fill the grooves of the gun.

The object of rifling a gun is to increase its accuracy of fire, and, by enabling elongated to be substituted for spherical projectiles, to obtain from it longer ranges. Rifling diminishes the deviations of ordinary projectiles, due to the following causes: 1st. Want of uniformity in figure and weight around the longitudinal axis of the projectile, passing through the center of gravity.

2d. Position of the center of gravity, before or behind the center of figure. 3d. Resistance of the air. I. By rotating the projectile around its longitudinal axis, the direction of these deviations is so rapidly shifted from side to side, that the projectile has no time to go far out of its course either way. II. The velocity of this rotation is such as to make the axis stable on leaving the bore, and to counteract the pressure of the air tending to turn the projectile over, or render it unsteady in flight. III. A given weight of projectile can be put into such a form as to oppose the least practicable cross-sectional area to the air, and thus to receive the least practicable retardation of velocity. Certain peculiar advantages follow from the rotation of the projectile, causing it to present the same part to the front throughout its flight. It becomes possible to make a much simpler percussion-fuse, because it is only necessary to provide for action in one direction in place of every possible direction. Shells required to act towards the front in any peculiar way have their bursting-charge and metal placed with a view to this object. So, again, the center of gravity may be brought to any desired part or the shell, and this is an important feature in the construction of projectiles. Rifling gives the power of altering the form of projectiles at will. The head may be made of any desired shape for penetration or flight. The projectile may be elongated so as to give a diminished surface for any resisting medium to act upon; thus in flight, velocity is kept up and the range extended, or on impact greater penetration is obtained. Weight for weight, the same effect may generally be produced with an elongated projectile by using a smaller charge of powder than with a spherical one. It follows from the flight of an elongated projectile meeting with less resistance from the air, and keeping up its velocity better, that at all but very short ranges the trajectory is flatter; hence the probability of hitting an ordinary object is greater. The power to vary the length of the elongated projectile enables all those for the same gun to be made of the same weight, and hence to require the same elevations with the same charge of powder. Or it is possible to make a projectile specially heavy if required. This obviously cannot be the case with spherical projectiles, which must be of the same size. The chief disadvantages are, bad ricochet, increased complication, and expense of manufacture, liability to injury arising from the necessity of soft studs, expanding rings, or a soft lead coat; increased strain on the gun, besides greater probability of jamming and injury to the bore, uncertainty of time-fuses.

RIFLED HOWITZERS. In consideration of the satisfactory results obtained with the 3.07-inch Moffatt breech-loading field-piece, and also of the evident advantages to be secured by the substitution of a breech-loading rifled howitzer for the 8-inch muzzle-loading smooth-bore howitzer, of at least equal power to the latter gun—for flank defense and siege purposes—a result believed to be attainable with this system by a 6-inch caliber, it was decided to construct such a howitzer on the Moffatt plan for experiments and tests, the slight changes in construction resulting either from some observed imperfection in the working of the mechanism in the field-piece or from the employment of a different nature of ammunition in the howitzer. A brief description here will therefore suffice. The howitzer consists of a steel body, to which is adapted the Moffatt breech-mechanism, a conical breech-plug closing the bottom of the bore through the agency of a strap or yoke, which locks into lugs on the sides of the breech for the support necessary to resist the shock of discharge, and which is attached to the trunnions as an axis of motion. The chamber is opened by tilting up the breech of the howitzer with a lever, whereby the block falls back upon the strap and uncovers the bore. In place of a leather strap to insure the opening of the breech, a heel is attached to the hinge of the breech-block, which, coming in contact with the strap as the breech is raised, throws down the block, and by the same movement turns with the hinge so as to clear the strap. The locking-bolt is bored through axially for the reception of a firing-pin, with which to explode the charge when primed metallic cartridges are employed. An ordinary vent is also provided by means of which the charge can be ignited by a friction-primer. The gun-body was made from a steel block furnished by Thomas Firth & Sons, of Sheffield, England. It was cast in an ingot, forged to dimensions, and bored by them to within one-quarter inch of its finished diameter. The steel contained about 0.64 of 1 per cent. of carbon. The breech-strap and block were made in Boston, and were of low steel, containing 0.44 of 1 per cent. of carbon.

The following are the principal dimensions of the gun:

Diameter of bore across lands.........	6 inches.
Diameter of bore through chamber...	6. 2 inches.
Diameter of breech-block cavity at seat of gas-check........................	6. 8 inches.
Diameter of breech-block cavity at outer edge................................	8. 5 inches.
Exterior diameter of piece at muzzle	12 inches.
Maximum diameter........................	16 inches.
Diameter of trunnions..................	5. 875 inches.
Diameter of rimbases.....................	8. 6 inches.
Distance between-rimbases.............	16 inches.
Diameter of loop (over trunnions) in breech-straps .... vertical	5. 875 inches.
Diameter of loop (over trunnions) in breech-straps .... horizontal.	6. 075 inches.
Length of gun body........................	78 inches.
Total length of gun.........................	88 inches.
Length of bore..............................	69. 625 inches.
Length of rifled portion of bore......	64. 625 inches.
Length of bevel joining lands to chamber..................................	1 inch.
Pitch of rifling, uniform, one turn in	30 feet.
Number of grooves and lands, each	17
Width of lands..........	0. 50 inch.
Width of grooves..........................	0. 6088 inch.
Depth of grooves...........................	0. 075 inch.
Length of trunnions......................	5. 875 inch.

The principal European Artilleries have produced rifled howitzers and mortars throwing shells of 80 kilos, with sufficient accuracy to render them formi-

dable to covered arches or blinds, such as exists at present.

On page 693 are some elements for a comparison of these different pieces.

It will be seen from this table that the French howitzer and the Austrian mortar of 8 po. permit of the attainment of the greatest ranges, but also that their weights are very considerable; the Austrian mortar, particularly, appears to have an exaggerated weight relatively to the effects attainable with it; it is possible by the system of banding to reduce this weight, say, at least 800 kilos., and to give the piece a greater length of bore, which would permit the use of larger charges and of a more progressive powder, by means of which ranges of 5,000 meters should be obtained.

In order to compare the accuracy of fire, we have calculated the ration of R and q of the mean deviations, longitudinal and lateral, to the ranges. The

*A 20°, R$=\frac{1}{34}$ to $\frac{1}{261}$; $q=\frac{1}{330}$ to $\frac{1}{1700}$.

above table indicates the limits between which these ratios vary for the different angles of fire, in proportion as the range increases.

It will be seen, from a study of the figures in this table, that the French howitzer has above all a notable inferiority in point of accuracy of range. The Prussian mortar has a sensible superiority over the Austrian mortar in point of accuracy of range; but the accuracy in direction of the Austrian mortar is very much greater than the Prussian. This latter fact would tend to prove that the Prussians, notwithstanding the modifications successfully introduced in the plan of their shell, have not yet succeeded in giving to it a stability upon its trajectory comparable to that of the Austrian shell. In respect to this, however, it should be observed that the inclination of the rifling in the Prussian mortar is 7°, while in the Austrian mortar the inclination is only 3°; it is generally admitted in France that the inclination of the rifling for large pieces should but little exceed 4°.

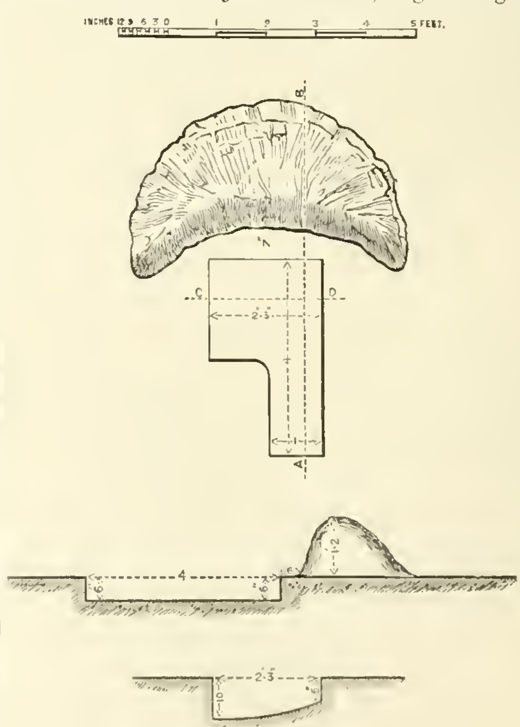
In respect to the effects of fire, the difference of weights of projectiles thrown by the pieces examined is too small to give rise to the supposition that there would be any appreciable difference in the effects of penetration for the same angles of fire and the same ranges; in point of the effects of explosion, the English shell, owing to its greater bursting charge, ought to be the most powerful.

From what precedes it is to be concluded that the French howitzer, which was remarkable enough at the time of its adoption, has not to-day a sufficiently accurate fire to warrant its introduction into siege-trains; for the armament of places, and the provisional armament of coast-batteries, it may possibly do good service, because, in these two cases, the effects of isolated shots may be very formidable, notwithstanding that, in order to obtain serious effects against the very solidly constructed shelters of a place, it is necessary to group the shots upon a small surface. See *Howitzer*, *Moffatt Gun*, and *Ordnance*.

RIFLED MUSKET.—A musket of which the bore is rifled. In 1855, Austria adopted for her infantry of the line, the *rifled musket*, with a barrel 37 inches long, and having four wide grooves equal to the land, making one turn in 83 inches. See *Rifle*.

RIFLEMEN.—Troops armed with rifles, and employed more or less as sharpshooters. The name has nearly lost all meaning, for the whole infantry are now riflemen; but as late as 1854, the riflemen were quite the exception, the army generally having the smooth-bore "Brown Bess." There were at that time only two English line regiments of Rifles, with two colonial regiments of infantry, and one Hottentot regiment of mounted infantry. The establishment of Rifle regiments was suggested to the British by the Americans and French, from the sharp-shooters of which nations the British armies suffered severely. During the French war, the 60th and 95th Regiments were armed as riflemen, taught light infantry drill, and clothed in dark green, to be as invisible as possible. The 95th became the Rifle brigade. Experiment has since shown that gray is less conspicuous than green as a uniform—hence it was at first adopted by many volunteer corps.

RIFLE-PIT.—A *hasty intrenchment*, large enough

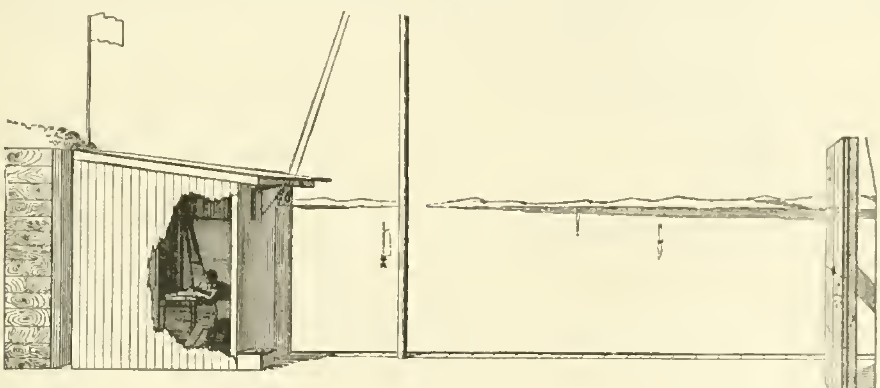


SHELTER-PIT FOR SKIRMISHERS.

to conceal a sharp-shooter or skirmisher, and by a small cover in front enable him to use his arms. A very slight earthen parapet is sufficient to protect men, in a great measure, from the effects of shrapnel and rifle bullets, besides screening them from view, which, in itself, is of great advantage. From recent experiments it has been ascertained that the penetration of rifle balls into newly excavated earth is about ten inches at 200 yards, and only twenty inches at a range of 10 yards. The diagram shows the dimensions of the pit and parapet that have proved in practice to be very desirable. After a little practice, each skirmisher will soon ascertain the exact form of pit that suits him. The depth need not be uniform, but should be about ten inches where the man's body will be, and about five or six inches in the other parts. In most instances the men will only have to improve natural cover. If time admits, the parapet may be made thicker and the trench deeper, and widened so as to give an abundance of room. The natural cover should always be taken advantage of when possible. See *Hasty Intrenchments* and *Shelter-trenches*.

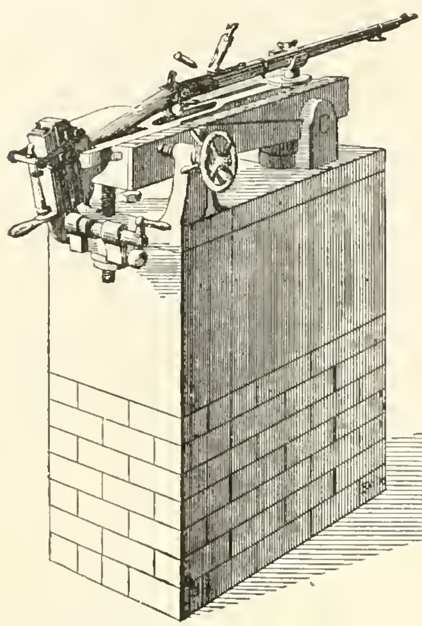
RIFLE PRACTICE.—While initial velocities and pressures are determined separately or conjointly by their special apparatus, nearly all other qualities of the ammunition are ascertained, directly or incidentally, from rifle practice at various ranges, with suitable rests and other appliances. The target ground and fixtures at the Frankford Arsenal possessing some peculiar features, a very brief description of their arrangement and use is appended.

The structures pertaining to the ground consist of one *firing house*, two *target houses* with their screens, and two cast-iron *targets* at distances of three hundred and five hundred yards from the firing house, and of dimensions 12′×12′ and 15′×15′ respectively. The firing house is provided with an improved *fixed rest* on brick pier, together with arrangements for firing from the shoulder and rest, recoil apparatus, etc. It is also supplied with armorers' bench and tools, desk, scales, clinometer, levels, telescope, etc., together with the usual instruments for determining the state of the atmosphere. The target houses with their screens are situated one in front of each target, at a distance from it of fifty feet and to the left of the plane of fire. They face their respective targets, and each has arrangements for a camera lens, which, by means of a mirror, throws an image of the target, reduced to one-twelfth, on the surface of the table, at which sits the target recorder. Lithographed target diagrams to scale, one of which, duly dated and numbered, is placed upon the table at the commencement of each series of twenty shots, enable the recorder to mark the position of each shot as it strikes, thus avoiding the delay and some degree of risk incident to the usual method of recording. These diagrams, moreover, duly signed and numbered, are filed as vouchers to their respective pages in the "Record Book of Experiments." A telegraph key and sounder placed at the side of the recorder place him in direct communication with the firing party. The targets are of the usual construction, the angle of depression of their centers being only seven feet for the five hundred yards, and twenty-one feet for the three hundred yard one, as viewed from the firing house. These arrangements have been in operation for some years, and the work of recording accomplished by their means is done accurately, safely, and with a rapidity limited only by outside considerations. The desiderata of a fixed rest are strength, solidity, capacity of adaptation to various models of small-arms, a facility in securing the arm firmly in position, without any undue strain upon any of its parts, an easy but steady recoil, and capacity for nice pointing and adjustment. The principal fixed rest at this Arsenal is a good attempt to embody these qualifications in the following manner: The support consists of a heavy freestone block resting upon a brick pier, and carrying the cast-iron bed plate of the rest as a cap covering its top and a portion of its sides. In this bed-plate is sunk the pintle which carries the trunnions upon which the *chassis as well as the top-carriage* move in a vertical plane. The chassis controls the recoiling top-carriage by accurately planed and scraped guides, whose surfaces have bearings upon its sides for a length of thirty-two inches; and, owing to the center of vertical motion being beneath, the recoil is always parallel to the axis of the piece at every elevation. The top-carriage contains the arrangements for directly supporting the piece, and these are so constructed as to dispense with direct screw pressure upon any portion



of it. The points of support, in addition to the butt-stop, are as usual two, one near the butt and the other at about thirty inches in front; at neither point, however, is any side screw clamp allowed to act directly upon the arm. At the rear the stock rests in a V while an inverted Λ descends upon its upper surface and secures it laterally as well as vertically by the pressure of a spring whose tension can be increased at pleasure. Meanwhile the thrust-block in rear of the butt plate—a solid brass segment moving vertically in a corresponding segmental bed—adjusts itself to the points of contact with the butt plate. The front support is also a V into which the barrel is pressed by the polished surface of a flat leaf spring above, which latter can, like the spring at the rear support, have its tension increased up to the limits of the strength of the rest.

The advantages of this arrangement are perfectly *symmetrical* character of the support afforded to the piece; the coincidence of the plane of sight with the plane of fire secured, without adjustment, as a mere consequence of the style of support; the absence of all distortion or buckling of the piece by local strains, or restraint of its longitudinal reaction, and the fact that the arm can be readily secured or released from the rest, since, when the tension of the restraining springs is once adjusted, the piece can be removed or returned and securely clamped, almost with a mere click, and will be found sighted upon precisely the point last aimed at. All bearing surfaces, journals, elevating and traversing screws, etc., about the machine are massive, far beyond the requirements of mere strength, and sufficiently highly finished to give great smoothness and steadiness to all adjustments; as is evidenced by the fact that alterations to the tenth of a minute can be made and read with ease and certainty in any direction by two independent means, the vernier and the micrometer screws. In adjusting



the lines for the sights of small arms, both means are always used, and a discrepancy of more than 0'.1 between them would demand a repetition of the trial. With the fixed rest and targets as described, all questions regarding accuracy and uniformity of flight of projectiles, can be determined by the usual method of co-ordinates and centers of impact. The subject of investigation may be the performance of a known arm with a new ammunition, or a known ammunition with a modified arm. A new arm with its own special ammunition may, too, be under trial as a whole system, but, in any case, the average trajectory, and the degree of closeness and uniformity with which the practice adheres to that average trajectory, can be determined.

Rifle practice constitutes a branch of military instruction peculiarly fitted for the National Guard, and in which they will always excel. The "*position*" and "*aiming drill*" which constitute the foundation of the system, can be acquired in their armories, and even at their homes, while the high state of intelligence existing among them enables them to soon apply upon the range the instruction they have received. Rifle practice is to a great extent a matter of judgment, particularly at the longer ranges, and the more intelligent men are, the better they will shoot. Thus both in England and Canada the volunteers have been found to shoot better than the regulars. In addition to the vast increase in military efficiency resulting from becoming good shots, it has been found that rifle practice has proved to be one of the most agreeable portions of military instruction. The honorable reputation of being a "crack shot," and the knowledge that the desired skill is solely dependent upon individual exertions, has done much to interest the National Guard in the subject, and has induced many to join its ranks.

While every inducement should be made to attract and develop good individual shots, so as to constitute a good regimental "team," and for this purpose individual emulation should be encouraged in every way, yet regimental commanders must bear in mind that the true object to be attained is to secure the *general efficiency* of the rank and file as riflemen. More credit should attach to an organization making high average shooting than to one having a champion team, and all influences possible should be exercised in that direction. Nor will this course interfere with the selection of a good team. Nothing has been more clearly demonstrated at Creedmoor than that shooting is a matter of education, and it will be found that a thorough course of instruction will not only make the regiment efficient as a whole, but invariably develop a number of "crack" shots from among those who supposed themselves to be without the qualifications requisite for a "Marksman," and the more "Marksmen" the better the chances for a strong "team."

Candle practice is specially to be recommended for the National Guard. It gives almost the same results as armory target practice, and, as it may be performed simultaneously by an entire company, the saving of time is a great desideratum. Calculating on a basis of one shot a minute, 5 shots by 30 men at a single target require two hours and a half, while at candles they could all be fired in ten minutes. In this practice, a gas pipe with small jets is preferable to candles. Some regiments place a miniature tin target in front of the lights aimed at, having the bull's-eye cut out, the flame appearing just behind its center, so that a "bull's-eye" extinguishes it. When candles are used, it is an advantage to insert them in a tube with a spiral spring, so as to always keep the flame in one position, as in a carriage lamp. Some regiments have a bench like a carpenter's horse to place the candles on, so as to admit of their being moved to different parts of the room to suit the light. In this practice the primer used on the regular cartridge does not contain sufficient fulminate to extinguish the flame at a distance of three feet with certainty. In order to meet this defect, special primers can and should be always obtained containing an extra quantity of fulminate Better effects are also found to result from enlarging the aperture into the cartridge. The shells made by the Union Metallic Cartridge Company are unsuited to this practice. The cone-shaped anvil used in them blows out, when used without powder, at the second discharge, spoiling the shell, and thus making the practice expensive. Neither the Remington shell nor that made by the United States Cartridge Company is liable to this objection, and in both, the opening for the fulminate can be enlarged. As a piece of the cap is frequently forced through the barrel by the explosion of the primer, care must be taken in this practice never to aim in any direction where injury could be caused by it. The main drill of the National Guard (in the cities at least) must take place at their armories, and practice at the range be but occasional, "not to learn, but to test what has been learned:" Officers should, therefore, devote all the available time to the sighting, position, and aiming drill, which form the foundation for the whole system. As these are apt to prove monotonous, candle practice should be frequently indulged in, this portion of the drill being always interesting to the men. It is, therefore, recommended that the men should be practiced in firing at candles at the conclusion of each aiming drill. With men of the intelligence of those composing the National Guard, the improvement that will be found to result from a little careful practice of this description will be found surprising; and a company that at the beginning could not extinguish more than two or three candles at a volley, in two or three months will put out nine out of ten; and it is frequently observed that those who have had the least previous practice as sportsmen will prove the best shots. This (candle) practice will also prove valuable as a substitute for ball practice in judging the efficiency of the men in those cases where the latter cannot be had; and none should be practiced in target firing who have not averaged extinguishing five out of ten candles at a previous drill.

There is no portion of rifle practice more important than understanding how to estimate distance, but the question of how such a knowledge shall be acquired and imparted, forms a very difficult problem for an officer of the National Guard. In the country, facilities for the purpose can be easily obtained; but in the cities, officers, in addition to requiring their men, when upon the range and not firing, to practice in this exercise must urge them to accustom themselves to judge distances the best way they can, impressing upon them that, no matter how accurate marksmen they may be at a fixed target, they are worthless if they cannot calculate the distance of an enemy. In estimating distances, the following suggestions may be valuable: At 50 yards the observer can name any one of his comrades readily, as the age, complexion, height, and figure can be determined at that distance. At 100 yards he should notice those parts which are clearly visible, and his attention drawn to the indistinctness of other portions. The lineaments of the face are no longer visible, the buttons down the front of the coat appears one continuous line. The movements of the men individually, and the form and color of the uniform, are, however, perfectly visible. At 225 yards, the colors of the uniform, cartridge-boxes, etc., are still visible; but the face now resembles a light-colored ball under the cap. At about 250 yards he can distinguish only the different parts of the body and the rifle. At about 450 yards, the direction of the line of march and the movement of the rifles can be detected, and in cavalry the helmet, cuirass, bright colors of the uniform, etc. At 600 yards the head looks like a small round ball, and the shoulders sloped off. At 700 or 800 yards the body has a dwindled appearance, but the legs of men in motion or extended arms are still distinguishable. At 900 and 1000 yards the separate files and direction of march are still apparent. At 1200 yards infantry can be distinguished from cavalry. At 2000 yards a man, or even a horse, looks like a mere speck or dot.

Individual practice should be encouraged by all officers and particularly in the case of the National Guard, to whom every inducement should be made to visit any available range for private practice. To prevent accidents and ensure the enforcement of the prescribed rules, every man should be required to enter his name on arriving at the range: those men who are the first to arrive should have the right to determine the distance at which they wish to fire. As the men arrive, they will form themselves into squads, each squad electing a Captain, who wil keep the score and enforce the rules of the range. All arriving subsequently are to obey his orders. If no markers or look-out men are employed, each Captain must make a detail from his squad for such purposes, and see that those detailed are properly relieved. The firing is to be conducted according to the principles above laid down, and every shot fired in rear of the firing point, whether accidentally or otherwise, unless fired into the pit provided for the purpose, shall be entered as a miss. The men last at the ground must see that the danger flag is hauled down, and the appurtenances belonging to the range replaced where they belong, or returned to the keeper. Practice upon the range is only intended to find out and apply what has been learned at drill, and acquire a practical knowledge of elevations and the allowances required for wind and weather. In all cases, therefore, extreme deliberation should be used. No advantage is gained by firing more than ten shots at a distance; and the habit beginners have of expending all the ammunition they can procure as fast as possible, is a positive detriment. Each shot should be fired with a definite purpose, and its results noted and remembered. The Captain of each squad, or of a team, should give special attention to this subject, as not only will the expense of the practice be greatly reduced, but the quality of the shooting greatly improved. There is nothing which prevents wild and hap-hazard shooting and develops those qualities of coolness, forethought, and judgment, which make a reliable shot, than to be kept on a short allowance of ammunition. See *Marksmanship*.

RIFLE RANGE. The first point to consider in regard to a range is its safety, and too much pains cannot be taken in the selection of the ground in order to protect the public from danger, as well as to prevent unnecessary expense in the erecting of butts, etc. While it is impossible to lay down precise rules for every feature of a country, the following suggestions will be found sufficient under ordinary circumstances: No ground is to be selected which does not afford a range of at least 300 yards, and it is most important that the ground behind the targets should be thoroughly commanded from certain points sufficiently clear of the line of fire to insure safety to the look-out men who are to be placed there in order that the fire may be easily stopped when necessary; hence a range down hill is generally to be preferred, as being more easily commanded to one uphill. The targets upon a range should, where the ground permits, be established by pairs, with an interval not less than ten yards between each target, and with a margin of at least 40 yards at the sides; the minimum breadth of ground for a pair of targets should be 90 yards, and all the targets should be on the same line. When, however, the number to be exercised in rifle practice is large, and the breadth of ground limited, a number of targets may be established, with an interval of ten yards between each, to be used as if for a pair, a margin being left at the sides of the outer targets of at least 40 yards. In these cases the number of each target should be conspicuously placed upon the butt in rear of it so as to be plainly seen from the firing-point, and the firing should be stopped at all the targets whenever the danger signal is shown at any target within 40 yards. The breadth of ground in rear of the target at each side of the outer ranges, should gradually increase from 40 to 80 yards, in those cases when the ranges are parallel; but when they converge towards the targets, the breadth may or may not be required, according to the degree to which the ranges are made to converge. The distances at the targets must never be less than ten yards between ranges in pairs, and eighty yards between pairs of ranges, whether they are laid out parallel to each other or converge towards the targets. If no butts are erected, and the ground is level, the space behind the targets should be about 1,500 yards. A less distance may, however, answer, if butts are erected, or if a steep hill rises in rear of the targets. Before steps are taken to procure grounds for ranges, it is essential to secure the right to fire over the land behind the targets to the extent required, should it not be desirable to purchase it. Generally this distance cannot be obtained, and a butt must be erected in rear of the targets, to arrest stray shots. The height of this must differ according to the nature of the background. If the range be on a plain, the regulation size of the butts is from 35 to 40 feet high, provided the distance behind the target is less than 1,500 yards. Under ordinary circum tances, however, the height of the butt need not be more than 20 feet, and when firing toward water a butt of 12 feet in height will be sufficient. On some ground there are found natural butts for the targets to rest against. To be of use in stopping stray bullets and thereby insure the safety of the public, the hill should incline 45 degrees, at least; if a smaller angle than this, it would, instead of acting as a stop, incur the chance of a ricochet, and therefore be unsafe. A few furrows from a plough will frequently lessen the chances of ricochets. The length of the butt for a pair of targets should not be less than 45 feet, measured along the top. They are far inferior to natural obstacles, and are expensive to erect and keep in repair. The number of each target should be placed on the butt directly over it in large figures, so as to be conspicuous from the firing-points. Where there are a number of targets these numbers should be painted red and black alternately. At long ranges Roman figures, made by laying rails on the butt, are more easily discerned than numerals. In crowded localities, where the range is short, and the danger of injury to the public great, a series of shields or screens may be thrown across the practice ground at different distances containing apertures of such a height and width as to permit the passage of all properly directed bullets, and to arrest random shots. These are sometimes high arches of cast-iron, and sometimes upright barriers of stout plank. Two or three sheds with plank roofs, made to slope *towards* the target, form a cheap and convenient screen, provided the ground between them is furrowed so as to prevent the ricocheting of the bullets which strike the sheds and glance downwards. In the longer ranges, these shields are objectionable, not only because the high trajectory of the bullet makes it difficult to place them properly, but because they confine the firing to a single distance, and render the appearance of the target as visible through the apertures so different from what it presents in the "open" as to deprive those using them of many of the advantages that should be derived from target practice, and particularly from acquiring a practical knowledge of distance. If care be taken that none be allowed to practice with ball who have not been through a course of "*position and aiming drill*," the danger of random firing will be reduced to a minimum, and the prescribed butt be found amply sufficient for all practical purposes. Every range is to be carefully and accurately measured, and the distances defined by a line of small pegs, at intervals of 50 yards, commencing at 100 yards from the target, and continuing to 900 yards, or to the extent of the ground, if under that distance. These pegs also serve as guides to prevent firing on a wrong target—a fruitful source of accidents. To avoid the sun, the targets must be placed at the northern end of the range; or if that is not practicable, at the eastern. In using the ranges the firing parties commence their practice close to the targets and gradually retire. Consequently, as there is not likely to be as much practice at the extremely long ranges as at the shorter ones, a piece of ground, of a triangular shape may be selected for an extensive range, the targets being placed at the broadest part, and the firing-points being reduced as the distance is increased. Several flag-staffs should be placed in such positions upon the range as to make the danger signal so conspicuous when hoisted upon them as to give notice to all passers-by that firing is going on. Smaller flag-staffs should also be provided at each lookout station. In addition to these flag-staffs, a suitable danger flag should also be provided for each firing-point, to be elevated in answer to the danger signal, as hereafter explained. Several flags should be erected above the top of the bank in rear of the targets during the practice, together with one amid way upon the range, to show the direction of the wind. A wooden socket should be set in the ground in front of each target, in which the marker should place the staff of his danger flag when obliged to leave his mantelet for any cause. This should be set at an angle so as to display the flag clearly.

The following is a list of the articles required for practice upon the range by a single regiment:

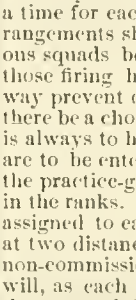
Iron targets, 6 feet by 2 feet, complete............ 8
Flags (when used), Red, 6 feet square (or flag-staff)............ 1
Flags (when used), Red, 3 feet by 4 feet (danger) 4
" " Red and white, $2\frac{1}{2}$ feet square 4
" " Dark blue, $2\frac{1}{2}$ feet square.... 4
" " White, $2\frac{1}{2}$ feet square......... 4
Poles—lance, 10 feet long............ 22
Discs (when used), Red flag, danger and for flag staff (as above............ 2
Discs (when used), Black and white disc, 18-inch diameter, 3d class, 9-inch............ 4
Discs (when used), Red disc, 2d class, 28-inch in diameter; 3d class, 8-inch............ 4
Discs (when used), White disc, 2d class, 18-inch in diameter; 3d class, 9 inch............ 4
Discs (when used), Black disc, 2d class, 18 inch in diameter, 3d class, 9 inch............ 4
Poles, $1\frac{1}{4}$-inch, for 2d class; for outer, 12 feet 6-inch; center, 10 feet 6-inch; bull's-eye, 8 feet 6-inch............ 22
Poles, 1-inch, for 3d class; for outer, 8 feet 6-inch; center, 7 feet 6-inch; bull's eye, 6 feet... 22
900 yards Gunter's chain or cord, labeled every 5 yards, and numbered from 1 to 900, divided into 18 equal parts............ 1
Pins of stout wire, 12 inches long............ 18
Stadometer complete, with 20 yards of chain, cross-staff and tripod for stand............ 1
Tripod rests............ 2
Sand-bags, bushel............ 2
Large brushes for coloring targets, 1 lb............ 4
Small brushes for coloring target (sash tools)... 4
Whiting, fine, without lumps (annually).... 1 cwt.
Lampblack............ 15 lbs.
Glue, to make size............ 42 lbs.

In practice at a range by military organizations it is indispensable that the regulations for practice should be carefully prepared and strictly enforced. Safety, accuracy in marking, and, above all, the avoidance of delays (a point to which particular attention must be paid) can alone be secured by having all officers thoroughly familiar with the prescribed regulations The regimental Inspector of Rifle Practice or (in default of such an officer) an officer specially detailed for the purpose, should be charged with the entire management of the targets, markers, and scorers, and should be held responsible for all delays or errors on the ground. He will also assist the squad commanders in instructing and correcting the practice of their men. Before the firing commences, the markers and look-out men should be posted, and a large red flag hoisted upon the flag-staff in the range. These men, when not attached to the range, should be detailed beforehand, and marched to their positions as soon as their party reaches the ground. If a guard is required, it should be posted in the same manner. Proper reliefs should also be provided from men who have completed their practice in time to allow those on duty to shoot. Printed orders should be furnished to both officers, markers, and look-out men, at the time they are detailed, in the following form, and care be taken that such orders are understood.

Orders for the Senior Officer at each firing-point—Not to allow any practice to take place until the large red flag is hoisted on the main signal staff, and the sentries or look-out men are posted, to prevent all persons whatever from attempting to cross the range and give notice of danger. To inspect the markers and register-keepers before they take their places, and see that they are provided with all requisites, and properly instructed. To see that the markers and sentries are properly instructed in time, and that they are afforded an opportunity of firing. To see that the men do not load except at the firing point, and then that they keep at a "*ready*" until they have fired. In all important competitions, to see that each man's trigger is tested at least once during the practice. To see that the squads firing are properly equalized. Not to allow a man to fire until the shot of the previous man (should it strike the target) has been signaled. To order the "*Cease firing*" to be sounded, and the "*danger*" flag to be hoisted at the firing-point, immediately the red flag is raised from the marker's butt, or any person or animal appearing in front of the firing party, and *on no account* to allow any firing to proceed so long as the danger flag is up at the marker's butt. When this flag is lowered, to order the "*Commence firing*" to be sounded, and the "*danger*" flag at the firing-point to be dropped. On the ranges situated in pairs, to see that the parties fire by classes at the same distances, and not one class in front of another. When the "*Cease firing*" sounds to see that the firing at all the targets which are within one hundred feet of the target at which the "*danger*" flag is displayed is discontinued until such "*danger*" flag is lowered, and the "*Commence firing*" is again sounded. To be most particular in cautioning his men that they will be almost certain to injure the marker if they should fire on a wrong target and the trap be open, and whenever a man fires on a target different from that to which he is assigned, to debar him from further practice and report him to the commanding officer. To see that all persons who desire to watch the practice stand to the rear and clear of the party, and on no account to allow any noise or talking among the men, whose attention should be fixed on the practice. To be most particular that the men keep their places in the ranks while the practice is proceeding, to allow no irregularity, and to be alert to prevent accidents. To see that the proper discs are used by the markers. To use his best endeavors to prevent delays, and forward the progress of the firing.

Orders for the Markers.—To see, on taking their places, that they are properly supplied with flags or discs, brushes, paint, etc., and when ready to wave their red flag and withdraw it. To see that the following flags or discs are raised to signal the position of the shots which strike the target, and the "*ricochet* and *danger*," or "*Cease fire.*" 1. Black disc or white flag—outer. 2. White disc with black cross, or similar flag—inner. 3. Red disc or dark blue flag—center. 4. White disc, or red and white flag—bull's-eye. 5. Red flag waved horizontally twice to and fro in front of the target—ricochet. 6. Red flag—danger, and cease firing. To see that the signal flags are invariably waved when the wind blows directly up or down the range; and (where flags only are used) whenever a shot strikes the target to the right of the center, that the flag denoting its value is inclined to the right, and *vice versa*; also, when a shot strikes the target high, that the flag is high as possible, and upright; and when low, that it is raised only high enough to be easily visible above the butt; and when using the disc that it is placed immediately in front of the hit on the target. To see that the "*danger*" flag is hoisted whenever it is necessary to cease firing, to re-color the target, or for any other purpose; and to allow no one *on any account whatever*, to leave the marker's butt until the "*Cease fire*" has been sounded, or the "*danger*" flag has been raised at the firing-points *in answer* to the "*danger*" signal; also to see that the red flag is kept up (and waved so as to attract attention) so long as the markers are out of the butt, or any person is in the line of range. To see that the "*danger*" flag is lowered directly the range is clear. To allow no person to enter the marker's butt, except those on duty, without an order from the senior officer on the range, nor to allow any one to enter or leave the butt except by the regular path. To check all talking or any disturbance in the marker's butt. To see that the "*danger*" flag is hoisted and shaken about immediately; any of the look-out men either hoists his flag or gives notice that persons or boats are within the line of fire, and that it is kept up until the range is clear, and the look-out man lowers his flag. When the firing is at long range, to see that all persons in the marker's butt stand as close as possible to the slope most distant from the target, to avoid the chance of being struck by the bullets when falling. At the first signal to "*Cease firing*" to put out the "*danger*" flag, but not leave the butt. At the second signal, to place their flags, etc., in the proper place, fall in, and return to their command. To report all damage done, or repairs necessary for firing discs, flags, etc.

Orders for Look-out Sentry.—To look out carefully, and the instant any person or animal appears at . . . . , going towards . . . . or along the shore (when firing seaward), coming from . . . . ., to hoist the red flag and call out to the non-commissioned officers in the marker's butt, in a loud voice, "DANGER," and to keep his flag flying until the said person has passed to the . . . . (according to the direction in which he is proceeding). The same precaution to be observed in respect to boats passing close in-shore in the line of range. To give notice to all persons who may be about to pass the range that they are in danger while the firing is going on, and to signal them back. In the performance of his duty (more particularly during the execution of the platoon and skirmishing practices), to keep as low as possible to avoid the risk of being hit by a ricochet shot. To return to his command at the second signal of "*Cease firing*," as prescribed for the markers. The marker in the butts, if not a marker belonging to the range, should invariably be a non-commissioned officer *of a different company from that engaged in firing*, and is responsible that the correct signals are given to the several shots which strike the target. The firing parties should not consist of more than twenty men each, and only one squad should be allowed to practice at a time for each target available. Such detailed arrangements should be made as will insure the various squads being at the firing-points by the time those firing have finished their practice, and in this way prevent delay. When exercising by classes, if there be a choice of time for practice, the senior class is always to have the advantage. The men's names are to be entered in a blank return before going to the practice-ground, in the order in which they stand in the ranks. One blank will answer for the squad assigned to each target to record the performances at two distances. During the practice, an officer or non-commissioned officer is to keep the register, and will, as each shot is signaled, call out its value and the name of the firer. Any objection to the marking must be made before the second shot is fired. All entries during competitions or practice for final classification should be made *in ink* on the practice-ground; should any alteration become necessary, a fine line is to be drawn through the figure or letter, and the correction made adjoining it, the initials of the company officer keeping the register being immediately attached to it (*thus*, 3 : A. L.), to verify the circumstances. Inattention to this regulation, or an erasure (which is prohibited), should invalidate the register. This rule should be adhered to in all cases to prevent complaints. See *Rifle Practice.*



Boxer Shrapnel.

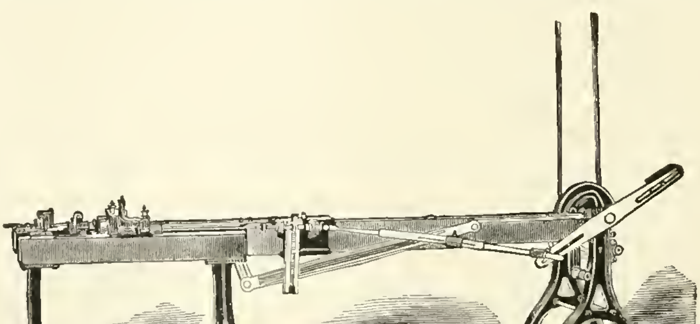
RIFLE SHRAPNEL.—The shrapnel for the 3-inch B. L., rifle, shown in the drawing, are filled in the same manner as the spherical shrapnel. The fuse-hole has a composition bouching by which it is distinguished from the shell of the same gun which has no bouching.

In the Boxer shrapnel for the rifled ordnance of the English service, the essential features of a shrapnel-shell are embodied. This shell has a cylindrical iron body, with a chamber at the bottom, and four longitudinal grooves inside to facilitate breaking up; it is cast without any head. A tin case for the bursting-charge fits into the chamber *on the shoulder* of which rests a wrought-iron disk. The shell is lined with paper, and filled with balls embedded in rosin. A wrought-iron tube passes down the middle of the shell and through a hole in the center of the iron disk, to lead the flame from the fuse to the bursting charge. A hard disk is placed over the top of the bullets. The wooden head is ogival in form, and made of elm covered with thin wrought-iron, which is riveted to the shell. This head contains a socket and bouching for the fuse. See *Case-shot*, *Projectiles*, and *Shrapnel*.

RIFLING.—This operation is performed by means of the rifling machine. The machine is horizontal, and the gun to be rifled is fixed in front of it and in line with the rifling bar, to which a stout head carrying the cutter is fixed. Only a single groove is cut at a time, and that as the cutter is coming down, the bore bringing the chips of metal before it. All the grooves in the gun are first cut out roughly in succession, and then finely. The distance between the grooves is regulated by a disk fixed to the breech of the gun, having its periphery equally divided by as many notches as there are to be grooves. The gun is fixed each time by a pawl, and when a new groove has to be cut is turned round to the next notch. The gun remains stationary while the head carrying the cutter works up and down the bore, so it is necessary to make the bar to which the head is attached turn round more or less at the same time that it advances and returns, otherwise we should merely have a straight groove cut along the bore, instead of the spiral we require to give rotation to the projectile. The gun-metal in which the cutter is fixed fits the bore accurately by means of burnishers. It is fastened to a stout hollow iron bar termed the rifling bar. This bar is fixed to a saddle capable of sliding backward and forward on an endless screw. Although the rifling bar is fixed to the saddle and moves with it, it can revolve independently of it; and toward the end farthest from the gun is fixed a pinion which gears into a rack sliding in the saddle at right angles to the bar itself. The outer end of this rack is fitted with two small rollers or friction wheels which run along a copying bar fixed to one side of the rifling machine. This copying bar is inclined at a certain angle to the side of the machine, and the greater this angle, the more the rack is pulled out by the friction rollers, and the greater the twist given to the rifling bar and so to the grooves in the gun. The angle can be altered if required; and we can also take away the straight copying bar and use a curved one, as is done when a gun is to be rifled with increasing twist. By thus changing the copying bars, or their position, we can use a single machine for any description of rifling. The cutting tool itself is of steel and works in and out of the head, being drawn in or forced out by means of a cam attached to one end of an iron rod passing through the hollow rifling bar.

The movement of the slide to which the outer end of the rod is attached (and consequently of the cutting tool) is regulated by another copying arrangement on the other side of the machine. This arrangement consists of two horizontal bars, one higher than the other, along which travels a weighted lever attached to a pinion which works the slide. When the rifling head is passing down the bore, this weighted lever travels along the upper bar; but when the machine is reversed, the lever is prevented by a small movable piece from returning on the same bar, so that the weight falls over on the lower one, and in doing so draws back the slide and spindle and forces the tool out. By varying the form of the upper surface of this lower bar the depth of the various parts of the groove can be regulated and altered as required.

The drawing shows a light machine used in armories for rifling gun-barrels with a uniform twist, from one turn in 20 inches to one in 36 inches. The cutter-rod carries from one to three cutters, as the rifling is four, five, or six to the circumference. An adjustable feed-stop gauges the depth of the rifling, and the racks, which are of steel, are double, to take up all back-lash, so that the cutters cannot ride on the lands. An oil-pump feeds automatically at each end of the stroke. The carriage is gibbed on the outside of the long slide, allowing free access to its working parts. Weight, 1,600 pounds. This machine rifles by the filing process, which is more correct than the planing process, and will turn out about one gun-barrel an hour. See *Grooves*, and *System of Rifling*.



RIGHT SHOULDER ARMS.—A position in the Manual of Arms, executed as follows: Being at a carry, the Instructor commands: 1. *Right shoulder*, 2. ARMS. Raise the piece vertically with the right hand; grasp it with the left at the lower band, and raise this hand till it is at the height of the chin; at the same time embrace the butt with the right hand, the toe between the first two fingers, the other fingers under the plate. (Two.) Raise the piece and place it on the right shoulder, the lock-plate up, the muzzle elevated and inclined to the left; so that, viewed from the front, the line of the stock from the toe to the guard, shall appear parallel to the row of buttons; slip the left hand down to the lock-plate. (THREE.) Drop the left hand by the side. 1. *Carry*, 2. ARMS. Carry the butt slightly to the left, and lower the piece with the right hand; grasp it with the left at the lower band, the hand at the height of the chin, the barrel to the rear, and vertical. (Two). Resume the carry with the right hand. (THREE). Drop the left hand by the side. Being at a support, to come to a right shoulder, the Instructor commands: 1. *Right shoulder*, 2. ARMS. Grasp the piece with the right hand at the small of the stock, and carry it in front of the center of the body, grasping it with the left hand at the lower band, the hand at the height of the chin. (Two). Carry and place the piece on the right shoulder, the lock-plate up, the right hand embracing the butt; slip the left hand to the lock-plate. (THREE). Drop the left hand by the side. See *Manual of Arms, Fig. 9.*

RIGID DYNAMICS.—That portion of theoretical dynamics which, based on the theory of the free and constrained motion of *points*, applies the principles thence deduced to a *system* of points rigidly connected, so as to bear throughout the whole continuance of their motion the same invariable position with relation to each other; in other words, as no body in nature can be considered as a point, but is truly a system of points, rigid dynamics has for its aim to apply the abstract theory of dynamics to the cases actually occurring in nature. For a long time problems of this sort were not resolved by any general and adequate method, but each class was worked out according to a method especially applicable to its particular circumstances. The great general principle discovered by the French geometer, commonly known as *D'Alembert's Principle*, which applies equally to all such problems, and removes the necessity for specially investigating each particular case, was an inestimable boon to mechanical science. It is thus stated in his *Traité de Dynamique*: In whatever manner a number of bodies change their motions, if we suppose that the motion which each body would have in the following moment, if it were perfectly free, is decomposed into two others, one of which is the motion which it *really* takes in consequence of their mutual actions, then the other component will be such, that if each body were impressed by a force which would produce it alone, the whole system would be in equilibrium. In this way every dynamical problem can be compelled to furnish an equation of equilibrium, and so be changed into a problem of *statics*; and thus the solution of a difficult and complex problem is effected by means of the resolution of a much easier one. D'Alembert applied his principle to various problems on the motions and actions of fluids, the precession of the equinoxes, etc.; and subsequently, in a modified form, the same general property was made the basis of a complete system of dynamics, by La Grange, in his *Mécanique Analytique*.

RIGODON.—Formerly a beat of drum while men who were shelled (a French punishment, the severest next to death) were paraded up and down the ranks previous to their being sent to their destination.

RIMBASE.—1. A short cylinder at the junction of a *trunnion* with the gun. The ends of the rimbases, or the *shoulders* of the trunnions, are planes perpendicular to the axis of the trunnions. Rimbases are for the purpose of strengthening the trunnions at their junction with the piece, and by forming shoulders, to prevent the piece from moving sideways in the trunnion-beds. 2. The shoulder on the stock of a musket against which the breech of the barrel rests.

RIMER.—An old name for a palisade in fortification.

RIM-FIRE CARTRIDGE.—A metallic cartridge in which the fulminate is placed in the *rim* surrounding the head. This rim being struck at any point, explodes the powder. Formerly much used in pistols and magazine-guns. These cartridges are not *reloaders*.

RIMPLER SYSTEM OF FORTIFICATION. In this system it is proposed to replace the curtain by a bastion that may flank the collateral works and be defended by them, to cover the garrison under casemates, and prepare an interior as well as exterior defense. This system contains excellent ideas. The besieger must carry two ravelins before reaching the counterscarp; then he must attack the fausse-braye, the bastion, its retrenchment, and furthermore drive the defenders from the casemates. The ditches and outworks are powerfully flanked, and the retrenchments of the bastions are excellent. This fortification is not practicable on account of the great space it occupies, of the large garrison it requires, and the immense outlay it would necessitate.

RINGED ARMOR. Armor of the Middle Ages, composed of flat rings sewed side by side on quilted linen or leather. See *Armor*.

RING GAGE.—A circular steel gage used in inspecting shot and shells. They are made of two sizes for each caliber, the larger being a trifle more and the smaller a trifle less in diameter than the true caliber of the projectile. All shot received must pass through the larger gage, but are rejected if they pass through the smaller.

RING WADS.—Wads consisting of a ring of rope-yarn, with two pieces of strong twine tied across it at right angles to each other. See *Grommet Wads*.

RIOT.—The legal name of an offense which consists in the assembling of three or more persons for an illegal purpose, or for the carrying out of a legal purpose in an illegal manner. Riots often commence in some supposed private wrong. Some degree of violence is incidental to a riot, and a degree of intimidation to the neighborhood. A riot cannot take place unless at least three persons act in concert. When a riot becomes formidable, it is usual for the authorities to take active measures to disperse it. Thus, in England, any Justice of the Peace may command the persons assembled to disperse peaceably by a form of words called Reading the Riot Act, which is as follows: "Our Sovereign Lady the Queen chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations, or to their lawful business, upon the pains contained in an Act of King George for preventing tumults and riotous assemblies. God save the Queen." If the rioters, after this formal proclamation, remain more than one hour afterward, they are guilty of felony, and may be seized and carried before a Justice. Sometimes it is difficult to distinguish between an illegal assembly and one which is legal, though noisy and tumultuous, and the opinion of the Justice of the Peace is not conclusive as to its illegality. Sometimes the Riot Act is read more than once during the disturbance, in which case the second or third reading does not supersede the first.

The great and overwhelming interest exhibited by the people of the United States in the late terrible railroad and labor riots in various parts of the country will cause us to extend the limits of this article. At a period of profound quiet and repose, the entire country was startled by the simultaneous seizure by lawless men of the four great trunk lines between the Atlantic Seabord and the Western States. In a single day the whole internal trade of the Union was suspended. Millions of dollars of capital were paralyzed, thousands of enterprises were confronted with ruin, and the whole of this great country was threatened with a crisis such as it had never experienced before. Instantly the whole military power of the general government and the great States immediately involved in the trouble was called upon to give protection to the endangered commerce of the land. The peaceful country resounded with the tramp of armed men hastening to assert the majesty of the law, on the one side; and with the rush of infuriated mobs, on the other side, gathering to resist the execution of the statutes of the land, and to overturn the very foundations of society. Almost without warning the American people were brought face to face with a conflict which for a while threatened their very existence as a nation. The excitement grew steadily, and for a time mob law was supreme. From all points came reports of lawless violence, of pillage, arson and murder. The worst elements of the Old World, that had been driven out of Europe, suddenly appeared, and proclaiming their terrible doctrines of destruction and rapine, endeavored to revive in this prosperous and peaceful land the horrors of the Parisian Commune. The danger was terrible and real, and for a moment the American people stood appalled, not knowing how far the revolt might extend, or what character it might assume. Never since the days of the Civil War had the nation been so profoundly moved, or so painfully apprehensive. On all sides the determination was made plain that the outbreak must be put down; the laws must resume their sway; and the future of this great country must not be perilled by mob violence. No man could tell how soon his home would be the mark of the rioter's torch, or his dear ones be at the mercy of an infuriated mob, and this thought brought hundreds of thousands to the support of the representatives of law and order. At the call of the civil authorities armed men came from all quarters, and it was soon apparent even to the most desperate rioters that the people were determined to preserve their institutions and property from violence at any cost. This formidable uprising of the people had the happiest effect, and the revolt succumbed before it. The disturbers of the peace slunk away, or were arrested, and the supremacy of the law re-established. The very originators of the strikes, horrified at the capture and distortion of their movement by the mob of lawless ruffians, in many instances, gave their assistance to the authorities in restoring order. The New York riots will be here noticed at length, as also the action of the general government. We are endebted to the *History of the Great Riots*, by Edward Winslow Martin, for the substance of this account.

Late on the evening of the 19th of July, 1877, a meeting of firemen and brakemen employed on the Erie Railroad was held at Hornellsville, New York, at the close of which a message was sent to the Superintendent of the Erie Railroad, giving him notice that the men of the Western, Susquehanna, and Buffalo divisions had resolved to quit work at one o'clock the next morning. The Superintendent proceeded at once to Hornellsville, where he found that the strikers had stopped work, and had taken measures to prevent all passenger and freight trains from leaving or passing through that place, east or west. Simultaneously, the firemen, brakemen, and switchmen at Salamanca, on the Western division, quit work, and when the Superintendent of that division, who had started out from Dunkirk for Hornellsville by a special train, arrived at Salamanca, his engine was cut loose from the train and put into the engine-house, and the strikers informed him that no engine or train would be permitted to pass Salamanca. At Andover station, on the Western division, one of the striking firemen took engine No. 22, and went out on the road without orders or permission from the Company, and on the time of trains, intending, he said, to go to Hornellsville. Up to four o'clock in the afternoon of the 20th the strikers had given the Company no reasons for their strike. At that hour their Committee handed Superintendent Wright a document containing the following demands, on behalf of the firemen, brakemen, switchmen and truckmen: That all of the men discharged for taking part in any meeting or going as a Committee to New York shall be reinstated. The brakemen to receive $2 a day, the switchmen $2, the head switchmen $2.25, truckmen in yard $1.50, truckmen on section $1.40, and pay no rentals on Company's grounds except as by agreement. The firemen to have same pay, or rates of pay, as they received prior to July 1st, 1877, and monthly passes to be continued as before, and passes to be issued to brakemen and switchmen. These demands were at once communicated to the Receiver at New York. By their action in seizing the Erie Railroad and stopping its business by force, the strikers not only violated the laws of the State of New York, but were guilty of resistance to the orders of the Supreme Court of the State, the Erie Railroad at this time being managed by a Receiver appointed by the Court. The officials of the Erie Railroad promptly made arrangements to have through passengers and baggage transported by the New York Central Railroad, and at the same time reported the seizure of their road to the Governor of New York, and asked the protection of the State. The Governor thereupon issued the following proclamation:

Whereas, the Receiver appointed by the Supreme Court of this State to take all care of the management of the Erie Railway and its properties has made known to me that a conspiracy has been formed to prevent his discharging his duty as such Receiver under the orders of the said Court: that the business of said road and the running of trains have been interrupted by violence which the civil authorities are unable to suppress; and, whereas, the honor and good faith of the State require that it should protect the said Court and its officers in the execution of its order: Now, therefore, I, Lucius Robinson, Governor of the State of New York, by virtue of the authority imposed upon me by the constitution and the laws, command all persons engaged in such unlawful acts to desist therefrom; and I call upon all good citizens and upon all the authorities, civil and military, to aid in suppressing the same and in preventing breaches of the peace. The law recognizes and protects the right of all men to refuse to work except upon terms satisfactory to themselves, but it does not permit them to prevent other men from working who desire to do so. Unless the State is to be given up to anarchy, and its Courts and laws are to be defied with impunity, its whole power must be exerted to suppress violence, maintain order and protect its citizens in their right to work, and the business of the country from lawless interruption within our borders. It is no longer a question of wages, but of the supremacy of the law, which protects alike the lives, the liberty, the property and the rights of all classes of citizens. To the maintenance of that supremacy the whole power of the State will be invoked if necessary.

Orders were despatched from Albany to the 23d (of Brooklyn) and the 74th (of Buffalo) Regiments of the National Guard of the State of New York to proceed at once to Hornellsville to sustain the authorities. Later on the 54th Regiment, from Rochester, was ordered to the same place. The companies of the 54th were the first to reach Hornellsville. They arrived at that place on the evening of the 21st, about four or five hundred strong. The crowd of railroad men surrounding the trains upon their arrival immediately began shaking hands with acquaintances and gave the soldiers a warm welcome, carrying pails of water along the train. By nine o'clock the Company's grounds surrounding the depot and railroad shops were in full possession of the military authorities. Two pieces of artillery were put in position at the rear of the Company's shops, and guards were stationed around the northern half of the yard, on which the shops and depot are located. As the Company did not attempt to start out a train, there was no demonstration made by the men engaged in the strike, and good order and quiet prevailed throughout the town. The Committee representing the men at the beginning of the strike served a notice on all the liquor dealers forbidding them to sell liquor to railroad men. The President of the village also issued a proclamation to the same effect. This, together with the fact that a large number of railroad men signed the Murphy temperance pledge in the preceding spring, is believed to account for the quiet existing under such exciting circumstances. No marked demonstration was made by the men until twenty minutes past nine on the morning of the 22d. The strikers had informed the railroad officials that they would not interfere with the mails, but that no passenger or freight trains should pass over the road. On the morning of the 22d, the railroad officials, nearly all of whom had gathered at Hornellsville, determined to attempt to run a passenger train westward from Hornellsville. An engine with a postal car attached was coupled to two passenger coaches. The latter were occupied by the Superintendent of the Western division, a squad of soldiers and two or three passengers. Soldiers were stationed on the platform of each car, two were also posted on the engineer's cab. The train then started from the yard guarded for some distance by soldiers stationed on both sides of the track. At Cass street crossing, a short distance beyond, a man attempted to board one of the cars, but he was driven back by the soldiers. From this post, for a distance of about fifty rods, to West street crossing, the track was covered with soft soap. The driving wheels began to slip, and the engineer threw sand on the track, but this was insufficient to give a headway of over five miles an hour. When the train reached West street crossing, about two hundred of the men were assembled. Here railroad torpedoes were thrown under the driving wheels of the engine, but still the train moved on. Men seemed to be reaching the ground from all quarters and by hundreds ran alongside the train. Suddenly it parted between the baggage car and passenger coach, and as the men saw the victory was theirs, with a shout, they took possession of two of the coaches as they came to a standstill and rendered the brakes useless. The soldiers and passengers were ordered out of the cars and obeyed, while the men, with cheers, shoved the cars back into the yard, and the soldiers marched back to the depot. The engine and postal car went on toward Dunkirk. Half an hour later the company started out train No. 7 on the Buffalo division, also guarded by soldiers. As the engine and tender switched off on the Buffalo track, the engine was boarded by the men. Some pushed the soldiers' guns aside and climbed up to the tender; others jumped on the pilot and went over the top of the engine to the cab, when they ordered the fireman, who was an extra man, to get off. After a short parley he was taken from the engine, and the Engineer ran the train back into the yard, the men cheering as before. The crowd of seven or eight hundred men suddenly melted away, and during the remainder of the day there was no disturbance, as the Railroad Company made no further efforts to run their trains. The strikers were very determined, and were prepared for a desperate resistance to the civil and military forces. They had a camp in the woods near Hornellsville, and were well supplied with small-arms and ammunition, besides having two pieces of cannon. They were well organized, and their movements were well directed.

The first detachment of the 23d regiment, nearly 400 strong, reached Hornellsville on the 23d. This brought the military force at that place to a strength of about 1,200 men. The rioters numbered about 2,000 men. About noon on the 23d, a Committee of strikers waited on the railway officials to state their grievances. The Chairman of the Committee made a general statement of the causes which forced the men to strike, and said they had received orders not to commit depredation. They proposed to stop the trains, but not to do violence. He then submitted the following, as the terms which he thought the men would accept and go to work. The wages demanded are just about the same as the Company now pay under the ten per cent. reduction. The brakemen are willing to go to work at the ten per cent. reduction, provided the train men are paid for any overtime that they may make in being ordered out and being abandoned; also any overtime which they may make while being delayed upon the road, to be paid for at the same rate per day; overrate per day to be $1.80. The trackmen in the Hornellsville yard to receive $1.50 per day, and be paid for overtime at the same rate; the trackmen on sections outside of the yard to receive $1.40 per day, and to pay no rentals for their houses, except as they may agree with the Company. The switchmen to accept the ten per cent. reduction, on consideration that ten hours shall constitute a day's work, and all overtime to be paid for at the same rate per hour—$1.80 and $2.05 per day. The firemen to accept the ten per cent. reduction on consideration that their several pay shall be $1.60, $1.92, $2.03 and $2.14, and that all firemen shall be promoted according to age. Coal-passers to be paid the same as before. The Superintendent said he was glad to see them make an effort for peace, but assured them that the Receiver would not go to work upon other terms than he had announced; that the Company could not accede to the demands presented. The Committee then asked if the Committeemen, who had been discharged, would be restored to their former places if the men went to work. The Assistant Receiver replied that they would not. The Committee then retired, being escorted through the lines. Later in the day the following notice was received and promptly published:

The Receiver fully appreciates the fidelity of his officers, agents, and men who have remained true to their duty in the present emergency, and such fidelity will not fail to be properly recognized. No compromise will be made with, and no concession will be made to, those misguided men who are, have been, or may be false to their trust, and violaters of the law. And all persons are warned that no one has the right to represent or speak for the Receiver, except his regular officers. Any other person pretending to do so is an impostor. The Receiver is induced to believe that the large majority of the employés now neglecting their duty are acting under the coercion and terror of lawless and desperate men, most of whom are strangers, and have never been in his service. All well-disposed employés will be protected.

From Hornellsville the disturbance spread rapidly along the line of the Erie Railway. Port Jervis, Corning, Painted Post, Buffalo, and other points were affected, and the Erie brakemen and firemen at all these places joined the strike and stopped the running of the trains. At Buffalo the strikers were exceedingly violent. Early in the afternoon of the 23d, an assault was made by nearly two thousand rioters on about two hundred soldiers who were guarding the Lake Shore round house. The military were obliged to leave the building, which was now barricaded by the mob, who had placed cars in position as defence against an attack. The Colonel of the 65th Regiment, with about thirty men and three officers, proceeded to the round house to retake it from the mob. They were met with yells of derision from the crowd, and, under a shower of stones, were obliged to retreat at the double-quick, and force their way through the yelling crowd at the point of the bayonet, some of the soldiers being badly cut on the hands with knives, and also clubbed. Four of the soldiers lost their muskets, which, however, were afterward recovered. The Colonel was badly clubbed, twice knocked down, forced across the canal, and obliged to take refuge in the Lake Shore paint shop. The Erie strikers did not confine their lawlessness to their own road, but invaded the shops of the Lake Shore and New York Central roads, and forced the men to stop work, and prevented the movements of all freight and stock trains in the depot yard. The Lake Shore men joined in the strike, as we shall see, but the men of the New York Central road showed no disposition to do so. A meeting of citizens was duly summoned by the Mayor of Buffalo, but it was slimly attended, and was captured by the strikers, whereupon it was adjourned by the Mayor. In the meantime the second detachment of the 23d Regiment left Brooklyn on the afternoon of the 23d of July, and reached Elmira shortly after seven o'clock on the morning of the 24th. At this point the Commander was warned that the strikers along the road would endeavor to stop the progress of the train, and accordingly stationed guards on the engine and tender, and on the platforms of the cars. These men were ordered not to fire without cause, but to see that the train was not interfered with. The train left Elmira at 9 o'clock, and reached Corning at 10..22 A. M. Several rioters attempted to board the train, but were quickly forced off by the guards. About one hundred of them gathered around the train, gesticulating and hooting, but making no further demonstration of violence. As the train moved past the depot, the rioters rushed ahead, and turned the switch. The engine was moving so slowly, however, that the train was at once stopped. The mob now hastened up the track and blockaded it by overturning a baggage car upon it. Several locomotives were also injured. The fireman of the troop train now deserted his engine and joined the mob. The track was torn up for a short distance by the rioters, and the advance of the troop train was effectually stopped. At several points higher up the road the track was torn up, and cars were overturned. A construction party was at once organized, and, under the protection of the troops, the track was relaid and the overturned cars righted. The train moved on slowly, at the rate of about one mile per hour, in order to protect the working parties, and reached Painted Post about four o'clock in the afternoon. The strikers were at this time about two miles ahead of the train, and were damaging the road as fast as was possible. Every effort was made to repair the track and enable the troops to come up with the rioters. So successful were these efforts, that at half-past four the troops were within half a mile of the rioters. A strong detachment was immediately thrown out, which, moving rapidly ahead of the train, soon came up with the rioters as they were engaged in tearing up the rails. At the sight of the troops the strikers fled to the woods. The damage to the track was at once repaired, and the train passed on to Addison. From this place no farther trouble was experienced until a point half a mile below Hornellsville was reached. Here the engine, tender and baggage car were thrown from the track by a loosened rail. In consequence of the presence of so strong a military force at Hornellsville, there was no disturbance at that place on the 24th. The leader of the strikers, was arrested and held by the civil authorities. No effort was made to rescue him. All through the 24th there was great excitement at Buffalo, but there was no outbreak. About 600 militia and two batteries of artillery, besides 300 policemen, were held in readiness to move upon the mob at any moment. On the night of the 24th an attempt was made to fire the bridge of the Erie Railroad over the Neversink river, at Port Jervis. Precautionary measures were taken by the Company at the commencement of the disturbances, an increased number of watchmen being stationed at this bridge. This fact undoubtedly saved it from destruction, as the next morning a five gallon can of kerosene oil was discovered under the bridge, placed in such a position that its ignition would have carried the flames to the woodwork of the bridge. It is supposed that the incendiaries became alarmed before the completion of their arrangements, and thinking that they were discovered, fled, leaving the oil behind them. The guards at that point were increased to prevent further trouble.

The Governor issued the following proclamation: "I deem it my duty to invite the special attention of all the citizens of this State, and especially of such persons as are now attempting to interfere by unlawful means with the running of railway trains, to the following act passed by the Legislature at its last session: Chapter 261. An act to Punish Trespassing on Railroads, passed May 10th, 1877: The people of the State of New York represented in Senate and Assembly do enact as follows: Section 1.—Any person who shall wilfully place any obstruction upon any railroad, or loosen, tear up or remove any part of a railroad, or displace, tamper or in any way interfere with any switches, frogs, rail, track, or other part of any railroad, so as to endanger the safety of any train, or who shall wilfully throw any stone or other missile at any train or any railroad, shall, upon conviction thereof, be punished by imprisonment in a State prison, not exceeding ten years, or be liable to a fine not exceeding $1,000, or by both such fine and imprisonment. Sec. 2.—This act shall take effect immediately. I warn all persons engaged in the violation of the above law to desist therefrom, and I call upon all sheriffs, magistrates, district attorneys and other civil officers, and upon all good officers to aid in the enforcement of the said law, and of the punishment of all who are guilty of its violation, and I hereby offer a reward of $500, to be paid upon the arrest and conviction of each and every person who shall be guilty of a violation of the said act. The failure or omission of any sheriff, district attorney, or other civil officer to take the most active steps in his power to enforce the provisions of this act will be considered sufficient cause for his removal." This proclamation had a happy effect in all parts of the State, and especially upon the line of the Erie Railroad. The offer of a reward was certain to sow discord in the ranks of the rioters, and convert some of them into informers.

Feeling themselves strong enough to enforce the law, the civil authorities at Hornellsville now determined to open the Erie Railroad to traffic, and to arrest the more prominent of the rioters. It was decided to enforce the law, even should a conflict with the rioters be necessary; and the 26th of July was fixed as the day on which the effort was to be made. In the meantime several prominent gentlemen of the place exerted themselves to bring about a settlement and avert the necessity of using force. Warrants were issued for the arrest of over one hundred of the rioters, and the 23d Regiment was assigned the duty of supporting the civil officers in making these arrests. Orders were issued for the regiment to be ready to move at six o'clock A. M. on the 26th. The Gatling guns were prepared for immediate use, and the regiment fully counted upon a sharp conflict with the mob. The railroad officials had a number of detectives among the rioters, and every movement of the strikers was known, as well as the location of their various camps. Few of the rioters were seen in Hornellsville, or in the immediate vicinity of their camps, but at a given signal they could have assembled at least 900 men. On a hillside overlooking the military and railroad head-quarters their outposts could be distinctly seen by day, and at night scores of moving lanterns gave evidence of their vigilance and activity. In different portions of the woods, and not remote from the line of the road, they had over half a dozen camps, which had been provisioned by plundering the freight cars in the depot yard at the beginning of the strike. The strikers' camps would have been surrounded early on the morning of the 26th, but during the night of the 25th a settlement was effected between the railroad officials and the rioters.

An effort was made by the strikers on the Erie Railroad to bring on a strike on the Lake Shore Railroad, which extends from Buffalo to Toledo, and forms a part of the New York Central's line to Chicago. The disturbance began at Buffalo, where the Lake Shore men struck on the 22d, and prevented the passage of freight trains. At Erie, Pennsylvania, and other points along the road, the train men joined the strike, and stopped the trains, but no further violence was attempted. No trains were allowed to run on the line between Buffalo and Erie, it having been determined not to undertake to run any trains until the strikers ceased their interference with the road. The Atlantic express from Chicago reached Erie at eleven o'clock on the morning of the 24th of July. It consisted of four fast mail cars, with heavy mails, two baggage cars, and four well-filled passenger cars. In accordance with orders from the President the train was run upon a side track and declared abandoned. The passengers were much incensed, and tried to urge the strikers to run the train through to Buffalo. The strikers partially consented, fired up an engine and attached it to the train. The Superintendent of the Buffalo division telegraphed to prevent the strikers from taking out the train. A meeting of the strikers was held at the depot at three o'clock in the afternoon. The mayor, sheriff, and a posse of police were on hand to preserve order. The mayor advised the men to let the train alone and not to interfere with the Company's orders. The chief of the strikers also advised the same course. The engine was then taken off, run into the round house, and the train was left on the siding. It contained about one hundred through passengers for New York, and the cars for the time were converted into a hotel. About half-past six o'clock the Chicago and St. Louis express came in from Chicago, and, like its predecessor was run upon a side track and abandoned. The trains were held at Erie until the morning of the 26th, when, it being certain that the strike was at an end, they were ordered to proceed to Buffalo. From this time the trains were run regularly over the Lake Shore road. It was believed that the strike would certainly extend to New York city. That city is the eastern terminus of the New York Central & Hudson River Railroad, and there the Company have vast interests at stake and give employment to several thousand men. The city of New York is peculiarly circumstanced. It contains a large class of professional criminals, and a larger multitude of idle and reckless men. In addition to these, there are many men of foreign birth, who, while pursuing some means of support, are thoroughly imbued with communistic ideas, and are ready at any time to make war upon the existing state of society. These classes make up a formidable section of the population of New York. It was feared that should the strike extend to New York, these classes would make it a pretext for riot and violence. New York being the wealthiest city of the Union, and one of the great financial centers of the world, always offers inducements to a mob of desperate characters to engage in an outbreak in the hope of plunder. The hard times from which the whole country was suffering had pressed very heavily upon the workingmen of New York. Many were out of work, and all were more or less discontented. In case of an outbreak it was certain that the rioters would be largely reinforced from this class.

The leaders of the communistic societies of New York, which associations are made up almost entirely of foreigners who have in many cases been members of similar organizations in Europe, regarded the exciting period as a fitting time to test the strength of the popular sympathy with them. They determined to hold a public meeting ostensibly for the purpose of expressing sympathy with the workingmen engaged in the strikes, but really to test their strength in New York, and see if they could command sufficient outside aid to enable them to bring on an outbreak. The permission of the authorities being necessary to enable them to hold such a meeting, they applied to the Police Commission for leave to hold their meeting in Tompkins Square. Their request was promptly granted, and a call was issued for a mass-meeting of the Trades Unions at Tompkins Square on the night of Wednesday, 25th of July, to express sympathy with the men engaged in the strikes in other parts of the country. The true character of the proposed meeting was well understood throughout the Union, and considerable surprise was manifested at the course of the New York authorities in allowing the meeting to be held. The Police Commissioners were convinced, however, that to prevent the meeting would be to increase whatever excitement and discontent might exist among the laboring classes, and that the best way to deprive the Communists of their influence was to permit them to hold their meeting and show their designs. They felt confident that the great mass of the workmen of New York were not in sympathy with any communistic schemes, and that they would be alienated from them to a still greater extent by their public proclamation. They, therefore, decided to allow the meeting at Tompkins Square. At the same time it was resolved to have a strong, well-armed force of police at hand to put down any attempt at an outbreak, and to be ready to support such action with the entire police force and the military. The commissioners felt fully confident of their ability to deal with the mob, and meant to show them that the city authorities were not afraid of them.

The meeting was held at the appointed time, and was watched with the keenest anxiety by the whole country. All felt that it would decide whether there would be a general communistic revolt, with its accompaniments of bloodshed, pillage, and arson, or whether the authorities were strong enough to enforce the laws. If the mob got the upper hand in New York, it was generally said, the terrible results would spread to the whole country; if the authorities could prevent an outbreak, the insurrection would receive its death blow.

The following resolutions were read to the meeting:

Resolved, That the workingmen's party of the city and county of New York tender their heartfelt sympathies to the railroad men now on strike in different localities in the country.

Resolved, That we consider all legalized chartered corporations, such as railroad, banking, mining, manufacturing, gas, etc., under the present system of operation, as the most despotic and heartless enemies of the working classes.

Resolved, That their acts of tyranny and oppression have been the cause of demoralizing thousands of honest workingmen, thereby driving them to acts of madness; desperation and crime that they would not otherwise have been guilty of had they been justly dealt by.

Resolved, That as these chartered companies have been the primal cause of their employés' miseries and of their consequences, we hold them morally responsible for all acts of violence that proceed from and are the legitimate results of their tyranny and oppression.

Resolved, That we view with alarm the growing influence and power of these corporations over the legislation of the State and nation, and believe if that influence continues, the executive, judicial, and legislative branches of the government will become totally demoralized, the rights of the masses destroyed, and, instead of the voice of the people, the power of the almighty dollar will become absolute and supreme.

Resolved, That we do earnestly request and advise all the working classes throughout the country to unite as speedily as possible for the purpose of forming a political party, based on the natural rights of labor. Let us make common cause against a common enemy.

Resolved, That nothing short of a political revolution through the ballot box on the part of the working classes will remedy the evils under which they suffer.

Resolved, That it is the purpose of the workingmen's party to confiscate through legislation, the unjustly gotten wealth of these legalized and chartered corporation thieves that are backed by the Shylocks and moneyed syndicates of Europe and of this country.

Resolved, That we love law and order, peace and tranquility, justice and righteousness above all else, and deprecate anything and everything that will pervert them, and that we are ever ready to give our lives in defense of the inherent rights of man.

The following address was made to the President of the United States: We, the workingmen of the city of New-York, in mass-meeting assembled, acting from a sense of duty, and prompted by true feelings of humanity and a sincere desire for peace and harmony in society, do earnestly and respectfully call your attention to the serious condition of affairs now existing, and which have existed for some time past between the operatives and the officials of the mining and railroad corporations in several States of the Union. The crimson tide of the life-blood of citizens, soldiers, and hardy workmen have already mingled in sanguinary strife. The heavens have been lit up with the lurid glare of incendiary fires that have reduced to ashes millions of property. Men have fallen beneath deadly blows dealt by unseen and unknown hands, until it seems as if evil days had fallen upon us as a nation. Three millions of the bone and sinew of the country converted into wandering vagabonds, and a large portion of those employed on the verge of starvation. Do these evils that have assumed such magnitude and proportions as to necessitate the issuance of a proclamation on your part to preserve the peace, come within the scope or jurisdiction of national legislation? Whatever may be the cause of these evils, the only remedy applied so far as been the hangman's rope and the soldier's bullet. Think you, Mr. President, these are effectual and permanent remedies that will insure henceforth peace and good order in society? We think not. Whatever cause produces these antagonistic relations between employer and employé must be sought out and removed. We address you, Mr. President, because you are one having great power and authority conferred upon you by the Constitution. You are Commander-in Chief of the armed forces of these United States, and during the recess of Congress they are at your absolute disposition. Need we suggest to you the wisdom of extreme caution in the exercise of your national military power, lest the breach of the peace be widened, class feeling intensified, and public safety more endangered? We think, Mr. President, that the situation of affairs is of such an important and alarming character that they justify on your part the immediate calling of an extra session of Congress. These terrible occurrences and disturbances between the employers and employés of mining and railroad companies that have startled and shocked the community of late involve, as you well know, what is termed the relations between labor and capital. Many are of the opinion that any interference or action on the part of the government to adjust these relations are contrary and inimical to the genius and spirit of modern civilization and republican institutions; that the function of the government is simply to prevent any violent collisions in society resulting from the antagonistic relations of these two elements performing such important functions in the affairs of human society, and that throughout the history of the world so far have been eternally at sword's points with each other. Those who take this view of the matter seem to overlook the great fact that legislation has always dealt with at least one of these factors—namely, capital; and has almost entirely ignored the other—namely, labor; which is, in our opinion, the primal cause of the present difficulties. Had legislation afforded the same opportunities and guaranteed the same rights and privileges to labor that it has to capital these evil days would not have befallen us. When railroad kings can build palaces to live in, costing millions, and others die bequeathing hundreds of millions to their children, and boast while living that they never troubled themselves about the election of representatives, but bought them up after they were elected, and used them as a means to enrich themselves at the expense of their employés and the general public, it seems about time to consider whether or not legislation cannot confer some justice and rights upon labor as well as privileges to capital. We have always considered that law should be the synonym of justice. Has not Congress the power under the Constitution to govern and control, for the benefit of the whole people, the highways and water-courses of the nations and regulate its internal commerce and trade? Is there any constitutional law that prohibits the State or general government from controlling or supervising the mineral resources of the nation? Should not, also, the telegraph system be connected with our postal department? and last, but not least, a governmental monetary system established that would supersede the present individual corporate banking institutions that are nothing more nor less than parasites on the body politic. All of these chartered institutions exist by a system of dividends or profits that proceed directly from the laboring classes. In their efforts to make those dividends the blood and marrow are extracted from labor, until finally, maddened and desperate by the exacting tyranny of capital, rendered ignorant and brutish by poverty, it resorts to brute force and violence to redress its wrongs. It cannot be expected that men acting under the impetus of starvation should act wisely or well, or adhere to moral principle. The very individuals who are most loud in their denunciation of the acts of the strikers, placed in their situation, might do, possibly, if they had the courage, far worse. We, as a class, view with alarm the growth and power of these gigantic corporations. Wielding thousands of millions of dollars' capital as a power they are fast demoralizing and corrupting the executive, judicial and legislative branches of the governments of both State and nation; and the rights of labor and the liberties of the common people, if we continue on in this course, will soon be swept away (and here let us state that a member of your Cabinet, has recommended as a measure of political reform in this State the restriction of suffrage on the basis of a moneyed qualification, thereby offering a direct insult to every workingman in this State); and when they are gone the revolution commences and the emancipation of the white wages slaves of the North will cost the Republic more blood and treasure than ever the emancipation of the black chattel slaves of the South did, and God knows that cost enough. We look to you, Mr. President, to be vigilant in respect of our interests and welfare, for the prosperity and perpetuity of this nation rests upon the principle of justice to labor. Class legislation is the ruin and eventual downfall of any nation.

After reading these resolutions and the address the following speech was made in support of the same: We are here to-night to propose a remedy for strikes and hard times. Our remedy is that government shall become the superintendent of education, property and trade, and the employer of the people on the basis of equal rights, opportunities and equitable compensation. Our motto is, "No Rich, No Poor." The age in which we live is pregnant with great political and social problems which are forcing themselves upon us for solution, and as we are more favorably circumstanced than other nations the duty rests with us of experimenting in the science of sociology until the hallowed object of perfecting human government is accomplished. Though thus far our efforts have not been crowned with the degree of success that was anticipated and formidable obstacles still remain to be overcome, let us not relax but rather redouble our efforts to stay the swelling tide of corruption and strife and to inaugurate an era of virtue and peace. The gigantic proportions of peculation and fraud developing in political circles and the increase of crime and inequality throughout the land are mortifying to us as a people, and, as the scheming speculators and legalized monopolists are growing richer and the useful classes poor, a crisis will soon be reached most fearful to contemplate, unless measures are speedily devised to arrest the evil.

We live upon a land flowing with the milk and honey of human subsistence, yet gaunt poverty sweeps over society, spreading distress, crime and premature death. Mammoth storehouses are filled to repletion with the products of industry, while thousands of producers famish for want of bread. Dense forests and rank grass cover millions of fertile acres, while houseless, homeless, anxious laborers loiter in the market begging for the privilege to toil. The development of labor-saving machinery marvellously increases the power to produce wealth, which should lighten the burden of the workmen and advance the prosperity of society; whereas it is swerved from a true and healthy course and enters into harmful competition with those whose living depends upon a demand for their labor. Though the earth teems with annual harvests and the hands of labor produce an abundance of every convenience and luxury of life, yet, under the baneful influence of a defective system of government, which fails to protect its citizens in the enjoyment of their equal and natural right to the soil, and under an Ishmaelitish system of commerce and industry, which regards land, as well as products, as an article of traffic and monopoly, society is divided into landlords and tenants, capitalists and laborers, rich and poor, and conditions of anxiety and antagonism are engendered which poison every sphere of social life. After a careful investigation of the causes of political and social evils we are constrained to believe that they are the legitimate effects of an anti-democratic feature in our government and of an antagonistic system of industry and commerce. Therefore, to expect a prosperous condition of affairs by a mere change of officers, the exposure of fraud or the denunciation of crime, while the present system remains unchanged, is to expect results contrary to the nature of things, for the opportunities open to our public officers to acquire wealth by an abuse of the power reposed in them and the fabulous fortunes often realized through legalized methods of fraud prove too great a temptation for frail human nature to resist. Therefore, when a reform has to be undertaken (to be successful) it must be supported by the whole people that feel oppressed; and as they are largely in the majority, they have the power to speedily and peacefully change the form of government under which we live. The necessity of a thorough change is manifest, and numerous are the plans proposed and the efforts made to mitigate the evils complained of; but mitigation is not enough. We believe the time has passed for fragmentary propositions of reform to awaken any considerable degree of enthusiasm in the people or to be of any permanent value to society if accomplished. Though the efforts to extend the right of suffrage, the formation of trade societies, protective unions, strikes for more equitable terms of time and wages, etc., are praiseworthy manifestations of the right spirit, and have been and still are valuable as a means of education; yet to arrest the further growth of fraud and remove the giant evils there is need of a more comprehensive scheme than any hitherto proposed, one that shall conserve the best interests of every useful class and calling, and unite their scattered forces in one consolidated army of progress. To realize the necessary reform and place the future developments of society upon a harmonizing upward grade, the government and industry of the country should be reconstructed upon the principles of natural right, political equality and mutual protection, and there are two methods by which this may be accomplished. The most speedy one is by political action, and the other is by the organization of labor on the basis of mutual interest. We live under governments that may be peacefully so amended by political action as to secure the sovereignty of the people, and the subordination of their legislative and executive officers, making them just in principle, wise in policy, and honest in administration. But the present constitutions exclude a majority of citizens from a voice at the polls, and set aside the cardinal principle of popular sovereignty by clothing the legislators with authority to enact laws, grant privileges, and appropriate public property without submitting their acts to the people for ratification (technically the referendum). Further, acting under their authority, the officers to whom their administration has been committed have issued depreciated currency, have chartered banks and legalized interest on money, and thereby imposed upon society the most oppressive system of aristocracy (except that of the land) that ever afflicted the civilized world. Therefore the governments are unjust in principle, unwise, partial and oppressive in legislation, and complex, extravagant, and subject to fraud in execution. Therefore, we present the following propositions of reform for the consideration of the people of this country, believing them to be true, and their adoption necessary for our prosperity as a nation:

First. All members of the human family are entitled by nature to use sufficient of the common elements (land, water, air and light) to maintain their existence and properly develop their being.

Second. Land being an inalienable natural right (to which all men are alike entitled), and not property, should be supervised by government for the use of its citizens upon the basis of equality.

Third. The unconsumed property and other advantages resulting from the experience of the past should be a common inheritance to the living generation.

Fourth. The currency of a nation should be issued by government only, be a legal tender and bear no interest, thereby protecting the people from the snares and frauds of gambling money-changers.

Fifth. As all just governments derive their powers from the consent of the governed, the right of suffrage should be secured to every citizen of mature age, without regard to sex or condition.

Sixth. To sweep away the present multitudinous and vexatious laws, and to introduce a more simple code, more easy to understand and observe; also to protect society against usurpation and peculation by public officials, and help to educate the people in political science, the government should be democratic. Though legislation may be done by representatives, the people should reserve the sovereign right to ratify or reject the acts of their public servants, and to protect the personal rights of the individual against any undue legislation in respect to freedom of speech, religious belief, habits of dress and diet, and the like.

Seventh. So long as the existence of an army or navy may be deemed necessary, they should be remodelled to correspond with the principles of equal pay and rations; and opportunities should be afforded to rise from the ranks to the command, and from the forecastle to the quarter deck.

Eighth. To avoid the evil consequences of official patronage and party bias, all officers should receive their commissions direct from the people, while clerks, mechanics and other operatives should be taken from the list of competent applicants, as their names stand recorded, or be drawn, as the names of jurors are drawn, from the wheel.

Ninth. To secure the greatest advantages of economy and convenience resulting from the improvements of the age, and to guard against the cupidity of contractors, the fraudulent principle of interest on money, the impositions of the banking system, and the extortions practiced by railroads, gas companies and other organized monopolies, the system of contracting public work should be abolished, and all public improvements, such as post roads, railroads, gas works, water works, mining operations, canals, post offices, telegraphs, expresses, etc., should be public property and be conducted by government, at reasonable rates, for the interest of society.

Tenth. To advance material science, develop the resources of the country, and protect the useful classes against the avarice of capitalists or the derangements of trade, the various branches of useful industry should be instituted by the government upon equitable principles, as to time and compensation, and thereby furnish employment to those who might otherwise be idle and suffer the pangs of poverty, or be tempted to crime.

Eleventh. To provide for the proper education of the people, schools, colleges and institutions of science should be supported by the government, and be free to all; and to enable the people to convene frequently to consider subjects of public interest, and review the acts and propositions of their public servants, the primary or public school houses should be open at least two evenings in each week for the use of the people.

Twelfth. The greatest degree of benefit to be realized from combined effort will flow from the most comprehensive union of interests, upon the principle of equality; to attain which, government must ultimately absorb and direct every department of use, extending to the citizens equal opportunities, equal compensation for services performed, and equal protection in seasons of sickness, disability and old age. Accordingly, let us hasten the realization of a just and wise system of government, established upon the principles above stated.

Fairly computed, there were probably less than ten thousand persons on the ground. Nearest the stand were the internationalists and society men; next to them a row three or four deep of mere listeners; and on the rim an ever-moving congregation of idlers, who only served the purpose of deluding one into the belief that it was a great throng. The crowd was generally tame and apparently aimless. It lacked enthusiasm. The speakers themselves seemed to feel the want of sympathy that is ordinarily expressed in hearty cheers, and were content with the mild hurrahs of the few malcontents who surrounded the platforms. The railway men did not put in an appearance, or if so, in such small numbers that their presence was not notable, while of societies the representation was small and without organization. In fact, judging from the comments of the more intelligent, the occasion was regarded as one which had been created for the benefit of a few demagogues and ward politicians, rather than for the illustration of any broad principle. From the beginning to the end of the meeting there was not the slightest exhibition of a dangerous purpose on the part of the gathering, and incendiary remarks, whether in English or German, fell upon the ear still-born. The orators had apparently lost heart. The stands were thronged with noisy boys, and there was an utter want of the vim and snap that characterizes an ordinary political meeting. Perhaps all this result was due to the fact known to every person on the ground, that while not a policeman showed his uniform in the crowd, or invited the slightest antagonism, five hundred sturdy men, armed to the teeth, were within earshot, ready to sweep down on the instant at any point where a disturbance might occur, and nearly a thousand more were in reserve, waiting with ready hands to preserve peace and maintain the fair name of the metropolis. Certain it is, that the so-called "dangerous class" of New York, if they were present, never in their history witnessed such a masterly preparation to punish, and, if necessary, crush them, as was then shown. The action of the police force was simply superb. The men seemed to rise out of the ground, and when the meeting dissolved, and the four calcium burners that had been used to light the square were extinguished, the long blue line that reached across the square, and steadily pressed before it those who loitered, told the story in five minutes that communism in New York was a fiasco and a fraud. The utmost good nature prevailed, the sidewalks of the square rang with the cries of hucksters, women and children lined the steps of the adjacent houses, or innocently elbowed their way among the multitude, and faces generally wore anything but the expression of excitement or anxiety which might be expected to attach to the occasion. Of the eight or ten thousand thus assembled, probably not more than three thousand were actively identified with the trades unions and international societies, and many of the former openly expressed their condemnation of the attempt of a few men to create further trouble and distress at this time. The bulk of the crowd was composed of people who curiously desired to see what was going on, and took good care to be sufficiently near the highways to make an early exit in case of a demonstration by police or military.

The intervention of the military power of the Federal government in behalf of the endangered railroad property of the country was a phase of the great outbreak which was certainly not contemplated by the strikers in commencing their movement. When the Governor of West Virginia called upon the President for assistance, there was a feeling of general surprise throughout the country: and when it was learned that the force sent in answer to his call numbered but a few hundred men, it was feared by many that it was not in the power of the general government to deal with such a movement as vigorously as it demanded, inasmuch as the army was too small and was scattered over so wide an extent of country. In addition to this, the use of the Federal army in the affairs of the States under the previous administration had so shocked the best sentiment of the country that many persons feared the employment of the army in the present instance would lead to results equally deplorable. The course of the President and his advisers proved in the main entirely satisfactory to the country, and demonstrated that the constitutional use of the army is in no way dangerous to the independence or reserved rights of any of the States; and the firmness and moderation which marked the action of the government called forth praise from all parties. The task before the President was a very delicate one; he was to fulfill his constitutional duty of protecting the States against internal disorders which they could not suppress, and he was at the same time to treat the disturbance as a matter strictly within the jurisdiction of the State, or in other words he was not to take the enforcement of the laws out of the hands of the State authorities, but was merely to sustain them in their efforts to suppress the disorder; and to do this he must place the Federal troops under the orders of the Governor of the State into which they were sent, and must still retain the general direction of them. In other words, the Federal troops were to be so many policemen loaned to the States to enable them to execute their laws. Happily for the whole country, the President was fully imbued with this view of his duty in the matter, and his course was in accordance with it.

The presence of the United States troops had every where the happiest effect. Though the detachments sent to the various points of danger were small, they were everywhere respected, and feared by the rioters. Their discipline and steadiness made it certain that they would obey orders literally and promptly, and the character and experience of the officers were a guarantee that while they would deal with the disturbance with forbearance and moderation, they would also put down resistance to them promptly and with vigor if called upon to act. Wherever the regulars appeared, the rioters slunk away; not a hand was raised against them; and their service was confined entirely to guard duty. The force at the disposal of the government was, as has been said, small and was scattered over the whole country. It became necessary to concentrate as strong a force as possible in the States of West Virginia, Maryland and Pennsylvania, and at the earliest moment. For this purpose detachments were brought from the Atlantic coast ports, and the troops that had been stationed in the Southern States by President Grant for political purposes were moved northward to the scene of danger. The policy of the government was to act with caution, but also with vigor and promptness. This line of conduct was strictly adhered to. The troops behaved with admirable firmness, paying no attention to the jeers and insults of the rioters, and avoiding in every way giving provocation to the mob. During the whole disturbance, the Signal Corps of the army rendered important service, in forwarding to the war department news of the events at their respective posts. The despatches of the signal officers were regularly laid before the Cabinet, and were always found free from exaggeration and thoroughly reliable. The government came to depend upon them as its most accurate source of information.

The *North American Review* for September to October, 1877, contained two articles relating to the strike, which are of so much interest to those interested in the question that we give the substance of them here: The first is from the pen of Colonel Thomas A. Scott, the President of the Pennsylvania Railroad. Colonel Scott, after reciting the history of the troubles, and stating the necessities of the rail road companies, makes the following deductions: This insurrection, which extended through fourteen States, and in many cases successfully defied the local authorities, presents a state of facts almost as serious as that which prevailed at the outbreak of the Civil War. Unless our own experience is to differ entirely from other countries—and it is not easy to see why it should, with the increasing population of our large cities and business centers, and the inevitable assemblage at such points of the vicious and evil-disposed—the late troubles may be but a prelude to other manifestations of mob violence, with this added peril, that now, for the first time in American history, has an organized mob learned its power to terrorize the law abiding citizens of great communities. With our recent experience before us, it is believed that no thoughtful man can argue in favor of delay by the proper authorities in dealing with lawless and riotous assemblages. Delay simply leads to destruction of property, and may lead in the end to the destruction of life. The force used to repress such assemblages should be as prompt in its manifestation as the evil with which it deals. The interests concerned are too grave to admit of delay. The raising of the black flag and the stoppage of all vessels on the Great Lakes and on the Mississippi and Ohio rivers would not produce one tithe of the damage to the whole country that has resulted from the recent stoppage of the great trunk lines. The burning of the vessels and their cargoes on these waters would raise a storm of wrath which no mob would dare to face, and would be visited by the United States government, under existing laws with most exemplary punishment. But what distinction can be established between such a crime and the hideous destruction at Pittsburgh of over one thousand eight hundred cars laden with the products of the various States, together with the engines ready to move them to their destination, and the station buildings and machine shops that were absolutely essential to their proper care and movement, and which, with other like doings, resulted in the stoppage of all commerce and business relations between the States not only on one highway, but on many important lines, through the concerted action of the mob and its leaders? In the city of Pittsburgh much human life and many private dwellings and other property were sacrificed as the result of mob violence; indeed, it is almost a marvel that a large portion of that city was not destroyed by fire. Only the prevailing direction of the wind averted greater and more general disaster.

The authority of the United States, now potent to protect commerce moving upon the waters, should be equally potent when the same commerce is exposed to greater peril upon land. This brings us then, to the practical question: In what shape can this protection be put so as to be extended most efficiently and with the least delay? The present regulations all favor, unintentionally, the rioters and the mob. In the first place the Mayor of a city must exhaust his power, the Sheriff of the county must essay his strength; then, while precious time is expending—for a mob constantly attracts dangerous elements and grows with impunity and success—the Governor of the State must be called upon by the Sheriff of a county. If the State happens to have an effective military organization, which at the present time is the case in perhaps not more than five out of thirty-seven States of the Union, the Governor can call out the military forces and suppress the riot. If the State has no such organization, or if the military forces of the State prove inadequate to the emergency, the Governor is paralyzed, and must call upon the United States for assistance. If the authorities of any State should, for any cause, fail to refuse to call upon the United States government, what possible remedy or protection is left to life and property within the limits of that commonwealth?

It can readily be seen what frightful possibilities of mischief are afforded by the necessarily long interval which must elapse in the present state of laws before the Federal authority can intervene in cases where its intervention is most imperative. In fact, as our recent experience has shown, the only roads which could procure prompt protection and immunity from interference were those whose misfortunes had made them bankrupt, and placed them in the direct custody of receivers appointed by the United States Courts. To the aid of these roads the United States Marshal could call the United States troops, and no rioter dared to resist the power represented by the small but admirably disciplined detachments quartered near the scenes of recent troubles. It will hardly be contended that the railway companies must become bankrupt in order to make secure the uninterrupted movement of traffic over their lines, or to entitle them to the efficient protection of the United States government. If a bondholder or other creditor is entitled to the protection of the Federal courts to prevent the threatened impairment of the value of a property through legal proceedings, he certainly should not be left without remedy against lawless violence which has actually destroyed the security for his investment, and has, as at Pittsburgh, converted millions of dollars into scrap iron and ashes. The laws which give the Federal courts the summary process of injunction to restrain so comparatively trifling a wrong as an infringement of a patent-right, certainly must have been intended or ought to give the United States authority to prevent a wrong doing, which not only destroys a particular road, but also paralyzes the entire commerce of the country and wastes the national wealth. It is demonstrable that during the recent disturbances the government of the United States was itself a direct loser, and through the government the tax-payers of the whole country to a very large amount, by the diminution of the national revenues arising from the interruption of business and the interference with many of the operations on which the internal taxes of the country are levied, as well as by the diminution of the customs revenues as all the imports during this period, instead of being forwarded to their destinations, were necessarily placed in store, of course without payment of any duty to the government for the time being. Suppose that this state of things had continued for sixty days, would not the United States government have been deprived of nearly all the revenues on which it relies to meet its current obligations?

Certainly it cannot have been contemplated in the formation of our government that the United States authorities should submit to see the transportation of the mails, covering the enormous financial and business transactions of the whole country, and the movement of supplies required for its own various departments, made dependent upon the grace and favor of rioters, whose misconduct in almost any other form would have secured their immediate arrest and condign punishment. During the recent riots the movement of United States troops was impeded at several points, and large quantities of ammunition and other Federal stores on their way to the Pacific coast were forcibly detained for days. The operations of the national government in some parts of the country were as completely blocked as in the early days of the Civil War. There certainly should be a protection against such dangers, and a remedy for such wrongs. If the government of the United States is to exercise its power of protection or of remedy, it perhaps can do so only through an adequate exhibition of the military force that may be given it for such purposes by Congress. The important question is to ascertain in what way the government can so exhibit its military force as to secure the utmost possible efficiency in the enforcement of law and order, without jarring or disturbing the general framework of our institutions and our laws. It seems to be indispensable, in the light of recent events, that whatever force is to be used by the government in such emergencies should be so distributed and controlled that it may be concentrated upon any point or points that may be threatened within a few hours of any outbreak. Several companies of regular troops that were quartered at Baltimore, Philadelphia, Pittsburgh, Reading, Scranton, Louisville, Chicago, and other places, during the recent riots, had to be transported for such distances that, if they had been compelled to march instead of moving by rail, they would have been powerless to avert mischief. It was only by the fear or favor of the rioters that the United States were able to concentrate their forces where they did. In some cases formal resolutions were passed by the strikers that no troops should be allowed to pass over the lines. In Jersey City a mob endeavored to prevent the departure of a United States battery and the troops connected therewith. On the Erie Railway, between Cornell and Hornellsville, a few lawless men, by tearing up tracks, destroying bridges, and tampering with switches, were able seriously to retard the military forces of the State, which were there under the orders of the Governor to re-establish law and order. What is needed, therefore, would clearly seem to be that proper forces should be so disposed at prominent points—large cities and other great business centers, in many of which the government has arsenals, custom-houses, mints, navy yards, and other property of its own to protect—that their movements can be combined rapidly and they be directed against points of danger, so as to be able to act effectively and with decision before violence can become triumphant.

With the experience of other countries to warn and guide us, and especially with the experience of England, where the rights of the people have for ages been guarded and asserted as jealously as they always have been and should be among ourselves, we shall have only ourselves to blame if, through apathy, demagogism, or weakness we leave ourselves unprepared to meet an issue which, from all the evidences of the times, is only too likely again to be forced upon us. With the approach of winter, and the loss of out-door employment which severe weather, even in the most prosperous times, entails, the country will have to deal not only with the deserving among the unemployed, who can be reached and helped through local organizations, but with vast numbers of idle, dangerous and, in many cases, desperate men, who have been allowed unfortunately to catch a glimpse of their possible power for mischief. Such men, unless confronted by a thorough organization in the cities States and other communities, backed by the power of the Federal government and an unmistakable public opinion, will need but little urging to renew the scenes which have already brought such disgrace upon the American name. It surely may be hoped that at the approaching session of Congress the earnest, unprejudiced and patriotic men of both houses will discuss this grave subject independently of party lines, and with the united resolve to secure equity to all interests, and to take all necessary measures to secure protection to life and property and impartial enforcement of the laws, including the guarantee to every man of the right to work for such compensation as he may agree upon with other men, free from interference or intimidation. The able lawyers of the Senate and House will perhaps frame a law which will give to the owners of every highway carrying inter-State commerce, whether by land or water, in which citizens of different States are interested, or carrying the United States mails or other government property, the right to appear by petition properly verified before the tribunal of the United States, in order to show that the movement of such traffic has been interfered with by unlawful combinations, by threats or by violence, and which, upon such showing, will give these tribunals the right, when necessary to call upon the United States, in the form now authorized by law to enforce their process by arresting the rioters and the suppression of all such unlawful combinations.

The magnitude of the evil to be met and dealt with can hardly be overstated. The remedy to be provided should be equally prompt and effective. It must be discussed and adopted in the interest of the whole country, and not of any particular class; for the interests of all classes of our citizens are the same in the maintenance of domestic peace and civil order. But to no one class in the community is an absolute assurance of peace so important as to the men who have no capital but their labor. When the accumulations of labor are put in peril by lawlessness, capital may always protect itself by suspending the enterprises which give labor its value and insure its reward. Anarchy not only deprives the laboring man of his present subsistence, but puts in jeopardy all his hopes of improvement for his own future and the future of his family.

The second article referred to is entitled "Fair Wages," and is signed "A Striker," and contends that the rights and value of labor, which were acknowledged here forty years ago because the country wanted hands, now turns the laboring men's earnings against them, and the country's prosperity becomes their disaster. The writer concludes as follows:

Let us put this matter in a plain way, as we understand it, and use round numbers, instead of fractions, as we have to deal with hundreds of millions, dividing the subject into sections.

"*First.* In the United States the amount of capital invested in railway property last year was $4,470,000,000, made up of $2,250,000,000 capital stock, and $2,220,000,000 bonded debt. The gross earnings were $500,000,000, or about eight and a half per cent on the capital. The running expenses (of which the bulk was for labor) were $310,000,000, leaving $185,000,000 as interest to the capitalist, or barely four per cent. on his investment. Labor is admitted into this enterprise as a preferential creditor, to be paid out of the gross earnings before the most preferred mortgagee or bondholder receives a dollar. For, as capital could not build the roads nor equip them without labor, so the enterprise, when complete, cannot be run without labor. Capital, therefore, takes a back seat when it comes to the push, and acknowledges not only that labor has the largest interest in the concern, but takes the first fruits. I take the railroad as a sample out of all enterprises, and if we could get at figures, there is no doubt it is a fair sample of the crowd. If, then, labor is the more important and essential factor in the result, when it comes to the question which of the two shall suffer in moments of general distress—the capitalist in his pocket or the laborer in his belly—we think the answer has been already settled by the rights assumed by one and acknowledged by the other.

Second. It is manifestly unjust that the workingman should be subjected to under wages in bad times, if he has not the equivalent of over wages in good times. If railroad companies in concert with the laboring class had established a tariff of labor, and paid a bonus on wages at every distribution of dividends, that bonus being in proportion to the profits of the road, so that each man becomes a shareholder in his very small way, then he would have submitted to bear his share of distress when all were called on to share trouble, but to share it equally and alike.

Third. When folks say that labor and capital must find, by the laws of demand and supply, their natural relations to each other in all commercial enterprises, and neither one has any rights it can enforce on the other, they take for granted that the labor 'market' is like the produce market—liable to natural fluctuations. If that were so, we should not complain. But it is not. The labor market has got to be like the stock and share market—a few large capitalists control it and make what prices they please. This sort of game may ruin the gamblers in stocks and injure those who invest, but the trouble is confined mostly to those who can afford it. But not so when the same practice operates in the labor market. The capitalist must not gamble with the bread of the workingman, or if he does, let him regard where that speculation led France one hundred years ago, when the financiers made a corner in flour, and the people broke the ring with the axe of the guillotine.

Fourth. When the railway companies obtained privileges and rights over private property, and became, by force of law, the great landowners of the State, holding its movable property as well, and controlling every avenue and department of business, public and private, they became powerful monopolies. The State endowed them with powers to frame laws of their own, and deprived citizens of their property, means, facilities of transport, to vest it all in their corporations. Thus endowed, they cannot pretend they are no more than ordinary commercial enterprises. They are responsible to the State for the result of their operations if they disturb fatally the order of our concerns. They are not independent. The State has claims upon them it has not on private concerns. They may not accept liabilities and then decline responsibility. It behooves the State to decide what the people are entitled to in return for all they have conceded to these companies, and to enforce such claims.

Fifth. The English Parliament legislated on the question of the number of hours a workingman should labor. It limits them to so many. It legislates for his health and supply of light and water. In all these matters the capitalist has an interest. (He does as much for his horse.) But when it comes to the question of a proper amount of food and clothing, of warmth and shelter, the government declines to interfere. It leaves the question of fair wages to be adjusted between employer and employed."

Commenting upon these articles, *The Philadelphia Times* pertinently said: "The chief importance of these two articles lies in the fact that they are written by men who represent what are supposed to be the two most opposite views of the labor question. One is the leading railroad man of the country, the head of the great corporation which had to stand the brunt of the recent outbreak of violence. The other, though unknown to fame, is evidently a fair representative of the restless, discontented spirit that actuated that outbreak, and though he cautiously deprecates a resort to violence he leaves no doubt as to where his sympathies were. And yet neither of these representative men really discusses the questions involved with any thoroughness. Mr. Scott, indeed, makes no pretence of doing so. He merely presents, at the editor's request, some practical thoughts suggested by his own observation and experience during the recent troubles, and these very naturally relate to the preservation of order and the prevention of riotous outbreaks, rather than to the causes of remedies of any existing trouble. The 'striker,' on the other hand, has nothing to say or to suggest except that men are entitled to 'fair wages,' and if the capitalist attempt to 'gamble with the bread of the workingman,' he must 'regard where that speculation led France one hundred years ago.' Unfortunately the capitalist, as the railroad man for example, has had too much reason lately to 'regard' this piece of history, which he has seen repeating itself under his own eyes, and it is a little disappointing to find that our representative striker has no very definite suggestions to offer as to how 'fair wages' are to be secured at a time when capital is making no profit at all."

Mr. Scott's reflections upon the strikes are such as would be natural to any man who had been compelled to sit still and see the property under his charge destroyed in the absence of any adequate power to protect it; who had witnessed the failure of the local and even of the State authorities, and the fatal delays of a system that was never designed for such an emergency, and who felt the interests intrusted to him secure only when the strong arm of the Federal government was at last stretched out to protect them. Naturally and justifiably, Mr. Scott would strengthen those defences of law and order which his own experience has found most trustworthy. He would rely upon the Federal power to protect the commerce between the States, and would provide for the prompt and speedy exercise of this power in every great emergency. We doubt if the country will follow him in this, or be willing to relieve the local authorities from the responsibility for the protection of property and the preservation of order within their jurisdiction.

There is one thing, however, in Mr. Scott's paper which all classes will readily recognize, and that is the entire confidence which he displays in the honor and intelligence of American workingmen and his practical belief in the community of interest between employers and employed. A railroad president represents both the owners and operators of the road, and it concerns the one class quite as much as the other that the business of the road shall be safely carried on. It is probable that he would not even dissent from the 'striker's' proposition, that when it comes to a question of which shall suffer in moments of general distress the demands of labor come first, since this has been practically acknowledged by everybody, and countless capitalists have done without their earnings within the last year that laborers might have bread. So, too, with the only practical suggestion which the *North American's* 'striker' has to make, that workingmen, if they are to be subject to under wages in bad times, should have the equivalent of over wages in good times, since that is also generally acknowledged and in a limited sense has been generally acted on. If any system of dividing a proportion of the profits among employés would secure contentment and universal happiness, there is little doubt that employers would gladly adopt it and would find it profitable; only such a system is much more easily suggested than fully elaborated and carried into effect. The first thing that we need is to learn to discuss these subjects temperately, and in a spirit of mutual trust, and it is a good sign that the most conservative and eminently respectable periodical in the country has undertaken to direct the discussion into a profitable channel. It may be only an accident that the representative employer approaches the subject in a more catholic spirit than the representative striker, but it shows at least that the leading men of the country are willing to meet the issues of the day and anxious to solve them for the good of all alike."

While the troubles we have detailed were in progress in the State of New York, many other States and localities throughout the United States were already or rapidly becoming involved in disturbances in many cases more violent and deplorable. About the middle of July, 1877, the Baltimore & Ohio Railroad Company made a reduction of ten per cent. in the pay of its employés. The pay of all the employed, of whatever grade, was equally diminished, no invidious distinctions being made. All accepted the change quietly except the firemen and the men who run the freight trains. The first-class firemen on this road had been receiving $1.75 per day; the reduction brought their wages to $1.58. The firemen of the second class were reduced from $1.50 to $1.35 per day. These men refused to accept the reduction, and stopped work. As soon as this became known, numerous applications were made to the company, by men out of work, for employment in the places of the men who had "struck." The company, having the large unemployed class along its line to choose from, had no difficulty in filling the places of the strikers, generally with experienced firemen who were eagerly seeking employment. Here the matter might have rested had the sober good sense of the strikers come to their aid. They had refused to work for the wages offered by the Baltimore & Ohio Company, and had abandoned their post. In so doing they had exercised an undisputed right. Having left the service of the company, they should have recognised the fact that they had no longer any interest in its action, and should have sought employment elsewhere. Unfortunately for themselves and for the whole country they chose a different line of conduct, and one which changed the sympathy which the country had felt for them in their privations to the sternest condemnation of their lawlessness. The leaders of the strikers now resolved to compel the railroad company to recall the order for the reduction of wages. They believed that they could accomplish this by taking forcible possession of the road at certain points, and preventing the passage of all freight trains until the company should be driven, by the loss of its business, into an acceptance of their demand for a return to the old wages. They did not seem to be aware that by seizing the property of their late employers, and stopping the business of the road, they were assuming the character of criminals and committing offenses against the laws of the land of so grave a nature that the authorities would be compelled to crush them by force.

On the morning of the 16th of July, about forty firemen and brakemen of freight trains on the Baltimore & Ohio Railroad, in Baltimore, refused to accept the reduction in their wages, which was to go into effect that day, and stopped work. The strikers assembled at Camden Junction, about three miles from Baltimore, and stopped a freight train, persuading the fireman to leave his engine, and refusing to allow another to take his place. At the request of the railroad officials, the city authorities sent a police force to the spot and dispersed the strikers. The trains were then run during the day without further delay. This, however, was but the beginning of the trouble. The news spread rapidly along the road, and the disaffection soon reached Martinsburg, in West Virginia, Cumberland, in Maryland, and Keyser, Grafton, and Wheeling, in West Virginia, the most important points on the line of the road, the last named place being its western terminus. At Martinsburg the Baltimore & Ohio Company have large shops, and there is always a large concentration of the rolling stock and employés of the road there. As soon as the news was received from Baltimore the firemen and the brakemen stopped work and took part in the strike. They numbered about one hundred men. They assembled about the depot, seized the road and the engines, and compelled the men who were willing to work to leave their places. No freight trains were allowed by the strikers to move either way, and all arriving at Martinsburg were compelled to halt; the engines were uncoupled and run on to the side tracks, and the firemen and train hands joined the strikers. The railroad officials, finding themselves powerless, applied to the Mayor and city authorities for protection. The strikers were ordered by the Mayor to disperse and cease their unlawful interference with the property of the railroad company, but refused to obey the command, which the officials were unable to enforce.

The Governor of West Virginia called for assistance, and the President directed the Secretary of War to send a sufficient force at once to Martinsburg. At the same time he issued the following proclamation to the rioters: *Whereas*, It is provided in the Constitution of the United States that the United States shall protect every State in this Union on application of the Legislature, or of the Executive when the Legislature cannot be convened, against domestic violence; and *Whereas*, The Governor of the State of West Virginia has represented that domestic violence exists in said State at Martinsburg, and at various other points along the line of the Baltimore & Ohio Railroad, in said State, which the authorities of said State are unable to suppress; and, *Whereas*, By laws in pursuance of the above it is provided (in the laws of the United States) that in all cases of insurrection in any State, or of obstruction to the laws thereof, it shall be lawful for the President of the United States, on application of the Legislature of such State, or of the Executive when the Legislature cannot be convened, to call forth the militia of any other State or States or to employ such part of the land and naval force as may be necessary for the purpose of suppressing such insurrection or causing the laws to be duly executed; and, *Whereas*, The Legislature of said State is not now in session and cannot be convened in time to meet the present emergency; and the Executive of said State, under section 4 of Article IV. of the Constitution of the United States and the laws passed in pursuance thereof, has made application to me in the premises for such part of the military force of the United States as may be necessary and adequate to protect said State and the citizens thereof against domestic violence, and to enforce the due execution of the laws; and, *Whereas*, It is required that whenever it may be necessary in the judgment of the President to use the military force for the purpose aforesaid, he shall forthwith, by proclamation, command such insurgents to disperse and retire peaceably to their respective homes within a limited time: Now, therefore, I, Rutherford B. Hayes, President of the United States, do hereby make proclamation and command all persons engaged in said unlawful and insurrectionary proceedings to disperse and retire peaceably to their respective abodes on or before twelve o'clock noon on the 19th day of July instant, and hereafter abandon said combinations and submit themselves to the laws and constituted authorities of said State, and I invoke the aid and co-operation of all good citizens thereof to uphold the laws and preserve the public peace. In witness whereof, I have hereunto set my hand and caused the seal of the United States to be affixed.

Disaffection continued to spread along the road. The passenger and mail trains had not been interfered with thus far, but the strikers at Cumberland, Keyser, Grafton, and other points, were firm in their determination that no freight trains should be run. At Keyser, on the night of the 19th, a meeting of workmen was held, at which the following resolutions were adopted: *Resolved*, That we, the men of the Third Division, will abide by the decision of our brother divisions in regard to wages in the future, and that we will stay by them in the present trouble until such decision is arrived at, as we have been oppressed by our superior officers beyond endurance. *Resolved*, That we, the men of the Third Division, have soberly and calmly considered the step we have taken, and declare that at the present state of wages which the company have imposed upon us, we cannot live and provide our wives and children with the necessaries of life, and that we only ask for wages that will enable us to provide such necessaries. *Resolved*, That we uphold the other divisions in the step they have taken in regard to the present trouble.

At Cumberland matters were especially bad. There, as at the other points on the line, the original strikers had been joined by large numbers of idle and disreputable persons, who were attracted by the hope of plunder. The mob, thus constituted, held the depot and yards and set the city authorities at defiance. As the trains sent out from Martinsburg reached Cumberland, they were stopped by the rioters, and the engineers and firemen were forced to abandon their posts. Thus the blockade, which had been broken at Martinsburg by the Federal troops, was established with equal rigor at Cumberland. At Wheeling, the western terminus of the main line of the Baltimore & Ohio Railroad, the excitement was very great. The men employed there stopped work, and joined in the strike, but attempted no violence. The company attempted to fill the places of the strikers with a party of men from Steubenville, Ohio, but the new comers were warned off by the strikers, who threatened them with assassination if they went to work. The state of affairs along the line of the Baltimore & Ohio Railroad had now become so threatening that the force of regulars was largely augmented. The troubles continued to increase, and brought on the Baltimore riots.

One of the Baltimore papers, commenting upon the character of the mob in that city, said: "The number of railroad employés engaged in the rioting here has from the first not exceeded 150; but at the outset of the affair they were joined by thousands of laborers and mechanics out of employment, and by the entire criminal masses of the city, eager for an occasion to plunder. A large number of men besides these, in various occupations, who have suffered a reduction of wages of late, are in a sullen temper with their employers and with capitalists generally. They imagine that they have been wronged, and welcome what they think is an attempt of the railroad men to right a similar wrong. Some have actively aided the rioters, and nearly all have fermented the movement by reckless and inflammatory talk. The communistic character of the riots is shown by every incident. The mob which assailed the 6th Regiment, Friday night, was not composed of railroad men, but was a miscellaneous assemblage of laborers. The crowd that stoned the United States troops to-day probably had not a single striker in its midst. So of the gangs gathered up by the police in the numerous combats around Camden station last night. Some were thieves and rowdies, and others were workingmen, usually well-behaved, but now crazed by the excitement of the outbreak. It is a notable fact that most of the men who yelled "bread" in the crowd that surged against the lines of the police and the soldiers last night had evidently money enough to buy whiskey, for they were half-drunk. Some of the strikers affirm that they and their friends were taking no part in the lawless acts, and that the movement has passed altogether out of their hands. The prejudice against the Baltimore & Ohio railroad among the working classes, and to some extent among people in the higher walks of life, furnished at the beginning a strong fund of sympathy to sustain the strike. It was currently believed that the policy of the company has been to starve its men in order to keep up its ten per cent. dividends. There is no doubt that this prejudice was the real basis of the outbreak. Desperate men took advantage of it to defy the law, relying upon popular support."

The troubles were not to be confined to the States of Maryland and West Virginia. About this time the Governor of Pennsylvania caused the following telegram to be forwarded from Harrisburg to the President of the United States:

Domestic violence exists within the State of Pennsylvania in the City of Pittsburgh and along the line of the Pennsylvania Railroad, and other railroads in said State, which the authorities are unable to suppress, and the Legislature of Pennsylvania cannot be convened in time to meet the emergency. I have, therefore, to request that in conformity to the Constitution the government of the United States shall furnish me with military force sufficient to suppress disorder, and to protect persons and property against domestic violence.

The President at once complied with this demand, and issued the following proclamation:

Whereas, It is provided in the Constitution of the United States that the United States shall protect every State in this Union on application of the Legislature, or of the Executive when the Legislature cannot be convened against domestic violence; and, *Whereas*, The Governor of the State of Pennsylvania has represented that domestic violence exists in said State which the authorities of said State are unable to suppress; and, *Whereas*, the laws of the United States require that in all cases of insurrection in any State, or of obstruction to the laws thereof, whenever in the judgment of the President it becomes necessary to use the military forces to suppress such insurrection or obstruction to the laws he shall forthwith by proclamation command such insurgents to disperse and retire peaceably to their respective abodes within a limited time: Now, therefore, I, Rutherford B. Hayes, President of the United States, do hereby admonish all good citizens of the United States and all persons within the territory and jurisdiction of the United States against aiding, countenancing, abetting, or taking part in such unlawful proceedings, and I do hereby warn all persons engaged in or connected with the said domestic violence and obstruction of the laws to disperse and retire peaceably to their respective abodes on or before twelve o'clock noon on the 24th day of July instant. In testimony whereof, I have hereunto set my hand and caused the seal of the United States to be affixed.

At the same time President Hayes ordered General Hancock to proceed to Philadelphia with such troops as could be spared from Baltimore, and orders were despatched to the Eastern posts to reinforce General Hancock at Philadelphia with every available man. On the same day orders were issued by the Governor of Pennsylvania placing the entire militia force of the State under arms. In the meantime the strike spread rapidly along the line of the Pennsylvania Railroad, from Pittsburgh eastward. At eleven o'clock on Saturday, July 21st, the train men of the Pennsylvania Railroad at Altoona struck, and taking possession of the road and shops at that point, refused to allow the passage of freight trains. They were joined by a large number of tramps and loafers from the city, and towards nightfall numbered several thousand men. No disturbance was attempted on Saturday. On Sunday the 22d, the news from Pittsburgh was received and created great excitement. The rioters declared that no more troops should pass Altoona on their way to Pittsburgh; and when it was announced, early on Sunday morning, that a detachment of 250 men under Generals Beaver and Lyle, were nearing the city, the strikers prepared to stop them

The train bearing the troops entered Altoona slowly and cautiously. As it reached the depot the engine was taken off, in order that a heavier engine might be connected with the train for the purpose of taking it over the mountain west of Altoona. The mountain engine was backed out of the round house, but as it appeared, the rioters, who had surrounded the depot to the number of at least 3,000 men, and who were terribly excited, took possession of the engine and returned it to the round house. General

Beaver then ordered his men to march down and bring the engine out again, but upon reaching the round house they were surrounded by the mob, and finally surrendered their arms. Practically, then, General Beaver was left without any command, except the men under General Lyle and Colonel Snowden, about 160 all told, and all Philadelphians. These troops remained at the depot in a broiling sun for an hour and a half, and were then ordered down the track to break into the round house in order to get the motive power to take the train over the mountains. The mob had increased by this time to fully 5,000 excited and violent men. This round house is situated on the side of a cut, and between two bridges which cross the road. The troops passed under the western bridge, eastward from the round house, the hillside on the right being dense with rioters, the houses on the left being occupied by strikers, and a mob filling the two bridges. The men were armed, some with the muskets surrendered by the Clearfield militia. About twenty of the strikers were guarding the gate of the round house, and when the troops had been marched up prepared to force the gate, the mob showered upon them every vile epithet, threat, and insult that could be invented, and gave them every reason to apprehend that any attempt to open the gate by them would be the signal for an instantaneous and terrible assault.

The rioters crowded up against the troops, standing shoulder to shoulder with them, shaking their fists in the faces of the men, and throwing stones, some of which wounded a number of the Weccacoe Legion. The rioters—those who were armed—stood with vindictive looks, their right hands resting upon their hips or thrust in their breasts, as if prepared to shoot at the slightest provocation. Having received information that the piston-rod of the locomotive had been removed, and the fires drawn from the furnace, it was concluded not to essay the effort of taking out an engine; that was useless, and to incur a foolish sacrifice of life. The troops would have been at a great disadvantage, and had a conflict taken place, would have been severely handled. They withdrew from the vicinity of the round house when the condition of the locomotive was ascertained.

A body of strikers then offered the troops a special train to the east, if they would promise to leave. This was declined, however. Colonel Snowden finding, upon inquiry, that it was impossible to go west on account of obstructions to the road and inability to secure an engine, determined upon a feint, by going east, as if to Philadelphia, and upon reaching Huntingdon to go south and endeavor to make Pittsburgh from that direction, or await the arrival of reinforcements. Upon nearing Huntingdon, Colonel Snowden received a dispatch stating that the rioters had assembled there in force, and that the train on the road to Bedford had been overturned and the road completely blockaded.

Colonel Snowden then telegraphed to the superintendent of the Harrisburg division whether the troop could get to that city, and the reply came that transportation could not be furnished to that point on account of the condition of the mob assembled in the depot, and determined not to allow the troop to return. This mob, he was assured, numbered 3,000 strong, and was vowing revenge against the troops, because, as was reported, they believed them all pecuniarily interested in the Pennsylvania Railroad. In order to avoid any destruction to railroad property, which the superintendent thought would surely ensue if the troops came to the city, he refused to give them transportation. The command then traveled east, and dropped off at Bailey's Station, about twenty-three miles west of the State capital, and waited there for the 7.30 accommodation train (Monday morning) to proceed to Rockville. On the train they were joined by a number of General Lyle's men, who had returned from Altoona, the General remaining at that place, where he was ordered to await further orders. It would have been perfect folly for the troops to remain at that place a moment later than they did, owing to the inflamed condition of the strikers. It was upon a calm review of the situation that Colonel Snowden took the responsibility of coming eastward, after all his efforts to get to Pittsburgh had failed.

At Bailey's Station the men had no breakfast, and were in poor condition when they got to Rockville. Here the Philadelphia troops separated from the other soldiers on the train, and marching down the track, apparently making for the Harrisburg depot, but after tramping for a mile or so, they took the road to Englestown. It was necessary to keep the purpose of this movement a secret, even from the other soldiers who had determined to go direct to town. Some of the rioters soon learned that these troops had left the track, and it was surmised they had taken the Northern Central road, and were going by the city in that direction, and endeavored to intercept them.

The other troops took the track, and were captured, as we shall see farther on. In the meantime, however, Colonel Snowden, with all his men, and all their accoutrements and clothing, even to their heavy overcoats, took the Englestown road, and made a long circuit of about twelve miles to Progress, a village about two miles northeast of Harrisburg, and thence in a direct line marched to the State arsenal, thus completely deceiving the rioters, who had formed their plans with great care to capture the troops, who executed their movement without the loss of a single article belonging to the command, and reached the arsenal about five o'clock on Monday afternoon. From this time until the arrival of the Governor and the State forces, on their way to Pittsburgh, the situation at Altoona remained unchanged. The rioters held possession of the road, allowing no freight trains to pass, but making no effort to interfere with the passenger trains. The strikers at Harrisburg began their operations on the morning of Sunday, July 23d. About ten o'clock several railroaders, encouraged by a large number of persons, went to the locomotives of several freight trains, and demanded that the engineers and firemen should leave their engines. The demand was readily complied with, and as the railroad men descended from their engines they were greeted with loud cheers from their friends. There had been indications on Saturday night of a strike along the middle division, but the railroad authorities were unwilling to believe that trouble would take place. The interference with a freight train and the hooting and stoning out of soldiers who passed through for Pittsburgh from Philadelphia were attributed to irresponsible outsiders by them, but all their hopes were dispelled on Sunday morning at ten o'clock, when, at the command of several apparent strangers, the engineers and firemen of several freight trains descended from their locomotives after having housed them. All the freight trains were deserted. The round houses in the upper portion of the city contained about forty locomotives, and over twelve hundred cars were standing on the sidings in the same vicinity. The strike was general on the middle division, between twelve and fifteen hundred being affected by it. Of these four or five hundred were employed in Harrisburg, most of them in the Pennsylvania round houses. A crowd collected at the Pennsylvania depot early on Sunday morning, and by two o'clock in the afternoon it had swollen to several thousands. Many of them congregated out of idle curiosity, but a considerable number were attracted by a determination to interfere with the passage through the city of several hundred Philadelphia soldiers destined for Pittsburgh. It was also believed that among the military would be several companies of negroes, and against them numerous dire threats were made. The ammunition for the expected white troops had been got in readiness at the State arsenal, but it was deemed prudent, considering the excitement at Altoona and in the city, to countermand the order, and the ammunition was returned to the arsenal. Had any of the military arrived, it is highly probable they would have encountered considerable difficulty in passing through the city, the ringleaders in the strike having expressed determination to throw all possible obstacles in their way.

A meeting of three or four thousand people, many of them railroaders, was addressed on a common, a few hundred yards above the depot, by a man named Torbett, who justified the strikers in their course and predicted their triumphant success. He counselled them not to destroy railroad or other property. He intimated that if attacked by troops they had a perfect right, in self-defence, to strike back, as their brethren had done in the affray at Pittsburgh. Torbett spoke from the top of a box-car, and when he referred to the military he was loudly cheered. After the meeting the crowd surged toward the depot. About eight o'clock the day express east, detained nearly five hours by the car fire at Pittsburgh, arrived.

The crowd gathered about the train, and several persons detached the engine several times, when the railroad officials ordered the engine to be taken to the round house. The passengers were compelled to lie over at Harrisburg. On the train were about a dozen soldiers, who had grown tired of the service which they had rendered at Altoona. Quite a number of them were sick; and one of them, named Ballenger, a perfumer, of Philadelphia, who had been sunstruck, was taken to the Harrisburg hospital for treatment.

The principal arsenal of the State of Pennsylvania, containing a large supply of arms and ammunition of all kinds, is located at Harrisburg. The ammunition for the troops called into service by the Governor was being prepared there. In view of the threatening condition of affairs, it was deemed best to station a guard of city troops at the arsenal. This was done on Sunday, and the force was increased during the next day or two as rapidly as possible. By direction of the State authorities seven cannon, occupying a position in the Capitol grounds, were spiked, on Sunday afternoon, as a precautionary measure

During the day the Mayor of Harrisburg issued a proclamation, calling upon the people to desist from gathering in crowds on the streets, and to remain quiet until an amicable settlement of the troubles could be had; and requested the saloon-keepers to close their houses during the excitement. The proclamation was unheeded, and the Mayor attempted to address the mob later in the day, at the depot, he was rudely hustled aside. During Sunday and Monday the rioters had everything their own way at Harrisburg. The police force of that city numbered twenty men, and was too small to offer the slightest resistance to the mob. No violence was done by the strikers to property, because no resistance was offered to the will of the mob. The railroad officials promptly withdrew their trains where opposition to their running was displayed by the mob, and no effort was made to risk the company's property. The workmen in several of the large industrial establishments in the city stopped work and joined the strikers, who were also reinforced largely by the roughs and disreputable classes of the town. During the night an attempt was made to throw a train from the track as it was coming into Harrisburg by the Reading Railroad, with several companies of State troops, but the effort very fortunately failed.

On the 22d, the train men at Columbia, 103 miles west of Philadelphia, and an important point on the eastern division of the Pennsylvania road, joined the strike. All engines were housed, and no freight trains were permitted to move either way. During the day several attempts were made to get engines out of the round house, of which the strikers held possession, but the rioters boarded the engines, ordered the engineers and firemen off, and ran the locomotives back into the house. The excitement was very great and increased daily, the strikers, as usual, being joined by all the disreputable and dangerous characters of the place. On the afternoon of the 24th the rioters compelled a force of track men to suspend work, taking their picks and shovels from them, and marching them into the town like prisoners. They declared that if they were interfered with, or if troops were sent to Columbia, they would fire the railroad buildings and trains. The authorities were powerless to deal with the trouble, and no effort was made to disperse the rioters, who remained in possession of the company's property until the appearance of the Governor backed by a strong military force, induced them to cease their violence and return to their duty. Philadelphia, as has been said, is one of the most important points on the Pennsylvania Railroad. It is also the second city of the Union, with respect to population, and the chief manufacturing city of the new world. Several lines of railroad center there, and thousands of workingmen find employment in the various industrial establishments. Like all large cities Philadelphia contains a large class of vagrants and criminals, who would be exceedingly troublesome to manage in case of a riot of any degree of importance. It was certain that the strike on the Pennsylvania Railroad would extend to Philadelphia, and by no means sure that the employés of the other roads entering the city would not follow the example of the Pennsylvania men. It was therefore of the highest importance that measures should be taken at once to prevent the strike from assuming the character of a riot. As has been related, the President of the Pennsylvania Railroad, promptly called upon the city authorities for protection for the company's property in the city of Philadelphia, and the Mayor responded to this request by detailing a force of 150 policemen, for duty in the vicinity of the depot and yards of the Pennsylvania Company at West Philadelphia. The city military companies were sent to Pittsburgh on Friday, the 20th, and from that time the duty of protecting all the vast interests at stake in Philadelphia devolved upon the Mayor and police force.

Philadelphia was profoundly excited by the news from Pittsburg on the 22d. Until a late hour of the night, the streets were thronged with persons eager to learn the news from the scene of trouble. For the first time since the close of the civil war, the afternoon papers issued Sunday editions, which were quickly bought up, and read with the most painful interest. It was understood that the train men at the West Philadelphia yards would join in the strike, and there was a very general fear on the part of the citizens that the strikers would be thrown aside, as they had been at Pittsburgh, by the mob, and that Philadelphia might be the scene of a terrible outbreak. Such, indeed, would have been the case but for the admirable conduct of the Mayor and his subordinates, and the gallantry of the police force.

Upon the receipt of the news of the fighting and conflagration at Pittsburgh, the Mayor, who had established his head-quarters at the West Philadelphia depot, issued the following proclamation to the people of Philadelphia:

Whereas, Violence, tumult, and riot exist in various portions of this Commonwealth, to the great injury of domestic industry and trade, and to the discredit of the fair name and fame of American institutions and her form of government, the perfection of which we last year celebrated in this the city of the Republic's birth; and, *Whereas*, It is of the highest importance that the great name which Philadelphia has made for herself among the nations of the earth during the Centennial year shall be preserved, and that she shall be spared the horrible scenes enacted in our sister cities: Now, therefore, I, William S. Stokley, in the name of the Commonwealth of Pennsylvania, and by virtue of the authority vested in me by law, do appeal to all citizens, of every occupation and calling, to render it unnecessary that, in the performance of my duty, I should be called upon to suppress outbreak and violence, which I assuredly will do if the occasion requires it, and hand over the offenders to condign punishment. And I make this appeal in the firm belief that the citizens of Philadelphia appreciate, as I do, the importance of maintaining peace and good-will among all classes of society, and I hereby pledge myself to give a patient hearing, and to do impartial justice, as I best know how, to all persons who desire it. Let all the people resume and continue their lawful occupations, and avoid assembling and organizing together for discussion or otherwise at the present time. This is the surest and best means of preserving the honor and fair name of the City of Brotherly Love.

The Pennsylvania Railroad was not the only sufferer from the strike in Pennsylvania. The roads extending through the coal regions soon became involved in it. The first outbreak in this section of the State occurred on the night of the 22d of July. The militia had begun to assemble in obedience to the orders of the Governor, and some companies had started for Harrisburg, at which place they were ordered to report. To prevent them from reaching their destination a party of rioters, on the night of the 22d, set fire to the Lebanon Valley Railroad bridge over the Schuylkill at Reading. The bridge was entirely consumed and the direct communication between Reading and Harrisburg broken. The loss to the Reading Railroad Company by the destruction of this bridge was $150,000. On the 23d there was great excitement at Reading, and during the day the city was in a state of riot and disorder. The railroad men formed but a part of the disorderly throngs; the greater part of these crowds consisted of loafers, disreputable characters, and tramps.

The General Manager of the Reading Railroad appealed to the Sheriff to call out his posse to protect the railroad and the company's property. This the Sheriff declined to do. Little or nothing was done by the city authorities to check the disorder, and during the day the rioters had their own way. About nightfall a detachment of the 4th Regiment from Allentown arrived at Reading. The tracks being torn up, the soldiers were obliged to leave the cars and march to the depot. The main line of the Philadelphia & Reading road passes through Reading on Seventh Street. Penn Street is the main highway, running in an opposite direction from, and crossing Seventh Street at right angles. From Penn Street northward, for two squares, two lines of track are laid leading to the new depot. These are laid through a deep cut with a heavy stone wall twenty feet high on each side. From the moment of leaving the cars, the troops had been threatened by a furious mob. The officer in command, in view of the threatening demonstrations of the mob, decided that it would be better to march to the depot through the deep cut, the steep sides of which would afford better protection to his flanks than could be had in the open street. He therefore directed his march towards the cut, but the soldiers had scarcely entered it before they were greeted with a terrible volley of stones from the sides of the cut, where the greatest crowds had assembled.

Pistol shots were also fired at the troops. Upon reaching Penn Street the regiment was attacked by another mob and lost patience. One of the men, without orders, discharged his piece, and immediately the regiment fired a volley into the mob. By this discharge ten persons were killed and forty wounded. Many of these were innocent bystanders, as is generally the case. The mob scattered and fled in terror, and the troops marched into the depot, in which they took up their quarters. Guards were stationed about the building, and citizens were not permitted to enter it. The firing upon the mob by the 4th Regiment produced the greatest excitement in Reading, and the death and injury of so large a number of innocent persons intensified this feeling. The troops were severely denounced by the citizens, many of whom joined the mob, and were loud in their threats of vengeance, committing in their unreasoning anger the mistake for which the people of Pittsburgh paid so terribly. Still, as it was necessary to take prompt measures to check the mob, the city authorities, who were joined by a detachment of armed citizens and a number of the Reading Railroad Coal and Iron Police, commenced on the 24th to assert the authority of the law, and to put down the outbreak. During the afternoon the police officials were informed where the strikers had stored a portion of their ammunition, and the Chief of Police with a small detail of officers, proceeded to an unfrequented basement in a quiet part of the city, forced an entrance, and succeeded in capturing two large boxes of old-fashioned muskets that the strikers had procured from the relics of an old military company. The young man who had informed the police of the whereabouts of the muskets narrowly escaped death at the hands of an infuriated mob. The strikers admitted that they had plenty of arms, and the officials were ready to believe the boast. It was decided by the authorities, in consideration of the threats of the mob against the troops who had taken part in the firing of the previous night, to send them away from Reading, as the best means of avoiding further trouble. It was hoped that their places could be filled by several companies of the 16th Regiment from Conshohocken and Norristown, which reached Reading about ten o'clock on Tuesday morning. These troops left the cars about five miles below Reading, and marched into the city, taking up their quarters at the depot where they joined the 4th Regiment.

These new soldiers, having heard of the killing of the ten citizens, conferred with the representatives of the strikers, and it was not long before many of the Conshohocken military freely expressed themselves as being ready and willing to throw down their arms or give them to the rioters. One soldier remarked, "We are workingmen and we don't fight against workingmen. We want bread at home, but we don't want to rob our fellow-workingmen for it. No, sir; we came up here to protect property, but not to murder the poor men of Reading." Shortly after this many of these soldiers, arm-in-arm with the railroaders, were going about the back streets in a jolly state of intoxication. As they staggered along they made many threats of violence, and the citizens became intensely alarmed at the situation. People coming in from the country reported several of the roads lined with the soldiers, without their guns, walking home, in the absence of suitable railroad transportation. In other words, they were deserting. All these things helped to fan the flame of prejudice and excitement against the military that first arrived and then fired into the crowd. By half-past three o'clock in the afternoon the rioters had won over so many of the Conshohocken troops, and these were so open in their expressions of hostility to the 4th Regiment and of sympathy with the mob, that there was danger of a conflict between the two divisions of troops. To avert this danger, the authorities determined to send both divisions out of the city at once. Accordingly, at four o'clock, they vacated their quarters at the depot, and marched out of Reading by different routes to their homes. Reading was now entirely dependent upon the efforts of the local authorities. About nightfall a force of about 300 regular troops, with four pieces of artillery, who had been disembarked on the outskirts of the city, marched into Reading. Four companies proceeded to the depot, where they were quartered, and a battery of artillery occupied a commanding eminence on the southern section of the city and went into camp. The mob looked on in silence, not daring to utter a word of insult. On the 25th, the authorities feeling strong enough, determined to begin the work of repairing the railroad tracks and arresting the leaders of the riot. The police officials were astir at early dawn, and a platoon of thirty men, each of them armed with a Spencer rifle, accompanied them. This detachment formed a guard for at least a thousand men who were early at work in repairing the tracks torn up by the mob. This was successfully accomplished, and by ten o'clock all through trains from tidewater to the coal fields were running without molestation. Before twelve o'clock information was sworn to, implicating about one hundred and fifty men as being concerned in acts of incendiarism, intimidation, and riot. Arrests were steadily being made, and as fast as the officials brought their prisoners in, they were either taken to jail at once or admitted to bail. But one of the accused was able to furnish security. It was generally conceded that some one well-informed as to the plans and personality of the rioters had given the information upon which these arrests were made. The prisoners were pale, nervous and trembling when brought to the station. They were arrested in various saloons and on street corners, and in other haunts of disreputable people. They were placed in a closely covered van and hurrried off to jail in default of bail, followed by a large crowd. These arrests were made very quietly, for the purpose of maintaining peace and order, and preventing excitement.

For some days Reading was uneasy and excited, and arrests continued to be made by the police; but no further outbreak occurred, and the city gradually settled down into its accustomed quiet. On the 7th of August, the Coroner's jury, which had been summoned a day or two after the conflict with the mob to consider the cause of the death of the killed on that occasion, rendered the following verdict, in which substantial justice is done to the troops:

First. The said persons came to their death by a firing of the military upon the rioters.

Second. That the soldiers composing a portion of the 4th Regiment, Pa. N. G., numbering about two hundred men, while marching through the railroad cut along Seventh Street, were continually assailed with stones and brickbats from the time they entered the cut at Walnut Street bridge until they approached Penn Street, a distance of two squares, the assault becoming severer the further they moved, and being accompanied with pistol shots after they had reached Washington Street bridge; that during said march many of the soldiers were badly wounded by the missiles, some of them being knocked down two or three times. Notwithstanding an order from the commanding officer not to fire, a single shot from one of the military was a signal for others to fire, which soon became general. It would be expecting too much of human nature, especially on the part of untrained soldiers, to expect them not to fire under the fearful peril in which they were placed, and when once the firing commenced, the volleys of stone and pistol shots continuing, and being especially directed against their ranks, the inquest cannot censure them for the manner in which they acted.

Third. That the military were here as the representatives of public order, under directions of Major-General Bolton, who was doubtless acting under the State civil authority, said orders having been duly communicated to General Reeder, commanding the 4th Regiment, who was instructed to report to the Sheriff, Mayor or railroad officials. Having been met before reaching Reading by several officers of the railroad company, who informed him that the railroad depot was in possession of the mob, he left the cars, with command, at a short distance above the depot, and marched down the railroad to the depot. Upon reaching the depot and finding it in possession of the Coal and Iron police, but meeting neither the Sheriff nor the Mayor (the latter official being out of the city), he was requested by an official of the railroad company to move in the direction of Penn Street to release a passenger train then in the hands of the mob, and while complying with this request the firing of the military took place. It thus appears that under the evidence, so far as it has been laid before the inquest, that General Reeder, with his command, was acting within his instructions, and if any blame is to be attached to the action of the military, it must be borne by the superior officer in command.

Fourth. That while the deaths were immediately owing to the firing of the soldiers, who were at the proper place, under proper authority, where the disorder was raging, yet the responsibility for the terrible tragedy of Monday night is directly attributable to those who composed the lawless body assembled near the corner of Seventh and Penn Streets, who were instigating the riotous proceedings. While many were present not as inciting to riot, but out of idle curiosity, they, nevertheless, by their presence gave aid and confidence to the mob spirit who initiated the disturbance. The latter are the persons primarily responsible for all the subsequent trouble and bloodshed, and, if detected and arrested, should be held to the severest accountability.

Fifth. The absence of the Mayor from the city may be a sufficient excuse for the inactivity of the city authorities at the time.

Sixth. While on the one hand the testimony clearly shows that the Chief of Police was faithful in the discharge of his official duty, it is a matter of regret to the inquest that the testimony does not equally commend the Sheriff in the discharge of his duty; on the contrary, though telegraphed for early on Monday morning, 23d July, and having reached the city by special train, provided by the railroad company, at five o'clock A. M., he nevertheless made no attempt to provide for the preservation of the public peace, although earnestly appealed to and urged to organize a posse by a number of citizens during the day. It is well known that during the whole of Monday the city was under the power and in the control of the mob, whose progress was hourly gathering strength, and that therefore at noon Messrs. Wootten and Miller offered to furnish a sufficient number of men, with arms and ammunition, to constitute a posse comitatus, and suppress the riot if the Sheriff would give the authority for so doing. This offer was declined by the Sheriff, who significantly remarked that the mob also had arms. All that the Sheriff of Berks county did in this fearful emergency, after wasting the whole day in his office doing nothing at all, was to issue his proclamation, after five o'clock in the evening, calling upon citizens to remain at home. In conclusion thereof, or in accorddance with evidence presented, the inquest believes that the Sheriff, having neglected and refused to perform what was his obvious duty, is in a measure responsible for the events which followed.

From Reading the strike spread rapidly into the mining regions of Pennsylvania. Attempts were made by the miners at Pottsville and Shamokin, in the Schuylkill district, to bring on riots on the 24th and 25th, but were failures. At Shamokin the rioters were fired upon by the burgess and his posse, and dispersed. The citizens gave an unswerving support to the authorities, and the danger was averted. At Mauch Chunk an effort was made to induce the firemen and brakemen on the Lehigh & Susquehanna Railroad to join in the strike, but the majority of the men refused to leave their work. The Lehigh Valley Railroad men joined the strike on the 25th, and there was considerable excitement at Bethlehem. The trains were stopped, and the engineers and firemen forced to abandon their locomotives. On the same day the brakemen and firemen on the eastern division of this road, extending from Easton to Mauch Chunk, struck.

and blockaded the road. The Lehigh Valley men at Easton joined the strike during the night, and those at Wilkesbarre took similar action about the same time. This placed the entire line of the Lehigh Valley Railroad in the hands of strikers. All freight trains were stopped, and the strikers announced that while they would allow the company to carry the mails over its line, no passenger trains would be permitted to run. The railroad officials then gave orders to stop all trains, and to make no attempt to carry the mails. Bethlehem and Wilkesbarre were the centers of the trouble. The principal excitement was at the latter place. On the night of the 25th all the passenger trains were stopped at Wilkesbarre, but on the morning of the 26th some of them were permitted to depart, in order that the men employed on them might reach their homes. The strikers continued to hold the road until the last of July. The company then determined to run their trains in spite of the strikers, and on the 31st succeeded in getting a train through from Bethlehem to Mauch Chunk. They announced to their employés that their abandonment of their posts was virtually a withdrawal from the service of the company, and that their places would be supplied with new men. This was done in a great measure. Application was made to the Governor for assistance, and a force of State militia and regulars was ordered to protect the road. The strikers declared their intention to stop the trains, and on the 1st of August, the day appointed for the resumption of traffic, a large crowd assembled at the depot at Wilkesbarre, resolved that no trains should pass that point.

Scranton, the most important point in the coal region, was profoundly agitated from the first of the troubles. On the afternoon of the 24th the strike was begun by the employés of the Lackawanna Iron and Coal Company. As soon as the gong sounded at noon, the men, to the number of about 1,500, stopped work and struck, and all operations ceased in the rolling-mills, foundries and steel works. The strike was first declared in the old rolling-mill, at a given signal, and the men retired from the building, leaving the red-hot bars in the rolls, and the fires glowing in the furnaces. They then proceeded in procession to the company's steel works, where work was immediately suspended, and the employés joining the strikers, the entire party marched to the foundries and shops, where similar scenes were enacted. The men said that it was impossible for them to live on the wages they had been receiving, and on the 15th of the month their pay was cut down ten per cent. more. A meeting was held in the afternoon, and it was resolved to demand a restoration of the last ten per cent. reduction. On the night of the 23d, the men employed at the Meadow Brook Mines in the suburb of Scranton, struck for higher pay, about 300 of them turning out. At six o'clock on the evening of the 24th the firemen in the employ of the Delaware, Lackawanna & Western and the Delaware & Hudson Companies struck work. As soon as the bell in the round house denoted the hour of six, the men conveyed their engines into the yard, drew the fires from them, and left them in good order. A coal train which left Scranton at five o'clock was returned, and placed side by side with about twenty other trains laden with black diamonds in the yard. The firemen retired from their work peaceably, and in the course of conversations held with several of them, they declared that they would protect life and property with their lives if need be. Superintendent Manville answered the men in the employ of the Delaware & Hudson Company in the afternoon to the effect that the company would make no concession, and the firemen on that line struck simultaneously with those on the Delaware, Lackawanna & Western road. The men took all the passenger trains to their destinations, and as soon as they arrived at the depot the fires were drawn and the engines placed in the yards. It was announced by the railroad officials that no freight, coal or passenger train would run until the difficulty was settled. The strike was solely on the part of the firemen, and the engineers, conductors and brakemen were not concerned in it. The effect of the strike on the road was to prevent all shipments of coal, and to make the mines throughout the Lackawanna valley idle.

In view of the excitement prevailing in the city, the Mayor of Scranton, on the 24th, issued the following proclamation:

In view of the excitement throughout the country occasioned by the labor troubles and the lamentable loss of life and property in our own and other States, it becomes the duty of all good citizens to use their best efforts to preserve peace and uphold the law. Recognising, as every one must the unfortunate condition of the business, and financial interests of all classes of the community, and especially the hardship and suffering of the laboring men, we must yet unite in maintaining to the fullest extent the majesty of the law and the protection of life and property. I therefore earnestly urge all good citizens, and especially the workingmen themselves, to abstain from all excited discussion of the prominent question of the day. The laboring men of our city are vitally interested in the preservation of peace and good order and the prevention of any possible destruction of property. I trust the leading men among the workingmen fully realize that the interests of the whole city are their interests, and that any riot or destruction of life or property can work only injury to all classes and to the good name of our city. Every taxpayer will realize that any destruction of property will have to be paid for by the city, and would by so much increase the burden of taxation. In one day Pittsburgh has put upon herself a load that her taxpayers will struggle under for years. In conclusion, I again earnestly urge upon men of all classes in our city the necessity of sober, careful thought and the criminal folly of any precipitate action.

The excitement continued to increase, and, on the 25th thousands of miners flocked into Scranton, swelling the crowds about the depot, and adding to the danger. The strikers declared that they would allow the mails to pass unmolested, but would suffer no passenger cars to go through. The excitement increased to fever heat when the morning mail train from Binghampton, for New York, arrived at 9.50. The strikers were indignant to find that an express car and three passenger coaches were attached, together with the mail car. Exciting demonstrations were made at the various stations along the line, and at Great Bend, forty miles north of Scranton, a crowd of five hundred sought to detach the passenger cars, but were deterred by the engineers. On arriving at the suburbs of Scranton, the train was boarded by a number of the strikers, who, as soon as it reached within a few yards of the depot, cut off the passenger and express cars, and permitted the mail to pass. At the depot an excited crowd boarded the train, and the postmaster was about to put on the mails when informed by the railroad officials that the train would go no further unless the passenger cars were allowed to run. This decision caused much indignation among the strikers, and several uttered loud threats of seizing the engine and running the mail to New York, but wiser counsels prevailed, and a meeting was forthwith held on the platform, when it was resolved to telegraph the Governor and Postmaster-General, apprising them of the state of affairs, and disclaiming all responsibility on the part of the men for the detention of the mails, which were carried back to the post-office. The reply was awaited with anxiety, and the telegraph office and depot were crowded till noon, when a flag was flung from a window of the head-quarters of the strikers. It was a call for a meeting, and there was a rush for the hall at once, none but firemen and brakemen being admitted. A despatch from the Governor was read amid cheers, stating that he had instructed the Superintendent to allow the mails to run through. The men then prepared a statement for publication in the local papers, setting forth their grievances and the cause for their present action. They also adopted a petition, asking the saloon-keepers to close their places of business. On the same day the brakemen joined the firemen in the strike. The excitement was increased during the day by the action of the miners, who represented no less than forty thousand men in the Scranton district, asking an increase of twenty-five per cent. on their wages. A committee of six waited on the General Coal Superintendent, and presented a series of resolutions, setting forth the fact that the men had endured repeated reductions until their wages had reached a starvation standard, and that they did not propose to endure it any longer. They further stated that if the men on the railroad returned to work, they would hold out until such time as their wages were advanced. The Superintendent informed them that he would forward their petition to the company, and would have an answer for them on Friday. The men then called a mass-meeting in the woods, in the suburbs, for the afternoon of the 26th.

The strike of the miners introduced a new and dangerous element into the troubles. The miners, not satisfied with quitting work, refused to allow the pumps of the mines to be worked. The men who attempted to run the pumps, the work of which was necessary to keep the mines from flooding, were driven away by the strikers, and the engines were "shut down." The water was thus allowed to gain steadily upon the mines, flooding them, and injuring them to the extent of many thousand dollars. This wilful destruction of the property of their employers by the miners was simply suicidal. A despatch from Scranton, on the 29th of July, thus summed up the state of affairs: "The entire Lackawanna region is idle. Week before last this region sent nearly 150,000 tons of coal to market. Last week it did not send a tithe of that quantity, and next week it will not send any. The miners of the Delaware & Hudson Canal Company quit work yesterday morning, and those of the Pennsylvania Coal Company are in enforced idleness on account of the destruction of a head-house and bridge on their gravity railroad. The head-house, which was situated in the woods east of this city, was burned down at three o'clock this morning by a mob which surprised the watchman, and tied him with ropes to a neighboring tree. They saturated the wood-work of the head-house, and then set it off with a match. It made a fierce blaze, which was plainly visible here. Destruction of the head-house causes a complete stoppage from Hawley to Pittston. It was not the work of the company's employés, but of outside persons, who took that mode of forcing the strike upon them. The Pennsylvania Coal Company have recently been working on full time at their mines, and the best of feeling exists between themselves and their workmen. The latter are indignant at the dastardly act, and the prospects are that the burned property will not be replaced until the dispute between labor and capital is finally settled.

The watchman who was driven from the head-house states that the place was set on fire by no fewer than a hundred men, who danced about the blaze like demons, and shouted in fiendish exultation while the work of destruction was going on. Superintendent Smith states that the act will make the company's mines idle for an indefinite period. They were working on full time, and shipping 30,000 tons a week. The men in the company's employ had made no demand for an increase of wages, and the burning of the head-house is the work of outsiders, who wanted to force them into a strike. Not a mine in the valley is at work, and the most of them are filling fast with water. An idea of the importance of flooding a mine can be obtained from the fact that in 1868 the Diamond Colliery was idle three days for the repair of its machinery, and it took eight months, and cost $30,000, to pump out the water that accumulated in that time. The Mayor and company's officials will make an effort to-morrow to set the mine pumps to work. The situation here is absolutely painful, and there is no knowing what moment an outbreak will occur.

The Mayor was very active in his efforts to bring about an adjustment of the troubles, and succeeded at length in inducing the miners in the neighborhood of Scranton to allow the pumps to be run by the bosses, clerks, and civil engineers in the employ of the coal companies. This concession gave great offense to the strikers in the lower part of the county, and delegations were sent to the Scranton miners to put a stop to the practise. Efforts were made to settle the strike on the Delaware, Lackawanna & Western Railroad, and with success. On the 30th of July the men gave up the struggle, and returned to work at the old wages. This surrender was brought about by the action of the Mayor, who sent for the executive committee, whom he informed that travel would have to be resumed over the road the next morning, even if the presence of the troops were necessary to such a result. Accordingly the men called a meeting at one o'clock, when a decision was had in favor of returning to work by a vote of 82 to 9. The committee then proceeded to inform the Superintendent of the decision arrived at, the only terms asked being that no one taking an active part in the strike should be prosecuted. This he consented to, and in half an hour later a passenger train started from this city for Northumberland. It was greeted by crowds at every station along the line, but no demonstrations were made. A despatch was forwarded to Binghampton to start No. 4 train from there to New York, and it passed through Scranton uninterrupted at six o'clock. Passenger and freight traffic was now fairly established all along the line, and the bubble of the Delaware, Lackawanna & Western Railroad strike had burst. The railroad men were bitterly denounced for their surrender by the miners, who numbered between 20,000 and 30,000 men in the Lackawanna valley. The miners avowed their intention to continue the strike until their terms were accepted by the coal companies. They became more and more turbulent every day, and it at last became evident to the Mayor of Scranton that the presence of troops at that city was necessary. The Governor was informed of the state of affairs, and decided to go to the assistance of Scranton with a force of State militia and regulars.

Scranton continued to be troubled with the excitement arising from the miners' riot. In spite of the powerful protection afforded by the troops, the workmen returned to their duties in the various industrial establishments slowly, being rendered afraid to go to work by the threats of the miners who still remained idle. A letter from Scranton, written August 7th, said: The miners of this region manifest a most determined attitude, and from present prospects, it is safe to say, will prolong the strike in the Lackawanna and Wyoming valleys for six months, if no settlement is made. An important meeting of delegates from every mine in Luzerne County will be held here to-morrow to appoint a general Executive Committee, and adopt a programme for the purpose of securing perfect unity of action, so that the men at all the mines will resume work simultaneously whenever the time for resumption has come. A mammoth store was opened here to-day by the Miner's Executive Committee to relieve the immediate necessities of their number who are in distress, and it was speedily filled with provisions. Business men placed a dozen teams at their disposal, free of charge, for the purpose of receiving and distributing supplies, and the scene about the store was animated in the extreme. Farmers in the surrounding country have made them donations of potato patches, and many of the miners have gone off in gangs to do work in the country and receive pay in provisions.

The disaffection in the coal regions continued to increase, and assumed its most formidable proportions after the railroad troubles had been satisfactorily adjusted. By the middle of August nearly all the mines in the Lehigh, Schuylkill, Lackawanna, and other mining districts were idle, and more than sixty thousand men were out of work. The miners presented a general grievance, declaring that their wages were too low to enable them to live, and demanded an increase of from ten to twenty per cent. Though there were many isolated acts of violence committed in the coal regions, there was no general outbreak.

The New York Division of the Pennsylvania Railroad, the Central Railroad of New Jersey, the Erie Railroad, the Lehigh Valley Railroad, and the Morris and Essex Division of the Delaware, Lackawanna and Western Railroad, terminate at Jersey City and Hoboken, opposite New York. As the strike had affected all these roads to a greater or less degree, it was feared that it would break out in Jersey City. Tha tplace contains a large population of railroad men, and a much larger number of persons in the lowest walks of life who are always ripe for an outbreak. Lying just across the river from New York, a mob in Jersey City would be rapidly reinforced by the dangerous element of the metropolis. The authorities were resolved to be ready for the danger if it should come, and to meet it promptly and firmly. The strike on the western lines and the outbreak in Pittsburgh produced great uneasiness and excitement on the New Jersey roads, and the Governor was informed by many of the railroad officials that it might be necessary for them to ask the protection of the State for their property. The officers of the Pennsylvania road were especially apprehensive, as the trouble on their main line had been so great. Trouble from employés was not dreaded so much as from the turbulent populace. An influx of ruffians from New York was feared, and the character of such reinforcements to the mob justified the gravest apprehensions. During the night of the 22d, and the small hours of Monday morning, the Governor was in receipt of despatches from various points along the company's line, indicating approaching trouble at Trenton or Newark. These were afterwards learned to be premature, but they induced the Governor to issue orders to the various military commands of the State to assemble at their armories ready for service. By daylight the 4th Regiment had gathered, fully equipped, at their armory, adjoining the City Hall, Newark Avenue, Jersey City, and in halls close by. The 7th, 300 men, was at Trenton; the 9th, 350 men, at Hoboken. The 1st and 5th of Newark, 800 men, were at Newark. Forty rounds of ammunition were supplied to each man. General Mott, in charge of the brigade, had his headquarters at Trenton, and was in constant communication with Jersey City. When morning had fully come, it was felt that although the militia had possibly been called out rather hastily, yet it was not to be regretted. Jersey City's element of "roughs" seemed to have increased during the night. The men, who had come from unknown quarters, lounged near saloons and talked constantly about the strike. No threat was made, but citizens generally grew uneasy as the day advanced.

The first shadow of actual trouble was at nine o'clock, when one of the employés called upon the Superintendent, and said he was authorized to inform him that the firemen would strike about noon. The Superintendent expressed a wish that a committee of the men should wait upon him, an l a committee of six did so. He argued with them that enough had already occurred to settle whatever questions had caused the strike, and that any further action of employés was not needed in that direction. If they left their engines, the mob in New York and Jersey City would avail themselves of the opportunity to enact here the terrible scenes of Pittsburgh and Baltimore; for all of which they would be primarily responsible. His talk had great influence. The men resolved not to strike, but to continue work unless assailed by the populace. A meeting that had been called for eleven o'clock was not held, and the Superintendent, congratulating himself upon having such sensible men, felt assured that if he could prevent any demonstration from outsiders, he had attained his end. Towards noon and later the arrival of regular troops on their way to Philadelphia became known. A battery of light artillery with four field-pieces arrived from Fort Hamilton and passed down the freight-yard to be loaded upon the flats. This display made the loungers on the corners and in the vicinity of the yards imagine that precautionary measures on a gigantic scale were taking place. They began to feel their unimportance and grew more excited. There were perhaps 700 or 800 of these unpleasant persons at different railway crossings and at open places. The liquor, that the times are never hard enough to prevent them from obtaining, began to take effect, and they cursed the troops right bravely. And then they retired to the saloons for reinforcements. It had been the intention of the Chief of Police to close the rum-shops, but the order did not appear to be put into effect. About four P. M. everybody was very nervous, not excepting the authorities at police head-quarters. There they fell to work drafting a proclamation. While that literary business was in progress, the light artillery was made rea ly to start They occupied four flats with their guns, five cattle-cars with the necessary number of horses, and two or three passenger coaches with the men. To these cars were added another coach, and a baggage car contained forty-seven of the regular troops that had arrived between one and two from New London, Connecticut. They landed at the Adams Express dock, which is retired and not withiñ the ken of persons in the freight-yard. The engine that was to take the train stood in the yard, and some rough men gathered around threatening to shoot the engineer and conductors if they moved the train of troops. These officials naturally were frightened, and when it became generally known that threats had been made, all sorts of fears were expressed. A posse of seventy-five police were immediately brought out, and they pushed from the track a crowd, possibly of 1,500 men and boys. The men who had threatened the engineer disappeared. The train of troops was finally ready, and the Superintendent said it should go. The engineer still hesitated. No other engineer would consent to take his place. The others said they were not called upon to do any man's work except their own. At length the engineer consented to take charge of his engine if the Superintendent would accompany him. The Superintendent did not hesitate a moment. The Millstone way passenger train was also just ready to start. Two tracks were cleared, and with this passenger train between it and the mob, the military train left the station. The engineer was in his place. The two trains moved slowly down the track, side by side, faster and faster. Finally, while every one was expecting trouble, the military train shot quickly ahead, and the danger was over. The Superintendent came back to his post and arranged for the further transportation of troops. At six o'clock twenty-seven sailors from the United States steamer Colorado embarked for the Navy Yard at Philadelphia. They started on an hour and a half's notice. Their departure excited no demonstration. More troops arrived at half-past six from Newport. They comprised ten officers and 147 men of Batteries K, B, E, and F. They filled four coaches, and started at half past eight with a protection train on their exposed side. The train accompanied them only a short distance. At nine o'clock three batteries from Boston, numbering about as many men as the Newport detachment, arrived and departed without the least disturbance. At six o'clock in the afternoon the Governor issued the following proclamation: To the people of the State of New Jersey: In the present state of the public mind I warn all citizens to keep at their homes and places of business, avoiding all gatherings in the street, so as to give no encouragement by their presence to evil-disposed persons. Let every good citizen now, by word, act and sentiment, aid the authorities in securing perfect peace. Sheriffs and officers of cities are particularly requested to exert all their powers in a calm, judicious, but effectual way to protect life and property from all lawlessness, and thereby save the counties and cities from any liability under the statute for destruction of property by mobs. The whole power of the State will be used for the maintenance of the laws. I caution every person disposed to distub the peace to desist at once, and thereby prevent any necessity for the use of the State force. Given under my hand, at the City of Trenton, on this 23d day of July, A. D. 1877.

Meanwhile all schedule trains had started on time, with many through passengers. The incoming trains were somewhat late, having been detained at Philadelphia. All evening trains were shifted and shunted in the company's yards, the police keeping up their line from the station to Railroad Avenue. About nine o'clock some freight cars and way passenger trains were stoned while passing through the heavy cut, two miles from the station. A squad of police went out to the gap, and remained on guard until relieved by militia. Detachments of State troops were brought from Trenton during the afternoon, and posted at the bridge over the Raritan, at New Brunswick, and the bridge over the Hackensack, between Newark and Jersey City. These important bridges were strongly guarded throughout the period of the disturbance. During the night the shops of the Pennsylvania Railroad in the Hackensack meadows were guarded by fifty men. The next day this guard was relieved by the 5th Veteran Regiment of Newark. At Newark, New Brunswick and Trenton there was considerable excitement, but no effort was made to bring on a strike. The passenger trains were run as usual, and the freight trains which were discontinued in consequence of the troubles at Philadelphia, and other points on the main line of the road, were resumed as soon as the route beyond Philadelphia was clear. By the night of the 24th, the danger on the Pennsylvania road was over; there had been no strike of the employés, and the mob had found the civil and military forces so strong that they wisely decided not to attempt an outbreak. On the evening of the 25th, the firemen and brakemen of the Morris & Essex division of the Delaware, Lackawanna & Western Railroad joined the strike, which, as we have related elsewhere, had already begun on the main line of this road in Pennsylvania. The men were quiet and orderly, and attempted no violence. There was not much life in the strike, and on the 17th the men at the eastern end of the line agreed to resume work at their former wages, trusting to the company to increase their pay as the times improved. This offer was accepted, and the strike finally came to an end. The trainmen of this road at Phillipsburg, opposite Easton, Pennsylvania, did not unite in this settlement until some days later. The next road to join in the strike was the New Jersey Central. The trainmen on this road struck on the 25th, and stopped the running of the freight trains. The principal disturbance was at Phillipsburg, opposite Easton. The New Jersey Central men there united with the employés of the Morris & Essex road, and with them put a stop to the business of both roads. On both roads the strikers refused to allow the running of passenger trains. They stated that the mails might be carried over the lines in the postal cars, but no other cars should be run. The authorities of both roads thereupon refused to send out any trains until their roads were freed from the interference of the rioters. Though all the strikers refrained from any further violence than the stopping of the trains, and announced their intention of protecting the property of their roads, it was uncertain how long this state of affairs would continue, and was of the highest importance that the railroad blockade should be ended at the earliest practicable moment. Accordingly a strong force of troops, under Brigadier General Sewell, was sent to Phillipsburg. This force consisted of the 1st, 5th, 6th, and 7th New Jersey Regiments and the Hoboken Battery. The troops reached Phillipsburg on the 28th of July, and at once took possession of the railroad property there. A feeble effort was made to prevent the railroad officials from resuming the running of the trains, but was promptly put down. The presence of the troops, and the determined attitude of the authorities convinced the strikers that their efforts at resistance to the laws would be in vain. On the night of the 28th the Morris & Essex men ceased their interference with their road, and early the next week returned to work. The strikers on the eastern end of the New Jersey Central Railroad returned to duty about the 28th of July. They had little sympathy with the outbreak at Phillipsburg. Being thus isolated, and overawed by the military, the strikers at Phillipsburg returned to duty about the 1st of August. The troops were kept on duty for some days longer as a matter of precaution, but no further trouble was experienced in New Jersey.

The excitement spread rapidly westward, and following the line of the Baltimore & Ohio Railroad, soon reached the State of Ohio. At Newark, about thirty miles from Columbus, the Baltimore & Ohio Railroad crosses the Pittsburgh, Cincinnati & St. Louis, or, as it is more commonly called, the Pan Handle Railroad. Newark is a city of considerable importance, and one of the principal railroad centers of the State. On the 18th of July the brakemen and firemen of the Baltimore & Ohio Railroad at Newark struck work, and refused to allow the freight trains of the road to pass the point. All arriving trains were stopped, the engines uncoupled from the cars, the fires put out, and the engineers and firemen forced to abandon their posts. The strikers were quiet and orderly at first, the only violence being the throwing of a man from a camel-back engine for attempting to start the fires. The Sheriff of Licking county repaired to the depot, and, after reading the Riot Act, ordered the strikers to disperse. They refused to comply with his demand, and he reported the disturbance to the Governor of Ohio, and asked for a military force to enable him to preserve order. The Governor directed a regiment to repair to Newark to assist the Sheriff, and issued a proclamation commanding the strikers to desist from personal intimidation and interference with property. The troops reached Newark during the night of the 21st, and by the next morning were on duty at the railway depot and yards. The militia soon made it evident that they were in sympathy with the railroad strikers, so that it was by no means certain that they could be depended upon in case of emergency. The men of the Pan Handle road now joined in the strike, that road having become involved at Pittsburgh and at its western end; and during the 22d a large number of them reached Newark from Dennison. The miners from the coal and iron regions near Newark were in active sympathy with the strikers, and assured them of assistance whenever called upon. For the time the strikers attempted no violence at Newark, but contented themselves with blockading the railroads. A Committee was sent by the Newark strikers to Columbus, to induce the railroad men at that point to join in the strike. Meetings of the brakemen and firemen of the Baltimore & Ohio and Pan Handle roads were held on the night of the 22d at Columbus, and resolutions were adopted demanding a restoration of the old rates of pay. The strikers at once left their work to await the answers of their respective companies. Their demands were refused, and on the morning of the 23d a meeting was held at the Union depot for the purpose of enforcing the strike. A large gang of men gathered about the depot and yards early in the day, but it was observed that but few railroad men were among the crowd. The main body was made up of idlers, curiosity seekers, and a set of roughs and non-railroaders, who seemed to have suddenly come to the front. From the depot the mob hastened into the city, resolved to force the employés in the private establishments of Columbus to quit work. The rioters numbered between two hundred and three hundred men. The first place visited was a rolling-mill on the banks of the Olentangy. The employés were ordered to cease work. As there was a general disposition among the mill men to join the strikers, they easily obtained a promise that the mill would shut down as soon as the heat on hand was finished, which was done. The mob then went to the Smith Pipe Works, farther north, and commanded an immediate suspension. Some were in favor even of letting the metal in heating out of the cupola. There was a charge of five tons nearly ready to pour out, and had the threat been carried out, the hot metal would have fired the building and destroyed the fine property. The Superintendent sensibly told the mob he would shut down as soon as the heat was off. The crowd then left. Before night every establishment containing an engine, on the west side of the river, had been closed up.

The officials of most of the roads voluntarily closed the railway shops for the time, thus depriving the mob of the opportunity of compelling them to close. The through lines declined to receive freight, and freight houses were generally closed up. Brakemen and switchmen declared that they had nothing to do with the raids on private establishments, and did not approve them; but few railroad men were seen in the mob. The Mayor of Columbus, on the afternoon of the 23d, issued a proclamation calling on the rioters to disperse and cease their interference with private property. Several hundred special policemen were sworn in. The railroad authorities decided to make no efforts to run their trains until the strike had been put down by the civil authorities, and thus to give no provocation to the mob. The promptness with which the citizens enrolled themselves in the special police force and the determination exhibited by the State and city authorities to put down mob violence at any cost, greatly demoralized the rioters. On the morning of the 24th nearly all the manufacturing establishments that were forcibly closed on the previous day were reopened, the operatives returning to work on being assured of protection. Columbus was excited, but quiet throughout the day. On the 25th, the Governor issued the following proclamation: Owing to trouble existing between railroad companies and their employés great excitement exists throughout the State. Of this unfortunate state of affairs lawless and disreputable persons are taking advantage and endangering life and property. The civil authorities, State, county and municipal, as well as military, must and will everywhere exert their power to enforce the law in every respect. The good name of our people demands that this shall be done, and in no other way can the order which is absolutely necessary to public and private safety be maintained to avert all danger, and in order to successfully meet all resistance to the thorough execution of law I hereby call on law-abiding men of all our cities, towns and villages to tender their services to their respective civil authorities, and, under their direction and control, organize themselves into a volunteer police force sufficiently strong to overawe the lawless elements. I confidently expect all good men will respond promptly and cheerfully to this call.

Every effort was made to place the military force of the state in a condition for service, and the determination of the people of Columbus to allow no more mob violence was too plain to be mistaken by the rioters. No further disturbance occurred, and for days matters remained unchanged. The failure of the strikes at other points disheartened the strikers, and they made no resistance to the running of the trains on their roads. By the 2nd of August both the Baltimore & Ohio and Pan Handle roads had resumed their freight traffic. When it was certain that the strike was dead, the troops were withdrawn from Newark, and the Columbus companies were dismissed. Other parts of the State were affected by the outbreak. Zanesville, on the line of the Baltimore & Ohio Railroad, was one of the first to be plunged into the excitement. The train hands took part in the strike about the time it was begun at Newark; and on the morning of the 23d a mob of about two thousand men assembled in front of a new hotel in process of erection, and ordered the men at work on the building to stop. The demand was at once complied with, and the mob then visited in succession the various manufacturing establishments of the town, and compelled the workmen to abandon their posts, thus forcing over fifty establishments into idleness. The rioters also compelled the street railway company to discontinue the running of their cars. No greater violence was attempted, but the proceedings of the rioters thoroughly alarmed the citizens, and a vigilance committee, composed of about one thousand of the most reliable citizens of Zanesville, was organized and armed. They were placed on duty on the afternoon of the 23d, and at once began the arrest of such rioters as could be secured. Under their protection the street cars resumed their trips about three o'clock in the afternoon, and the mob slunk away. From this time Zanesville was quiet. The strike on the railroad was adjusted between the Baltimore & Ohio Company and its employés, and the mob did not venture again to raise its head.

Cleveland, on Lake Erie, is an important railroad point. The Lake Shore & Michigan Southern Division of the New York Central Railroad passes through it. This road engaged in the strike at an early period, the troubles along its line beginning at Buffalo. The strike quickly spread to Cleveland. On the morning of the 23d of July the men in the Lake Shore & Michigan Southern shops, to the number of 250 or 300, quit work, held a meeting, and addressed a communication to the Superintendent, embodying the following demands:

First.—An increase of twenty per cent. on wages received July 1st, and that such advance date from July 1st.

Second.—That assurances be given by the company that no employé shall suffer on account of his participation in the strike.

A Committee waited on the Superintendent, and were informed that he could give no answer until the matter was laid before President Vanderbilt, and that he would forward it immediately. Before leaving, the Committee assured him that no property should be destroyed, but that the men were determined that no work should be done in the shops until the demand was acceded to. These men had been receiving from nineteen to twenty-one cents per hour, according to skill, and were running on ten hours time.

The next move was by the hands in the freight depot of the Lake Shore road to the number of 225. Their demand was that the company should pay them $1.50 a day for ten hours work and $2 for the same amount of work on Sunday; that they be paid in proportion for overwork; that they be paid for the time lost by the strike, and that they receive their pay by the 15th of each month. These propositions were also forwarded to New York by the Superintendent. During the afternoon a meeting was held by the shop and freight men for the purpose of concerting action among themselves and with the train men already out at Collinwood. A Committee of ten was selected to confer with the brakemen and firemen and with others who might be on a strike. The meeting was orderly throughout, and when a political speaker of greenback and labor reform tendencies was noticed in the room, the President arose and said that they wanted nothing from the politicians, as the men were perfectly able to attend to their own business. Collinwood, a short distance from Cleveland, was the point where the Lake Shore trains were held. All was quiet there on the 23d, only an occasional pony engine being allowed to move along the track. The strikers preserved order and obliged others to do so. They compelled all the saloons to close, and permitted none of their men to indulge in liquor. The side tracks were crowded with freight cars and the round house was full of engines. A large number of stock cars had been unloaded, the sheep being driven into the country. The hogs were hauled to the yards near by, where a hundred died from lack of water. Cattle were driven on to Painesville, where the company could care for them. The men in the machine shops, with the train men of the Cleveland, Columbus, Cincinnati & Indianapolis Railroad, went out on strike on the 23d, as they were refused the increase of twenty per cent. which they demanded on Saturday. At noon the shop men held a meeting at their shops to receive any communication from the company in response to their demand and the establishment of a regular pay-day. None coming, they decided to strike, and when leaving were met by their President, who addressed them. He expressed regret at having been so long delayed at his office, and then explained that, as President of the company, he owed a mutual obligation to stockholders and employés, and that embarrassment must necessarily arise in adjusting matters so as to fulfil his duties to both. He blamed the difficulty on too much cutting of rates, and said that no one had done more toward a pooling of rates than he. A consultation was then held at which a compromise was made, the men receiving an advance of ten per cent. on and after August 1st, and working ten hours instead of eight hours; they, on their part, agreed to go back to work the next morning. The advance was to be general, benefitting the train men also. An effort was made by the Lake Shore men to induce the employés of the Atlantic & Great Western road to join in the strike, but the latter had the independence to refuse, stating that their relations with their company were satisfactory.

A letter from Collinwood, on the 24th, thus describes the state of affairs there: "Everything presents the appearance of a Sunday in a New England village at Collinwood, the little station where the Lake Shore round house and shops are located. There are no crowds, no threats—simply the men sitting around in small groups, arrayed in their holiday attire, talking over the situation. The men have been anxious of late to have the remaining cattle cars unloaded, but the yard-master of the Erie division has seemed to be very slow in doing this. They say that it is cruel to let the animals suffer. About five hundred and fifty cattle have already been driven to Painesville, and others will probably follow. A very large number of the animals have died. One car containing 1,500 fowls gives forth an almost intolerable stench. The dead hogs are being carted away to the soap factories, and many of them buried to avoid the plague that must soon follow if the dead animal matter is not removed. Great trouble arises from insufficient means of watering the cattle, and scores of them are constantly dying of thirst. There is, of course, much feeling against some of the officials of the road, the men saying that if the officers had treated them properly they would not have complained of the reduction. At the first meeting, held at ten A. M., the prospects of their propositions being acceded to were fully discussed. The sum of what was expressed was that President Vanderbilt cannot exercise his power here as he could in a monarchy. This is a republic, and the poor man shall have his rights and his family must be supported. Furthermore, there will be no trouble at Collinwood, no fights or arson if the militia is kept back; but the moment the militia is used in the support of monopoly then the laborer will no longer keep quiet. There is much feeling among the men over the question of passes. One man said: "Suppose I am ordered to run my train down to Cleveland; I get for this sixteen cents; but I must return here to report to my superior, and for that I must pay my fare of twenty-five cents." He felt that this was an unbearable outrage. Another grave complaint lies in the fact that the men are only paid while in actual service. For instance, if a man runs from Collinwood to Toledo, which would take a little more than a day, he would be paid for that; but he is liable to lie off there for three days without pay, although required to be ready to report for duty at any moment. In this way the small pay earned is entirely absorbed." Matters continued in this state until the last of July, when the strikes on the other roads having been settled, and it having become plain to the men that they could not carry their point, they ceased their interference with the movements of the road, and signified to the General Superintendent their willingness to return to work at the reduced wages. The Superintendent agreed to correct some local abuses in regard to extra pay and the granting of passes, and repeated to the Lake Shore men the promise to increase wages when the business of the road should justify such a step. By the 3d of August, business was entirely resumed by the Lake Shore road.

There was considerable excitement also at Cincinnati. On the 23d of July the trainmen on the Ohio & Mississippi Railroad joined in the strike, and prevented the passage of trains. The employes of the Cincinnati, Hamilton & Dayton Railroad having been informed that their wages would be reduced ten per cent. on the 23d, protested against the proposed reduction, and announced their intention to strike if it should be enforced. The authorities of this road thereupon reconsidered their decision, and the wages remained unchanged. This determination was announced to the men on the night of the 22d, and consequently they took no part in the strike. Cincinnati was greatly aroused. Mass-meetings were held in the market places on the afternoon of the 22d, and were generally attended by men who had no interests in the railroads entering Cincinnati. They were addressed by speakers of the communist stamp and the excitement was fanned to a high pitch. Cincinnati contains a large population of idle and vicious persons, who are always ready to join in an outbreak. A large part of the militia force of the city had been sent to Newark to hold the rioters there in check, and the preservation of order depended mainly upon the police and the better class of citizens. The morning of the 23d of July found Cincinnati in a feverish and dangerous state. The rioters, who comprised the worst elements of the place, had taken courage from the fact that they had not been interfered with, and had increased so rapidly that they now comprised a large and formidable force. By the afternoon they had become threatening, and had completely wrested the strike from the hands of the railroad men. Early in the afternoon a crowd of perhaps fifteen hundred, composed mostly of boys from thirteen to twenty-one years of age, and backed up by sullen, vicious-looking men, with their hands behind their backs, surrounded the Cincinnati, Hamilton & Dayton Depot. As the half-past two train was about to leave, a boy of not more than eighteen sprang upon the engine, which had not yet been coupled to the train, and pulled the throttle. The engineer, who was near by, jumped on the engine in time to save it from destruction. The crowd then demanded that he should come down, but he stood by his post until an order came from the President to run the engine into the round house and abandon all trains for the day. The mob headed by two or three villainous-looking men, then started for the machine and repair shops of the company to force the employés to quit work. At the rail shop they were met by an officer of the road, who asked them if they were railroad men or strikers. They answered, "No," but they wanted those shops closed up. The workmen at last yielded, against their will, and left the shop. The crowd then went through the yard, taking each shop in succession, and compelling the men to quit work. This was the nature of the strike on the Cincinnati, Hamilton & Dayton road. The company's employés declared that if they had been permitted they would themselves have driven back the mob and started the trains. A letter from Cincinnati said: "Loud condemnation is heard on all hands of the inactivity of the police, who have, so far stood by and watched the progress of the rioters without lifting a hand. The entire militia force of the city is two hundred miles away, and it is beginning to be felt that the only protection of life and property is to be found in vigilance committees and individual efforts by citizens. The demand for muskets and revolvers has been so great as to completely exhaust the stock of the gun stores. It is noticed that these arms are bought by the respectable part of the community. Bankers are beginning to fear raids upon their vaults, and anxiety is felt by the officials of the United States sub-treasury, where several millions in currency are locked up in old safes. Threats have been made by the communists that they will burn the great manufacturing establishments, and no one would be surprised if they were carried into execution. There are men in this city who were engaged in the pillage and arson at Pittsburgh, and they do not hesitate to say that they came here on the same mission. This afternoon the Mayor delivered a speech to the thieves and rapscallions at the Cincinnati, Hamilton & Dayton depot, entreating them not to burn and destroy. "What good would it do you," he asked, "to set fire to buildings?" "It would show that we are men," answered a voice in the crowd.

The early evening trains on the Indianapolis, Cincinnati & Lafayette road were stopped by uncoupling the cars as fast as the engineers attempted to pull them out. Thousands of men doing business in the city and living in the distant suburbs have no means of getting home to their families to-night. If the present condition of affairs continues, the old stage-coach will be brought into requisition for transporting mails and passengers. Business is almost entirely suspended, it being impossible to move goods in any direction."

At nightfall on the 23d Cincinnati was almost at the mercy of the mob. During the night a party of thieves and tramps, having no connection with the railroad strike, set fire to the bridge of the Ohio & Mississippi Railroad over Mill Creek. The alarm was quickly given, and the fire was put out. The rioters who had been engaged in the effort to burn the bridge then withdrew to a point on the river sufficiently remote to secure them from the interference of the police, and passed the night there. At early dawn on the 24th they seized all the milk and market wagons coming into the city by that road, and gutted them. The danger which threatened Cincinnati on the morning of the 24th was very great, and aroused the authorities to the necessity of taking more vigorous action than they had yet thought necessary. The officers of the various railroads running from Cincinnati, with the exception of the Ohio & Mississippi road, which was still engaged in the strike, determined to run their trains in spite of the mob, and accordingly armed their employés with revolvers and coupling pins. A number of these armed employés were placed on each train, and whenever a gang of roughs undertook to interfere with the running of the trains, they were met by the determined employés, who informed them that they could not succeed in their objects without fighting. The rioters did not choose to fight, and the trains were unmolested. The men of the Ohio & Mississippi road refused to join the rioters in plundering, and by this refusal greatly disheartened the mob. A meeting of the Police Commissioners was held in the morning, and a call was made upon the citizens to volunteer as special policemen. Large numbers of citizens responded to the call, and on every side a stern determination was manifested to make short work of the mob should the necessity for a conflict arise. The rioters were overawed by this determination on the part of the citizens, and gradually slunk away. By the night of the 24th the danger in Cincinnati was practically over. The city continued in a feverish state for several days longer, but no further trouble was experienced. A number of arrests of rioters were made by the police, and the mob was shown that the sternest measures would be used against it.

The strike on the Pittsburgh, Fort Wayne & Chicago road, which, began at Allegheny City, Pennsylvania, rapidly extended westward. At eight o'clock, on the night of the 21st of July, the trainmen of this company at Fort Wayne joined in the strike. The freight train, which should have left Fort Wayne for Chicago at eight o'clock, was made up, but the brakemen and firemen refused to go on duty. The engineer and conductor declined to take the train out without any crew, and the officials were unable to obtain substitutes for the strikers. Every employé of the company peremptorily refused to take their places. In a very short time a crowd of several hundred men had gathered at the railway station and proceeded at once to spike the switches. Squads were detailed to guard the main and side tracks extending through the city, to prevent the passage of trains. News of the strike spread rapidly, and soon the crowd swelled to several thousand. The employés of the Wabash and other railways appeared in force, and encouraged the strikers to persist, offering to render any assistance required. The excitement was quickly at fever heat, and the officials announced to the strikers their determination to run trains out at all hazards, and the men declared that no train should be moved from the city by any power less formidable than the United States troops, until the order making the ten per cent. reduction in wages was rescinded. Some of the general officers of the road attempted to turn the switches, but were driven away without accomplishing anything. They got on an engine and made repeated efforts to take the train out of the yards, but were forced to desist. One engine wiper, who volunteered to serve as fireman, was taken off the engine by the strikers and subjected to rough usage. Master Mechanic, Superintendents and Masters of Transportation were also compelled to dismount from the locomotive. The police made several ineffectual efforts to scatter the mob, and at two o'clock, on the morning of the 22d, the Mayor read a proclamation ordering the crowd to disperse and refrain from disorderly conduct and obstruction of traffic. He was hissed down. The proclamation was printed and circulated among the strikers, who paid no attention to it.

On the morning of the 23d of July the aspect of affairs at Fort Wayne was very threatening. About eight o'clock a large force of strikers visited the extensive shops of Pittsburgh, Fort Wayne and Chicago Railway, where 1,000 men are employed, and insisted that they should be closed up. The men said they would not stop work until they received orders from the officials, but they were threatened with force and succumbed. The shops were at once closed up, and the fires put out. Committees then went east and west on hand cars, and induced the section and trackmen for a considerable distance to stop work. These men came to the city in the afternoon, and added a very ugly element to the crowd already assembled. A rumor prevailed that all the railroad shops and manufactories in the city would be compelled to shut down, but they ran all day as usual without interference. In the afternoon the strikers held a large meeting, and made exorbitant demands of the railroad officials, stating that they would not resume work until the force was replaced as it existed prior to June 1st, both as to number and rate of wages, and insisting upon the abandonment of all classifications in the rank and pay of engineers. They also adopted an address to the strikers, which was printed and circulated, and had a good effect. The address was as follows:

Strikers—News from Pittsburgh and other railroad points of terrible sacrifices of life and property is something that should be justly considered by you all. The latest despatches show that a very small percentage of strikers are taking an active part in the great and terrible destruction of the company's property, but that it is mostly done by outsiders, who, by such acts, believe themselves practically expressing the wishes of the strikers. Your friends and co-laborers hereby desire to express the earnest hope, and will give their assistance, that you will, should any such thing occur here, endeavor, by every means in your power, to protect the property of the company in this city. You are perfectly able to bring about a compromise without violence, or suffer others to destroy the property of the company. To destroy property will positively not remedy the matter, but, on the contrary, cause a slow restoration of better times. Do your work justly, honorably, quietly and thoughtfully, and allow no disinterested persons to meddle with the properties you helped to create, and which stand as everlasting monuments to your skill, perseverance and energy. Do as you would be done by, and do not act in too great haste. If the company has been unjust in its demands upon you, settle it as peaceably as you can without allowing the destruction of railroad institutions, that—to a very great extent—constitute the future prosperity, life, comfort and pride of our city.

The City Council met in special session during the afternoon, and issued a call to the strikers to disperse. An extra police force of 200 men was ordered to be sworn in at once, which was done, and the Mayor was directed to close all the drinking saloons of the city. The strikers remained firm. They took possession of the depots, yards and shops of the company, and prevented the passage of all freight trains. At the same time they made arrangements to guard the company's property from injury or destruction. Up to this time the Pittsburgh, Fort Wayne & Chicago Railroad was the only road entering Fort Wayne which was affected by the strike. On the 24th, however, the train men on the Wabash and the Grand Rapids & Indiana Railroads demanded an increase of ten per cent. in their wages, and notified the officers of their respective roads that they would strike if their demands were not complied with. During the night of the 24th, Fort Wayne was ably guarded by large bodies of armed men, who were kept on duty to protect the railway shops, rolling stock and private manufactories. The strikers furnished guards wherever desired, and rendered all the protection to property which was necessary. At a late hour two gangs of drunken tramps, numbering from fifty to a hundred each, gathered at the stock yards and railway bridge across the St. Mary's river and made vicious demonstrations and ugly threats. The strikers, upon being apprised of this, sent squads of men on hand cars to disperse the mob, which they did most effectually, driving all of the tramps some distance beyond the city limits. The men were kept going on the hand cars all night to prevent the gathering of any more such assemblages. During the evening a large mob of section and track men from the Western division of the road, many of them under the influence of liquor, seized a number of hand cars and entered Columbia City, where the Pittsburgh & Fort Wayne Company was buiding a new depot, and compelled the men employed therein to stop work. These hands drank freely and soon became very riotous. They started for the city on hand cars, making threats of violence and incendiarism. A force of strikers, learning of the threatened invasion, took an engine and coach and went out and met the mob. The strikers were well armed, and they compelled the drunken rabble to turn back and abandon their intended invasion of Fort Wayne. The strikes in this as in other instances were uniformly on the side of good order, and saved the city from the serious dangers which menaced it. Passenger trains were still running on the Pittsburgh, Fort Wayne & Chicago Railway and were not molested. On the night of the 24th the strikers notified all of their number who desired to come from Crestline to Fort Wayne to get on the passenger trains, and if the conductors insisted upon collecting fare they were instructed to take possession of the train and run it to suit themselves. Their fare was remitted, however, by the conductors, and all difficulty was thus avoided. The officers of the Pittsburgh, Fort Wayne & Chicago Railroad made no attempt to move the trains of their road. They appealed to the Governors of the States through which their line ran for protection, and ordered the discontinuance of all trains. The strikers thereupon took possession of the road, and those at Allegheny City and Fort Wayne, acting in concert, ran the passenger trains with considerable regularity. On the night of the 25th a secret meeting of the strikers was held at Fort Wayne, which, among other things, determined to take formal possession of the road, and run it to suit themselves. The strikers selected three of their own number to fill the positions held by the Superintendent, Master Mechanic and Master of Transportation. These officials soon learned that it was the intention of the strikers to take possession of their offices and control the telegraph wires, and determined to hold their offices against any attempt to oust them. They obtained from the city authorities a strong guard of police for their offices, and made their preparations for resistance. The strikers, upon hearing of these preparations, wisely decided not to attempt the seizure of the offices, which would surely bring them in conflict with the civil authorities. They had practical possession of the road, and the seizure of the offices mentioned would have given them no real advantage. On the morning of the 26th a Committee of the Pittsburgh & Fort Wayne strikers left for Pittsburgh to confer with the railroad officers, having receved an invitation to do so. They were joined at Crestline, Alliance and other stations by Committees from those points bound on a similar errand. On the same day a Committee of twenty-two train men of the Wabash Railroad, which had been sent to Toledo to confer with the officers of that road, returned to Fort Wayne. A meeting of the Wabash employés was at once called, and the committee stated the results of their conference. They reported a very satisfactory interview with the President of the road, who had agreed to redress their real grievances and to advance their pay whenever the business of the Company would admit. The meeting was very stormy, one element desiring to go to extremes. Better counsels finally prevailed, and at noon the meeting adjourned, having decided to abandon the strike if the employés at other portions of the line would do the same. A Committee was appointed to go to Lafayette and Logansport to urge the cessation of the strike, but this was not necessary, as the men at those places telegraphed that they had decided to resume work as soon as the Company desired them to do so.

The collapse of the strike on the Wabash Railroad caused a perceptible discouragement of the Pittsburgh & Fort Wayne strikers, and they were from this time somewhat less defiant than before, though they declared themselves confident of bringing the company to their terms. The sentiment of the people, who were put to great inconvenience by the embargo on freight traffic and on travel, was turning speedily against the strikers. On the night of the 26th the citizens of Fort Wayne held a meeting, and pledged their support to the authorities in their efforts to put down the strike and place the railroad company in possession of their property. The Committee appointed by the Fort Wayne strikers proceeded to Pittsburgh, and had an interview with the officials of the road. The result was a refusal by the Company to grant the demands of the strikers, and a resolve on the part of the strikers to continue their movement. On the afternoon of the 29th an effort was made by the officers of the road to start a train from Fort Wayne. An engine was run from the round house into the yard, but the strikers gathered en masse, and took the engine back, having forced the engineer and firemen from their posts. The city authorities now demanded that the strikers should cease their interference with the railroad, but met with a stubborn refusal. Not being strong enough to enforce the law, a call was made upon the Governor of Indiana for troops. As has been related, the strike on the Fort Wayne road at Allegheny City, Pennsylvania, ended on the arrival of the Governor at Pittsburgh with troops. Seeing that they were powerless to resist the force brought by the Governor, the Allegheny strikers surrendered to the Company and ceased their interference with the railroad. This surrender greatly disheartened the strikers at Fort Wayne and at other points on the road. Towards the last of July many of the men began to withdraw from the strike, which they now saw was hopeless, and these desertions still further disheartened their comrades. On the 2d of August the Sheriff notified the men that troops were on their way to Fort Wayne, and that the blockade of the railroad would be raised the next day regardless of consequences. He advised them not to provoke a conflict in which their defeat was certain. A meeting of the strikers was then held, and the men decided that they would return to work, provided that the Superintendent would promise that no man should be removed for taking part in the strike, and that he would use his personal influence with the Board of Directors to have all the grievances of the strikers redressed. He readily gave these pledges, and the men thereupon abandoned the strike and reported for duty. From this time there was no further trouble on the Fort Wayne road. Other points of Indiana were also much excited by the strike. The Ohio & Mississippi Railroad runs across the southern part of Indiana. The strike extended rapidly along this road from Cincinnati towards St. Louis. On the 22d of July freight trains were stopped at Vincennes on this road, but passenger trains were not interfered with. No violence was resorted to by the men on this line, and after holding out for several days, the strikers, disheartened by the failure of the movement in other parts of the country, surrendered to the Company, and returned to duty. On the 23d the train men and shop men on the Vandalia Railroad struck at Terre Haute and other points along the road. The machine-shops at Terre Haute, employing about six hundred men, were closed. The strikers were quiet and orderly, and passed resolutions declaring that they would abstain from drinking intoxicating liquors during the strike. One of the principal centers of excitement was Indianapolis, the capital of the State. The strike began there on the 23d, and embraced all the lines entering the city. The freight trains were stopped, and on some of the roads only the mail and express cars were allowed to be taken over the line. The Indianapolis and St. Louis men stopped work on the 23d, and compelled all freight trains along the entire route to lie over.

On the 26th of July the Governor of Indiana issued the following proclamation: Many disaffected employés of the railroad companies doing business in this State have renounced their employments because of alleged grievances and have conspired to enforce their demands by detaining trains of their late employers, seizing and controlling their property intimidating their managers, prohibiting by violence their attempts to conduct their business, and driving away passengers and freight offered for transportation. The peace of the community is seriously disturbed. By these lawless acts every class of society is made to suffer. The conduct and happiness of many families not parties to the grievances are sacrificed. A controversy which belongs to our courts or to the province of peaceful arbitration or negotiation is made the excuse for an obstruction of trade and travel over chartered highways within our State; the commerce of the entire country is interfered with, and the reputation of our community threatened with dishonor among our neighbors. This disregard of law and the rights and privileges of our citizens and of those of sister States cannot be tolerated. The machinery provided by law for the adjustment of private grievances must be used as the only resort against debtors, individual or corporate. The process of the Courts is deemed sufficient for the enforcement of civil remedies as well as the penalties of the criminal code, and must be executed equally in each case. To the end that the existing combination be dissolved and destroyed in its lawless form I invoke the aid of all law-abiding citizens of our State. I ask that they denounce and condemn this infraction of public order and endeavor to dissuade these offenders against the peace and dignity of our State from further acts of lawlessness. To the judiciary I appeal for the prompt and rigid administration of justice in proceedings of this nature. To the Sheriff of the several counties I commend a careful study of the duties imposed upon them by the statute which they have sworn to discharge. I admonish each to use the full power of his county in his preservation of order and the suppression of breaches of the peace, assuring them of my hearty co-operation, with the power of the State at my command, when satisfied that occasion requires its exercise. To those who have arrayed themselves against government and are subverting law and order and the best interests of society, by the waste and destruction of property, the derangements of trains and the ruin of all classes of labor, I appeal for an immediate abandonment of their unwise and unlawful confederation. I convey to them the voice of the law, which they cannot afford to disregard. I trust that this admonition may be so promptly heeded that a resort to extreme measures will be unnecessary, and that the authority of the law and the dignity of the State, against which they have so grievously offended, may be restored and duly respected hereafter.

The Indiana Central, Lafayette & Illinois, and Bloomington & Western Railroads were being operated at the time of the strike by receivers appointed by the United States Circuit Court. The Judge ordered the United States Marshal to protect these roads against the interference of the srtikers, and it was announced that the force of United States troops quartered in Indianapolis would be used, if necessary, to enforce the orders of the Court. The necessity for employing force never arose, however. The failure of the strikers in other parts of the country, and the manifest determination of the citizens to uphold the authorities in their repressive measures, disheartened the strikers. Throughout the whole movement all the strikers refrained from violence, and so avoided a conflict with the civil authorities. After holding out for a few days they began to show signs of weakness, and gradually surrendered to their respective companies. By the 1st of August, the trouble was over, and Indiana was at peace again. The roads had resumed their business, and no further interruption with them was experienced.

Chicago was quickly affected by the strike. The city contains a large and well-organized party of socialists and communists, who on several occasions had manifested an unruly disposition and a determination to bring on a riot whenever a favorable opportunity should occur. For some weeks previous to the railroad strike these men had been preparing for a public meeting, after which they intended to march in procession to the City Hall and demand of the Common Council the collection of the back taxes due the city, and the employment of all the unoccupied laborers by the municipal authorities. The certainty of the railroad strike reaching Chicago gave the communists very great encouragement. Meetings were held in various parts of the city, on the 22d of July, and were roused to fever heat by the news of the terrible outbreak at Pittsburgh. The communists seemed to scent, in the general uneasiness that prevailed, their opportunity for plunging the beautiful Lake City into anarchy and ruin. The Workingmen's Party, a communist organization, issued the following addresses to the workingmen of the United States:

COMRADES:—In the desperate struggle for existence now being maintained by the workingmen of the great railroads throughout the land, we expect that every member will render all possible moral and substantial assistance to our brethren, and support all reasonable measures which may be found necessary to them.

COMRADES:—We call your attention to the following questions, believing that the measures suggested will, if adopted, solve the difficulty now pending on all the great railroad lines of the land: *First.* Proper steps should be taken by the national government to enable it to take possession of and operate all the railroads and telegraph lines in the country, as is now done in all the more advanced countries of Europe, thus destroying the present and most powerful monopoly of modern times. *Second.* The establishment in every State, and by the national government, of an eight hour work day—thus employing all the idle workmen wherever increasing numbers, constantly added to by the rigid introduction of labor-saving machinery, is a constant menace to all those fortunate enough to have employment, and must invariably reduce wages to a rate consistent with the standard of living. The most ignorant and uneducated workers whose labor can be utilized.

It was hoped by the communist leaders that these documents would bring them large reinforcements from the genuine working classes. Throughout the 22d of July great uneasiness and anxiety prevailed among the citizens of Chicago. All were apprehensive of the effect of the excitement upon the poorer classes of the city, many of whom were sympathizers with the communists. The Mayor remarked that he did not fear the Irish or Germans, but the large class of half-savage Bohemians who inhabit the lumber district of the city, along the south branch of the river. These men work for fifty cents a day, are thoroughly imbued with communistic ideas, and are ripe for anything. Meetings were held during the day by Michigan Southern, Rock Island, Chicago & Northwestern, and Milwaukee & St. Paul Railroad men, but their proceedings were kept secret. "No one knows what took place," says a letter from Chicago, "but from expressions gleaned among the men to-day, it seems that they passed resolutions of sympathy for their striking brethren East. The excitement continued during the 23d. The streets were thronged with people hurrying from point to point in search of news, and spreading the most alarming rumors. The railroad men appeared to be the most quiet class. The citizens had little fear of them, their dread as on the previous day, being excited by the communists. The city authorities, in the meantime, were quietly but rapidly preparing to deal with the mob. It was decided, if a conflict did come, to put down the outbreak at once and with vigor. Muskets were sent to the various station-houses for the use of the police, and three pieces of cannon were placed in charge of an artillery company organized for the purpose. The militia regiments of the city were ordered under arms by the Governor and were directed to assist the municipal authorities whenever called upon.

On the night of the 23d, a mass-meeting of the "Grand Army of Starvation," as they styled themselves, was held in Market Street. Ten thousand persons were present. At eight o'clock the crowd began to gather, and a little later the torchlight processions from the various divisions of the city arrived, amid the deafening cheers of the crowd. Stands were at once improvised and speakers supplied in quick succession. Six men addressed the crowd at once in English and German, and in the most inflammatory language. The speakers openly appealed to the multitude to rise and follow the example of their brethren in the East. Said one of the men: "We, laboring men, have common cause with the railroad strikers at Pittsburgh, and we must rise up in our might, and fight for our rights. Better a thousand of us be shot down in the streets than ten thousand die of starvation." The meeting broke up at half-past eleven, after resolving to meet at the same place the next morning at ten o'clock, to sign the platform of the Laborers' League. They left without disorder, carrying their banner bearing such inscriptions as "We want Work, Not Charity;" "Life by Work, or Death by Fight." It was evident, on the night of the 23d, that the dissatisfaction of the railroad men was approaching a crisis. On the morning of the 24th of July, it culminated in a general open strike of the railroad hands. Early in the morning the employés of the Michigan Central Railroad sent a Committee to the officers of that road and demanded the restoration of their former wages. The General Superintendent refused to accede to their demand, and the Committee withdrew. The employés of the road at once stopped work and joined the strike. The Company made no effort to send out any trains during the day, and consequently there was no disturbance. At nine o'clock the freight men on the Illinois Central, who work in and around the yards, quietly stopped work. They were the switchmen and helpers who make up the trains, numbering about twenty-five; the laborers who handle freight in the freight houses, numbering about one hundred, and the men who pick, assort, and store the freight in the cars, numbering about forty. They were incited to strike by a delegation from the Michigan Central, and by the general feeling of dissatisfaction at the reduction of pay which pervaded every class of railroad employés. The strike was orderly, and the men exhibited no ill disposition, save in exceptional cases. The first action taken by the freight men was the informal appointment, by general consent, of a delegation of four from the switchmen and train-makers to call upon the Master of Transportation, and ascertain whether the wages could not be restored. He received them pleasantly, and talked to them fairly and squarely. The men acted reasonably and like men. They said that they represented only the switchmen. On July 1st a special reduction, not extending to other employés, had been made in their pay, and they felt that injustice had been done in making them specially subject to a decrease in salary. They had been called upon to join in the general strike, and they now wanted to know whether, before doing so, a restoration might not be promised. If not, they would have no reason to give the other strikers for not joining them, and so would be forced into the revolt. The delegation claimed that these reductions had been made only on the men they represented, and thus they considered unfair. It was explained that it was a mistaken idea that unequal reduction had been made by skipping certain departments, leaving them undisturbed. Of course, if the men wished to strike, he could not prevent it, and, though he deplored such an action and hoped they would try to prevent it, and preserve the harmony which had always existed, yet, if they did stop work, he would shut up the freight houses at once. The Committee left dissatisfied, however, and went out and reported to the men, who started immediately to go to the Michigan Southern yards to consult with the men there. The result was the visit of another delegation to the officials, which was more unsatisfactory than the first.

The crowd, composed of some 500 Michigan Central and Illinois Central men, then started in procession to visit the other yards and enforce a strike. They proceeded first to the Baltimore & Ohio, where the men fell in readily and without much persuasion. The crowd of howling men and boys then marched to the Rock Island yard, between Fifteenth and Sixteenth Streets, where they took the men off their engines and told them they must quit. The mob shut the water off the tanks, and when everything was fixed to suit them, they started for the Chicago, Burlington & Quincy. Here the men did not offer the most feeble resistance, but left their engines and switches at the word of command from the mob. The agent of the Rock Island freight house shut the doors at their approach, but was soon compelled to open them again. The crowd visited the Chicago & Alton freight depot, but were met by the men of that road who had quit the Company, having stopped the traffic, both passenger and freight.

The numerous outrages of the mob warned the civil authorities to be on the alert, and every effort was made to prepare for an emergency. The First and Second Volunteer Regiments and the Ellsworth Zouaves were held in readiness at their armories; the Grand Army of the Republic prepared to turn out with full ranks whenever called upon; and a large number of special policemen were sworn in and armed. The Mayor issued the following proclamation:

Whereas, The railroad troubles and strikes which have taken place in several of the large cities in the country have, in most cases, been attended with incendiarism and plunder; and, whereas, some of the employés of a few of the railroads in this city have struck for an advance of wages, and have been joined by the operatives in some of our factories; and, whereas, it is feared that the bad and vicious element in this community will seize this as a favorable opportunity to destroy property and commit plunder; therefore, I, by the authority vested in me as Mayor of the city of Chicago, call on all good citizens to aid in enforcing the laws and ordinances, and in suppressing riot and other disorderly conduct. To this end I request that the citizens organize patrols in their respective neighborhoods, and keep their women and children off the public highways. Proud of the deserved reputation of all classes of our people as law-abiding citizens, I trust and believe no act will be suffered or permitted by any of them now which would disgrace us in our own estimation and that of the country at large. The workingmen must remember that all industries are suffering from financial depression throughout the country, and that acts of violence, instead of tending to rectify their wrongs, will tend to deprive them of all sympathy. The city government has made ample preparation to protect the lives and property of all citizens, and any lawless acts will be promptly detected and punished.

This was followed by a second, closing the liquor saloons of the city, as follows:

Whereas, The public mind is unduly excited owing to rumors of strikes, and the fact that some excited and bad men are congregating and endeavoring to promote confusion and disorder, and deeming it for the best interests of our citizens of all classes that no cause be given or permitted to influence passions or prejudices; therefore, by virtue of the power and authority vested in me as Mayor of the city of Chicago, I hereby order that all saloons in the city be closed, and that no liquor be sold by any licensed saloon keeper or others from and after six o'clock P. M. of this date until further notice, under penalty of the law and forfeiture of license. All patrolmen and policemen are hereby instructed to see that this order is promptly and vigorously enforced.

On the same day, the Governor of Illinois issued a proclamation, in which, after reciting that troubles were occurring in certain States, he called upon the people to aid in maintaining the peace; enjoined vigilance upon Mayors, Sheriffs and others in authority in suppressing violence, and declared all these questions must be regulated by ballots instead of mobs. The merchants of the city also armed their employés and made preparations to defend their establishments against the mob. "The strike," said a Chicago letter, written on the 25th, "has brought business at the banks to a complete standstill. The Express Companies are unable to receive currency for shipment, hence the city banks are unable to respond to the calls of country institutions for funds. The impossibility of obtaining currency from New York is also inconvenient, and places some of the banks who had previously telegraphed there for funds to be forwarded by express, in an awkward position. Exchange is virtually unsalable from the fact that it is deemed useless to remit East with the expectation that it will go through.

The police and the mobs have met face to face about one dozen times. On Twenty-second Street, which penetrates the lumber districts, two skirmishes occurred. The police were attacked with stones, clubs, and missiles of all kinds, but they did not lose their temper nor their patience, and bloodshed was avoided. They have been provoked to the very verge of madness several times during the day; many of them have been hurt severely with clubs and stones, but they have obeyed orders and behaved admirably. At noon on the 25th, the aspect of affairs seemed so threatening, and the size of the communist mob appeared to be increasing so rapidly, that the Mayor issued a proclamation asking all good citizens to organize themselves into safety guards in their respective wards, called upon all to respect the laws, and asked aid and encouragement for the military companies then under arms. This was followed soon after by an address signed by the Mayor and a number of the leading merchants, bankers and journalists of the city, calling for a grand mass-meeting at the Tabernacle at half-past three P. M. At this meeting there were fully sixty thousand business men present, and a resolution was adopted approving the course of the authorities, and standing by them in their efforts to preserve the peace. A special meeting of the City Council was also held, and a resolution was adopted giving the Mayor plenary powers. The merchants held meetings in different parts of the city at night, for the purpose of effecting an organization. The strength of the mob was variously estimated at from 25,000 to 40,000 men. During the night they caused serious trouble. A mob gathered at the Chicago, Burlington & Quincy round house soon after dark, and began to put out the fire in the engines. For nearly an hour they stoned the building and crowded around the yards, when all at once a squad of police that had been summoned rushed up and were met by a volley of stones. The officers drew their revolvers and fired on the mob, which retreated at the first fire. Three men fell; one was carried away by the mob. It is said that sixteen were wounded by the firing, which lasted ten minutes. The officers at length exhausted their cartridges and charged upon the crowd with their clubs, when they retreated. Soon after the squad retired the rabble returned and stopped the street cars on the Halstead Street viaduct, stoning the inmates until they alighted. One car was torn to pieces, and the others taken to the stables. The rioters next broke into a gun shop, completely gutted it, taking away fifty breech-loading shot guns, one hundred and fifty revolvers, and several kegs of gunpowder. They then passed off south toward Bridgeport, and gave no further trouble during the day.

During the afternoon, a strong force of regular troops arrived from Chicago from the far West. The prospect was so threatening that it was deemed best to hold them at Chicago.

Chicago was profoundly excited on the morning of the 26th of July, and it was generally felt that the day would not pass without a serious conflict with the mob. The rioters called themselves workingmen, but they were generally loafers and bummers who never did an honest day's work. The leaders were communists. But few honest workingmen were found in the crowd, and the railroad men could scarcely be seen in it. About nine o'clock in the morning a meeting of self-styled workingmen, mainly made up of roughs and loafers, was convened at Turner Hall, within a block and a half of the police station. Nobody seemed to know what was going on, but it was understood that certain carpenters and cabinet makers, representing, or claiming to represent, their respective trades, were gathered there for conference. The mob began to gather, and surged up and down on the sidewalk and in the street, a howling, yelping mob of irresponsible idiots. They talked of what they were going to do, and how they had gotten things all their own way, every language except Chinese being used. The communistic element was largely represented, many of the lowest class of Poles and Bohemians being on hand. About ten o'clock a body of twenty-five policemen appeared on the scene. As they neared the surging crowd, the hooting and yelling became terrific, and the mob began to pelt the officers with bricks, stones, and other missiles. The police stood the attack quietly for a few minutes; but this encouraging the mob to greater violence, a charge was ordered, and the men turned upon their assailants, hitting right and left with their clubs, and hitting to hurt. Outside the police station was another detachment of officers, numbering about a score, who speedily came to the assistance of their comrades. There was a very lively fight for a few minutes, but discipline and organization proved too much for the rioters, who were soon put to rout. The police, having disposed of the outsiders, forced their way into the hall. In the second story they found a panic-stricken mob of perhaps one hundred and fifty, who, in their frantic efforts to escape, ran hither and thither like rats in a pit. Many jumped from the windows, and so gained the street, but some seized chairs and other pieces of furniture, with which they attempted to defend themselves. A good many were hurt during these operations, but none fatally, and only one of the special police received any damage. He was led back to the station, where it was found that, aside from a cut on the head, of no great depth, he was all right, and he remained on station duty during the day. The crowd spread itself over the neighborhood, many of the rioters having received a lesson which will lead them to respect the police a trifle more in the future. While the rioting about Turner Hall was in progress, a crowd of boys and roughs gathered about the Halstead Street viaduct. The street cars were stopped, and for some time it appeared as if the roughs were to have everything their own way. A detachment of twenty-five policemen sent to disperse them was received with stones and revolvers. The police returned the fire with good effect, knocking over several of the rioters with their bullets. But the crowd, being constantly swelled by reinforcements, maintained their ground. Stones were thrown at the police from the roofs of houses and from alleyways. Having exhausted their ammunition, the officers at length retired, the mob following, hooting, yelling, and throwing stones. On meeting with a detachment sent to reinforce them, the police turned, and made a vigorous charge on the rioters, and scattered them in all directions.

This defeat by no means disheartened the mob, and they gathered again at the Halstead Street viaduct. By eleven o'clock they numbered fully ten thousand men and boys. The undecided peacefulness of the horde had vanished; their numbers seemed to inspire them with the valor of savages; and it was evident that they were bent on violence, and would hesitate at nothing. The north approach to the Halstead Street viaduct, and the structure itself, were black with the mass of rioters. The aspect of affairs was so threatening that a strong body of police was sent to the viaduct with orders to disperse the mob. The moment the rioters beheld the approach of the police, who marched from the Harrison Street station, they broke indiscriminately and fled to the other side of the viaduct, howling like fiends. The police broke into a run, and pursued them, firing as they ran. A counter charge was made by the rioters in an attempt to pass the police on the viaduct, in order that there might be a force of desperadoes on each side of the beleaguered peace defenders. The scheme was promptly and creditably frustrated by a free use of the baton and a display of pistols, from which blank cartridges were fired. The mob then pitched itself headlong down the descent across Sixteenth Street, and a similar crowd went east, in the direction of the Chicago, Burlington & Quincy freight houses. There was a brief moment of inactivity; during which the police formed in line and prepared for a charge. This was the signal for a shower of stones, pistol shots and other missiles. For a little time the wildest disorder prevailed, and it was evident that the police were just a little alarmed, as well they might have been, at the overwhelming force arrayed against them. For half an hour the discharge of weapons was kept up at short intervals, in reply to stones that were being continually pelted down from all sides. With every moment of delay, during which the rioters were unharmed, the belief grew in their minds that the police were not firing bullets, and they began surging near a central focus. Several times did a few of the more daring attempt to break in upon the police, and each time they were successfully repulsed. The police had now but a few rounds of ammunition left, and it was evident they could not stand their ground much longer unless reinforcements came. Seeing that the rioters were again closing in on his men, as if they knew they could not fire many more times, the Sergeant gave the order to his men to fire off rapidly all the charges they had left, and at the same time to withdraw across the viaduct towards the station. The order was obeyed, and the police having exhausted their ammunition, formed in line, and started back across the viaduct. The tremendous crowd of maddened roughs at once started in hot pursuit, throwing volley after volley of stones, which fortunately failed to do any damage. The police attempted to guard their retreat at first, but soon found it absolutely impossible, and they turned and fled. The chase for life and death was one of the wildest excitement. The vast throng hung closely upon the heels of the police, and did not cease to pursue till the latter arrived at Fifteenth Street. The position of the police was now critical in the extreme. The rioters were pressing them hard, and unless assistance should come it was plain they would never reach the station. At this moment, however, a cheer was heard, and a body of veteran cavalry dashed into the street and rode rapidly at the rioters. This force was followed by several large wagons, bearing reinforcements of police. These came up on a run, and the men dismounted and joined their comrades, who had made so gallant a stand against the mob. When the rioters saw the cavalry and reinforcements of police, they turned to retreat. Then began the most destructive scene of the morning. As they ran the police began firing. One of the mob was shot through the brain and instantly killed; another was killed by a projectile hurled by one of his own party. The police used their clubs effectively, sparing no one. The police made no attempt to cross the viaduct a second time, but stopped a little northward.

The cavalry pushed on over the bridge and drove back the rioters. During the remainder of the day the cavalry were kept on duty in the vicinity of Halstead Street, breaking up crowds wherever they would collect, and capturing rioters, over one hundred of whom were sent to the station houses. About eleven o'clock orders were received by the Second Illinois Regiment to proceed at once to the scene of disturbance. The men were instantly gotten under arms, and the regiment set out on the double quick for Halstead Street, accompanied by two pieces of artillery.

During the day additional companies of regular troops arrived. The regulars were posted at various points in the city which were believed to be in danger. The Second Illinois Regiment was kept on duty at the Halstead Street viaduct, and the First Regiment was stationed close by. Parties of cavalry and police patrolled the city during the day, making many arrests. The rioters did not dare to gather in force again, but small crowds constantly assembled on the streets as fast as broken up, and while no effort was made to oppose the troops with force, the rioters vented their rage by cursing them roundly. Several minor encounters took place between the police and the mob during the afternoon, but no general outbreak was attempted. The rioters were still noisy and loud in their threats, but they were too thoroughly cowed by the determined attitude of the military and police to attempt a renewal of their efforts of the morning.

The night of the 26th passed away without further disturbance, the city being held by the regulars, the volunteers and the police. The rioters were feverish and restless, but avoided a conflict. They had lost their courage, and were afraid to meet the force opposed to them. On the morning of the 27th a crowd was reported to be gathering in the quarter known as "Bridgeport." Three cavalry companies and two companies of the Second Regiment were ordered to the spot. The Board of Trade cavalry and Colonel Agramonte's veterans, some three hundred strong, repaired to the scene, supported by the infantry. The mob was dispersed without difficulty. The Halstead Street viaduct, the scene of the disturbance on the previous day, was held by the Second Regiment. The cavalry patrolled the western part of the city throughout the day. The mob was sullen and cross, but it was beaten, and the danger was at an end. The police and the cavalry had orders not to allow people to gather in crowds in the streets, and this order was rigidly enforced. The Mayor issued the following proclamation:

The city authorities having dispersed all lawlessness in the city, and law and order being restored, I now urge and request all business men and employers generally to resume work, and give as much employment to their workmen as possible. I consider this the first duty of our business community. I am now amply able to protect them and their workmen. Let every one resume operations, and report any interference at police head-quarters. Citizens' organizations must continue in force, and on no account relax their vigilance, as the cause of trouble is not local and not yet removed. All such organizations should form themselves into permanent bodies, continue on duty and report regularly as heretofore.

From this time the excitement in Chicago gradually subsided. The communist leaders and their desperate followers saw that they were no match for the force at the command of the authorities, and were terrified by the wholesale arrests of their comrades. They slunk out of sight, and in a day or two Chicago was enjoying its normal repose. The railroad men, disheartened by the failure of the strikes on other parts of their roads, surrendered to their respective companies, and returned to duty at the old wages.

Other parts of Illinois shared in the general excitement, but no serious conflict occurred, nor was any great damage done outside of Chicago. At Peoria a mob seized several of the railroads entering the city, and attempted to stop the running of the trains. The local authorities took prompt measures to put down the outbreak, and the volunteer companies of the town were ordered out to assist the police. On the 26th of July the police made a gallant charge on the mob, and arrested three of the principal leaders. The prisoners were taken to the jail, and the mob followed with the intention of rescuing them. The military at once repaired to the jail, and forced back the mob at the point of the bayonet. The mob, deprived of its leaders, was powerless, and though threats were freely indulged in, no further violence was attempted. On the 27th of July the Governor of Illinois issued the following proclamation:

Whereas, Certain persons active in the violation of law have assumed to interfere with and prevent the movement of railroad trains in this State, and have sought to intimidate honest workingmen engaged in the avocations by which they earn their daily bread, and to compel them to cease from their labor; and

Whereas, This condition of affairs continues, and is intolerable, entailing as it does disastrous consequences, the nature and extent of which it is impossible to foresee: *Therefore*, I, Shelby M. Cullom, Governor of Illinois, acting under and by the authority of the laws of this State, do command all such riotous and disorderly persons to desist and return to their homes, and do call upon all Sheriffs, Mayors, and other officers charged with the execution of the laws to break up all conspiracies against the rights of property and of persons, and to that end to employ every lawful means in their power, and do enjoin upon all good citizens to assist in bringing about the restoration of order, the resumption of business, the moving of trains, and the revival of manufactures. I further give notice that the entire military force at my disposal as Commander-in-Chief of the militia will be employed for the support of the civil authorities in this endeavor, and that orders will be given to the troops to use whatever amount of force may be necessary to compel obedience to the laws. In testimony whereof I have hereunto set my hand and caused the great seal of the State to be affixed.

There were slight disturbances at Decatur, Effingham, Galesburg, Joliet, and Carbondale, but no outbreak. Braidwood, an important place in the mining regions, was profoundly excited by a strike of the miners, but no trouble was experienced. At East St. Louis, on the Illinois shore of the Mississippi River, opposite the city of St. Louis, there was quite a formidable strike, and the State authorities were compelled to break it up by a concentration of the State troops.

The city of St. Louis is the terminus of a number of important railway lines. The Mississippi is here spanned by a magnificent iron bridge which gives St. Louis direct connection with the States lying east of the great river. The eastern end of the bridge is at East St. Louis, in the State of Illinois. Here the shops and round houses of the various railroads using the bridge are located. East St. Louis is thus a very important railroad point, and being so closely connected with its greater neighbor over the river, the strikes on the two sides of the river were really one movement, and must be treated as such. On the 22d of July, signs of excitement and disaffection began to show themselves at East St. Louis. A secret meeting of the railroad men was held in the afternoon, at which it was resolved to make a formal demand upon the various lines centering at St. Louis for an increase of wages, and to inaugurate a general strike, should the demand be refused. After the adjournment of the secret meeting, an out-door meeting was organized, in which about two hundred members of the French, German, Bohemian, and English sections of the workingmen's party of the United States from St. Louis participated. Their coming was greeted with cheers and much enthusiasm. Several speeches were made by the leaders of this section, in which they offered sympathy for the strikers, and pledged themselves to stand by them in their struggle. It was stated from the stand that there would be another meeting at night, composed strictly of railroad men, at which a declaration of their purpose, and what action they proposed to take, would be made. The section of the workingmen's party before referred to held a meeting at Turner's Hall in the afternoon, and after several speeches on the labor question in general, and the present situation in particular, they unanimously adopted the following resolutions:

Whereas, The workingmen of the different railroads in this country are rising *en masse* to demand their just rights; and, *Whereas*, The United States Government has allied itself on the side of capital and against labor; therefore, *Resolved*, That we, the workingmen's party of the United States, heartily sympathize with the employés of all the railroads of the country who are attempting to secure just and equitable reward for their labor. *Resolved*, That we will stand by them in this most righteous struggle of labor against robbery and oppression, through good and evil report, to the end of the struggle.

The demand agreed upon by the meeting of railroad men was made upon the various Companies on the night of the 22d, but was refused. At midnight a general strike was begun on all the roads at East St. Louis. On the morning of the 23d it was announced by the strikers that passenger and mail cars might be run on the eastern roads, but that no freight trains would be permitted to pass. The men were quiet and orderly, but determined. The Companies generally accepted the situation, and made no effort to run their freight trains. The men of the Toledo & Wabash road had not had their wages reduced, and declared that, though they had no grievance against their Company, they struck out of fellowship for the employés of the other roads. An effort was made during the morning to start a freight train on the Chicago & Alton road, but the strikers stopped it and took it back into the yard. Everything was very quiet in the Union depot, and in the yards of the Union Railway & Transit Company of St. Louis during the morning. One stock train was allowed to cross the bridge, but none were permitted to pass after twelve o'clock. The employés of the Transit Company, who do duty in East St. Louis, fifteen in number, struck with the firemen and brakemen of the railroad. The employés of the Company on the St. Louis side of the river, whose duties are performed at and in the vicinity of the Union depot in moving trains in the yard, through the tunnel, and across the bridge, did not formally strike, but they were idle for the reason that there was nothing for them to do, as the strikers across the river would not permit the freight trains to pass. The Transit Company rescinded their order for a reduction of ten per cent. on wages, and notified their employés to that effect, but the latter took no notice of it. During all, the trains on the Missouri, Pacific & St. Louis, Kansas City & Northern roads went out and came in as usual, there being no strike on those roads yet, nor had the employés manifested any disposition to take action in the matter. The St. Louis, Iron Mountain & Southern Railroad does not connect with the Union depot, but has its own depot in the southern part of the city. Everything was quiet on that road, and business was progressing in the regular way. The strikers in East St. Louis gave a special permit to the National Stock yard people to use their own locomotives to haul feed to the yards for the stock there. They also permitted the Union Railway & Transit Company to select ten men to switch passenger trains coming to the Relay depot at East St. Louis, and destined for the city. On the morning of the 24th, the East St. Louis strikers, encouraged by having been unmolested by the civil authorities, changed their plan of operation and refused to allow the running of passenger trains. Upon the arrival of the eastern bound train on the Vandalia road at the Relay house at East St. Louis, an effort was made to impede its progress. After the short halt there, which is customary with all trains, and when the train was just getting in motion, a striker drew the coupling pin behind the mail car and called out roughly to the conductor, "Go on with your United States mail; we've got nothing to complain of against the Government." This rash act and declaration was greeted with loud shouts by the five hundred strikers. The conductor stepped out on the platform of a car and appealed to the mob to replace the coupling pin and permit him to proceed. He said, "I have one hundred and twenty-five passengers on board, and they have paid their passage to eastern points on the faith of your promise that you would not interfere with passenger travel. You are in honor bound to let them pass." [Cries of "That's so." "Let them go," etc.] "It's a mean, contemptible trick," said the plucky conductor, "and if you persist in it, it proves that you are not honorable men." The appeal of the conductor created a dissension in the ranks of the strikers, many of them contending that the train should be allowed to proceed, and others declaring it should not. Nearly an hour was spent in wrangling among the men, and finally the Committee in charge decided to let the train go, and it is unnecessary to say it went very rapidly. In the meantime there was great excitement among the passengers inside, and two or three of the ladies fainted, one of them, an invalid, being still unconscious when the train took its departure. When the mail train on the Cairo narrow gauge road arrived at the Relay house the passenger car was detached from the mail coach, and the conductor proceeded without his passengers. In the meantime the leaders telegraphed across the river to their representatives in the city not to allow any more passenger trains to pull out from the Union depot. At eleven o'clock, twenty-five strikers, boarded an engine and tender, steamed through the tunnel, and dashed into the Union depot. This was the first appearance of the strikers in the limits of St. Louis proper, and their arrival caused a great sensation in that hitherto quiet neighborhood. They quickly alighted from the engine that had borne them over, and, with a shout, proceeded across the depot sheds, where they seized two engines belonging to the Missouri road, and, mounting the engines, steamed rapidly up the track a mile and a half to the machine shops of that company. The workmen in the employ of the Missouri Pacific Railroad at the machine shops, numbering two hundred and fifty, had been advised by the strikers that they would be visited during the day, and when the strikers arrived, they received them cordially, though they continued their work; and in answer to the question whether they were willing to strike, replied that the Pacific Company had partially acceded to their demands, and they thought they should continue at work. "But you must help us out," replied the leader of the strikers, "and in order to do this you must quit work." A long conference between the strikers and workmen ensued, and, at the end of half an hour, the former, despairing of success in inducing the latter to strike, withdrew. A number of policemen stationed at the machine shops attempted to prevent the entrance of the strikers into the shops, but their efforts were fruitless. From here the strikers returned to the Union depot, and at two o'clock, when the Belleville passenger accommodation train on the Cairo road was about to start out, one of, the leading strikers, stepped aboard the engine and whispered to the engineer, who, with the firemen immediately left their posts, and the strikers announced that the train would not be permitted to leave the depot. Officers of the road expostulated, but for over two hours the strikers were firm in their refusal to grant the request. At the end of that time the train was allowed to go. A large force of police were on hand, but did not undertake to interfere with the strikers. Three or four thousand people, composed of discontented and unemployed laboring men, gathered under the depot sheds, and much incendiary talk was engaged in.

As a result of these riotous demonstrations the police cleared the saloons in the neighborhood, and ordered them to be kept closed. About four o'clock another engine, with the flat cars loaded with 400 strikers from the eastern shore, arrived at the depot, and were received with loud cheers by the crowd. The strikers disembarked, formed in line, and, with the music of the fife and drum, marched in the direction of the Pacific machine shops. At every street crossing the procession was joined by numbers of sympathizers, and by the time the shops were reached there were 2,000 men in march. Arrived at the shops, they found that the shopmen, being advised of the approach of the strikers, had already quit work, and were on the platform ready to receive the strikers. A representative machinist received the visitors and made a speech to them, saying the shopmen had concluded not to strike, but to quit work in deference to the demands of the strikers. They had no cause of complaint against their employers, but would not return to work until the strikers had secured a redress of their wrongs.

From this place the strikers marched to the North Missouri Railroad track on the levee, where they took possession of an engine and ten flat cars, and boarding them proceeded to the round house of that company in the northern part of the city, where they were met by the employés of the company. A conference was held, and as a result the employés agreed that no more freight trains should be allowed to go out on the road from St. Louis. The strikers returned to the Union depot at six o'clock.

The arrival of the troops had no perceptible effect in cooling the ardor of the strikers, the leaders declaring that they would avoid collision with the troops, but were determined to carry their point at every risk. By nightfall nearly all the strikers had deserted the eastern side of the river, and were congregated at the Union depot, where they passed the night. During the day there was great popular excitement throughout the city, and the strike was the absorbing theme of conversation. A serious feeling of apprehension was abroad among the people, and a general belief prevailed that the crisis was bound to result in blood and devastation. The city authorities had been very passive since the beginning of the strike, and their attitude excited much indignant comment at the time. It was based upon the fact that there were not 1,000 stand of arms in St. Louis at the disposal of the authorities, and it was deemed best not to undertake to interfere with the mob until it could be done in an effective manner. In the meantime every exertion was made by the municipal authorities, in concert with a number of prominent citizens, to obtain arms and ammunition for a force of five thousand men. On the night of the 24th the Internationalist, or Communist leaders, who have a large following in St. Louis, held meetings in several parts of the city, which were attended by monster audiences. The most incendiary speeches were made and threats of burning the buildings of the newspapers, which had criticised them only, were indulged in. Processions of excited men marched through the streets yelling and making other noisy demonstrations. A large proportion of the city police force had been withdrawn from the regular beats and held in readiness at the points of danger.

The morning of the 25th found the city greatly excited. About nine o'clock a crowd of 1,000 men assembled in Lucas' market place around a stand erected by the workingmen's party, while two or three thousand spectators gathered in the vicinity. The crowd was made up mostly of wire-workers who had struck, and strikers from other manufacturing establishments. At ten o'clock they formed in column and marched past the City Hall to Turner Hall, where the executive committee of the workingmen's party was in session. Half an hour later a body of 500, made up chiefly of negroes, was sent to the levee, and marched its entire length for the purpose of inducing the roustabouts to join them. The strikers said they were to receive explicit orders from hour to hour, and expected to stop all manufacturing establishments before night.

A crowd of 2,500 people gathered at the Union depot, but nothing of importance occurred there. The only passenger train which passed over the bridge during the morning was the Toledo, Wabash & Western, the strikers making an exception in favor of that road because of its position toward the employés in the past. On all the other roads only the postal cars were allowed to leave. The Chicago & Alton people refused to be dictated to, and at the regular hour sent out their postal car and baggage car and one passenger coach. The train reached East St. Louis, but the strikers refused to allow any but the engine and postal car to proceed. This discrimination was declined, and the whole train was backed over to the depot on the city side. The Missouri Pacific machine shops and freight depots and yards were closed, and none of the men were at work. They told the officers of the road that they were satisfied to work, but that it would only precipitate an attack and general trouble with the strikers. The position of the men was approved by the company, and the shops and depots closed by mutual consent. The company sent out three or four freight trains between one and five o'clock in the morning, but decided not to start any more for the present.

A large delegation of strikers from the city visited Cheltenham, four miles west of the city, during the morning, and ordered the men out of the smelting and fire clay works. They offered their employers to continue at work if protected, and a request was sent to police head-quarters for a detail of police, but it was refused. The police force was on duty at station houses, and the city was almost entirely unpatrolled. The force was kept in reserve, to be used only when the strikers should resort to violence or a mob should be formed. Another urgent request for a detail was received from officers of the Union Street Railway, an important line, which runs from Fourth and Locust Streets to the Fair Grounds. The employés notified the company that unless the recent cut of ten per cent. was restored, they would strike at twelve o'clock and stop the cars. Fears were entertained for the safety of property. The police were instructed to be in readiness to march to the stables upon the commission of any overt act, but not before.

A "Citizen Organization for the Protection of Property" was organized at the Four Courts. Meetings were held by citizens in various parts of the city, and companies were also formed and officered. These at once reported for duty, and by nightfall the organization numbered 1,500 armed men. A company of fifty men was organized for gun-boat service, and placed on the city harbor steamer, with order to patrol the river. The work of organization was carried on rapidly, and by noon the next day 10,000 citizens had enrolled themselves. At ten o'clock on the morning of the 26th a procession of 2,000 men, consisting partly of workingmen who had joined the strikers, but mostly of loafers and idlers, marched from Lucas Market to the manufacturing district north of Washington Avenue. They first visited Belchers' sugar refinery, where some 400 employés were forced to quit work on the day before, and finding the doors closed, broke them open, rushed in, extinguished the fires in the furnaces and displaced the machinery, so the employés could not return to work, as they had announced their intention of doing. Many of the workingmen protested against injuring or destroying property and aban doned the procession; but the mob continued its march, visiting about forty different factories and flour and planing mills, compelling the employés, aggregating nearly one thousand, to quit their work and close the doors, although the employés in many cases earnestly protested against being interfered with. Several planing mills were among the establishments closed by the mob. No respect of persons was shown, women and girls being treated in the same manner as the men. All were forced to stop work whether they were willing or not. The operations of the mob were generally uniform.

A mob of negroes proceeded to the levee, and forced the officers of all the steamboat companies and independent steamers represented there to sign pledges to increase the wages of all classes of steamboat and levee laborers. Their demands were of the most extortionate character, the increase insisted upon ranging from sixty to one hundred per cent. They were very peremptory, and would not allow a boat to leave the wharf until their demands were complied with. The rioters were very insolent and defiant throughout the day, and announced their intention to close every workshop and place of manufacture in St. Louis. As was to have been expected, the negroes were by far the most turbulent and unmanageable of the rioters. But little business was transacted in the city. Many of the stores were closed, and the work of arming and drilling the citizens' force at the Four Courts was carried on rapidly. The Sheriff also organized and armed a posse of 2,000 men. The Governor arrived in the city during the morning and gave his aid to the work of suppressing the disorder. The arming and drilling of the citizens was carried on actively all morning at the Four Courts building. No outward demonstration was made up to noon save that heavy guards were on patrol duty in front of the building. Two large brass field-pieces loaded with shrapnel, and with horses attached and ready to move at a moment's notice, were kept in waiting in the yard of the jail in charge of a company of sixty men. About half-past ten o'clock a large crowd marching in procession arrived in front of the Four Courts building. The rioters broke ranks at once, and surging up to the pavement pressed hard upon the guards, who were doing duty on the side-walk. The guards were immediately reinforced by details from within, and the companies were formed to resist an attack. A detachment of police left the building at a run, charged the rioters, drove them back a short distance, and arrested two of their leaders. A few stones were thrown, but the mob made no effort at resistance. As the police withdrew, the mob pressed up close to the side-walks again, and jeered and taunted the military force in the most insulting manner, daring them to fire and commence a fight. The police pressed the crowd back again, and it withdrew for a square without resistance. A number of noisy and unruly men were arrested by the police and confined in the jail. No disturbance occurred during the day. In the afternoon the Governor of Missouri issued a proclamation calling upon the rioters to cease their disorderly conduct and interference with private property, and to disperse. By the morning of the 27th the city authorities felt themselves strong enough to put down the mob, and determined to check the disturbance. The rioters, up to this period, had been encouraged by the failure of the police to stop their lawlessness, and many of them were convinced that neither the Mayor, the police, nor the citizens' force would dare provoke a conflict with them. They were now to learn their error. At an early hour on the 27th the mob began to gather at Schuler's Hall, and by two o'clock upwards of two thousand men were congregated in the immediate vicinity, waiting to obey the orders of their so-called executive committee, the body specially delegated to direct the movements of the crowd. The last proclamation of the Mayor and that of the State Government commanding them to disperse and return to their homes or else take the consequences, was freely circulated among them, but a general spirit of defiance prevailed, and bold threats of armed resistance was made on all hands. Inside the hall the executive committee were in session with closed doors, and there, too, the sentiment expressed was that any attempt on the part of police or militia to drive them away should be resisted to the last. Verbal orders were circulated among the mob to stand firm and that an armed force would not dare to molest them. This meeting being reported to the Mayor, it was resolved by the city authorities to break it up and arrest the leaders. For this purpose fifty mounted police, twenty-five armed with muskets, and about the same number with the usual club and pistol, were ordered to proceed to the hall and make the arrests. That there should be no failure, five hundred of the Citizens' Guard and two companies of the National Guard, with one piece of artillery, were ordered to accompany and support the police should the crowd offer any resistance, or attempt to rescue the prisoners. This force left Four Courts at 2.30 P. M.

About three o'clock the military force, headed by the mounted police, appeared coming up Fifth Street. The column halted within a square of the crowd, and drew up in line across the street, ready for a charge, while the piece of artillery was prepared for action. The military advanced no further, but the order was given to the police to charge the crowd and seize the hall. About one-half of the police swept down on the mob at a gallop, scattering the rioters right and left, driving fully three thousand men before them. They drew their pistols and charged on the crowd, riding their horses along the sidewalks, using their revolvers as clubs while the least hesitancy to move on occurred. In five minutes the street was cleared, and not a rioter was to be seen in the vicinity of Schuler's Hall save those in custody. In the meantime the other part of the police force, had advanced to the foot of the stairs leading to the above hall. The whole squad went up, and two minutes later they brought down about seventy men whom they found in the hall, and placed them between lines of police, armed with muskets, and the whole thing was over. Every one in the upper part of the building was arrested. One man attempted resistance, but a blow over the head from a club subdued him very quickly. Having secured their prisoners, the police and military marched back to the Four Courts, and were greeted along the route with cheers from the citizens. After the departure of the police, a few of the mob returned and indulged in bitter denunciations of their leaders for deserting them, but it was evident that the backbone of the riotous assemblage was completely broken, and that they would not likely have such another large gathering. Another victory was won by the authorities earlier in the day. When the 27th opened, the Union depot was held by a force of strikers. The civil authorities resolved to put an end to this state of affairs, and at eleven o'clock a battalion of four hundred men was despatched from the Four Courts to the Union depot, with orders to take possession of and occupy that building and drive out the strikers. The arrival of the military was a surprise to the strikers, who held the depot in large force. About half-past eleven the battalion marched in with loaded rifles and fixed bayonets. Without the loss of a moment the order was given to clear the building and yards, and the troops executed it with a will, driving out the strikers with the bayonet. The movements of the troops were greeted with cheers and yells. The depot and yards being secured, the authorities announced that no more interference with trains would be permitted in St. Louis. Encouraged by the promise of protection, some of the roads on the west side of the Mississippi resumed their freight traffic on the 27th, and the rest prepared to do so in the next day or two. The city authorities also announced their readiness to furnish armed guards for such shops and manufacturing establishments as desired to resume work. Three meetings were called by the Executive Committee of the workingmen's party, in various parts of the city, on the night of the 27th, but two of them were total failures, the speakers not appearing, and the small crowds which gathered at the appointed places soon dispersing. The third meeting brought together quite a large crowd, but before the meeting opened the crowd was dispersed by a force of five hundred policemen. The mob was now thoroughly cowed, and the danger was over. The 28th of July passed away quietly in St. Louis, there being no disturbance of any kind. A number of the leaders of the outbreak were arrested and imprisoned: their followers made no attempt to rescue them, having no desire to meet the five thousand armed citizens, the regulars, and the police who now stood ready to crush any uprising. On the 28th, nearly all the roads on the St. Louis side of the Mississippi resumed their freight business. Sunday, the 29th, passed away tranquilly, and by Monday the danger was at an end in St. Louis, and the business of the city had resumed its accustomed course. The expulsion of the strikers from the Union depot on the 27th confined the strike to East St. Louis. The strikers congregated there in considerable force, and, being very bitter over their defeat in the city, declared that they would maintain the blockade on the Illinois shore with even greater vigor. They were not to succeed, however. The Ohio & Mississippi, and the St. Louis & Southeastern Railroads were being operated by receivers appointed by the United States Court. The Court ordered the United States Marshal to prevent the strikers from interfering with these roads. The strikers resisted, and the Marshal, being unable to execute the orders of the Court, asked for troops to assist him. His appeal was granted, and orders were sent from Washington granting the Marshal all necessary military assistance.

The City of San Francisco contains a large Chinese population. Between these and certain portions of the white inhabitants there has always been a bitter enmity. The working classes are especially hostile to the Chinese, as they regard them as rivals in the labor market; but the bitterest enemies of the Mongolians are the "Hoodlums," or the idle loafers, street loungers, and "bummers," of the city. Many riots have occurred between the Chinese and their enemies in San Francisco, and not long since it was seriously proposed by the whites to organize a deliberate movement for the purpose of compelling the Chinese to leave the entire State of California. It was well understood in San Francisco that this feeling of hatred to the Chinese only lacked a favorable opportunity to break out into open hostility. The news of the labor troubles in the Eastern and Western States was received with profound interest in San Francisco, especially by the working classes. On the evening of the 23d a workmen's meeting was held, and was attended by about 10,000 persons. These riots were in no way connected with the railroad riots east of the Rocky Mountains. They were a brutal and unprovoked outbreak of the worst elements of the city, and were caused by nothing but a love of violence and disorder on the part of those who engaged in them. As they occurred simultaneously with the railroad troubles in the East, they are generally classed with them: and for this reason have been noticed here.

The anthracite coal regions of Pennsylvania, " generally recognized as the 'northern,' 'middle,' and 'southern' coal basins, are comprised within or bounded by a line of mountain, which, forming itself some distance eastward from Mauch Chunk, takes, under the name of the 'Second Mountain,' a southwesterly course to the Susquehanna River, leaving the towns of Mauch Chunk, Tamaqua, Pottsville, and Tremont to the north; thence in a northeasterly course, as the " Peters Mountain," to a point nearly southwest from Tower City; thence northwestwardly, as 'Berrie's Mountain,' again crossing the Susquehanna; thence southwestwardly to Taylorsville, as the 'Mahantongo Mountain'; thence nothwestwardly again in the direction of the Susquehanna, as the 'Line Mountain'; thence bearing in a southeasterly direction, as the 'Little Mountain,' leaving Shamokin, Ashland, Shenandoah, and Mahanoy City to the south, to a point in Union Township, Schuylkill County. Here the mountain runs almost due north for some miles, as the 'Catawissa Mountain,' when its course is again changed to southeasterly, as the 'Nescopeck Mountain'; thence north and northwest, as the 'Wyoming Mountain;' and thence again in an easterly direction, running north of Wilkesbarre and Scranton, as the 'Shickshinny Mountain.' Within the area inclosed by this mountain lies all the at present discovered anthracite coal of Pennsylvania. It embraces not only the large basins before named, but also a number of comparatively small detached coal fields. . . . Within this area are enclosed the coal producing portions of Carbon, Schuylkill, Dauphin, Northumberland, Columbia, and Luzerne Counties, and it is to a great extent occupied by a series of majestic mountains, the Sharp, the Broad, the Big Mahanoy, the Little Mahanoy, the Locust, the Green, the Macauley, and others." Dauphin and Columbia are agricultural as well as mining counties, but the others are strictly mining counties. By the census of 1870, the population of the purely mining counties was as follows: Carbon, 28,144; Schuylkill, 116,428; Northumberland, 41,444; Luzerne, 160,755. Since the census of 1870 the population of these counties has largely increased.

The business of mining coal has drawn large bodies of men to these counties, and has gathered them at fixed points, in cities, towns, and large mining settlements. The amount of arable land being small, on account of the mountainous character of the country, but a limited portion of the area is under cultivation. The natural formation of the country is very favorable to lawlessness. A walk of a few minutes from any of the towns, in almost any direction, leads to glens and haunts where one might bide in safety for months from the police.

Not only is the singular feature presented of nearly the whole population of the coal regions living in cities, towns and small settlements, often called "patches," but the character and habits of the population in the several settlements differ widely from each other. Scranton, Wilkesbarre, Mauch Chunk, Pottsville, and Tamaqua are all business centers, wherein are located banks, manufacturing establishments, the general offices of railroads and coal companies, large stores, and where, to a great extent, the wealth of the region naturally clusters. The cities and towns are not only business centers, but offer additional inducements, social, educational, and religious, to the coal operator and those whose means enable them to retire from business, in the selection of a place of residence. As a consequence, they have lost, in a great degree, the distinctive character of mining settlements, and differ, perhaps, from other places of equal size throughout the country only in being more cosmopolitan; this arising from the wide range embraced by their business operations, and the varied character of the inhabitants. Towns such as Ashland, Shenandoah, Mahanoy City, Minersville, St. Clair, Hazleton, Pittston, Plymouth, and many others of large population, to a certain degree partake of the character of business and social centers, but the mining classes, being largely in the majority, regulate and altogether control them. Besides these two classes of towns there are a great number of 'patches' or settlements, whose population is entirely composed of miners and laborers and those whose business is directly or indirectly connected with the mines. While the admixture of the foreign element pervades every part of the region, in large cities and towns native born citizens of the

United States hold control, but at the colliery towns the power of the foreigner is absolute. In these last still further divisions are made, some being almost exclusively composed of Irishmen, with natives of Queens and other counties, Ireland, largely in the majority. In such towns not only have the manners, customs and modes of thought of the Irish people been transplanted, but even the local prejudices incident to certain localities in that beautiful but in many respects unfortunate land. Coming here fresh from the contest with the landlord and land agent in Ireland, with no surrounding influences to teach them their error, they transfer a prejudice which has grown with their growth and strengthened with their strength, to the coal operator and the boss from whom they derive their subsistence, and under whose direction they work. Taught from infancy to believe that as against them capital is never used except as an instrument of oppression, under the influence, sometimes, of real wrongs, but more frequently under a mistaken belief of encroachment upon their rights, a spirit of resistance is aroused, which wicked and designing wretches have so used and controlled as to render the undetected commission of horrid crimes not only easy, but, to a certain extent, sympathized with. That the above is no justification for such a state of affairs is true; nevertheless, it explains, or tends to explain, the possibility of its existence. Such is the region that has become notorious throughout the Union as the country of the Mollie Maguires and the scene of their terrible crimes.

The order of the "Mollie Maguires" is of foreign birth, and was imported into this country from Ireland. It was organized there by the Irish peasantry as a means of opposing a combined resistance to the exactions of the landlords. Brought to this country by the emigrants who found work in the coal regions of Pennsylvania, it became an organization which sought to control the relations of the miners towards their employers and to compel the latter to submit to any demand the former might impose upon them. The "Ancient Order of Hibernians" is a large and powerful Irish society extending throughout the United States. Its objects are professedly benevolent. It is regularly incorporated under the laws of the various States in which it exists. Outside of the coal regions of Pennsylvania, there is no positive proof that the society is at all criminal in its character. The worst charge that has been brought against it is that it supported and continued its relations with the Mollie Maguires after their exposure, and raised a large sum by assessments upon its members throughout the Union to defray the expenses of the defense of the Mollies charged with crime in the coal regions. The order is secret, and wields an immense influence over its members. Its members are Roman Catholics, notwithstanding the fact that it has been *nominatim* condemned by the Holy See, and is under the ban of the Church. The Mollie Maguires were all members of the Ancient Order of Hibernians. In the coal fields of Pennsylvania, they controlled the Order, and gave their society's name to it. Hence we shall speak of the order simply as the Mollie Maguires. The principal work of the order in Ireland was the shooting of the agents of the Irish landlords. It is said to have received its name from a ferocious Irishwoman who particularly distinguished herself in this work. The Mollies appeared in Pennsylvania as early as the year 1854, when it became evident to the authorities that a criminal organization existed in the counties of Schuylkill and Carbon. The members of this organization were popularly termed "Buckshots." They gave considerable trouble to the authorities, but were not considered especially dangerous during the next five or six years. The great demand for coal which the stimulus of the Civil War produced, and which set in about the year 1862, drew an immense population to the Pennsylvania coal fields, and as a very large proportion of the newcomers were Irishmen, the strength and power of the Mollie Maguires increased with the growth of the population. The existence of the order was known, but, as its members, when questioned, stoutly denied their connection with it and preserved the most rigid secrecy respecting its transactions, nothing was known with certainty by the authorities.

In the summer of 1862 the first draft for the purpose of filling up the ranks of the United States Army was ordered. Active preparations were made by the Mollies in Schuylkill and Carbon Counties to prevent the enrolment. In both counties the enrolment was effected, however. This led to numerous threats on the part of the Mollies, and in Carbon County to much violence. Men connected with the draft, or representing the capitalists operating the mines were assaulted, beaten and murdered, and houses were burned by unknown parties. The authorities seemed powerless to detect or punish the perpetrators of these outrages, and the country was plunged into a state of terror. Notices were served upon leading coal operators to suspend operations until after the discontinuance of the draft, and bosses and miners were warned that if they went to work, they would do so at the peril of their lives. Upon one occasion in the summer of 1863, a large body of armed Mollies entered the town of Mauch Chunk, overawed the citizens, seized the jail, and released a number of the prisoners. From this time on to 1867, more than fifty murders were committed in Schuylkill County. Of these, twenty-seven, or more than one-half, were committed by unknown persons, and may be safely set down to the Mollie Maguires. The chief stronghold of this order, however, was Carbon County, where they had matters very much their own way. During all this while none of the Mollies had been convicted of the crimes they had committed. Arrests of suspected parties had been made, and they had been brought to trial in some instances; but the State had been unable to convict them. The friends of the prisoners were always on hand, ready to swear to anything necessary to secure their acquittal. Whenever a member of the order was tried for an offense, a convenient *alibi* was set up and sustained by as many witnesses as were thought necessary. An acquittal was thus readily secured, and the law was rendered powerless to punish the guilty parties. Large rewards were offered by the civil authorities and the coal-mining companies, and strenuous efforts were made to bring the murderers to justice, but up to 1871, no Mollie had ever been convicted of murder in the first degree. So strong had the Mollies become, especially in Schuylkill and Carbon counties, that they did not believe the authorities could punish them, and regarded themselves as at liberty to carry out their plans as they liked.

As has been said, the authorities of the counties embraced in the coal regions were convinced that the reign of lawlessness in their midst was due to a powerful secret organization of Irishmen, and they had learned that it was known as the Mollie Maguires, but beyond this they could discover nothing. Detectives had been set to work to ferret out the mysterious order, but had been baffled and forced to give up their efforts in despair. The Mollies, secure in the mystery with which they enshrouded themselves, continued their horrid work, and laughed at the authorities. Meanwhile the respectable inhabitants of the coal regions lived in a state of constant terror. No man could tell when his life might be taken or his property destroyed by the terrible order, which struck its blows in the dark and without assigning any reason for them. So strong had the Mollies become, that they even ventured to take possession of the very machinery of the law by causing themselves to be elected to public offices in the counties of Schuylkill and Carbon. Having gained possession of the offices they proceeded to manipulate the public funds in the interests of their organization. They became a potent influence in State politics, and John Kehoe, county delegate for the Schuylkill branch of the Ancient Order of Hibernians, openly boasted of his ability to extend the influence of the society into national politics. Mollies were repeatedly elected as county commissioners and school directors. In one instance a member of the society was sent to the legislature, and one of their members ran for an associate justiceship, but was fortunately beaten at the polls. So powerful did the Mollies become in the coal regions, and so general was the feeling of terror and insecurity which they aroused, that the prosperity of that section began to be seriously affected. It was seen that the immense interests centered there were at the mercy of a mob of lawless ruffians, and that if these men were permitted to extend their power, capital and respectable industry of all kinds would be driven from the coal-fields. It was therefore resolved by certain parties deeply interested in the welfare of the coal counties that the Mollie Maguires should be exposed and brought to justice.

The Ancient Order of Hibernians exists in Great Britain and Ireland, as well as in the United States. It is controlled in this country and abroad by a Directory, known as the "Board of Erin," selected from members in England, Ireland, and Scotland. These regulate and give out the signs and passwords of the order, which are changed every three months. The headquarters of the order in the United States are at New York. The national officers are elected by the State officers, and consist of the National Delegate, National Secretary, National Treasurer, and President of the Board of the City and County of New York. Each State has its own officers. The headquarters of the order in Pennsylvania are at Pittsburgh. The officers consist of a State Delegate, State Treasurer, and State Secretary. They are elected by the County officers, who also consist of a County Delegate, County Treasurer, and County-Secretary. The county officers are elected by county conventions, which are made up by the officers of the various divisions. The division officers are the Division Master or Body-master, Secretary and Treasurer, and are elected by the members of their respective divisions. No man can be a member of the order but an Irishman or the son of an Irishman, and a Roman Catholic. It is stated that there are over six thousand divisions or lodges in the United States and that the membership of the order is over one hundred thousand. From this large body of men, with the exception of a portion of a division (No. 2) in Philadelphia, not one word of condemnation of the Mollie Maguires of the coal regions has been heard. On the contrary, every effort has been made and money has been liberally subscribed to enable them to escape justice.

The signs and passwords of the Order show its foreign character and sympathies. They are changed every three months. In addition to the signs and passwords given in the account of McKenna's initiation, the following were furnished by him in his evidence before the Courts at the trials of the Mollies: May 18th, 1874: Password.—"That the trouble of the country may soon be at an end." *Answer.*—"And likewise the men who will not her defend." Quarrelling Toast.—"You should not dispute with a friend." *Answer.*—"Not if I am not provoked." Night Password.—"Long nights are unpleasant." *Answer.*—"I hope they will be at an end." Sign.—The front finger and thumb of the right hand to touch the neck-tie or top button of the shirt. *Answer.*—Right hand to rub across forehead touching hair. August 10th, 1874: Password.—"What do you think of the Mayo election? I think the fair West has made a bad selection." *Answer.*—"Whom do you think will duty betray?" Quarrelling Toast.—"Don't get your temper so high." *Answer.*—"Not with a friend." Sign.—Putting the thumb of right hand into the pocket of the pantaloons. *Answer.*—Putting the thumb of left hand on lower lip. Jan. 11, 1875, Password: *Question.*—"Gladstone's policy must be put down: He is the support of the British crown." *Answer.*—"But our Catholic lords will not support his plan, For true to their church they will firmly stand." Quarrelling Toast: *Question.*—"Don't give way to anger." *Answer.*—"I will obey a friend." Night Password: *Question.*—"The nights are getting shorter." *Answer.*—"They will soon be at their shortest." Body-Master's Toast.—"Let every Irish peasant Espousing Erin's cause, In college green They may be seen There making Irish laws." Sign.—Nail of the right thumb across the bridge of the nose. *Answer.*—Tip of the fore-finger of the left hand to the chin. May 4th, 1875: Password: *Question.*—"What is your opinion of the Tipperary election? I think England broke her constitution by Mitchell's rejection." *Answer.*—"But didn't O'Connell resign his oath and seat? Yes, and by agitation gained the emancipation." Quarrelling Toast: *Question.*—"Keep your temper cool." *Answer.*—"I will not raise it to a friend." Body-Master's Toast.—"Here's that every Irishman may stand to his cause, And subdue the British government and its coercion laws." Sign.—The fore-finger of the right hand in the left sleeve of the coat. *Answer.*—The thumb of the left hand in the left side vest-pocket. November 4th, 1875: Password.—"Here's health to every Irishman That lives in Ireland, To assemble round in Dublin Town In memory of Great Dan." *Answer.*—"When born he found our country in chains and slavery; He labored hard to set her free, But now he's in the clay." Quarrelling Toast; *Question.*—"You seem to be getting vexed." *Answer.*—"Not with you, sir." Night Password: *Question.*—"These nights are fine." *Answer.* "Yes; we shall have a fine harvest." Sign.—Tip of the fore-finger of the right hand to the hole of the right ear. *Answer.*—Tip of the fore-finger of the left hand to the hole of the left ear. January 22d, 1876: Password: *Question.*—"Home rule in Ulster is making great progress." *Answer.*—"Yes, if every Irishman would support the cause." *Question.*—"I wonder if Ireland can gain tenant right?" *Answer.*—"Yes, if supported by the Irish members." Night Password: *Question.*—"Moonlight is pleasant." *Answer.*—"Yes, so is freedom." Quarrelling Toast: *Question.*—"Be calm, sir." *Answer.*—"I am never too boisterous." Body-Master's Toast.—"Here's to every Irishman that crossed the Atlantic wave, That they may return with heart and hand their native land to save."

Members of the Order are confined to the divisions to which they belong, and have no right to attend the meetings of other divisions. This is a check upon the spread of dangerous information. A member in good standing may change his division, but for such a purpose a card of recommendation from the Body-Master of his late division is necessary. Should it be proposed to use the card out of the county, the county delegate places upon it his private mark. The card may be presented to either a Body-Master or a County Delegate; if the former, the card is forwarded to the County Delegate for the verification of his private mark. In leaving the State, a travelling card, which also bears the County Delegate's private mark, is used. The use of the Body-Master's toast, which is given to those officers alone, is to enable them to recognize each other. The quarrelling toast is used to prevent broils among the members. If a blow is struck after it is given, the offender is liable to expulsion from the order. Among the Mollie Maguires there is a thoroughly arranged system for the commission of crimes. A member having made complaint of certain parties who have offended him, or who are considered dangerous to the order, the matter is referred to the Body-Master, or a meeting of the division, or to a meeting of the Body-Masters of all the divisions and other leading men of the Order.

Murder is the most common of all forms of punishment with the Mollies. "Dead men tell no tales," is the well known principle of the Order. It is quite enough for a man to incur the dislike of one single influential member of the Order to forfeit his own life. The murder is generally committed in some lonely place, and with all the aggravated features of assassination. Though the conduct of the murderers is in the highest degree cowardly, they are regarded as heroes by the Mollies, and large rewards have been paid by the society for the killing of particularly obnoxious individuals. Should a member commit a murder or a robbery on his individual account, the act is endorsed by the Society, and its whole influence is used to screen and protect the criminal. When a member is arrested for a crime, the others are assessed in a certain sum for the purpose of raising money to employ counsel to defend him. The next step is to find witnesses enough to establish an "alibi." Perjury in such a case being counted a virtue by the Mollies, the witnesses are always forthcoming. Evidence of any kind that is wanted, can be promptly furnished by the Order. Such is the Order of the Mollie Maguires, and such are its leading features. Though its members claim to be Roman Catholics, the Order has been anathematized by the Roman Catholic Church. The Church, however, has so far failed to influence its members. The Order flourishes in spite of the clergy, and while professing the utmost devotion to the Church, encourages crime and wickedness.

The following formations for *Street Riot Duty*, prepared for the National Guard of New York, by General Wm. H. Brownell, have secured most flattering recognition from all quarters. It must be acknowledged that to provide a plan which would be effective under *all* circumstances for the quelling of riots is simply impossible, as every occasion may present different features, so that the means to employ must be left to the occasion; for instance, were rioters in possession of buildings and had the advantage of shelter from roofs, windows, doorways, etc., or had barricades of all conceivable kinds, each occasion would present new combinations, and only the cool judgement of the officer commanding could provide methods to successfully cope with the enemy. While all of these difficulties are recognized respecting all *fortified mobs*, we are not prevented from providing plans to disperse *riotous mobs in the streets*, and it is for this purpose these formations are presented. A large proportion of all riotous mobs consists of people who are present simply through curiosity, with no desire to commit a breach of the peace, yet before they are aware of it are identified as rioters, and giving countenance to the outbreak with their presence, and it is presumed are willing enough to start for home, if they can be freed from the mob, particularly after a demonstration from the troops. It will be observed that provisions are made, in the movements here provided, to secure this most desirable object, as opportunities are offered at every intersecting street. Moderation that will cause riotous mobs to secure the slightest confidence, or an impression that there is hesitation on the part of the troops, cannot be afforded, hence movements should show decision, be promptly executed, and rid of all forms that will cause delays, rather depending upon force of habit secured through close application in the drill room. The movements are simply combinations from Upton's rules, and may be readily executed.

The assembly for riot duty should be with service uniform, overcoats, if not worn, slung in horse collar form over left shoulder, the tie under and to the rear of the right arm pit, canteens with water, and haversacks with rations, if possible knapsacks to be taken if ordered to a distant point. A small detachment of reliable men, in charge of an experienced officer, should be left in the armory for its protection. Recruits and others, not having the requisite instructions for street work, should be left with this detachment where, under the tuition of the experienced men, they may be taught to assist materially in the defense of the building, should it be attacked. Field musicians should be taken with the regiment for employment, if necessary, as an ambulance corps. The regiment should be equalized into an even number of companies, bayonets fixed. Before leaving the armory details of marksmen will be made, sufficient in number to provide each company with at least four to act as *sharpshooters*; they will march, if their company is in column of fours, just outside of line of file closers, and if in line, in rear of file closers. It is not unusual to have large crowds in front of an armory on the ordinary occasions of "marching out," and it is reasonable to suppose that under the circumstances of "Riot Call" still greater numbers will congregate. While these crowds may be entirely friendly, the experience of many, and the duty of the Commandant, demand that every precaution be taken to provide for any emergency, and it is this that prompts the first formation upon leaving the armory.

Provision for armories located on streets having a line of buildings on both sides. Armories located on corners usually have the main entrance on a wide street, and are provided with an exit on the side street, which is more narrow; under these circumstances, it would be preferable to use the exit on the street that will oblige the crowd to present the smallest front during the formation.

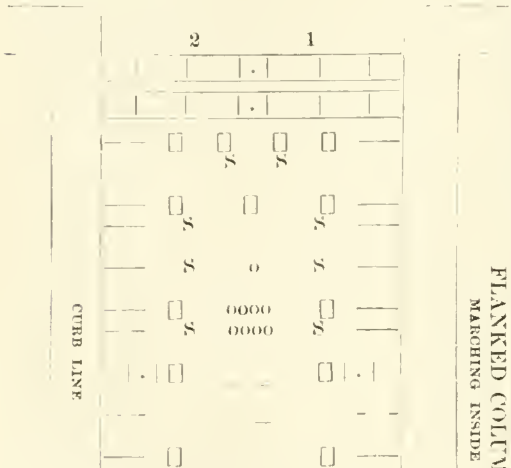
If the march is to be toward the left of the exit, form the first and fifth (or fourth, if only eight companies) divisions. As the doorway may not be wide enough for two columns of fours to pass, both divisions should be faced to the right; the first division, with the Captain, file closers and sharpshooters, on the right of the column; the fifth division, with the Captain, file closers and sharpshooters, on the left of the column. At the command, 1, *Forward*; 2, *March*; given by the Colonel, both divisions march by the flank, in parallel columns, the fifth division on the right, across the street to the fence, or building-line, when the Chief of the first division commands: 1, *First division*; 2, *By the left flank*; 3, MARCH. The Chief of the fifth division commands: 1, *Fifth division*; 2, *By the right flank*; 3, MARCH. The first division continues the march, driving the crowd entirely from the street and sidewalks, and halts inside the building-line of the first cross-street. The fifth division is marched company distance to the rear and halted; or, if near a crossing street, inside the building-line. The other divisions move out successively in columns of fours, right in front, and form line by "fours left," in trace of the first division, each at company distance. All divisions having become part of the column, the fifth division will be faced about, officers, file closers and sharpshooters in front, and moved up to company distance.

If the march is to be to the right of the exit, the first and fifth divisions march out by the left flank, with the first division on the right, and, after reaching building-line, the first division executes "*by the right flank, march*," and proceeds as previously explained; the fifth division, "*by the left flank, march*," and halted after marching company distance, or to the building-line. The other divisions march out successively in column of fours, left in front, and form line by "fours right," in the trace of first division, the fifth division facing about, and all closing up to company distance.

If the exit is near a corner to the left, and the march is to be to the left, the first and fifth divisions are marched out; the first division is halted just inside the building-line, and the fifth division is marched a sufficient distance to the rear to admit the interior divisions in the column, which march out as follows: column of fours, right in front; the fourth goes out first and forms line by "fours right," and when near the fifth "fours right about"; the second and third march out successively and form in rear of the first, when the fifth division faces about and all close to company distance.

If the exit is near a corner to the right, and the march is to be to the right, the first and fifth divisions are formed and marched out; the first division forms line "*by the right flank, march*," and marches company distance, or to the building-line, and halted; the fifth division forms line "*by the left flank, march*," and marches to the rear a sufficient distance to admit the interior divisions, which march out in columns of fours, left in front, in the following order: the fourth, forming line by "*fours left*," and when near the fifth division executing "*fours left about*; the second and third then follow, forming line by "*fours right*" in rear of first division, when the fifth division faces about and all close to company distance.

Marching to the place of disturbance in flanked column order. Being on the street in column of divisions, right in front, the Colonel commands: 1, *Flanked column order*; 2, *March*. At the first command Chief of first division commands: 1, *First division*; 2, *Stand fast*. Chief of fifth division: 1, *Forward*; 2, *Guide right*. Captains of third, fifth, and seventh companies command such company: 1, *Right forward, fours right*. Captains of fourth, sixth, and eighth companies command such company: 1, *Left forward, fours left*. The command "*March*" is repeated by all Captains of interior divisions and chief of fifth division, The companies of the interior divisions form the columns as ordered, file closers darting through the intervals between fours, and sharpshooters passing around the rear (in double

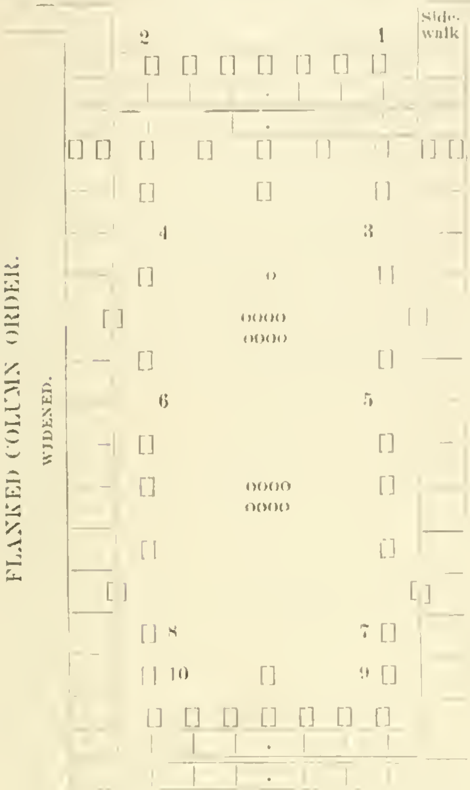


FLANKED COLUMN ORDER

time), to the side of the guide. The several companies close up until they are united in column of fours, the head of each flank column marching in trace of the flank fours of the leading division. The rear division is marched up until the flank fours unite with the rear of the columns. The left guides of the right companies of the first and fifth divisions cover the right guides of the left companies, who shall be the guides of the divisions, and the dressing, if necessary, shall be on the center. All officers, musicians, colors, signalmen, etc., will be placed in the interior of the column. The Colonel wherever he deems his presence necessary. Lieutenant-colonel between third and fourth companies, to supervise right wing. Major between seventh and eighth (or fifth and sixth, if eight companies), to supervise left wing. Staff, non-commissioned staff, and colors, in the center of the oblong. One drummer or trumpeter (the latter preferred) between third and fourth, and one between fifth and sixth companies. Chief of first division in rear of line of sharpshooters. Chief of rear division in front of line of sharpshooters. If the place of disturbance is at a distance and haste is demanded, it would probably be unnecessary to drive people from the sidewalks, until the troublesome district is reached; therefore, to facilitate the march, the column may be narrowed as follows. It can be, at any time, widened, as shown further on. The formation having been perfected and the "*Forward, March*" commanded, the Colonel directs the chief of the first division to order a sufficient number of fours from right and left to rear (equal number from each flank) to enable the front to march with flanks inside of the curb-line. The head of the flank columns will unite in column with the rear fours of the first division, and conform to their movements. The Commandant of the rear division will order a sufficient number of fours from right and left to the front (executing it according to principles of "right and left forward, fours right and left") to unite with the rears of the flank columns. Whenever the column is halted, the rear division will be faced to the rear by command of its chief (*such division about face*), and will be faced to the front at the command *forward* to the column. *Should the column be attacked* it can be halted, and the Colonel may command: 1, *Flank companies*; 2, *Fours right and left*; 3, March. 4, *Flank companies*; 5, Halt. The last command being given as line is formed. Fours thrown to the rear and front, forming line with the flank columns. The rear division will face to the rear, as previously explained. First Sergeants of flank companies will be in the line and covered by the Second Sergeant of next company.

If at any time it may be necessary to entirely drive the crowd from the streets and sidewalks, the Colonel will command: 1, *1st division*; 2, *Rear fours front into line*, 3, March. At the command *march*, flank column companies will conform to the increased front heads of the columns marching in rear of the flank fours on the sidewalk and rear division completing its front, with the fours previously thrown to the front. If only one four has been thrown to the front from each flank, the division line will unite with them, as the flank fours must march in trace of the rear of the flank columns. If more than one four was thrown to the front from each flank, at the command to widen the rear division marches forward, and, as the line is even with its leading flank fours (they having obliqued with the flank columns) the Chief commands *Flank fours*; 2, *Left and right front into line*; 3, *March*, when they execute the command on the leading fours and unite with the division line.

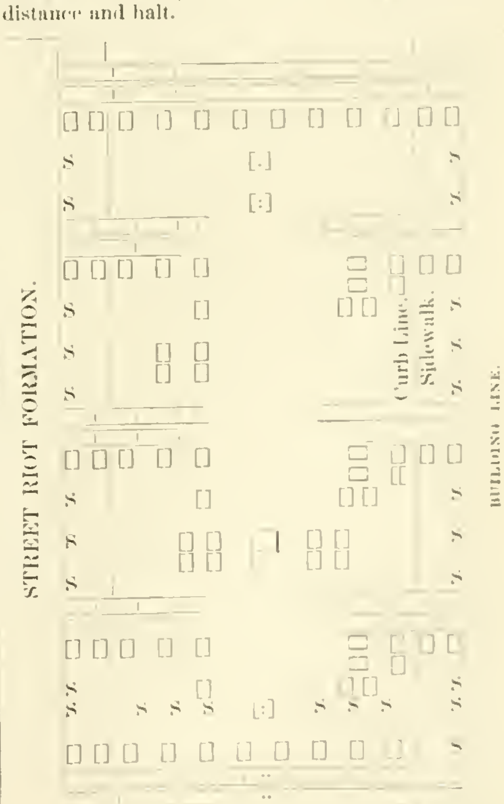
To form flanked column order from column of companies, right in front, the Colonel commands: 1, *Flanked column order*; 2, *Form first and fifth* (*or fourth, if eight companies*) *divisions*; 3, March. At second command, Captains of first and ninth (or seventh, if eight companies), command: *such company right oblique*. Captains of second and tenth (or eighth, if eight companies), command: *such companies left oblique*. Captains of odd numbered interior companies, third, fifth and seventh, command: *such company right forward; fours right*. Captains of even numbered interior companies, fourth, sixth and eighth, command: *such company left forward, fours left*. The third command "*march*," is repeated by all the captains When the left of the first company reaches the center of the street, it will be marched forward, and halted when it has advanced company distance. When the right of the second company reaches the center of the street, it is marched forward, and halted when uniting with the first company, the left guide of the first company stepping to the rear of the right guide of the second, who shall be the guide of the



division, and the dressing, if necessary, shall be on the center. As soon as the division is formed, its chief will order a sufficient number of fours from right and left to rear (equal number from each flank), to enable the division front to march with flanks inside of the curb. The interior companies will form the column, as ordered, file closers darting through the fours, and sharpshooters passing around the rear to the side of the guide (in double time); the several companies closing up until they are united in columns of fours, the head of each column marching in trace of the fours thrown to the rear of the 1st division. The rear division will be formed on the same principle as explained for the first, excepting that the file closers and sharpshooters will place themselves in front, and fours from right and left be thrown to the front, executing "right and left forward, fours right and left," and conform to the column ahead, the division marching forward and completing the "flanked column order."

When the exit of an armory faces a large open space, the flanked column order may be formed as follows: First company being in column of files (double rank), right in front; second company on the left of the first, in column of files (double rank), left in front — both march out in parallel columns. When the head of columns are clear of the doorway the first company executes column right and the second company column left: as the rears have executed the change, the first company forms line by the left flank, the second company by the right flank, thus forming the first division and moving forward. In meantime the odd numbered companies are formed in columns of fours, right in front, even numbered companies left in front, and march out as follows: third and fourth, fifth and sixth, seventh and eighth, ninth and tenth; odd numbered companies in column of fours, uniting with the right flank four of the first division, even numbered uniting with the left flank four. When the ninth and tenth companies have cleared the building and united with the flank columns, they will execute right and left front into line respectively, thus forming the rear division and completing the formation. The column can be narrowed as previously explained. In changing direction care must be observed to have the men on the pivot side of the column shorten step until they have passed the changing point, so as not to advance more rapidly than the marching flank. The command for changing would be simply, 1, "Column right (or left);" 2, "March," the leading division executing a wheel.

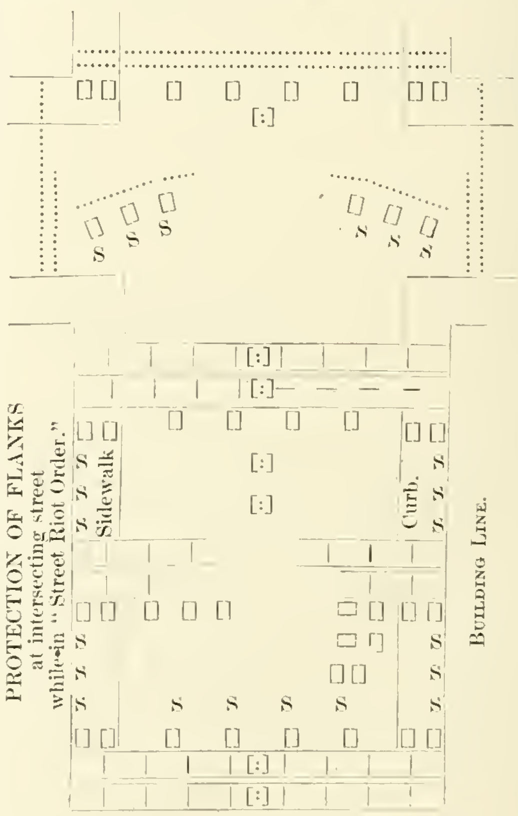
The assaulting or fighting formation is termed *Street-riot order*. This formation is simply a column of divisions, formed *from "column of fours," "column of companies," or the "flanked column order."* The command for forming divisions being prefixed with "*street-riot order*." To form from "flanked column order," the Colonel commands: 1, *Street-riot order*; 2, *Flank companies left and right, front into line*; 3, MARCH. At second command, the Chief of 1st division commands: 1, *1st division*; 2, *Forward*; 3, *Guide center*. Chief of rear division commands: 1, *Such division*; 2, *Forward*; 3, *Guide center*. Captains of right flank companies command: 1, *Such company*; 2, *Left front into line*. Captains of the left flank companies command: 1, *Such company*; 2, *Right front into line*. At command "*march*," repeated by all Commandants, 1st division will march division distance and halt.



Flank companies will execute front into line, from a halt, as explained in Tactics (in quick time), corresponding companies uniting and forming the interior divisions, file closers darting through the intervals, and sharpshooters passing, in double time, around either flank. Rear division is marched forward, company distance, and halted. When divisions are formed *either from "column of fours," "companies," or "column order,"* the right guide of each left company will remain on the right of his company, and will be covered by the left guide of the right company; the guide of divisions will be center. Right and left guides of divisions will place themselves in rear of, the extreme flank files of their respective companies, all officers and file closers in rear of the division, and chiefs of divisions, excepting the rear division, in rear of the center of their respective divisions. Sharpshooters, as the column of divisions is formed, will be placed in column (as in column of skirmishers), with equal intervals between the flanks of divisions, excepting those belonging to rear division, who will continue to march in front of that division. Colonel wherever he may deem his presence necessary. Lieutenant Colonel to be between 1st. and 2nd. division. Major between 4th and 5th (or 3d and 4th should there be four divisions). Staff, noncommissioned staff, music, and colors, between 2d and 3d, or 3d and 4th divisions. In this formation distances between divisions may be *increased* or *decreased*, either uniformly or not, as circumstances may demand. Sharpshooters, in either case, regulating the length of their intervals. In case of obstruction to the advance during action, interior divisions may be put under cover if available, although the front and rear should each have a division at hand for support or relief, as may be necessary. Being formed in street riot order, the column can be moved either to front or rear, by simply facing to the rear or front, as may be desired. Should fronts not be wide enough to cover sidewalks, they may be increased with rear rank men on each flank. If an avenue of unusual width is entered, the front and rear divisions may be reinforced by men from the interior divisions. *To afford free passage* from front to rear for officers or messengers, for quick communication, all divisions, when formed in street riot order excepting 1st and rear, will cause one four to break to the rear from the left of right company, the left guide of such company (who has covered the guide of the division) placing himself on the left of front rank, and preserving the interval necessary for the four. *When a division ceases to be a rear* division, officers, file closers, and sharpshooters pass through the intervals created in the center, and place themselves in their proper places in the rear.

If moving forward, and driving the mob, numbers of it will naturally break right and left through the intersecting streets, either for the purpose of attacking the flanks, or to escape the effects of severe measures from the troops; in either case the flanks, while passing, should be covered, and for this purpose is provided the following *important movement:*

As an intersecting street is approached the command is given: 1, *1st and 2d divisions*, 2, *Arms;* 3. *Port*. At this command should the mob be large and aggressive, the second division, the rear four being ordered, "front into line" (all officers in front passing through the interval before closing it), the left guide taking his place as previously explained, may be moved up quickly to within a few yards of the 1st. As the street is reached the command is given: 1. *1st. division;* 2. *Companies right and left turn;* 3. MARCH; just as the building line is reached, each Captain giving the proper command to his company. This being the quickest change of direction for a front, and being done promptly and resolutely, resolves itself into a rush on the mob. The "turns" being completed, companies are halted just inside the line of buildings. Should the fronts not be sufficient to command the street turned into, they will be widened immediately with rear rank men, to extend the line. Sharpshooters of the turned companies will secure positions (with cover, if possible) where they may command a clear view of the mob cut off, and select the leaders, so that should firing be ordered they can pick off the most active rioters. During the execution of the turns the column is still advancing, and forcing the main body of the mob ahead of it. The 2d division now having become the 1st (and all other divisions having changed their numerical designation), and must execute the same as explained above, at the next street, again dividing the mob, and so at each street presenting new and fresh fronts, without unnecessary exposure; in fact each change being in itself a *direct attack on three sides*. The first division must not, under any circumstances, approach the turning points in face of a crowd, until the second division is close at hand to take its place as the leading division. *As the rear of the column* passes, the turned flank companies will be *faced to left and right, execute column left and right, and formed to the front as the rear division*, file closers and sharpshooters placing themselves in front, thus completing again the formation and shutting out the mob. *Should the mob in the rear be violent*, as the column has passed, *the rear division of the main column* will be halted, faced about, and cover the formation of the flank companies, which will form division between the one halted and the main column.



Should it be deemed necessary at any time to relieve the first, or any division, even in the middle of a block, the same system can be employed as explained for passing an intersecting street. It is admitted that some exposure must exist. With the formation in "street riot order" it would be comparatively slight, as the interior divisions, should the resistance be severe, *could be moved back to full distance* or more if desired, so that missiles thrown at the 1st division would not be apt to reach the 2d. It is not necessary that wheeling distances be preserved. Staff officers, colors, and music will pass through the intervals provided in the center of the division, whenever the division they are in front of is about to become the 2d division. If, as is frequently the case, an intersecting street does not cross the one that the column is on, both companies turn (right and left) the same as explained for a crossing street, as the integrity of the division should be preserved. Advancing in "street riot order," should it be necessary to change direction—for instance turning a corner into another street—*if to the right*, the second division will be moved up close to the first, the right company of the first division will continue the march forward; as the changing point is reached the rear rank will extend to the left; the left company executes the left turn, the second division (both companies) right turn, as the building-line is reached, and continues the march, both companies of the first division halting at the building-line, when the column has passed, they face to the right, march to the right and form "by the left flank" as rear division. If the change is to be *to the left*, the left company of the first division advances and its rear rank extends to the right, the right company executing the right turn, the second division executing the left turn and continuing the march. Both flank companies, as the column passes, execute left face, march to the left and form "by the right flank" as the rear division. All divisions in rear of the second execute the "turn" at the changing point. While advancing in street rior order, should a large opening be reached, such as a square, or park, the flanked column order may be used, or such formations provided by Tactics for field work, as the circumstances may demand. While double rank formation is recommended, these movements can be executed in single rank, if necessary owing to lack of numbers. Should the regiment equalize with companies of sufficient size, the same principles can be used with platoons and companies as explained for companies and divisions. If it may be desirable to divide the force, for the purpose of flanking barricades, marching in parallel streets or detaching companies for special duty, three divisions (or companies, if large enough) are sufficient for "street riot order."

Firings are left to the judgment of the officer commanding, but great caution is advised in clearly indicating the front that is to fire. It is suggested that one trumpeter or drummer in each wing be used, to indicate cease firing. If a drummer, a short sharp roll should be given. *As the din in a street fight* would prevent to a great extent, commands being heard clearly, the Commandant may employ his staff officers to *communicate commands* directly to officers, when the noise is great. *The Lieutenant Colonel and Major will each be provided* with a non-commissioned staff officer, to enable them to promptly report anything of importance; in this connection it will be remembered that intervals to pass through are provided in the column for this purpose. The usual manner of directing dressings must be omitted in the face of an angry mob, and the habit secured in company drills of perfecting alignments be depended upon, the dressing in column being always toward the center.

Sharpshooters should be generally supervised by the Inspector of Rifle Practice, who should be especially detailed for that purpose. When the column is in "*street riot*" *order*, sharpshooters will be constantly on the alert, and if the district is dangerous, watch the windows and roofs of houses on the side opposite their flanks, and should a halt occur, will immediately seize any prominence that will afford them *view of the mob*, those of the 1st and 2d divisions watching the front, and those of the rear division watching the rear, but must not fire until individually ordered, unless they have special or general instruction to the contrary. Of course during a general engagement with rioters, they could be instructed to pick off any who are noticed as assailants. *Leaders of mobs* are usually shrewd enough to know the importance of disposing of commanding officers of troops, and thereby, in some instances, perhaps, cause demoralization. For this very reason, the knowledge that sharpshooters were with the column, would be apt to secure from the leaders of mobs a most profound respect for the troops they are resisting.

Should Artillery be employed with the regiment, the sections will be placed between the 1st and 2d divisions, and 4th and 5th, or 3d and 4th (if four divisions), and, if not to be engaged, will, as an intersecting street is approached, be halted until the 2d division has passed and reformed, as explained in Tactics for the passage of obstacles. When the companies who have executed the "turn" have reformed as rear divisions, the same movement will be executed by the division in rear of the rear sections. Should it become necessary to use the guns, owing to a heavy onslaught of the mob, *promptness* will be of the utmost importance, and from whichever front the guns are to be served, sufficient fours will be moved to rear to enable the guns to be run out on the line. While it is of course desirable to move the fours back, in order, the great object is to get them back *immediately*, and to accomplish this, captains will direct in such manner as will be the most practicable for the occasion. The fronts remain protecting the guns, and firing if deemed necessary.

By these formations it may be seen that several advantages are secured, for instance: 1. A precautionary formation in leaving the armory. 2. A column consisting of an oblong, marching inside the curb, ready for any emergency, and which can be widened so as to entirely clear the street. 3. The turns while in street riot order, affording protection to the flanks while passing. 4. The repeated changes of fronts caused by the leading division of the column being used to cover the flanks at intersecting streets, the 2d division as it passes becoming the first, and so on to the end, one company or division is not required to bear the whole brunt of the resistance as the changes occur as often as it becomes necessary, to protect the flanks. 5. Frequent separation of the mob. Respecting this feature, it may be claimed that the turbulent element cut off would soon unite again with the main body; very possible, but it must be borne in mind that the most active of the rioters would be in the front, and to separate any from their fellows (even if but temporary), would be of vast assistance in quelling the riot, besides affording a means of escape for many innocent people. 6. The piece being at arms port, is clutched firmly with both hands, can be used as a powerful pushing lever, at the same time be ready for charge bayonets or firing, or to use the butt as explained in the bayonet exercise. 7. A continuous advance on the main body of the mob. 8. The simplicity of the "*street riot order*," as it can be formed from "*flanked column order*," *column of fours, column of companies, or column of divisions*, etc., etc. 9. Artillery can be employed without changing the formation. In a street of ordinary width a regiment with five divisions can hold four city blocks at one time, and, if companies are large enough to operate with platoon formation, nine blocks can be held.

In providing these formations it is not supposed that an advance will be an unbroken march; it is therefore very important for all officers to watch the movements of the column and guard against confusion that might follow a sudden check. Commanding Officers should exercise extreme caution in entering dangerous districts, and not expose their men needlessly to the dangers of fortified defiles, as streets with buildings on both sides might be such in effect. These formations are simply tactical; methods for the erection or destruction of barricades, defending or assaulting of fortified buildings, attack or defense in general of fortified places, and matters incidental thereto, should be subjects for private instruction and discussion, as publicity might tend to neutralize the effect of any measure that might be employed.

RISBAN.—In fortification, any flat piece of ground upon which a fort is constructed for the defense and security of a port or harbor. It likewise means the fort itself.

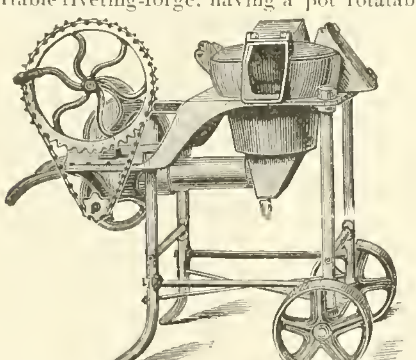
RISBERME.—A work composed of fascines, such as is sometimes constructed at the bottom of a town-wall. A sort of glacis of fascine-work used in jetties, the sides of which, towards the sea, are so formed as to withstand its violence.

RISING.—In Heraldry, a term applied to a bird when represented opening his wings as if about to take flight.

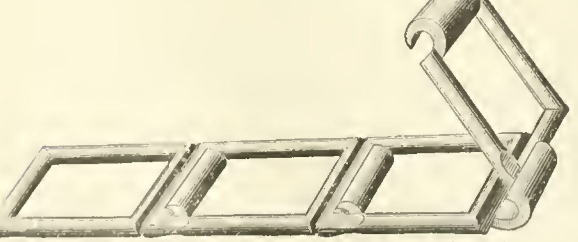
RISING FROM THE RANKS.—To pass through the successive stages in the ranks until a Non-commissioned Officer attains the rank of a Commissioned Officer. Each Non-commissioned Officer rising from the ranks in the English Army receives, on getting his commission, a grant of £150 in the cavalry, and of £100 in the infantry, to enable him to purchase his outfit.

RIVET.—A metal pin for connecting two plates of metal or other material together. The rivet is put through holes in both plates, and the projecting ends are then beaten down so as to represent the head of a nail on each side, and thus hold the plates in close contact. Rivets are of most essential importance in armor making, and in building iron ships. They are often put through the holes and beaten down while red-hot, in order that the contraction of the rivet as it cools, may produce more intimate contact of the plates. The principle of the *riveting-machine* is simply the bringing a powerful lever to bear upon the head of the rivet, so that the smith can hammer upon the other and softened end without displacing it. See *Riveting-machines*.

RIVETING FORGE.—A variety of forge much used in arsenals and founding shops. The drawing shows a portable riveting-forge, having a pot rotatable by



gearing, and having three doors, so as to employ three operatives; it contains a grate-like basket, which allows the blast from the tuyere to pass through. At the bottom of the basket is a grate and a comb-raker, operated from the outside. Beneath



the grate is the tuyere box. A fan is provided for creating a blast.

Various devices have been resorted to for transmitting power to the fan used on portable forges. All the standard Keystone forges have what is here shown and known as the "Square-Linked Malleable Iron Chain," which is very satisfactory in operation. It is more durable than cog gear and more reliable than friction pulleys. It is positive in its action, and from its construction it cannot slip, and may, therefore, be run slack, with much less friction upon the journals and bearings. As it neither stretches nor contracts by heat or dampness, it is always the same in all kinds of exposure. To use the chain, place it upon the wheel, with the open hook of the link out. To hook or unhook a link, make an angle, as represented in the drawing, and slide the link out by a side motion; the two depressions on the side of the link are for this purpose.

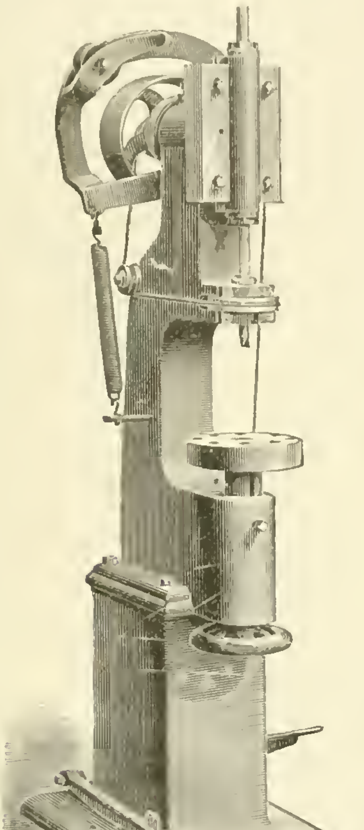
RIVETING-MACHINES.—As manufacturers in the United States of Mr. Ralph H. Tweddell's various Hydraulic Machines for riveting, so extensively used in England, Messrs. William Sellers & Co., have largely increased the applications of his invention in riveting armor-plates, etc., as well as improved the machines. The improvements in their steam riveting machines have been in the direction of greater strength and increased durability, and the application of the best features of the hydraulic system to the steam system. That is to say, they now make the steam riveters do their work by pressure, and not by impact or blow. Where the boiler pressure can be varied to suit the size of the rivets being driven, and can be maintained at a uniform pressure during the entire work, the steam riveter will be in all respects as effective as the hydraulic in stationary machines.

The attractive feature of the hydraulic system is, that the pressure to be applied in each case is gauged at the accumulator by an adjustment of the weights, which determine the pressure per square inch on the ram of the machine. If the water be admitted to the machine from the accumulator slowly, the pressure on the ram will be that in the accumulator as determined by the weights, and if the valve is opened quickly, so as to admit a very free flow of water and a consequent rapid fall of the accumulator, there may be an increase of the pressure over that due to the weight from the impetus of the falling load on the accumulator, but not amounting to any injurious increase.

The very much higher pressure per square inch at which hydraulic machines are run, as compared to either steam or pneumatic machines, makes the cylinder smaller, and consequently the machines are less cumbersome with equal power, a matter of very great importance with portable riveting machines, and of some moment in many kinds of stationary riveting machines. The hydraulic riveting machine can be used wherever power by belt is obtainable, and the pumps and accumulator may by placed at any point most convenient for the application of the power, their distance from the riveting machine involving no serious loss in efficiency.

Very extended experience with the hydraulic riveting machine system in its various forms has led to make alterations in the steam-system of riveting to bring it to the same standard of excellence. So long as it was believed that blows were needed to do good riveting by power, the improvements in the machines were in the direction of making them stronger and better able to withstand the severe shocks which sooner or later break down all such structures. Hydraulic riveting demonstrated not only that the work could be as well done without a blow, but that it could be *better done without a blow*, and that the riveted material was stronger when so secured than when subjected to the more severe treatment under impact. Many experiments with steam riveting machines led to the adoption of a system of very small steam-pipe connections from the boiler to the riveter, coupled with an increase in the diameter of the riveting cylinder and the use of a very large valve on the machine to permit a free flow of steam in exhausting and effecting the draw-back with the charge used in driving the rivet. This improvment has brought the steam riveting plant up to the best conditions of hydraulic riveting, so far as stationary machines are concerned, with the one single exception that the regularity of the steam pressure is still left to the discretion of the persons employed in doing the work. When a separate boiler is employed to run the riveter no great trouble is found in a close regulation of the steam, and the steam riveting system is very satisfactory.

The drawing shows what is known as the Elastic Blow Riveting-machine, and much used in arsenals



for a great variety of the lighter work. The most remarkable feature of the machine is the peculiar elastic blow, the force of which can be varied at the will of the operator, from a slight to a heavy blow, by more or less pressure applied to the treadle, and without moving the work in any manner.

A self-acting device attached to the machine stops instantly the blow of the hammer, allowing the operator to withdraw his work. An adjustable anvil allows vises or other suitable contrivances to be attached, for holding work of different shapes and thicknesses, and an extra treadle (shown in engraving) is furnished with each machine, to allow these vises to be operated by the foot if desired.

The work, while in the machine, is stationary, thus insuring the hammer always striking on the rivet and heading it equally. Both hands of the operator being free, he is able to handle the work with ease and rapidity. The hammer being rotated while the blows are given, the work can be riveted flush, or with a smooth, rounded head, as desired. The machine is used in five sizes, for heading soft rivets of $\frac{3}{16}$, $\frac{7}{32}$, $\frac{1}{4}$, $\frac{3}{8}$, and $\frac{1}{2}$ inch diameter respectively.

RIVETING PLATES. In gun-carriages, the small, square, thin pieces of iron, through which the ends of the bolts pass and are riveted upon them.

RIVERS. Rivers traversing the theater of war occupied by hostile armies have a marked influence on the operation of each. Whenever they are to be crossed in the presence of an enemy, either in advancing or retiring, the use of artillery and of field-works becomes of great importance; this, for the reason that the operation of crossing necessarily consumes considerable time, during which the army is

divided—astraddle, as it were, the stream and requires the aid of that arm which, from a fixed position, possesses the power of covering at long range the movements of other troops. The place of crossing, whether bridge, ferry, or ford, is simply a defile through which the army has to pass, and which must be completely covered from the fire of the enemy, who must not be permitted to establish batteries within range of the crossing. This is best effected by covering every point accessible to him with the fire of artillery.

A river in front of an army operating on the defensive, stands to it, somewhat, as a wet ditch does to a fortification, and should be so guarded as to make the crossing of it a difficult, if not a hazardous, operation to an advancing enemy. Points at which the communications of a country converge are those most advantageous for an enemy to select for crossing. These should be secured by strong inclosed works, armed with artillery of such power as to cause him to make a long detour and to adopt a less advantageous point. If the stream is navigable, such works form a place of refuge for the craft that ply on it, and which, falling into the hands of the enemy, would furnish him with means of crossing and assist him in carrying on his operations. The size of the work will, to a great degree, depend upon the force that can be detached from the main body for garrisoning it; but, generally, a well-constructed work containing a thousand men, adequately supplied with artillery, will prove a formidable obstacle to the crossing army. Points thus established should not be so numerous as to cripple the efficiency of the defending army by dispersion. They should be rather in the nature of bases for temporary points of observation along the river, secure against capture by *coup de main*, and threatening to the flanks and rear of the crossing army.

A bridge is protected by a *tête-de-pont*, the nature and extent of which will depend upon the character of the attack to be expected. Against mere raiding parties, a mere redan or lunette will amply suffice Two or three pieces of artillery may be put in it, but it is preferable to locate batteries, on the opposite side of the river, to flank the redan and cross their fire in front of it. Against a large force well supplied with artillery, a *line* of works must be thrown up and well armed with artillery, for the purpose of keeping him beyond artillery range from the bridge. Batteries of heavy pieces are placed, to flank the line.

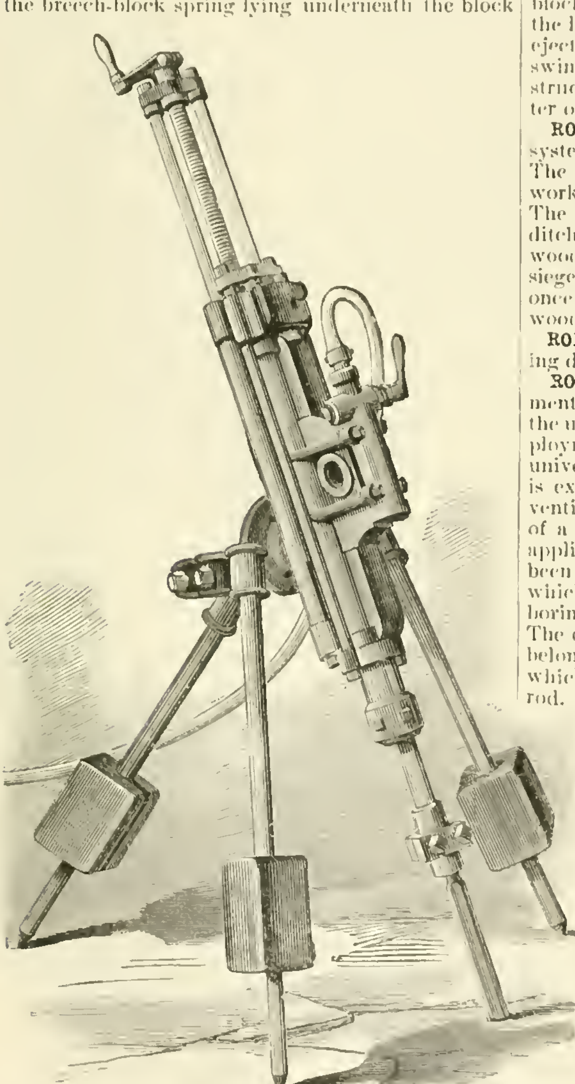
The operation of crossing a river by an army in presence of a vigilant enemy, is one of great delicacy, as it necessarily consumes considerable time, during which it is more or less divided and subject to every disadvantage. Judicious use of artillery is of the first importance. The first thing to be done is to gain a footing on the opposite side. This is usually accomplished by stratagem or by surprise. Before a large opposing force can arrive, batteries must be established on the side from which the crossing is made to cover with their fire a large area of ground opposite. Every available piece must be put in, and the enemy kept back until bridges can be laid and a strong line of infantry passed over and intrenched. Siege guns, owing to their great range and power, are the best adapted for this service. The batteries should be extended up and down the stream for three or more miles on each side of the crossing-place; this, for the main purpose of enfilading the flanks of the enemy and preventing him from bringing his artillery to bear upon the crossing. The place for crossing should be selected, as far as practicable, with a view to advantageous positions for batteries. The convex side of a curve with hills dominating the opposite side gives every advantage. This secures a cross-fire upon the opposite peninsula, under cover of which the infantry line and light field batteries can be thrown forward to a distance of two or three thousand yards and established in an intrenched line as represented in the drawing.

If the enemy has gun-boats on the river, especially if they are iron-clads, provision against them must be made by laying across the channel lines of submarine mines, with heavy batteries established for their protection. These batteries must be strongly intrenched. The operation of crossing a river by an army pressed in rear by another, is the reverse of that just described. When practicable, the concave side of a bend is selected, across which a line of temporary intrenchments is constructed: batteries are established on the opposite side, and the army withdrawn under protection of their fire. The batteries should cover themselves with gun-pits, and give special attention to such artillery as the enemy may bring forward for the purpose of reaching the place of crossing. See *Bridges*.

RIZAMEDAR.—In the East Indies, an officer commanding a small body of horse.

ROADS.—When it is proposed to construct a line of road, extending between two places, the officer upon whom such duty devolves, first makes himself well acquainted with the surface of the country lying between the two places; he is then to select what he thinks, all circumstances being taken into consideration, the best general route for the proposed road. But previously to laying it out with accuracy, it is necessary to make an instrumental survey of the country, along the route thus selected; taking the levels from point to point throughout the whole distance, and making borings in all places where excavations are required, to determine the strata through which such cuttings are to be carried, and the requisite inclinations of the slopes or slanting sides as well of the cuttings as of the embankments to be formed by the material thus obtained. It is also requisite, in the selection of the route for the proposed road, to have regard to the supply of materials, not only for first constructing it, but for maintaining it in repair. The results of such an investigation should be reduced to plan and section; the plan of the road being on a scale not less than 66 yards to an inch, and the section not less than 30 feet to an inch. The loss of *tractive* power and consequent danger produced by steep acclivities, render it necessary that a proper and carefully determined limitation should be imposed on the acclivities or inclinations on every line of road. As, however, in most instances, this reduction of hills in a country where much inequality of surface exists, is attended with great labor and expense, greater rates of inclination must be allowed to hills or roads where the traffic is not sufficient to repay the expense of excavations. A dead level, even where it can be obtained, is not the best course for a road; a certain inclination of the surface facilitates the drainage, and keeps the road in a dry state. There is one certain inclination or acclivity, which causes, at a uniform speed, the traces to slacken, and the carriages press on the horses, unless a drag or brake is used; the limiting inclination within which this effect does not take place is called the *angle of repose*. On all acclivities less steep than the angle of repose, a certain amount of tractive force is necessary in the descent, as well as in the ascent: and the mean of the two drawing forces, ascending and descending, is equal to the force along a level road. The exact course of the road, and the degree of its acclivities being determined, the next thing to be considered is the formation of its surface. The qualities which ought to be imparted to it, are twofold: first, it should be smooth; secondly, it should be hard; and the goodness of the road will be exactly in proportion as these qualities can be imparted to it, and permanently maintained upon it. The means resorted to accomplish these objects are: 1. *Gravel Roads*. A coating of four inches of gravel should be spread over the road bed, and vehicles allowed to pass over it, till it becomes tolerably firm—men being required to rake in the ruts as fast as they appear; a second coating of 3 or 4 inches of gravel should be then added and treated like the first, and finally a third coating. 2. *Broken Stone Roads*, or McAdam roads. French engineers value uniformity in size of the broken stone less than McAdam. They use all sizes from $1\frac{1}{2}$ inches to dust. McAdam considers from 7 to 10 inches of depth of stone on the road sufficient for any purpose. He earnestly advocates the principle, that the whole science of road-making consists, in most cases, in making a solid dry path on the natural soil, and then keeping it dry by a durable water-proof coating. 3. Broken stone roads with a paved bottom or foundation, or *Tilford Roads*; a road thus constructed will, in most cases, cost less than one entirely of broken stone. 4. *Roads of Wood*. The abundance, and consequent cheapness of wood renders its employment in road-making of great value. It has been used in the form of logs, of charcoal, of planks, and also of blocks. When a road passes over soft, swampy ground it is often made passable by felling straight young trees, and laying them side by side across the road at right angles, or very nearly so, to its length. This is the primitive and very well known *corduroy* road. A very good road has been lately made through a swampy forest, by felling and burning the timber, and covering the surface with charcoal thus prepared. Timber from 6 to 18 inches through is cut 24 feet long, and piled up lengthwise in the center of the road about five feet high, and then covered with straw and earth in the manner of coal pits. The earth required leaves two good ditches, and the timber, though not split, is easily charred; and when charred the earth is removed to the side of the ditches, and the coal raked down to a width of 15 feet, leaving it two feet thick at the center and one at the sides. 5. *Plank Roads*. Two parallel rows of small sticks of timber (called sleepers) are imbedded in the road three or four feet apart. Planks, 8 feet long and 3 or 4 inches thick, are laid on these sleepers across them. A side track of earth to turn out upon is carefully graded. Deep ditches are dug on each side to insure perfect drainage; and thus we have the plank road. 6. *Roads of Earth*. These roads are deficient in the important requisites of smoothness and hardness, but they are the only roads usually made in the field to carry on military operations. Their shape, when well made, is properly formed with a slope of but 1 in 20 each way from the center. Its drainage should be made thorough by deep and capacious ditches, sloping not less than 1 in 125. Trees should be removed from the borders of the road, so as not to intercept the sun and wind. The labor expended upon it, will, however, depend upon circumstances. Every hole or rut in the road should, however, be at once filled up with good materials, for the wheels fall into them like hammers, deepening them at each stroke, and thus increasing the destructive effect of the coming wheel. The cross-section of a road embraces: 1. *The width of the road*—from 16½ to 30 feet, according to its importance, and the amount of travel upon it. 2. *The shape of the road-bed*—The best shape of the transverse profile for a road on level ground is two inclined planes meeting in the center of road, and having their angle slightly rounded. On a steep hill, the transverse profile should be a single slope inclining inwards to the face of the hill. 3. *Footpaths, etc.* 4. *Ditches*—The ditches should, if possible, lead into the natural water-courses of the country. 5. *The side slopes of the cuttings and fillings*—These vary with the nature of the soil.

ROBERTS GUN.—A breech-loading rifle having a fixed chamber closed by a movable breech-block, which rotates about a horizontal axis at 90° to the axis of the barrel, lying above the axis of the barrel and in rear, being moved from above. The piece is opened by raising a hooked catch-lever, at the end of the tang of the breech-block, out of its notch in the tang of the receiver. This depresses the forward end of the block so as to expose the chamber. The reaction of the breech-block spring lying underneath the block



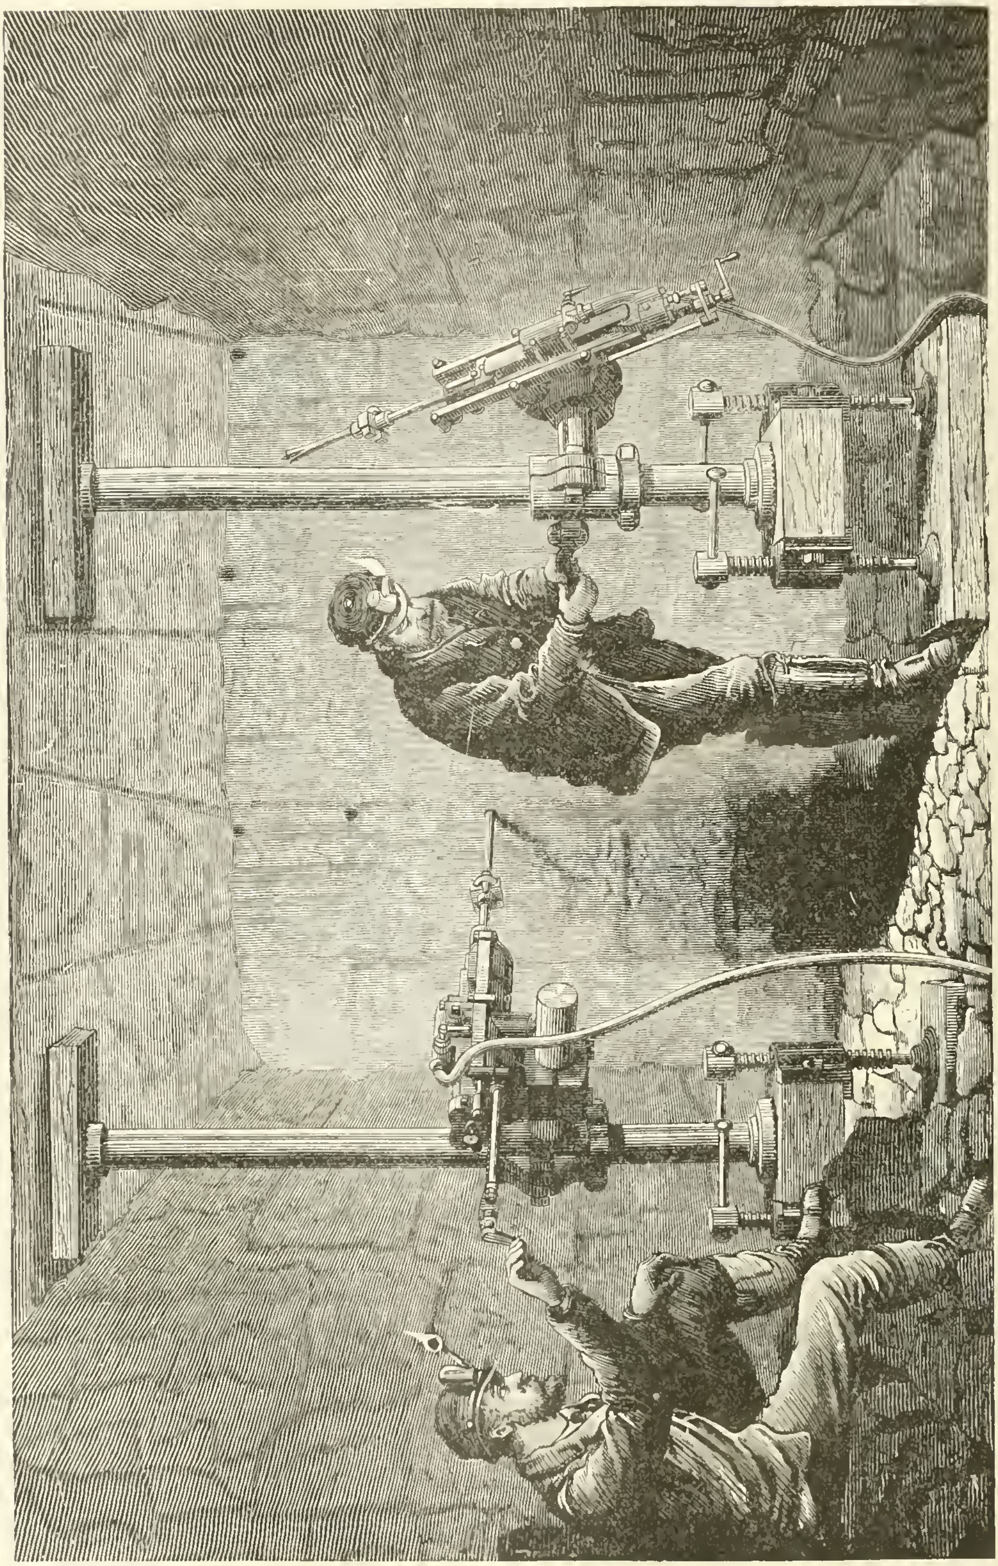
throws up the front of the block sufficiently to keep the cartridge from falling out of the chamber before the breech is fully closed. The closing is done by returning the lever to its place, or automatically by cocking the piece. The back of the hammer in the latter case presses against the end of the slot in the tang of the breech-block in which it plays, and so raises the front of the block into place. The piece is locked by the position of the breech-block, which is also kept in place by the engaging of the hook of the catch-lever with a corresponding notch in the tang of the receiver. Extraction and ejection are accompanied by a bent lever pivoted to the side of the receiver below the chamber, and struck by the breech-block face in its descent.

ROBERTSON RIFLE.—A breech-loading small-arm having a fixed chamber closed by a movable breech-block, which rotates about a horizontal axis at 90° to the axis of the barrel, lying below the axis of the barrel and in front—being moved from below by a lever. By depressing the lever the block is pulled down by a link connecting the two. By reversing the lever the block is raised into place against the end of the barrel, and is locked by the middle joint of the linked combination rising above the line joining the other two, and causing the strain upon the block from the discharge to tend towards bringing the lever more closely into place. Extraction and ejection are accomplished by a small straight lever, swinging on a center below that of the block, and struck by the block, during the opening, near its center of motion.

ROBILLARD SYSTEM OF FORTIFICATION.—This system has been called the "system of demolition." The enceinte resembles that of Vauban. The outworks consist of ravelins, counterguards, and fleches. The terrepleins of all these works are intersected by ditches, which are covered either by masonry or by wooden frames and earth, so that when the besieger has breached a work, the defenders obtain at once a retrenchment by removing that masonry or wood by the mine.

ROBINET.—An ancient military machine for throwing darts and stones.

ROCK DRILL.—The two most important improvements in modern rock-drilling apparatus consists in the use of compressed air as a motor, and the employment of diamond points. The former is now universally used in operations on a large scale, and is extensively employed in coal-mining, serving to ventilate the shaft besides performing the functions of a motor. The drilling-machines to which it is applied are various, very great improvements having been made within the past few years, previous to which time the old systems of turning the drill, and boring or pounding by hand, held undisputed sway. The drawing illustrates the Rand Rock Drill, which belongs to the class known as "striking drills," in which the drill steel is an extension of the piston-rod. The cylinder slides in a shell or guide, which is in turn mounted upon a tripod with a universal joint. The cylinder is fed toward the rock as fast as the steel penetrates it. The tripod legs are adjustable, and can be placed in any position desirable. The weights are removable. The positive valve movement insures certain operation when steam or air is admitted, without depending upon close fits or clean parts. It allows of a variation in design between the up and the down stroke, thus economizing steam and increasing the working capacity of the machine. By a patented feature, the valve is moved in the same direction with the piston. The rotating bar is made full size where it enters the ratchet, and, unlike the other forms, it does not break. The piston-rod and chuck, or drill-holder, is made rather small and solid outside of the cylinder, whereby a much greater lifting power is attained than is ever possible in any other machines of the same diameter of cylinder. The split crank-nut, feed-nut, and adjustable-slides



RAND'S LITTLE GIANT ROCK DRILL.

Mounted on Tunnel or Drifting Column.

provide for taking up wear as fast as it occurs. The throttle or stop cock, employed in the Rand drill is placed in the steam chest, where it cannot be lost or injured in handling, as is the case where a common valve attached to the hose is used. The lightning coupling provides for instantaneous connection of the hose without the use of wrench or spanner; it does not leak, and has no gaskets that can drop out.

The full page engraving opposite shows this drill mounted so that several holes can be drilled each side of the column without taking down the drill or moving the column. The arm is made so that by loosening one nut it can be swung around to any position, or it can be raised or lowered on the column. The Rand air-compressors, used with this drill are of the horizontal duplex type, with air and steam cylinders in line. This arrangement makes a machine that is very accessible, that is correctly designed, and readily available as an engine as well as a compressor, and that has its framing so disposed as to take the strains in direct lines. The engine is fitted with the Meyer valve gear, the cut-off being adjusted by a hand wheel, while the machine is in motion, the point of cut-off being shown by a pointer moving over a graduated scale. The machine is run with a wide-open throttle, and is controlled entirely by the cut-off. At the same time an ordinary ball-governor protects the machine from running away in case of breakage of the air pipes, or sudden loss of pressure from any cause—a not infrequent occurrence. Attached to the ball-governor is a pressure governor, whose object is to slacken speed whenever the air pressure reaches the maximum desired—usually 65 lbs. per sq. in. The main frames are of the Corliss pattern, and very heavy. The air and steam cylinders are tied together by a heavy cast-iron sole-plate and tie-rod, which take the strain in direct lines. The bearings are of brass, very large, and fitted for taking up wear. The cranks are of wrought iron, the crank pins and cross head pins of steel. The fly wheel is very heavy, in order to give smooth motion when it is desired to run one side at a time. The method of absorbing the heat of compression is believed to be the most perfect in use. Injection of water into the cylinder is not feasible in cold climates, owing to the freezing of the water in the air pipes. At the same time the ordinary cast-iron jackets for circulating water around the cylinder merely serve to keep the metallic parts of the machine from becoming overheated, and have but an insignificant effect in cooling the air. In this compressor the air-cylinder is made of hard brass, owing to the better conductivity of this material, and as thin as it can be made with safety; the cylinder heads are hollow and have water circulating through them, and finally the piston and piston-rod are hollow, and by means of a telescopic arrangement of tubing at the back end of the air-cylinder, are kept supplied with cold water. The piston packing consists of four composition rings arranged in pairs at each end of the piston. Before escaping, the water of the piston circulation is made to pass between these rings, completely around the piston in contact with the inside cylinder walls.

ROCKET GAUGES.—Brass rings, which are employed to ascertain whether the case is exteriorly of the proper dimensions.

ROCKETS.—Projectiles set in motion by forces residing within themselves, and performing the twofold functions of pieces and projectiles. A rocket is essentially composed of a strong case of paper or wrought iron, enclosing a composition of *niter, charcoal* and *sulphur*—the same as gunpowder, except that the ingredients are proportioned for a slower rate of combustion. If penetration and range be required, its head is surmounted by a *solid shot*; if explosion and incendiary effect, by a *shell* or *spherical case-shot*, to which is attached a fuse, which is set on fire when it is reached by the flame of the burning composition. The base is perforated by one or more *vents* for the escape of the gas generated within, and sometimes with a screw-hole to which a guide-stick is fastened. The disposition of the different parts

will be readily understood by reference to the drawing which represents a section through the long axis of a Congreve rocket.

The rocket is set in motion by the reaction of a rapid stream of gas escaping through its vents. If it be surrounded by a resisting medium, the atmosphere, for instance, the particles of gas, as they issue from the vent, will impinge against and set in motion certain particles of air, and the force expended on the inertia of these particles will react and greatly increase the propelling force of the rocket. It follows, therefore, that, though a rocket will move with very great ease *in vacuo*, its propelling force will be increased by the presence of a resisting medium. Whether the effect will be to accelerate the rocket depends upon the relation between the resistance which the medium offers to the motion of the gas, and that which it offers to the motion of the rocket. As the rate of combustion of the composition is independent of the pressure of the gas in the bore, it follows, that if the size of the vent be contracted, the flow of the gas through it will be accelerated. The strength of the case, and the friction of the gas, which increases as the vent diminishes, alone limit the reduction of the size of the vent. For vents of the same size, but of different shapes, that one which allows the gas to escape most freely, will be most favorable to the flight of the rocket. A conical form of vent, with the larger orifice next to the bore, will allow the gas to escape more rapidly than one of cylindrical form.

As the composition of a rocket burns in parallel layers of uniform thickness, the amount of gas generated in any given time, or the velocity of its exit from the case, depends on the extent of the inflamed surface. Experience shows that to obtain the required surface of inflammation, it is necessary to form a very long cavity in the mass of the composition. This cavity is generally called the *bore*. In small rockets, the bore is as a general thing formed by driving the composition around a spindle which is afterward withdrawn; but in the larger ones, the composition is driven into the case in a solid mass by a powerful hydrostatic press, and then bored out with a bit. In all rockets the bore should be concentric with the case; its shape should be made conical to facilitate the drawing out of the spindle, and to diminish the strain on the case near its head, by reducing the amount of surface where the pressure on the unit of surface is greatest.

Suppose the rocket in the state of rest, and the composition ignited; the flame immediately spreads over the surface of the bore, forming the gas, which issues from the vent. The escape is slow in the first moments, as the density of the gas is so slight; but as the surface of the inflammation is large compared to the size of the vent, the gas accumulates rapidly, and its density is continually increased until the velocity of the escape is quite sufficient to overcome all of the several resistances which the rocket always offers to motion. These resistances are, inertia, friction, the component of weight in the direction of motion, and, after motion takes place, the resistance of the air. The constant pressure on the head of the bore accelerates the motion of the rocket until the resistance of the air equals the propelling force; after this, it will remain constant until the burning surface is sensibly diminished. When the gas ceases to flow, the rocket loses its distinctive character, and becomes, so far as its movement is concerned, an ordinary projectile. The increase in the surface of combustion whereby more gas is developed in the same time, and the diminution in the weight of all the remaining composition, cause the point of maximum velocity to be reached with increased rapidity. If the weight of the rocket be increased, the instant of maximum velocity will be prolonged, but the amount will remain the same. A change in the form of the rocket which increases the resistance of the air, will have the effect to diminish the maximum velocity. The maximum velocity of French rockets, and the distances at which they are attained, are given in the following table:—

Caliber.	Distance.	Maxm. Velocity.
$2\frac{1}{2}$ inches.	121 yds.	273 yds.
$3\frac{1}{2}$ "	139 "	364 "

According to the calculations of Piobert, for small rockets it takes about $\frac{3}{4}$ second for the gas to attain its maximum velocity of 837 yards.

It is readily seen that the propelling force of a rocket changes its direction with the axis along which it acts; it follows, therefore, that without some means of giving stability to this axis, the path described will be very irregular, and so much so, at times, as to fold upon itself; and instances have been known where these projectiles have returned to the point whence they started. An example of this irregular motion may be seen in "serpents," a species of small rockets without guide-sticks. The two means now used to give steadiness to the flight of a rocket are, *rotation*, as in the case of a rifle-ball, and the *resistance of the air*, as in an arrow.

The first is exemplified in Hale's rocket, where rotation is produced around the long axis by the escape of the gas through five small vents situated obliquely to it. In his first arrangement, the inventor placed the small vents in the base, completely surrounding the large central vent, so that the resultant of the tangential forces acted around the posterior extremity of the axis of rotation. In 1855, this arrangement was changed by reducing the number of the small vents to three, and placing them at the base of the head of the rocket. The rocket thus modified is the one now used by the United States Government for war purposes.

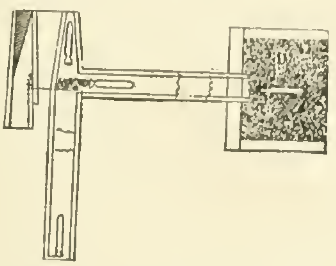
A Congreve rocket is guided by a long wooden stick attached to its base. If any cause act to turn it from its proper direction, it will be opposed by resistances equal to its moment of inertia and the lateral action of the air against the stick. The effect of these resistances will be increased by placing the center of gravity near the head of the rocket, and by increasing the surface of the stick. In *signal* rockets, where the case is made of paper, the stick is attached to the side by wrapping around twine; and there is but one large vent, which is in the center of the case. In *war*-rockets the stick is attached to the center of the base, and the large central vent is replaced by several smaller ones located near its circumference. The former arrangement is not so favorable to accuracy as the latter, inasmuch as rotation will be produced if the force of propulsion and the resistance of the air do not act in the same line. Rockets are generally fired from *tubes* or *gutters*; but should occasion require it, they may be fired directly from the ground, care being taken to raise the forward end by propping it up with a stick or stone. As the motion is slow in the first moments of its flight, it is more liable to be deviated from its proper direction at this time than any other: for this reason the conducting tube should be as long as practicable, say from five to ten feet. Take that portion of the trajectory where the velocity is uniform. The weight of the rocket applied at its center of gravity, and acting in a vertical direction, and the propelling force acting in the direction of its length, are two forces the oblique resultant of which moves the rocket parallel to itself; but the resistance of the air is oblique to this direction; and acting at the center of figure, a point situated between the center of gravity and extremity of the guide-stick, produces a rotation which raises the stick, and thereby changes the direction in which the gas acts. As these forces are constantly acting, it follows that each element of the trajectory has less inclination to the horizon than the element of an ordinary trajectory in which the velocity is regarded as equal. When the velocity is not *uniform*, the position of the center of gravity has a certain noticeable influence over the form of the trajectory. To understand this, it is necessary to consider that the component of the resistance of the air which acts on the head of the rocket is greater than that which acts on the side of the stick. It is also necessary to consider that the pressure of the inflamed gas acts in a direction opposite to the resistance of the air, that is to say, from the rear to the front, and that the center of gravity is near the rear extremity of the case.

At the beginning of the trajectory, when the motion of the rocket is accelerated, its inertia is opposed to motion, and being applied at the center of gravity, which is in rear of the vent, the point of application of the moving force, it acts to prevent the rocket from turning over in its flight. But when the composition is consumed, the center of gravity is thrown further to the rear, and the velocity of the rocket is retarded, the inertia acts in the opposite direction, and the effect will then be, if the center of gravity or inertia is sufficiently far to the rear, to cause it to turn over in the direction of its length. If the rocket be directed toward the earth, this turning over will be counteracted by the acceleration of velocity due to the weight, and the form of the trajectory will be preserved.

When the wind acts obliquely to the plane of fire, its component perpendicular to this plane, acting at the center of figure, will cause the rocket to rotate around its center of gravity. As the center of figure is situated in rear of the center of gravity, the point will be thrown toward the wind, and the propelling force acting always in the direction of the axis, the rocket will be urged toward the direction of the wind. To make an allowance for the wind, in firing rockets, they should be pointed toward the opposite side from which the wind comes, or with the wind instead of against it. If the wind act in the plane of fire from front to rear, it will have the effect to depress the point, and with it the elements of the trajectory in the ascending branch, and elevate them in the descending branch; as the latter is shorter than the former, the effect of a front wind will be to diminish the range. The converse will be true for a rear wind.

Rockets were used in India and China for war purposes before the discovery of gunpowder; some writers fix the date of their invention about the close of the ninth century. Their inferior force and accuracy limited the sphere of their operations to incendiary purposes, until the year 1804, when Sir William Congreve turned his attention to their improvement. This officer substituted sheet-iron cases for those formed of paper, which enabled him to use a more powerful composition; he also made the guide-stick shorter and lighter, and removed a source of inaccuracy of flight by attaching the stick to the center of the base instead of fixing it to the side of the case as before. He also states that he was enabled by his improvements to increase the range of 6-pdr. rockets from 600 to 2,000 yards. Under his direction they were prepared, and used successfully at the siege of Boulogne and the battle of Leipsic. At the latter place they were served by a special corps. The advantages claimed for rockets over cannon are, unlimited size of projectile; portability; freedom from recoil; rapidity of discharge; and the terror which their noise and fiery trail produce on mounted troops. The numerous conditions to be fulfilled in their construction in order to obtain accuracy of flight, and the uncertainty of preserving the composition uninjured for a length of time, are difficulties not yet entirely overcome, and which have much restricted their usefulness for general military purposes. See *Hale War Rocket*, *Life-saving Rockets*, and *Macdonald's Hale Rocket*.

ROCKET TROUGH. A small rocket with a hemispherical head of wood, which is frequently employed for firing mines. To use it, a wooden trough, with a smooth interior, must be placed from the charge to the point where the rocket is to start; tin tubes have been recommended, but are found not to answer. The rocket is then placed in the end of the trough, the quick-match with which it is pro-



vided is lighted, and the rocket starts with very great velocity, penetrates the charge, and fires it.

When the rocket has to pass elbows, or when it is desired to fire several mines at the same moment, a rocket is placed at each turn of the trough, with its quick-match secured around a nail; the first rocket arriving at the point where the other is placed, fires it. In order the better to insure the first rocket firing the second, a quantity of powder ($\frac{1}{4}$ ounce) should be scattered about the match of the latter, protected by a wedged-shaped slip of deal, nailed to the bottom of the trough; the rocket meeting this passes over the powder, which its rapid motion would otherwise disperse.

A rocket may be made to easily turn in a circular trough, when the radius of that part is not less than twice the length of the rocket. In order to prevent the smoke of the charge penetrating the gallery through the trough, one or two small iron traps may be placed in the trough, which, being raised by the rocket, fall again by their own weight, and cut off all communication between the gallery and the charge.

A rocket six inches long will travel 100 yards at least, and its velocity is so great, that two rockets fired at the same moment, to run very different distances, leave no perceptible interval in the times of their arrival. This property of rockets renders it easy to proportion the trains of mines to be fired simultaneously, which, with the powder-hose, requires great nicety.

The ordinary rocket for this service contains $\frac{3}{4}$ of an ounce of a composition formed $\frac{2}{5}$ of fine powder, $\frac{1}{5}$ of saltpeter, and $\frac{1}{5}$ of charcoal dust. These ingredients should be very carefully mixed, to make the rocket burn uniformly. Its usual diameter is nearly $\frac{3}{4}$ of an inch, and entire weight about $1\frac{1}{2}$ ounce. Rockets may be made much smaller when required. See *Box-trap* and *Monk*.

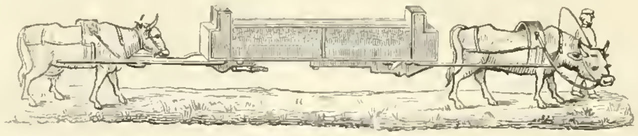
ROCKET WAGON.—A conveyance differing from the ordinary field ammunition wagon in the boxes being made deep enough to receive about 25 Hale's rockets, resting vertically in each box, and in having no center boxes.

ROCK FIRE.—A composition which burns slowly, is difficult to extinguish, and is used to set fire to buildings, ships, etc. That which is put into shells is cast in cylindrical cases of paper having a priming in their axes. The composition consists of *rosin*, 3 parts; *sulphur*, 4; *niter*, 10; *regulus of antimony*, 1; *mutton-tallow*, 1; *turpentine*, 1. To prepare rock-fire, pulverize the sulphur, niter, and antimony separately; mix them well with the hands, and pass them through sieve No. 2; melt the tallow first, then the rosin, stirring the mixture with spatulas; add the turpentine, and next the other materials in small quantities at a time, stirring the whole constantly with large spatulas. Let one portion of the composition be melted before more is added, and work with great precaution to prevent it from taking fire. When the composition becomes of a brown color, and white vapors are disengaged, the fire is permitted to go down; and when the composition is sufficiently fluid the cases are filled with the ladle not more than three-fourths full.

The cases are made of rocket-paper in the manner described for port-fire cases. The priming tubes are made of cartridge-paper, pasted after the first turn, and rolled hard. The cases are arranged in a frame, the lower end of each inserted in a socket, in the center of which is a spindle to support the priming tube. The upper ends of the cases are held in place by short cylindrical spouts attached to the lower side of a reservoir which rests on the top of the frame. The composition is poured into the reservoir, and the frame is gently shaken to settle the composition in the cases until they are filled. When the composition has become solid, the cylinders are taken out of the frame and trimmed; the priming tubes are charged with composition No. 1 for mortar-fuses, driven the same as mortar-fuses; the ends of the cylinders are last dipped in mealed powder. When rock-fire cannot be had to put into shells, the paper cases may be filled with port-fire composition, driven as usual; or pieces of port-fire may be inserted in the shells. See *Compositions* and *Fireworks*.

ROCK MORTARS.—Excavations resembling the interior of mortars, formed out of solid rocks, of which there are several in the Island of Malta, executed upon a large scale for the defense of the harbors, etc. The following interesting experiments have been made on two of these mortars situated in St. Julian's and St. George's Bays. 1st. At St. Julian's, 140 pounds of powder was inclosed in a sort of cask prepared to fit the chamber of the mortar, and being lodged there, a large cane tube filled with quickmatch was applied to a groove cut along the upper surface of the bore to receive it, and a bottom of wood covered the chamber. The stones were then piled, by four men, within the mortar as they were brought to it in baskets containing about 120 pounds each; a dozen stones, weighing from 120 to 80 pounds each, were first put in, then fifty baskets of other stones, from 60 to 30 pounds, then fifty more, of 20 to 5 pounds each, amounting in the whole to upward of 10 tons. This operation being completed, a piece of portfire was fixed to the end of the tube at the mouth, which communicated through a hole in the cask to the powder. In this manner it was fired as is usual in proving ordnance, and ranged about 700 yards. 2d. The same mortar was loaded with 180 pounds of powder and about ten tons of stones; they spread considerably more than the first time, but did not range quite so far. The explosion this time cracked the mortar in a direction nearly vertical, leaving a fissure in the rock about one-twelfth of an inch wide, ten feet in the rear and four feet in front. 3d. The other mortar of similar dimensions was fired with a charge rather larger than the first of these, but the effect was not quite so considerable; from whence it is concluded that the first proportion should not be exceeded, especially if after repeated. The stones used in these experiments were chiefly fragments of the rock, which, having been exposed to the air, were become something harder, and did not suffer so much as might be expected from such violent explosions, which in some degree resembled the tremendous discharge of a volcano.

RODLICH LITTER.—A large litter for two or more wounded men, suspended between two oxen. The drawing shows the manner of its construction and use. It is too large and unwieldy to be of prac-



tical or any general application; and, moreover, the movements of all oxen are very slow, and this unfits them for purposes of military transport. See *Litter*.

RODMAN CUTTER.—An instrument used for making indentations in castings. The indenting part of the tool is in the form of a pyramid, having a rhombus for its base, the diagonals of which are respectively one inch and two-tenths of an inch; the height of the pyramid one-tenth of an inch. In late experiments the form of the pyramid has been changed and improved somewhat by causing it to make a longer line, and mark minute differences more accurately. The volume of an indentation made with this tool is taken as the measure of the work required to produce it, and is inversely proportional to the hardness of the specimen, that is (denoting by H the hardness of any specimen), $H = \frac{k}{v}$....(1) k denoting any convenient constant, and v the volume of the indentation corresponding to H.

It has been found by experiment that a pressure of 10,000 on the base of the pyramid makes an indentation, in the softest metals used in guns, about nine-tenths of an inch long. The maximum indentation, one inch in length, of the instrument is therefore assumed as the unit of hardness; and denoting by V the volume corresponding to an indentation one inch in length, we obtain from equation (1),

$$1 = \frac{K}{V}, \text{ or } K = V;$$

and, in general,

$$H = \frac{V}{v};$$

or, putting l = the number of tenths of an inch in the length of any given indentation,

$$H = \frac{V}{v} = \frac{1000}{l^3};$$

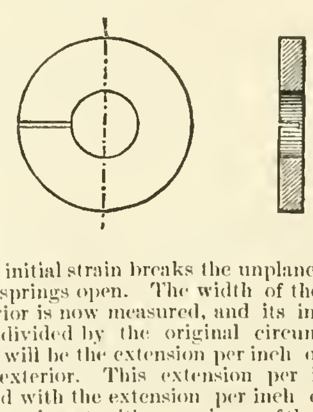
since pyramids are to each other as the cubes of any similar dimensions.

A pressure of less than 10,000 will probably be found better suited to the purpose, with the improved tools. A better standard of comparison may be found in some metal of an uniform density and hardness, easily obtainable in all places. The silver coin of the country will best fulfill these conditions. The volume of the cavity made in this, by the adopted unit of pressure, may be assumed as the unit of hardness; and this, divided by the volume of the cavity in any sample tested, will denote the hardness of that sample as compared with that of silver coin. See *Circular Cutter*.

RODMAN GUN.—The principal difficulty formerly experienced in manufacturing very large cast-iron cannon was the injurious strains produced by cooling the casting from the exterior. As far back as the year 1844, General Rodman, of the Ordnance Department, sought to discover the means to overcome this difficulty. After much observation and study, he developed his theory of the strains produced by cooling a casting like that of a cannon, and as a remedy for them he proposed that cannon should be cast on a hollow core, and cooled by a stream of water, or air, passing through it. After an elaborate series of experiments the truth of his theory was established, and his new mode of casting was adopted by the War Department. As a result of General Rodman's theory, he claimed that he could cast cannon of any practicable size, and asked that a 15-inch cast-iron gun might be made. This was done in 1860, and the gun was successfully tested shortly afterwards. General Rodman then projected a 20-inch gun, which was made at the Fort Pitt Foundry in 1863, under his directions.

Formerly it was customary to use but one kind or size of grain of powder for all cannon, whatever their size. General Rodman proposed for his large cannon that there should be a proportional increase in the size of the grain, expecting thereby to get as high a velocity for the projectile without a corresponding increase in the strain on the breech or weak part of the piece; this led to the introduction of our present mammoth powder. He also thought that the powder which would produce the least strain on the gun, giving certain initial velocity to the projectile, would be that which should develop its gas as the space behind the projectile increased; or in other words, that the powder should burn on an increasing instead of a decreasing surface. With this object in view he proposed to compress the substance of the powder into short hexagonal prisms, which could be easily fitted together without loss of space. These prisms were perforated with longitudinal holes, from which the combustion of the powder spread. While this idea has to a certain extent been confirmed by experiment, this powder has not been officially adopted in this country; it is understood that it has been to a certain extent in Russia for service in heavy rifle-guns.

The several operations in the manufacture of this gun are *molding, casting, cooling,* and *finishing.* These are noticed in detail under the separate headings. When these several operations have been complied with, a ring, about three inches thick, is taken off the gun-head parallel to the face of the muzzle, and as near thereto as is practicable. This ring is not reamed out or turned upon the exterior, but is a section of the rough casting. When two rings are taken from the same head, the one nearer to the muzzle is marked number 1, the other number 2. In the 15-inch gun the distance of ring No. 1 from the face of the muzzle measured to the center of the ring is 3.7 inches; and of ring No. 2, 7.5 inches. In a 10-inch gun the distance of No. 1 is three inches; of No. 2, 6⅝ inches. Each ring is cut through by planing a groove 0.5 inch wide from the exterior to the core



until the initial strain breaks the unplaned part, and the ring springs open. The width of the groove at the exterior is now measured, and its increase over 0.5 inch divided by the original circumference of the ring will be the extension per inch of the metal on the exterior. This extension per inch is then compared with the extension per inch obtained by actual experiment with a specimen of the same iron, and the corresponding stress required to produce it will be the initial tension.

For example, the ring from a 15-inch gun head is, say, 38 inches in diameter; the width of the groove before the bursting of the ring is 0.5 inch, and afterwards 0.65 inch, showing a total extension on the exterior of 0.15 inch, then

$$\frac{0.15}{\pi 38} = \frac{0.15}{119.38} = .00127$$

for the extension per inch of metal on the exterior. Upon examination of the tests of this metal we find the stress corresponding to this extension per inch to be 20,000 pounds per square inch, which will be the initial tension of the ring, supposing the iron to possess the same tenacity and elasticity, and that the breaking of the ring entirely relieved it of strain, which it cannot probably do. To illustrate the effect of this initial strain upon the strength of the gun, let us suppose that the initial strain of extension upon the exterior of a gun one caliber thick and of which the tenacity of iron is 30,000 pounds per square inch —is 15,000 pounds per square inch, the metal at the surface of the bore will be subjected to a compressive strain of 15,000 pounds per square inch.

Now if we suppose the tangential strain due to the action of a central force, such as fired gunpowder, to decrease directly as the distance from the axis of the bore increases, and that an interior force just sufficient to relieve the metal at the surface of the bore from compression has been applied, then will the exterior of the gun be brought to a strain of extension of 20,000 pounds per square inch. Now increase the interior pressure of gas until the metal at the surface of the bore is under a tensile strain of 30,000 pounds per square inch, and the tensile strain of the metal on the exterior of the gun will be increased to 30,000 pounds per square inch also, and the whole thickness of the walls of the gun would be brought to the breaking strain at the same instant, which is the object of initial strain. But in practice we know that the strain due to a central force diminishes in a higher ratio than directly as the distance from the axis, and this would require an increase of initial strain in order to bring the outer portions of metal to the breaking point at the same time, while on the other hand the fact that a given increase of load or strain will produce a much greater extension when applied to a specimen near to its breaking strain than when applied to the same specimen when strained within, or even considerably above the limits of its permanent elasticity, causes the maximum resistance of a gun, having too little initial strain, to approach more nearly than it would otherwise do to what its maximum resistance would be with a proper initial strain.

The law of diminution of tangential strain from the bore outward in a gun is not and cannot be accurately known, nor, therefore, can the exactly proper initial strain be determined. But, as the foregoing reasoning shows, after the initial strain shall be equal to that estimated on the hypothesis that this strain is inversely as the distance from the axis of the bore, it may vary considerably above that point without affecting to any considerable degree the maximum resistance of the gun; and we therefore know that we are safe in fixing the initial strain at, or a little above, that which the law of diminution of strain as the distance from the axis increases, would give.

The initial tension-rings for Rodman guns, on being planed through, should open on the exterior 0.25 inch for 20-inch guns; 0.17 inch for 12-inch rifles, 0.15 inch for 10-inch rifles. The properties of iron employed and the rate of cooling should be so regulated as to produce these openings. If the rings do not open sufficiently, add more water and fire longer, which will insure a higher tension. If the rings open too much diminish the quantity of water and the length of time the fire is kept up in the pit. The gun should not in any case be "steamed"; but, if necessary, the water may leave the casting at 200° or 205°. The more rapid the cooling the higher the iron, and the more rapidly the interior is cooled over the exterior the greater the tension. If a higher density of the metal is required a less fire will be required in the pit. Cold iron should not be put into a pool of melted iron. If the iron is not high, it should be kept in fusion and evenly stirred till a satisfactory result is obtained. In planing through the rings for initial tension they should be so clamped in the planing-machine that one-half should be free to spring open when the thickness is so far reduced by planing that the initial strain will break the metal thus left. In other words, the planing should be continued till the ring parts. The thickness of the metal broken should be accurately measured, as also the amount of opening in its exterior. For 10-inch guns the thickness of the broken part of the ring should be about one-tenth of the whole thickness of the ring. Should it be less, more water and a longer continued fire in the pit will correct the defect. The amount of initial tension on the exterior, which General Rodman thought should obtain in a properly constructed gun, was about one-half the ultimate tenacity of the metal. Bloomfield gun-iron, when employed in 20-inch guns, should be so far decarbonized as to have a density of 7.24 to 7.26, with a tenacity of 32,000 pounds. When employed in 12-inch rifles it should have a density of from 7.26 to 7.28, with a tenacity of 32,000 pounds. When employed for 12-inch shot to be chilled at the point it should have a density of from 7.32 to 7.35. Richmond gun-iron, when for 10-inch rifles, should have a density of from 7.28 to 7.30, with a tenacity of 32,000 pounds.

In the manufacture of 4.5-inch siege rifles the application of the water-cooling process is impracticable, owing to the great length and small size of the bore. These guns are, therefore, cooled from the exterior. The best quality of gun-iron should be employed in these guns, with a density not to exceed 7.25, say from 7.22 to 7.25. The guns should be cooled slowly in covered pits. The following are some of the particulars and charges of Rodman guns:

Name of Gun.	Length.	Length of Bore.	Maximum Diameter.	Weight.	Service Charge.	Bursting Charge, Shell.	Weight of Shot.	Weight of Shell.
Smooth Bores.	In.	In.	In.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs
20-inch gun	243.5	210.	64.	15200	100	...	1080	
15-inch do.	190.	165.	48.	49100	50 mammoth.	17	{ 440 / 425 }	330
13-inch do.	177.6	155.94	41.6	32731	30 cannon.	7	{ 300 / 280 }	224
10-inch do.	136.66	105.5	32.	15059	{ 15 for shell. / 18 for shot. }	3	127	100
8-inch do.	123.5	110.	25.6	8465	10	1	68	48

RODMAN PRESSURE PLUG.—An invention used when it is desired to ascertain the pressure per square inch exerted by the powder on the surface of the bore of a piece. To apply this instrument, it is first taken apart by unscrewing the cap and removing the piston and disc containing the knife. The whole is then thoroughly oiled with sperm oil. This done, place a copper disc in the plug, and after it the disc containing the knife, the latter being *slid* down so as not to cut the copper disc. Next pass the piston into the hole in the stem of the cap, and screw the cap into its place. For this operation the plug is held horizontally in a vise. A small copper gas-check is then inserted into the hole on top of the piston; a wooden drift is used to set the gas-check firmly in its place, and a small wad of cotton-waste is inserted over the gas-check; the plug is now put into the empty cartridge-bag, with its grooved end at the bottom and center of the bag, and the bag tied firmly to it from the outside, with twine passing around the grooves on the bottom of the plug. The powder is next put in, care being taken to distribute it evenly around the plug. The bag is tied close to the powder so as to make the cartridge firm and compact. When inserting the cartridge into the gun, care is taken that the plug, when at the bottom of the bore, is, as nearly as possible, in the axis of the piece. After the discharge, the plug is removed from the bore by a rake made for the purpose; the cap is unscrewed, the copper disc is removed, and, after being wiped, the cut made upon it by the knife is measured, from end to end, with a pair of dividers. The dividers are then applied to the scale and passed down the two long lines until they intersect a cross line the length of which corresponds to the width of the dividers; the figures at this point indicate the number of pounds pressure to the square inch. Pressure plugs are of three sizes: one for the 12-inch rifle and 13-inch and 15-inch smooth-bores; one for the 100-pounder Parrott rifle and 8-inch and 10-inch smooth-bores; and one for smaller calibers.

RODMAN TESTING MACHINE.—A machine used to determine the capacity of any metal to resist a *tensile*, *transverse*, *torsional*, or *crushing* force. It is also used to obtain the indenting force. By a combination of levers and cog-wheels, the action of the power employed is greatly augmented and transmitted to the specimen under trial. The machine consists essentially of a system of three levers, A C, A′ C′, and A″ C″. The position of the fulcrum in each of these cases is denoted by F F′ and F″, respectively. The power is applied at P, and the position of the weights is denoted by W. The levers are connected by rigid rods. The mechanical advantage of the levers A C is 10 to 1; that of A′ C′ is 20 to 1, and that of A″ C″ is 10 to 1. We have, therefore, by the formula for compound levers,

$$\frac{W}{P} = \frac{10}{1} \times \frac{20}{1} \times \frac{10}{1} = 2000.$$

A weight of one pound, therefore, applied to the platforms of the suspending rod on the same lever, exerts a force of 200 pounds on the straps connecting with the main lever, and of 2,000 pounds at the point where the strain acts upon the sample.

The weights used are of two denominations, viz, half-pounds and five pounds, representing respectively 1,000 and 10,000 pounds. Smaller increments of strain than 1,000 pounds are noted on the small lever, which is provided with a sliding weight, and graduated from zero to ten, each number representing an additional hundred pounds. Of the first denomination there are ten weights, representing a strain of 10,000 pounds, and of the second, there are nine weights, representing a strain of 90,000 pounds. The aggregate strains of all the weights, or the capacity of the machine, being 100,000 pounds.

The errors incidental to the use of this machine are due to three causes: 1st. Weight of its different movable parts. 2d. Motion of the centers of gravity of the levers towards or from their fulcrums. 3d. Friction.

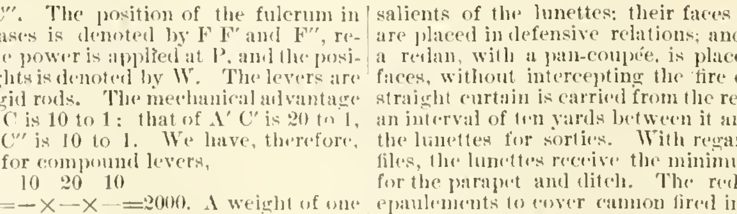
The first cause of error is avoided in practice by means of the adjusting weights already described. The system is brought into perfect equilibrium, so that any increase of W will be balanced by a proportionate increase of P.

The second cause of error is comparatively unimportant, because the levers A C and A′ C′ are so adjusted as never to make a large angle with a horizontal line passing through the fulcrum, and in the case of the lever A″ C″, which makes a larger angle, the shape is such as to bring the center of gravity very near the center of motion. Let D denote the distance through which the center of gravity moves; a denote the distance of the center of gravity from the center of motion; L denote the angle described by the lever during the breaking of a specimen. In general the levers are so adjusted that the line connecting the centers of gravity and of motion is horizontal when the movement of the lever is half completed. $\therefore D = a$ versine $\frac{1}{2}$ L. It is evident that one or both of these factors is very small in each case.

The third cause of error is made as small as possible by the use of knife-edges and steel-plates, and is practically inconsiderable.

The determination of the absolute breaking and other strains involve the elimination of errors due to friction, etc., but for obtaining the comparative strength of specimens, the machine is all that can be desired. See *Testing-machines*.

ROGNIAT LINE.—A system of defense has been proposed by General Rogniat, the spirit of the arrangement of which partakes both of the bastioned line with double flanks, and of the line with intervals. Points of 250 yards apart are taken for the



salients of the lunettes; their faces and the flanks are placed in defensive relations; and between them a redan, with a pan-coupée, is placed to flank the faces, without intercepting the fire of the flanks; a straight curtain is carried from the redan, and leaves an interval of ten yards between it and the flanks of the lunettes for sorties. With regard to the profiles, the lunettes receive the minimum profile both for the parapet and ditch. The redans are simple epaulements to cover cannon fired in barbette; and the curtains consist of a trench with the earth thrown in front to form a parapet, which is so arranged that the infantry may march from the trench in order of battle over it.

The advantages claimed for this system are, *first*, the short time required to form the works, by which an army may intrench its field of battle in one night; *second*, the lunettes form the first line of the order of battle, and contain only infantry, and the batteries are placed in the redans, where they are more secure, protect the lunettes, and withdraw the fire of the enemy's artillery from the lunettes; *third*, the curtains are well defended by infantry, who can sally from them at a moment's warning, and aided by the light artillery and cavalry, who débouche through the intervals between the curtains and lunettes, and attack the enemy in flank. If the flanks of his position are not secured by natural obstacles, Gen. Rogniat proposes to throw up towards the rear a strong square redoubt on each flank, and to place a heavy battery in the interval between the redoubt and the adjacent lunette.

Lines with intervals are peculiarly adapted to very well disciplined and active troops. The works thrown in advance constitute the first line of the order of battle, against which the first shock of the enemy is partially thrown away, and he dare not attempt to neglect them, for an endeavor to penetrate through the intervals would expose his flanks to a close and deadly cross-fire. If the enemy is repulsed, the main body of the army, which is drawn up in rear of the works immediately assumes the offensive, and, by a vigorous advance movement, charges the enemy in turn, relying on the works to cover its retreat if driven back. In every combination of this nature the flanks are the weak points; they should rest, if practicable, on some unassailable point, as a marsh, river, etc.; otherwise very strong works should be thrown up for protection. See *Lines*.

ROGUE'S MARCH.—Derisive music performed in driving away a person under popular indignation, or when a soldier is drummed out of a regiment.

ROI D'ARMES.—King-at-Arms, an officer formerly of great authority in armies; he directed the Heralds, presided at their chapters, and had the jurisdiction of armories.

ROLL CALL.—In military life it is necessary, for the sake of discipline, and to prevent soldiers from wandering about indiscriminately at all hours, as well as for the purpose of having them available at any moment in case their services are required, that the men of a regiment, company, or detachment should be present to answer their names during certain fixed periods of the day, or at any time the Commanding Officer may think advisable. This act is termed *Roll-call*. In the United States, there are daily at least three roll-calls, viz., at *reveille*, *retreat*, and *tattoo*. They are made on the company parades by the 1st Sergeants, *superintended by a Commissioned Officer* of the company. At all established roll-calls, except dress-parade, after the companies are dismissed, each officer superintending the company roll-call reports, to the Adjutant or other officer designated, the result of the roll-call; the Adjutant or officer designated reports the result of the roll-call to the Commanding Officer. Immediately after *reveille* roll-call (after stable-duty in the cavalry), the tents or quarters, and the space around them, are put in order by the men of the companies, superintended by the chiefs of squads, and the guard-house or guard-tent by the guard or prisoners.

ROLLER HANDSPIKE.—An implement for working the eccentric rollers of casemate carriages, and is made of round iron tapering to fit the mortise in the eccentric. It may be made single like a truck handspike, or with two branches to fit in both mortises of the roller at the same time.

ROLLERS. Solid cylinders of wood, used in mounting guns upon their carriages, or shifting them from one carriage to another, and in moving them on the ground. Their dimensions vary with the service for which they are intended. When a gun is moved on rollers, they must be horizontal, and handspikes should be applied to guard against accident, when the gun has a tendency to roll off. The rollers must be placed at right angles to the direction in which they are intended to move, projecting equally on each side of the axis of the gun. The gun upon rollers may be moved either by hauling upon it with ropes, or by means of levers. When a gun is moved on rollers, it passes over twice the distance passed by the rollers themselves. The term "roller" is also applied to a massive roller of iron, weighing about 4½ tons, having faces 18 inches broad, which are used in the incorporation of gunpowder.

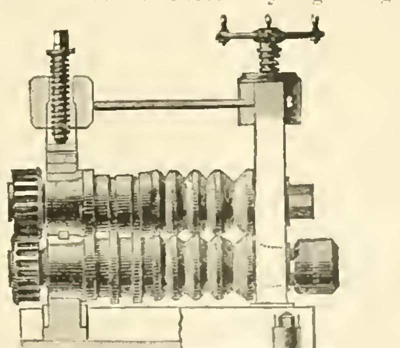
ROLLING BOARD. A smooth piece of plank, with a strap tacked over the upper side near the end under which the hand is placed in using it. It is employed in making the cases of port-fires and the like.

ROLLING FIRE. 1. A discharge of musketry by soldiers in line, in quick succession, and in the order in which they stand. 2. A fire where the axis of the piece is parallel, or nearly so, with the ground or water, and the projectile rebounds over the surface in a succession of ricochets.

ROLLING-HITCH. In cordage, a useful hitch formed as follows: Pass the end of a rope round a piece of timber take it round a second time riding the standing part then carry it across and up through the bight. See *Cordage*.

ROLLING MILL.—One of the most important of modern inventions for the working of metals. It was first introduced practically by Mr. Corb in 1784, and since then has gradually become more and more useful, as its capabilities have been developed. The rolls may be engraved so as to impress a pattern on the bar as it passes through; this is done by the brass-workers to a great extent; and tubes of brass, copper, tin, etc., are also operated on in a similar way, a mandrel or rod of iron being fitted inside the tube, to sustain the pressure of the rollers.

In its simplest form a rolling-mill consists of two cast-iron cylinders placed with their axes horizontally one above the other, as shown in the drawing, and connected by spur-gearing so as to revolve at the same velocity. The surface of the rolls may be either smooth, as is the case in the plate-mills, or grooved into various patterns, as in those used for the production of merchant bars. The reduction in the size of the bloom is effected by regulating the



vertical distance between the two rolls, by the use of grooves diminishing regularly in size, or by a combination of both methods.

As the direction of rotation of the rolls is constant under ordinary circumstances, it is necessary, after the bar has passed through one groove, to return it by lifting it over the top roll, in order to bring it in position to pass through the next smaller one, and so on in succession. This may be easily done with blooms of small size, but is attended with considerable difficulty when it is required to handle large masses of iron, and in any case gives rise to a certain loss of time and consequent waste of iron by scaling, from exposure to the atmosphere in a highly heated condition for a longer time than is absolutely required. Very heavy mills, such as are used for armor-plates, require to be reversed at each passage of the pile, the distance between the rolls being diminished each time. See *Iron*.

ROLL OF A DRUM.—The continuous and uniform beat of the drum for a certain time. What is known as the *long-roll* is a beat by which troops were formerly assembled at any particular spot of rendezvous or parade.

ROLL OF ARMS.—A heraldic record of arms, either verbally blazoned or illuminated, or both, on a long strip of vellum, rolled up, instead of being folded into leaves. Rolls of arms are the most important and most authentic materials for the history of early Heraldry. In England they go back to the reign of Henry III., the oldest being a copy of a roll of that reign, containing a list of the arms borne by the Sovereign, the Princes of the Blood, and the principal Barons and Knights between 1216 and 1272, verbally blazoned without drawings. The original has been lost, but the copy, which, having been made by Glover, Somerset Herald, in 1586, is called "Glover's Roll," is in the English College of Arms. This roll exhibits Heraldry as at that early period already consolidated into a system. In the British Museum is a copy of another roll of the middle of the 13th century, containing 700 coats tricked, that is, drawn in pen and ink. The *Roll of Caerlaverock* is a heraldic poem in Norman-French, reciting the names and Arms of the Knights present at the siege of Caerlaverock in 1300. It has been published with notes by Sir N. H. Nicolas. Copies exist of rolls of the Knights who were with Edward I. at the Battle of Falkirk.

ROMAN CANDLE.—A long and strong tube charged with stars, which are thrown out successively by a charge of powder placed under each star. The ends of gunbarrels, 20 inches long, are used for cases. When paper cases are used, make them about .65 to .7 inch interior diameter, and 1-inch exterior diameter; roll them like port-fire cases. Three drifts of different lengths are used; they are made of hickory or other hard wood, with brass tips on the lower ends.

Put in the case a ladleful of clay, and drive it with ten blows of the mallet; then a ladleful of composition, which is driven in the same way; next a charger of powder and a star, which is gently pressed down, then another ladleful of composition, a second charger of powder, and another star, driving the composition and pressing down the star gently; continue until the ten stars are in, and add a half ladleful of composition. Prime the candle with a strand of quick-match 6 inches long, held in place against the side of the case by a little composition driven in on its ends. Cover the end of the candle with a strip of paper pasted on. Roman candles are inserted in holes bored in frames, or tied with wire or twine in the direction in which they are to throw their stars. The stars used for Roman candles have a hole through their axes communicating the fire to the charge below, which throws it out. See *Fireworks*.

ROMAN LEGIONS.—To a truly illustrious Frenchman, whose reverses as a minister can never obscure his achievements in the world of letters, we are indebted for the most profound and most eloquent estimate that we possess of the importance of the Germanic element in European civilization, and of the extent to which the human race is indebted to those brave warriors who long were the unconquered antagonists, and finally became the conquerors of imperial Rome. Many very eventful years have passed away since M. Guizot delivered from the chair of modern history at Paris his course of lectures on the history of Civilization in Europe. During those years the spirit of earnest inquiry into the germs and primary developments of existing institutions has become more and more active and universal, and the merited celebrity of M. Guizot's work has proportionately increased. Its admirable analysis of the complex political and social organizations of which the modern civilized world is made up, must have led thousands to trace with keener interest the great crises of times past, by which the characteristics of the present were determined. The narrative of one of these great crises, of the epoch A. D. 9, when Germany took up arms for her independence against Roman invasion, has for England this one attraction—that it forms part of her national history. Had Arminius been supine or unsuccessful, her Germanic ancestors would have been enslaved or exterminated in their original seats along the Eyder and the Elbe. Great Britain would never have borne the name of England, and the mighty English nation, whose race and language are now overrunning the earth, from one end to the other, would have been utterly cut off from existence. Arnold may, indeed, go too far in saying that they are wholly unconnected in race with the Romans and Britons, who inhabited that country before the invasion of the Saxons; and that, "nationally speaking, the history of Cæsar's invasion has no more to do with them than the natural history of the animals which then inhabited the forests." There seems ample evidence to prove that the Romanized Celts whom her Teutonic forefathers found there influenced materially the character of that nation. But the main stream of her people was and is Germanic. The English language amply proves this. Arminius is more truly one of Britain's national heroes than Caractacus; and it was his own primeval fatherland that the brave German rescued when he slaughtered the Roman legions eighteen centuries ago, in the marshy glens between the Lippe, and the Ems.

Dark and disheartening, even to heroic spirits, must have seemed the prospects of Germany when Arminius planned the general rising of his countrymen against Rome. Half the land was occupied by Roman garrisons; and, what was worse, many of the Germans seemed patiently acquiescent in their state of bondage. The braver portion, whose patriotism could be relied on, was ill armed and undisciplined, while the enemy's troops consisted of veterans in the highest state of equipment and training, familiarized with victory, and commanded by officers of proved skill and valor. The resources of Rome seemed boundless; her tenacity of purpose was believed to be invincible. There was no hope of foreign sympathy or aid; for "the self-governing powers that had filled the Old World had bent one after another before the rising power of Rome, and had vanished. The earth seemed left void of independent nations.

The German chieftain knew very well the gigantic power of the oppressor. Arminius was no rude savage, fighting out of mere animal instinct, or in ignorance of the might of his adversary. He was familiar with the Roman language and civilization; he had served in the Roman armies; he had been admitted to the Roman citizenship and raised to the rank of the equestrian order. It was part of the subtle policy of Rome to confer rank and privileges on the youth of the leading families in the nations which she wished to enslave. Among other young German chieftains, Arminius and his brother, who were the heads of the noblest house in the tribe of the Cherusci, had been selected as fit objects for the exercise of this insidious system. Roman refinements and dignities succeeded in denationalizing the brother, who assumed the Roman name of Flavius, and adhered to Rome throughout all her wars against his country. Arminius remained unbought by honors or wealth, uncorrupted by refinement or luxury. He aspired to and obtained from Roman enmity a higher title than ever could have been given him by Roman favor. It is in the page of Rome's greatest historian that his name has come down to us with the proud addition of "Liberator haud dubie Germaniæ". Often must the young chieftain, while meditating the exploit which has thus immortalized him, have anxiously revolved in his mind the fate of the many great men who had been crushed in the attempt which he was about to renew—the attempt to stay the chariot-wheels of triumphant Rome. Could he hope to succeed where Hannibal and Mithradates had perished? What had been the doom of Viria-

thus? and what warning against vain valor was written on the desolate site where Numantia once had flourished? Nor was a caution wanting in scenes nearer home and more recent times. The Gauls had fruitlessly struggled for eight years against Cæsar; and the gallant Vercingetorix, who in the last year of the war had roused all his countrymen to insurrection, who had cut off Roman detachments, and brought Cæsar himself to the extreme of peril at Alesia—he, too, had finally succumbed, and had been led captive in Cæsar's triumph, and had then been butchered in cold blood in a Roman dungeon.

It was true that Rome was no longer the great military republic which for so many ages had shattered the kingdoms of the world. Her system of government was changed: and after a century of revolution and civil war, she had placed herself under the despotism of a single ruler. But the discipline of her troops was yet unimpaired, and her warlike spirit seemed unabated. The first year of the empire had been signalized by conquests as valuable as any gained by the republic in a corresponding period. It is a great fallacy, though apparently sanctioned by great authorities, to suppose that the foreign policy pursued by Augustus was pacific; he certainly recommended such a policy to his successors (*incertum metu an per invidiam.* Tac., *Ann.*, i., 11), but he himself, until Arminius broke his spirit, had followed a very different course. Besides his Spanish wars, his Generals, in a series of generally aggressive campaigns, had extended the Roman frontier from the Alps to the Danube, and had reduced into subjection the large and important countries that now form the territories of all Austria south of that river, and of East Switzerland, Lower Wirtemberg, Bavaria, the Valtelline, and the Tyrol. While the progress of the Roman arms thus pressed the Germans from the south, still more formidable inroads had been made by the imperial legions on the west. Roman armies, moving from the province of Gaul, established a chain of fortresses along the right as well as the left bank of the Rhine, and, in a series of victorious campaigns, advanced their eagles as far as the Elbe, which now seemed added to the list of vassal rivers, to the Nile, the Rhine, the Rhone, the Danube, the Tagus, the Seine, and many more, that acknowledged the supremacy of the Tiber. Roman fleets also, sailing from the harbors of Gaul along the German coasts and up the estuaries, co-operated with the land-forces of the empire, and seemed to display even more decisively than her armies, her overwhelming superiority over the rude Germanic tribes. Throughout the territory thus invaded, the Romans had, with their usual military skill, established fortified posts; and a powerful army of occupation was kept on foot ready to move instantly on any spot where any popular outbreak might be attempted.

Vast, however, and admirably organized as the fabric of Roman power appeared on the frontiers and in the provinces, there was rottenness at the core. In Rome's unceasing hostilities with foreign foes, and still more in her long series of desolating civil wars the free middle classes of Italy had almost wholly disappeared. Above the position which they had occupied, an oligarchy of wealth had reared itself; beneath that position, a degraded mass of poverty and misery was fermenting. Slaves, the chance sweepings of every conquered country, shoals of Africans, Sardinians, Asiatics, Illyrians, and others, made up the bulk of the population of the Italian peninsula. The foulest profligacy of manners was general in all ranks. In universal weariness of revolution and civil war, and in consciousness of being too debased for self-government, the nation had submitted itself to the absolute authority of Augustus. Adulation was now the chief function of the senate; and the gifts of genius and accomplishments of art were devoted to the elaboration of eloquently false panegyrics upon the prince and his favorite courtiers. With bitter indignation must the German chieftain have beheld all this and contrasted with it the rough worth of his own countrymen; their bravery, their fidelity to their word, their manly independence of spirit, their love of their national free institutions, and their loathing of every pollution and meanness. Above all, he must have thought of the domestic virtues that hallowed a German home, of the respect there shown to the female character, and of the pure affection by which that respect was repaid. His soul must have burned within him at the contemplation of such a race yielding to these debased Italians.

Still, to persuade the Germans to combine, in spite of their frequent feuds among themselves, in one sudden outbreak against Rome; to keep the scheme concealed from the Romans until the hour for action arrived; and then, without possessing a single walled town, without military stores, without training to teach his insurgent countrymen to defeat veteran armies and storm fortifications, seemed so perilous an enterprise, that probably Arminius would have receded from it had not a stronger feeling even than patriotism urged him on. Among the Germans of high rank who had most readily submitted to the invaders, and become zealous partisans of Roman authority, was a chieftain named Segestes. His daughter, Thusnelda, was pre-eminent among the noble maidens of Germany. Arminius had sought her hand in marriage; but Segestes, who probably discerned the young chief's disaffection to Rome, forbade his suit, and strove to preclude all communication between him and his daughter. Thusnelda, however, sympathized far more with the heroic spirit of her lover than with the time-serving policy of her father. An elopement baffled the precautions of Segestes, who, disappointed in his hope of preventing the marriage, accused Arminius before the Roman Governor of having carried off his daughter, and of planning treason against Rome. Thus assailed, and dreading to see his bride torn from him by the officials of the foreign oppressor, Arminius delayed no longer, but bent all his energies to organize and execute a general insurrection of the great mass of his countrymen who hitherto had submitted in sullen hatred to the Roman dominion.

A change of Governors had recently taken place which, while it materially favored the ultimate success of the insurgents, served, by the immediate aggravation of the Roman oppressions which it produced, to make the native population more universally eager to take arms. Tiberius, who was afterward Emperor, had recently been recalled from the command in Germany, and sent into Pannonia to put down a dangerous revolt which had broken out against the Romans in that province. The German patriots were thus delivered from the stern supervision of one of the most suspicious of mankind, and were also relieved from having to contend against the high military talents of a veteran commander, who thoroughly understood their national character, and also the nature of the country, which he himself had principally subdued. In the room of Tiberius, Augustus sent into Germany, Quintilius Varus, who had lately returned from the proconsulate of Syria. Varus was a true representative of the higher classes of the Romans, among whom a general taste for literature, a keen susceptibility to all intellectual gratifications, a minute acquaintance with the principles and practice of their own national jurisprudence, a careful training in the schools of the rhetoricians and a fondness for either partaking in or watching the intellectual strife of forensic oratory, had become generally diffused, without, however, having humanized the old Roman spirit of cruel indifference for human feelings and human sufferings, and without acting as the least checks on unprincipled avarice and ambition, or on habitual and gross profligacy. Accustomed to govern the depraved and debased natives of Syria, a country where courage in man and virtue in woman had for centuries been unknown. Varus thought that he might gratify his licentious and rapacious passions with equal impunity among the high-minded sons and pure-spirited daughters of Germany. When the General of an army sets the example of outrages of this description, he is soon faithfully imitated by his officers, and surpassed by his still more brutal soldiery. The Romans now habitually indulged in those violations of the sanctity of the domestic shrine, and those insults upon honor and modesty, by which far less gallant spirits than those of our Teutonic ancestors have often been maddened into insurrection.

Arminius found among the other German Chiefs many who sympathized with him in his indignation at their country's abasement, and many whom private wrongs had stung yet more deeply. There was little difficulty in collecting bold leaders for an attack on the oppressors, and little fear of the population not rising readily at those leaders' call. But to declare open war against Rome, and to encounter Varus's army in a pitched battle, would have been merely rushing upon certain destruction. Varus had three legions under him, a force which, after allowing for detachments, cannot be estimated at less than fourteen thousand Roman infantry. He had also eight or nine hundred Roman cavalry, and at least an equal number of horse and foot sent from the allied states, or raised among those provincials who had not received the Roman franchise. It was not merely the number, but the quality of this force that made them formidable; and, however contemptible Varus might be as a General, Arminius well knew how admirably the Roman armies were organized and officered, and how perfectly the legionaries understood every maneuver and every duty which the varying emergencies of a stricken field might require. Stratagem was, therefore, indispensable; and it was necessary to blind Varus to their schemes until a favorable opportunity should arrive for striking a decisive blow.

For this purpose, the German confederates frequented the headquarters of Varus, which seem to have been near the center of the modern country of Westphalia, where the Roman General conducted himself with all the arrogant security of the governor of a perfectly submissive province. There Varus gratified at once his vanity, his rhetorical tastes, and his avarice, by holding courts, to which he summoned the Germans for the settlement of all their disputes, while a bar of Roman advocates attended to argue the cases before the tribunal of Varus, who did not omit the opportunity of exacting court-fees and accepting bribes. Varus trusted implicitly to the respect which the Germans pretended to pay to his abilities as a judge, and to the interest which they affected to take in the forensic eloquence of their conquerors. Meanwhile, a succession of heavy rains rendered the country more difficult for the operations of regular troops, and Arminius, seeing that the infatuation of Varus was complete, secretly directed the tribes near the Weser and the Ems to take up arms in open revolt against the Romans. This was represented to Varus as an occasion which required his prompt attendance at the spot; but he was kept in studied ignorance of its being part of a concerted national rising; and he still looked on Arminius as his submissive vassal, whose aid he might rely on in facilitating the march of his troops against the rebels, and in extinguishing the local disturbance. He therefore set his army in motion, and marched eastward in a line parallel to the course of the Lippe. For some distance his route lay along a level plain; but on arriving at the tract between the curve of the upper part of that stream and the sources of the Ems, the country assumes a very different character; and here, in the territory of the modern little principality of Lippe, it was that Arminius had fixed the scene of his enterprise. A woody and hilly region intervenes between the heads of the two rivers, and forms the watershed of their streams. This region still retains the name (Teutoberger = Teutobergiensis saltus) which it bore in the days of Arminius. The nature of the ground has probably also remained unaltered. The eastern part of it, round Detmold, the modern capital of the principality of Lippe, is described by a modern German scholar, Dr. Platte, as being a "tableland intersected by numerous deep and narrow valleys, which in some places form small plains, surrounded by steep mountains and rocks, and only accessible by narrow defiles. All the valleys are traversed by rapid streams, shallow in the dry season, but subject to sudden swellings in autumn and winter. The vast forests which cover the summits and slopes of the hills consist chiefly of oak; there is little underwood, and both men and horse would move with ease in the forests if the ground were not broken by gullys, or rendered impracticable by fallen trees." This is the district to which Varus is supposed to have marched; and Dr. Platte adds, that "the names of several localities on and near that spot seem to indicate that a great battle has once been fought there. We find the names 'das Winnefeld' (the field of victory), 'die Knochenbahn' (the bone-lane), 'die Knochenleke' (the bone-brook), 'der Mordkessel' (the kettle of slaughter), and others."

Contrary to the usual strict principles of Roman discipline, Varus had suffered his army to be accompanied and impeded by an immense train of baggage-wagons and by a rabble of camp followers, as if his troops had been merely changing their quarters in a friendly country. When the long army quitted the firm level ground, and began to wind its way among the woods, the marshes, and the ravines, the difficulties of the march, even without the intervention of an armed foe, became fearfully apparent. In many places, the soil, sodden with rain, was impracticable for cavalry, and even for infantry, until trees had been felled, and a rude causeway formed through the morass. The duties of the engineer were familiar to all who served in the Roman armies. But the crowd and confusion of the columns embarrassed the working parties of the soldiery, and in the midst of their toil and disorder the word was suddenly passed through their ranks that the rear guard was attacked by the barbarians. Varus resolved on pressing forward; but a heavy discharge of missiles from the woods on either flank taught him how serious was the peril, and he saw his best men falling round him without the opportunity of retaliation; for his light-armed auxiliaries, who were principally of Germanic race, now rapidly deserted, and it was impossible to deploy the legionaries on such broken ground for a charge against the enemy. Choosing one of the most open and firm spots which they could force their way to, the Romans halted for the night; and, faithful to their national discipline and tactics, formed their camp amid the harassing attacks of the rapidly thronging foes, with elaborate toil and systematic skill, the traces of which are impressed permanently on the soil of so many European countries, attesting the presence in the olden time of the imperial eagles.

On the morrow the Romans renewed their march, the veteran officers who served under Varus now probably directing the operations, and hoping to find the Germans drawn up to meet them, in which case they relied on their own superior discipline and tactics for such a victory as should reassure the supremacy of Rome. But Arminius was far too sage a commander to lead on his followers, with their unwieldy broadswords and inefficient defensive armor, against the Roman legionaries, fully armed with helmet, cuirass, greaves, and shield, who were skilled to commence the conflict with a murderous volley of javelins, hurled upon the foe when a few yards distant, and then, with their short cut-and-thrust swords, to hew their way through all opposition, preserving the utmost steadiness and coolness, and obeying each word of command in the midst of strife and slaughter with the same precision and alertness as if upon parade. Arminius suffered the Romans to march out from their camp, to form first in line for action, and then in column for marching, without the show of opposition. For some distance Varus was allowed to move on, only harassed by slight skirmishes, but struggling with difficulty through the broken ground, the toil and distress of his men being aggravated by heavy torrents of rain, which burst upon the devoted legions, as if the angry gods of Germany were pouring out the vials of their wrath upon the invaders. After some little time their van approached a ridge of high woody ground, which is one of the offshoots of the great Hercynian forest, and is situated between the modern villages of Driburg and Bielefeld. Arminius had caused barricades of hewn trees to be formed here, so as to add to the natural difficulties of the passage. Fatigue and discouragement now began to betray themselves in the Roman ranks. Their line became less steady; baggage-wagons were abandoned from the impossibility of forcing them along; and, as this happened, many soldiers left their ranks and crowded round the wagons to secure the most valuable portions of their property; each was busy about his own affairs, and purposely slow in hearing the word of command from his officers. Arminius now gave the signal for a general attack. The fierce shouts of the Germans pealed through the gloom of the forests, and in thronging multitudes they assailed the ranks of the invaders, pouring in clouds of darts on the encumbered legionaries, as they struggled up the glens or floundered in the morasses, and watching every opportunity of charging through the intervals of the disjointed column, and so cutting off the communication between its several brigades. Arminius, with a chosen band of personal retainers round him, cheered on his countrymen by voice and example. He and his men aimed their weapons particularly at the horses of the Roman cavalry. The wounded animals, slipping about in the mire and their own blood, threw their riders and plunged among the ranks of the legions, disordering all around them. Varus now ordered the troops to be countermarched, in the hope of reaching the nearest Roman garrison on the Lippe. But retreat now was as impracticable as advance; and the falling back of the Romans only augmented the courage of their assailants, and caused fiercer and more frequent charges on the flanks of the disheartened army. The Roman officer who commanded the cavalry, Numonius Vala, rode off with his squadrons in the vain hope of escaping by thus abandoning his comrades. Unable to keep together or force their way across the woods and swamps, the horsemen were overpowered in detail, and slaughtered to the last man. The Roman infantry still held together and resisted, but more through the instinct of discipline and bravery than from any hope of success or escape. Varus, after being severely wounded in a charge of the Germans against his part of the column, committed suicide to avoid falling into the hands of those whom he had exasperated by his oppressions. One of the Lieutenant-generals of the army fell fighting; the other surrendered to the enemy. But mercy to a fallen foe had never been a Roman virtue, and those among her legions who now laid down their arms in hope of quarter, drank deep of the cup of suffering which Rome had held to the lips of many a brave but unfortunate enemy. The infuriated Germans slaughtered their oppressors with deliberate ferocity, and those prisoners who were not hewn to pieces on the spot were only preserved to perish by a more cruel death in cold blood.

The bulk of the Roman army fought steadily and stubbornly, frequently repelling the masses of the assailants, but gradually losing the compactness of their array, and becoming weaker and weaker beneath the incessant shower of darts and the reiterated assaults of the vigorous and unencumbered Germans. At last, in a series of desperate attacks, the column was pierced through and through, two of the eagles captured, and the Roman host, which on the yester morning had marched forth in such pride and might, now broken up into confused fragments, either fell fighting beneath the overpowering numbers of the enemy, or perished in the swamps and woods in unavailing efforts at flight. Few, very few, ever saw again the left bank of the Rhine. One body of veterans, arraying themselves in a ring on a little mound, beat off every charge of the Germans, and prolonged their honorable resistance to the close of that dreadful day. The traces of a feeble attempt at forming a ditch and mound attested in after years the spot where the last of the Romans passed their night of suffering and despair. But on the morrow, this remnant also, worn out with hunger, wounds, and toil, was charged by the victorious Germans, and either massacred on the spot, or offered up in fearful rites at the altars of the deities of the old mythology of the North. A gorge in the mountain ridge, through which runs the modern road between Paderborn and Pyrmont, leads from the spot where the heat of the battle raged to the Externsteine, a cluster of bold and grotesque rocks of sandstone, near which is a small sheet of water, overshadowed by a grove of aged trees. According to local tradition, this was one of the sacred groves of the ancient Germans, and it was here that the Roman captives were slain in sacrifice by the victorious warriors of Arminius. Never was victory more decisive, never was the liberation of an oppressed people more instantaneous and complete. Throughout Germany the Roman garrisons were assailed and cut off; and, within a few weeks after Varus had fallen, the German soil was freed from the foot of an invader.

At Rome the tidings of the battle were received with an agony of terror, the reports of which we should deem exaggerated, did they not come from Roman historians themselves. They not only tell emphatically how great was the awe which the Romans felt of the prowess of the Germans, if their various tribes could be brought to unite for a common purpose, but also they reveal how weakened and debased the population of Italy had become. Dion Cassius says (lib. lvi., sec. 23), "Then Augustus, when he heard the calamity of Varus, rent his garment, and was in great affliction for the troops he had lost, and for terror respecting the Germans and the Gauls. And his chief alarm was, that he expected them to push on against Italy and Rome; and there remained no Roman youth fit for military duty that were worth speaking of, and the allied populations that were at all serviceable had been wasted away. Yet he prepared for the emergency as well as his means allowed, and when none of the citizens of military age were willing to enlist, he made them cast lots, and punished by confiscation of goods and disfranchisement every fifth man among those under thirty-five, and every tenth man of those above that age. At last, when he found that not even thus could he make many come forward, he put some of them to death. So he made a conscription of discharged veterans and of emancipated slaves, and, collecting as large a force as he could, sent it, under Tiberius, with all speed into Germany."

Dion mentions, also, a number of terrific portents that were believed to have occurred at the time, and the narration of which is not immaterial, as it shows the state of the public mind, when such things were so believed in and so interpreted. The summit of the Alps were said to have fallen, and three columns of fire to have blazed up from them. In the Campus Martius, the temple of the war-god, from whom the founder of Rome had sprung, was struck by a thunder-bolt. The nightly heavens glowed several times, as if on fire. Many comets blazed forth together; and fiery meteors, shaped like spears, had shot from the northern quarter of the sky down into the Roman camps. It was said, too, that a statue of Victory which had stood at a place on the frontier, pointing the way toward Germany, had of its own accord turned round, and now pointed to Italy. These and other prodigies were believed by the multitude to accompany the slaughter of Varus's legions, and to manifest the anger of the gods against Rome. Augustus himself was not free from superstition: but on this occasion no supernatural terrors were needed to increase the alarm and grief that he felt, and which made him, even months after the news of the battle had arrived, often beat his head against the wall, and exclaim, "Quintilius Varus, give me back my legions." We learn this from his biographer Suetonius; and, indeed, every ancient writer who alludes to the overthrow of Varus attests the importance of the blow against the Roman power, and the bitterness with which it was felt. The Germans did not pursue their victory beyond their own territory; but that victory secured at once and forever the independence of the Teutonic race. Rome sent, indeed, her legions again into Germany, to parade a temporary superiority, but all hopes of permanent conquests were abandoned by Augustus and his successors. The strong blow which Arminius had struck never was forgotten. Roman fear disguised itself under the specious title of moderation, and the Rhine became the acknowledged boundary of the two nations until the fifth century of the present era when the Germans became the assailants, and carved with their conquering swords the provinces of imperial Rome into the kingdoms of modern Europe.

It will be interesting in this connection to append a brief account of that civil war in which Cæsar and Pompey contended for the mastery over Rome and the Republic. In his first Commentary Cæsar recorded his campaigns in Gaul,—campaigns in which he reduced tribes which were, if not hostile, at any rate foreign, and by his success in which he carried on and maintained the potency, traditions and purport of the Roman Republic. It was the ambition of the Roman to be master of the known world. In his ideas no more of the world was really known than had become Roman, and any extension to the limits of this world could only be made by the addition of so-called barbarous tribes to the number of Roman subjects. In reducing Gaul, therefore, and in fighting with the Germans, and going over to Britain, Cæsar was doing that which all good Romans wished to see done, and was rivaling in the West the great deeds which Pompey had accomplished in the East. In his second Commentary he is forced to deal with a subject which must have been less gratifying to Roman readers. He relates to us the victories which he won with Roman legions over other legions equally Roman, and by which he succeeded in destroying the liberty of the Republic. It must be acknowledged on Cæsar's behalf that in truth liberty had fallen in Rome before Cæsar's time. Power had produced wealth, and wealth had produced corruption. The tribes of Rome were bought and sold at the various elections, and a few great oligarchs, either of this faction or of that, divided among themselves the places of trust and honor and power, and did so with hands ever open for the grasping of public wealth. An honest man with clean hands and a conscience, with scruples and a love of country, became unfitted for public employment. Cato in these days was simply ridiculous; and even Cicero, though he was a trimmer, was much too honest for the times. Laws were wrested from their purposes, and the very Tribunes of the people had become the worst of tyrants. It was necessary, perhaps, that there should be a master;—so at least Cæsar thought. He had, no doubt, seen this necessity during all these years of fighting in Gaul, and had resolved that he would not be less than First in the new order of things. So he crossed the Rubicon.

The reader of this second Commentary will find it less alluring than the first. There is less in it of adventure, less of new strange life, and less of that sound, healthy, joyous feeling which sprang from a thorough conviction on Cæsar's part that in crushing the Gauls he was doing a thoroughly good thing. To us, and our way of thinking, his doings in Gaul were stained with terrible cruelty. To him and to his Romans they were foul with no such stain. How other Roman conquerors acted to other conquered people we may learn from the fact, that Cæsar obtained a character for great mercy by his forbearance in Gaul. He always writes as though he were free from any sting of conscience, as he tells us of the punishments which policy called on him to inflict. But as he writes of these civil wars, there is an absence of this feeling of perfect self-satisfaction, and at the same time he is much less cruel. Hecatombs of Gauls, whether men or women, or children, he could see burned or drowned or starved, mutilated or tortured, without a shudder. He could give the command for such operations with less remorse than we feel when we order the destruction of a litter of undesirable puppies. But he could not bring himself to slay Roman legionaries, even in fair fighting, with anything like self-satisfaction. In this he was either soft-hearted or had a more thorough feeling of country than generals or soldiers who have fought in civil contests since his time have shown. In the Wars of the Roses and in those of Cromwell we recognize no such feeling. The American Generals were not so restrained. But Cæsar seems to have valued a Roman legionary more than a tribe of Gauls.

Nevertheless he crossed the Rubicon. We have all heard of his crossing of the Rubicon, but Cæsar says nothing about it. The Rubicon was a little river, now almost if not altogether unknown, running into the Adriatic between Ravenna and Ariminum—Rimini,—and driving the provinces of so-called Cisalpine Gaul from the territory under the immediate rule of the magistracy of Rome. Cæsar was, so to say, at home north of the Rubicon. He was in his own province, and had all things under his command. But he was forbidden by the laws even to enter the territory of Rome proper while in the command of a Roman province: and therefore, in crossing the Rubicon, he disobeyed the laws, and put himself in opposition to the constituted authorities of the city. It does not appear, however, that very much was thought of this, or that the passage of the river was in truth taken as the special sign of Cæsar's purpose, or as a deed that was irrevocable in its consequences. There are various pretty stories of Cæsar's hesitation as he stood on the brink of the river, doubting whether he would plunge the world into civil war. We are told how a spirit appeared to him and led him across the river with martial music, and how Cæsar, declaring that the die was cast, went on and crossed the fatal stream. But all this was fable, invented on Cæsar's behalf by Romans who came after Cæsar. Cæsar's purpose was, no doubt, well understood when he brought one of his legions down into that corner of his province, but offers to treat with him on friendly terms were made by Pompey and his party after he had established himself on the Roman side of the river.

When the civil war began, Cæsar had still, according to the assignment made to him, two years and a half left of his alloted period of government in the three provinces; but his victories and his power had been watched with anxious eyes from Rome and the Senate had attempted to decree that he should be recalled. Pompey was no longer Cæsar's friend, nor did Cæsar expect his friendship. Pompey, who had lately played his cards but badly, and must have felt that he had played them badly, had been freed from his bondage to Cæsar by the death of Crassus, the third triumvir, by the death of Julia, Cæsar's daughter, and by the course of things in Rome. It had been an unnatural alliance arranged by Cæsar with the sole view of clipping his rival's wings. The fortunes of Pompey had hitherto been so bright, that he also had seemed to be divine. While still a boy, he had commanded and conquered, women had adored him, and soldiers had worshipped him. Sulla had called him the Great; and, as we are told, had raised his hat to him in token of honor. He had been allowed the glory of a triumph while yet a youth, and had triumphed a second time before he had reached middle life. He had triumphed again a third time, and the three triumphs had been won in the three quarters of the globe. In all things he had been successful, and in all things happy. He had driven the swarming pirates from every harbor in the Mediterranean, and had filled Rome with corn. He had returned a conqueror with his legions from the East, and had dared to disband them, that he might live again as a private citizen. And after that, when it was thought necessary that the city should be saved, in her need, from the factions of her own citizens, he had been made sole Consul. It is easier now to understand the character of Pompey than the position which, by his unvaried successes, he had made for himself in the minds both of the nobles and of the people. Even up to this time, even after Cæsar's wars in Gaul, there was something of divinity hanging about Pompey, in which the Romans of the city trusted. He had been imperious, but calm in manner and self-possessed—allowing no one to be his equal, but not impatient in making good his claims; grand, handsome, lavish when policy required it, rapacious when much needed, never self-indulgent, heartless, false, politic, ambitious, very brave, and a Roman to the backbone. But he had this failing, this weakness;—when the time for the last struggle came, he did not quite know what it was that he desired to do; he did not clearly see his future. The things to be done were so great, that he had not ceased to doubt concerning them when the moment came in which doubt was fatal. Cæsar saw it all, and never doubted. That little tale of Cæsar standing on the bridge over the Rubicon pondering as to his future course, —divided between obedience and rebellion, it is very pretty. But there was no such pondering, and no such division. Cæsar knew very well what he meant and what he wanted.

Cæsar is full of his wrongs as he begins his second narrative. He tells us how his own friends are silenced in the Senate and in the city; how his enemies, Scipio, Cato, and Lentulus the Consul, prevail; how no one is allowed to say a word for him. "Pompey himself," he says, "urged on by the enemies of Cæsar, and because he was unwilling that any one should equal himself in honor, had turned himself altogether from Cæsar's friendship, and had gone back to the fellowship of their common enemies,—enemies whom he himself had created for Cæsar during the time of their alliance. At the same time conscious of the scandal of these two legions which he had stopped on their destined road to Asia and Syria and taken into his own hand, he was anxious that the question should be referred to arms." Those two legions are very grievous to Cæsar. One was the legion which, as we remember, Pompey had given up to friendship,—and the Republic. When, in the beginning of these contests between the two rivals, the Senate had decided on weakening each by demanding from each a legion, Pompey had asked Cæsar for the restitution of that which he had so kindly lent. Cæsar, too proud to refuse payment of the debt, had sent that to his former friend, and had also sent another legion, as demanded to the Senate. They were required nominally for service in the East, and now were in the hands of him who had been Cæsar's friend but had become his enemy. It is no wonder that Cæsar talks of the infamy or scandal of the two legions! He repeats his complaint as to the two legions again and again.

In the month of January Cæsar was at Ravenna, just north of the Rubicon, and in his own province. Messages pass between him and the Senate, and he proposes his terms. The Senate also proposes its terms. He must lay down his arms, or he will be esteemed an enemy by the Republic. All Rome is disturbed. The account is Cæsar's account but we imagine that Rome was disturbed. "Soldiers are recruited over all Italy; arms are demanded, taxes are levied on the municipalities, and money is taken from the sacred shrines; all laws divine and human are disregarded." Then Cæsar complains to his soldiers his wrongs, and the crimes of Pompey. He tells them how they, under his guidance, have been victorious, how under him they have "pacified" all Gaul and Germany, and he calls upon them to defend him who has enabled them to do such great things. He has but one legion with him, but that legion declares that it will obey him, him and the Tribunes of the people, some of whom, acting on Cæsar's side, have come over from Rome to Ravenna. We can appreciate the spirit of this allusion to the Tribunes, so that there may seem to be still some link between Cæsar and the civic authorities. When the soldiers have expressed their goodwill, he goes to Ariminum, and so the Rubicon is passed.

There are still more messages. Cæsar expresses himself as greatly grieved that he should be subjected to so much suspense, nevertheless he is willing to suffer anything for the Republic; "omnia pati reipublicæ causâ." Only let Pompey go to his province, let the legions in and about Rome be disbanded, let all the old forms of free government be restored, and panic be abolished, and then,—when that is done,—all difficulties may be settled in a few minutes' talking. The Consuls and Pompey send back word that if Cæsar will go back into Gaul and dismiss his army, Pompey shall go at once to Spain. But Pompey and the Consuls with their troops will not stir till Cæsar shall have given security for his departure. Each demands that the other shall first abandon his position. Of course all these messages mean nothing. Cæsar, complaining bitterly of injustice, sends a portion of his small army still farther into the Roman territory. Marc Antony goes to Arezzo with five cohorts, and Cæsar occupies three other cities with a cohort each. The marvel is that he was not attacked and driven back by Pompey. We may probably conclude that the soldiers, though under the command of Pompey, were not trustworthy as against Cæsar. As Cæsar regrets his two legions, so no doubt do the two legions regret their commander. At any rate, the consular forces with Pompey and the Consuls and a host of Senators retreat southwards to Brundusium, Brindisi, intending to leave Italy by the port which we shall use before long when we go eastwards.

During this retreat, the first blood in the civil war is spilt at Corfinium, a town which if it now stood at all, would stand in the Abbruzzi. Cæsar there is victor in a small engagement, and obtains possession of the town. The Pompeian officers whom he finds there he sends away, and allows them even to carry with them money which he believes to have been taken from the public treasury. Throughout his route southward the soldiers of Pompey, who had heretofore been his soldiers,—return to him. Pompey and the Consuls still retreat, and still Cæsar follows them, though Pompey had boasted, when first warned to beware of Cæsar, that he had only to stamp upon Italian soil and legions would arise from the earth ready to obey him. He knows, however, that away from Rome, in her provinces, in Macedonia and Achaia, in Asia and Cilicia, in Sicily, Sardinia, and Africa, in Mauritania and the two Spains, there are Roman legions which as yet know no Cæsar. It may be better for Pompey that he should stamp his foot somewhere out of Italy. At any rate he sends the obedient Consuls and his attendant Senators over to Dyrrachium in Illyria with a part of his army, and follows with the remainder as soon as Cæsar is at his heels. Cæsar makes an effort to intercept him and his fleet, but in that he fails. Thus Pompey deserts Rome and Italy,—and never again sees the imperial city or the fair land.

Cæsar explains to us why he does not follow his enemy and endeavor at once to put an end to the struggle. Pompey is provided with shipping and he is not; and he is aware that the force of Rome lies in her provinces. Moreover, Rome may be starved by Pompey, unless he, Cæsar, can take care that the corn-growing countries, which are the granaries of Rome, are left free for the use of the city. He must make sure of the two Gauls, and of Sardinia, and of Sicily, of Africa too, if it may be possible. He must win to his cause the two Spains, of which at least the northern province was at present devoted to Pompey. He sends one Lieutenant to Sardinia with a legion, another to Sicily with three legions, and from Sicily over into Africa. These provinces have been allotted to partisans of Pompey; but Cæsar is successful with them all. To Cato, the virtuous man, had been assigned the government of Sicily; but Cato finds no Pompeian army ready for his use, and, complaining bitterly that he has been deceived and betrayed by the head of his faction, runs away, and leaves his province to Cæsar's officers. Cæsar determines that he himself will carry the war into Spain. But he found it necessary first to go to Rome, and Cæsar, in his account of what he did there, hardly tells us the whole truth. We quite go along with him when he explains to us that, having collected what sort of a Senate he could,—for Pompey had taken away with him such Senators as he could induce to follow him,—and having proposed to this meagre Senate that ambassadors should be sent to Pompey, the Senate accepted his suggestion; but that nobody could be induced to go on such an errand. Pompey had already declared that all who remained in Rome were his enemies. And it may probably be true that Cæsar, as he says, found a certain Tribune of the people at Rome who opposed him in all that he was doing, though we should imagine that the opposition was not violent. But his real object in going to Rome was to lay hand on the treasure of the Republic,— the sanctius ærarium,— which was kept in the temple of Saturn for special emergencies of State. That he should have taken this we do not wonder; but we do wonder that he should have taken the trouble to say that he did not do so. He professes that he was so hindered by that vexatious Tribune, that he could not accomplish the purposes for which he had come. But he certainly did take the money, and we cannot doubt but that he went to Rome especially to get it. Cæsar, on his way to Spain, goes to Marseilles which, under the name of Massilia, was at this time, as it is now, the most thriving mercantile port on the Mediterranean. It belonged to the province of Further Gaul, but it was in fact a colony of Greek traders. Its possession was now necessary to Cæsar. The magistrates of the town, when called upon for their adhesion, gave a most sensible answer. They protest that they are very fond of Cæsar, and very fond of Pompey. They don't understand all these affairs of Rome, and regret that two such excellent men should quarrel. In the mean time they prefer to hold their own town. Cæsar speaks of this decision as an injury to himself, and is instigated by such wrongs against him to besiege the city, which he does both by land and sea, leaving officers there for the purpose, and going on himself to Spain.

At this time all Spain was held by three officers, devoted to the cause of Pompey, though, from what has gone before, it is clear that Cæsar fears nothing from the south. Afranius commanded in the north and east, holding the southern spurs of the Pyrenees. Petreius, who was stationed in Lusitania, in the southwest, according to the agreement, hurries up to the assistance of Afranius as soon as Cæsar approaches. The Pompeian and Cæsarean armies are brought into close quarters in the neighborhood of Ilerda (Lerida), on the little river Sicoris, or Segre, which runs into the Ebro. They are near the mountains here, and the nature of the fighting is controlled by the rapidity and size of the rivers, and the inequality of the ground. Cæsar describes the campaign with great minuteness, imparting to it a wonderful interest by the clearness of his narrative. Afranius and Petreius hold the town of Ilerda, which is full of provisions. Cæsar is very much pressed by want, as the corn and grass have not yet grown, and the country supplies of the former year are almost exhausted. So great are his difficulties, that tidings reach Rome that Afranius has conquered him. Hearing this, many who were still clinging to the city, doubtful as to the side they would take, go away to Pompey. But Cæsar at lasts manages to make Ilerda too hot for the Pompeian Generals. He takes his army over one river in coracles, such as he had seen in Britain; he turns the course of another; fords a third, breaking the course of the stream by the bulk of his horses; and bridges a fourth. Afranius and Petreius find that they must leave Ilerda, and escape over the Ebro among the half-barbarous tribe further south, and make their way, if possible, among the Celtibri,—getting out of Aragon into Castile, as the division was made in after-ages. Cæsar gives us as one reason for this intended march on the part of his enemies, that Pompey was well known by these tribes, but that the name of Cæsar was a name as yet obscure to the barbarians. It was not, however, easy for Afranius to pass over the Ebro without Cæsar's leave, and Cæsar will by no means give him leave. He intercepts the Pompeians, and now turns upon them that terrible engine of want from which he had suffered so much. He continues so to drive them about, still north of the Ebro, that they can get at no water; and at last they are compelled to surrender. During the latter days of this contest the Afranians, as they are called—Roman legionaries, as are the soldiers of Cæsar—fraternize with their brethren in Cæsar's camp, and there is something of free intercourse between the two Roman armies. The upshot is that the soldiers of Afranius resolve to give themselves up to Cæsar, bargaining, however, that their own Generals shall be secure. Afranius is willing enough; but his brother-general, Petreius, with more of the Roman at heart, will not hear of it. We shall hear hereafter the strange fate of this Petreius. He stops the conspiracy with energy, and forces from his own men, and even from Afranius, an oath against surrender. He orders that all Cæsars's soldiers found in their camp shall be killed, and, as Cæsar tells us, brings back the affair to the old form of war. But it is all of no avail. The Afranians are so driven by the want of water, that the two Generals are at last compelled to capitulate and lay down their arms. Five words which are used by Cæsar in the description of this affair give us a strong instance of his conciseness in the use of words, and of the capability for conciseness which the Latin language affords. "Premebantur Afraniani pabulatione, aquabantur ægra." "The soldiers of Afranius were much distressed in the matter of forage, and could obtain water only with great difficulty." These twenty words translate those five which Cæsar uses, perhaps with fair accuracy; but many more than twenty would probably have been used by any English historian in dealing with the same facts.

Cæsar treats his compatriots with the utmost generosity. So many conquered Gauls he would have sold as slaves, slaughtering their leaders, or he would have cut off their hands, or have driven them down upon the river and have allowed them to perish in the waters. But his conquered foes are Roman soldiers, and he simply demands that the army of Afranius shall be disbanded, and that the leaders of it shall go, whither they please. He makes them a speech in which he explains how badly they have treated him. Nevertheless he will hurt no one. He has borne it all, and will bear it, patiently. Let the Generals only leave the Province, and let the army which they have led be disbanded. He will not keep a soldier who does not wish to stay with him, and will even pay those whom Afranius has been unable to pay out of his own funds. Those who have houses and land in Spain may remain there. Those who have none he will first feed, and afterwards take back, if not to Italy, at any rate to the borders of Italy. The property which his own soldiers have taken from them in the chances of war shall be returned to them, and he out of his own pocket will compensate his own men. He performs his promise, and takes all those who do not choose to remain, to the banks of the Var, which divides the Province from Italy, and there sets them down, full, no doubt, of gratitude to their conqueror. Never was there such clemency, or we may say, better policy! Cæsar's whole campaign in Spain had occupied him only forty days. In the mean time Decimus Brutus, to whom we remember that Cæsar had given the command of the ships which he prepared against the Veneti in the west of Gaul, and who was hereafter to be one of those who slew him in the Capitol, obtains a naval victory over the much more numerous fleet of the Massilians. They had prepared seventeen big ships, "naves longæ" they are called by Cæsar, and of these Brutus either destroys or takes nine. In his next book Cæsar proceeds to tell us how things went on at Marseilles both by sea and land after this affair.

In his chronicle of the Gallic war, Cæsar in each book completed the narrative of a year's campaign. In treating of the civil war he devotes the first and second books to the doings of one year. There are three distinct episodes of the year's campaign narrated in the second;—the taking of Marseilles, the subjugation of the southern province of Spain,—if that can be said to be subjugated which gave itself very readily,—and the destruction of a Roman army in Africa under the hands of a barbarian king. But of all Cæsar's writings it is perhaps the least interesting, as it tells us but little of what Cæsar did himself,—and in fact contains chiefly Cæsar's records of the doings of his Lieutenants by sea and land. He begins by telling us of the enormous exertions made both by the besiegers and by the besieged at Massilia which town was now held by Domitius on the part of Pompey,—to supplement whom at sea a certain Nasidius was sent with a large fleet. Young Brutus, as will be remembered, was attacking the harbor on behalf of Cæsar, and had already obtained a victory over the Massilians before Nasidius came up; and Trebonius, also on the part of Cæsar, was besieging the town from the land. This Decimus Brutus was one of those conspirators who afterwards conspired against Cæsar and slew him,—and Trebonius was another of the number. The wise Greeks of the city,—more wise than fortunate, however,—had explained to Cæsar when he first expressed his wish to have the town on his side, that really to them there was no difference between Pompey and Cæsar, both of whom they loved with all their hearts,—but they had been compelled to become partisans of Pompey, the Pompeian General, Domitius, being the first to enter their town; and now they find themselves obliged to fight as Pompeians in defence of their wealth and their homes. Thus driven by necessity, they fight well and do their very best to favor the side which we must henceforward call that of the Republic as against an autocrat;—for, during this siege of Marseilles, Cæsar had been appointed Dictator, and a law to that effect had been passed at Rome, where the passing of such a law was no doubt easy enough in the absence of Pompey, of the Consuls, and of all the Senators who were Pompey's friends.

The Massilians had now chosen their side, and they do their very best. We are told that the Cæsarean troops, from the very high ground on which Trebonius had placed his camp, could look down into the town, and see "how all the youth who had been left in the city, and all the elders with their children and wives, and the sentinels of the city, either stretched their hands to heaven from the walls, or, entering the temples of the immortal gods, and throwing themselves before their sacred images, prayed that the heavenly powers would give them victory. Nor was there one among them who did not believe that on the result of that day depended all that they had," namely, liberty, property and life; for the Massilians, doubtless, had heard of Avaricum, of Alesia, and of Uxellodunum. "When the battle was begun," says Cæsar, "the Massilians failed not in valor; but, mindful of the lessons they had just received from their townsmen, fought with the belief that the present was their only opportunity of doing aught for their own preservation; and that to those who should fall in battle, loss of life would only come a little sooner than to the others, who would have to undergo the same fate, should the city be taken." Cæsar, as he wrote this, doubtless thought of what he had done in Gaul when policy demanded from him an extremity of cruelty; and, so writing, he enhanced the clemency with which, as he is about to tell us, he afterwards treated the Massilians. When the time came it did not suit him to depopulate a rich town, the trade of whose merchants was beneficial both to Rome and to the Province. He is about to tell us of his mercy, and therefore explains to us beforehand how little was mercy expected from him. We feel that every line he writes is weighed, though the time for such weighing must have been very short with one whose hands were so full as were always the hands of Cæsar.

Nasidius, whom we may call Pompey's Admiral, was of no use at all. The Massilians, tempted by his coming, attack bravely the ship which bears the flag of young Brutus; but young Brutus is too quick for them, and the unhappy Massilians run two of their biggest vessels against each other in their endeavor to pin that of the Cæsarean Admiral between them. The Massilian fleet is utterly dispersed. Five are sunk, four are taken; one gets off with Nasidius, who runs away, making no effort to fight; who has been sent there,—so Cæsar hints,—by Pompey, not to give assistance, but only to pretend to give assistance. One ship gets back into the harbor with the sad tidings; and the Massilians—despairing only for a moment at the first blush of the bad news—determine that their walls may still be defended. The town was very well supplied with such things as were needed for defence, the people being a provident people, well instructed and civilized, with means at their command. We are told of great poles twelve feet long, with sharp iron heads to them, which the besiegers could throw with such force from the engines on their walls as to drive them through four tiers of the wicked crates or stationary shields which the Cæsareans built up for their protection,—believing that no force could drive a weapon through them. As we read of this we cannot but think of Armstrong and Whitfield guns, and iron plates, and granite batteries, and earthworks. These terrible darts, thrown from "balistæ," are very sore upon the Cæsareans; they therefore contrive an immense tower, so high that it cannot be reached by any weapon, so built that no wood or material subject to fire shall be on the outside,—which they erect story by story, of very great strength. And as they raise this step by step, each story is secured against fire and against the enemy. The reader,—probably not an engineer himself,—is disposed to think as he struggles through this minute description of the erection which Cæsar gives, and endeavors to realize the way in which it is done, that Cæsar must himself have served specially as an engineer. But in truth he was not at this siege himself, and had nothing to do with the planning of the tower, and must in this instance at least have got a written description from his officer,—as he probably did before when he built the memorable bridge over the Rhine. And when the tower is finished, they make a long covered-way or shed,—musculum or muscle Cæsar calls it: and with this they form for themselves a passage from the big tower to a special point in the walls of the town. This muscle is so strong with its sloping roof that nothing thrown upon it will break or burn it. The Massilians try tubs of flaming pitch, and great fragments of rock; but these simply slip to the ground, and are pulled away with long poles and forks. And the Cæsareans, from the height of their great tower, have so terrible an advantage! The Massilians cannot defend their wall, and a breach is made, or almost made.

The Massilians can do no more. The very gods are against them. So they put on the habit of suppliants, and go forth to the conquerors. They will give their city to Cæsar. Cæsar is expected. Will Trebonius be so very good as to wait until Cæsar comes? If Trebonius should proceed with his work so that the soldiers should absolutely get into the town, then—Trebonius knows very well what would happen then. A little delay cannot hurt. Nothing shall be done till Cæsar comes. As it happens, Cæsar has already especially ordered that the city shall be spared; and a kind of truce is made, to endure till Cæsar shall come and take possession. Trebonius has a difficulty in keeping his soldiers from the plunder; but he does restrain them, and besiegers and besieged are at rest, and wait for Cæsar. But these Massilians are a crafty people. The Cæsarean soldiers, having agreed to wait, take it easily, and simply amuse themselves in these days of waiting. When they are quite off their guard, and a high wind favors the scheme, the Massilians rush out and succeed in burning the tower, and the muscle, and the rampart, and the sheds, and all the implements. Even though the tower was built with brick, it burns freely—so great is the wind. Then Trebonius goes to work, and does it all again. Because there is no more wood left round about the camp, he makes a rampart of a new kind—hitherto unheard of—with bricks. Doubtless the Cæsarean soldiers had first to make the bricks, and we can imagine what were their feelings in reference to the Massilians. But however that may be, they worked so well and so hard that the Massilians soon see that their late success is of no avail. Nothing is left to them. Neither perfidy nor valor can avail them, and now again they give themselves up. They are starved and suffering from pestilence, their fortifications are destroyed, they have no hope of aid from without—and now they give themselves up—intending no fraud. "*sese dedere sine fraude constituunt.*" Domitius, who is the Pompeian General, manages to escape in a ship. He starts with three ships, but the one in which he himself sails alone escapes the hands of "young" Brutus. Surely now will Marseilles be treated with worse treatment than that which fell on the Gaulish cities. But such is by no means Cæsar's will. Cæsar takes their public treasure and their ships, and reminding them that he spares them rather for their name and old character than for any merits of theirs shown towards him, leaves two legions among them, and goes to Rome. At Avaricum, when the Gauls had fought to defend their own liberties, he had destroyed everybody;—at Alesia he had decreed the death of every inhabitant when they had simply asked him leave to pass through his camp;—at Uxellodunum he had cut off the hands and poked out the eyes of Gauls who had dared to fight for their country. But the Gauls were barbarians whom it was necessary that Cæsar should pacify. The Massilians were Greeks, and a civilized people—and might be very useful.

Before coming on to Marseilles there had been a little more for Cæsar to do in Spain, where, as has been previously narrated, he had just compelled Afranius and Petreius to lay down their arms and disband their legions. Joined with them had been a third Pompeian General, one Varro—a truly distinguished man, though not, perhaps, a very great General—of whom Cæsar tells us that with his Roman policy he veered between Pompeian and Cæsarean tactics till, unfortunately for himself, he declared for Pompey and the wrong side, when he heard that Afranius was having his own way in the neighborhood of Lerida. But Varro is in the south of Spain, in Andalusia—or Bætica, as it was then called—and in this southern province of Spain it seems that Cæsar's cause was more popular than that of Pompey. Cæsar, at any rate, has but little difficulty with Varro. The Pompeian officer is deserted by his legions, and gives himself up very quickly. Cæsar does not care to tell us what he did with Varro, but we know that he treated his brother Roman with the utmost courtesy. Varro was a very learned man, and a friend of Cicero's, and one who wrote books, and was a credit to Rome as a man of letters if not as a General. We are told that he wrote 490 volumes, and that he lived to be eighty-eight—a fate very uncommon with Romans who meddled with public affairs in these days. Cæsar made everything smooth in the south of Spain, restoring the money and treasures which Varro had taken from the towns, and giving thanks to everybody. Then he went on over the Pyrenees to Marseilles, and made things smooth there.

But in the mean time things were not at all smooth in Africa. The name of Africa was at this time given to a small province belonging to the Republic, lying to the east of Numidia, in which Carthage had stood when Carthage was a city, containing that promontory which juts out toward Sicily, and having Utica as its Roman capital. It has been already said that when Cæsar determined to gain possession of certain provinces of the Republic before he followed Pompey across the Adriatic, he sent a Lieutenant with three legions into Sicily, desiring him to go on to Africa as soon as things should have been arranged in the island after the Cæsarean fashion. The Sicilian matter is not very troublesome, as Cato, the virtuous man, in whose hands the government of the island had been intrusted on behalf of the Republic, leaves it on the arrival of the Cæsarean legions, complaining bitterly of Pompey's conduct. Then Cæsar's Lieutenant goes over to Africa with two legions, as commanded, proposing to his army the expulsion of one Attius Varus, who had, according to Cæsar's story, taken irregular possession of the province, keeping it on behalf of Pompey, but not allowing the Governor appointed by the Republic so much as to put his foot on the shore. This Lieutenant was a great favorite of Cæsar, by name Curio, who had been elected Tribune of the people just when the Senate was making its attempt to recall Cæsar from his command in Gaul. In that emergency, Curio as Tribune had been of service to Cæsar, and Cæsar loved the young man. He was one of those who, though noble by birth, had flung themselves among the people, as Catiline had done and Clodius,—unsteady, turbulent, unscrupulous, vicious, needy, fond of pleasure, rapacious, but well educated, brave and clever. Cæsar himself had been such a man in his youth, and could easily forgive such faults in the character of one who, in addition to such virtues as have been named, possessed that farther and greater virtue of loving Cæsar. Cæsar expected great things from Curio, and trusted him thoroughly. Curio, with many ships and his two legions, lands in Africa, and prepares to win the province for his great friend. He does obtain some little advantage, so that he is called "Imperator" by his soldiers,—a name not given to a General till he has been victorious in the field; but it seems clear, from Cæsar's telling of the story, that Curio's own officers and own soldiers distrusted him, and were doubtful whether they would follow him, or would take possession of the ships and return to Sicily;—or would go over to Attius Varus, who had been their Commander in Italy before they had deserted from Pompey to Cæsar. A council of war is held, and there is much doubt. It is not only or chiefly of Attius Varus their Roman enemy, that they are afraid; but there is Juba in their neighborhood, the king of Numidia, who will certainly fight for Varus and against Curio. He is Pompey's declared friend, and equally declared as Cæsar's foe. He has, too, special grounds of quarrel against Curio himself; and if he comes in person with his army, bringing such an army as he can bring if he pleases, it will certainly go badly with Curio, should Curio be distant from his camp. Then Curio, not content with his council of war, and anxious that his soldiers should support him in his desire to fight, makes a speech to the legionaries. We must remember, of course, that Cæsar gives us the words of this speech, and that Cæsar must himself have put the words together.

It is begun in the third person. He,—that is Curio, —tells the men how useful they were to Cæsar at Corfinium, the town at which they went over from Pompey to Cæsar. But in the second sentence he breaks into the first person and puts the very words into Curio's mouth. "For you and your services," he says, "were copied by all the towns; nor is it without cause that Cæsar thinks kindly of you, and the Pompeians unkindly. For Pompey, having lost no battle, but driven by the result of your deed, fled from Italy. Me, whom Cæsar holds most dear, and Sicily and Africa without which he cannot hold Rome and Italy, Cæsar has intrusted to your honor. There are some who advise you to desert me,—for what can be more desirable to such men than that they at the same time should circumvent me, and fasten upon you a foul crime? . . . . But you,—have you not heard of the things done by Cæsar in Spain,—two armies beaten, two Generals conquered, two provinces gained, and all this done in forty days from that on which Cæsar first saw his enemy? Can those who, uninjured, were unable to stand against him, resist him now when they are conquered? And you, who followed Cæsar when victory on his side was uncertain, now that fortune has declared herself, will you go over to the conquered side when you are about to realize the reward of your zeal? . . . . But, perhaps though you love Cæsar, you distrust me. I will not say much of my own deserts towards you, —which are indeed less as yet than I had wished or you had expected." Then, having thus declared that he will not speak of himself, he does venture to say a few words on the subject. "But why should I pass over my own work, and the result that has been as yet achieved, and my own fortune in war? Is it displeasing to you that I brought over the whole army, safe, without losing a ship? That, as I came, at my first onslaught, I should have dispersed the fleet of the enemy? That, in two days, I should have been twice victorious with my cavalry; that I should have cut out two hundred transports from the enemy's harbor; that I should have so harassed the enemy that neither by land nor sea could they get food to supply their wants? Will it please you to repudiate such fortune and such guidance, and to connect yourself with the disgrace at Corfinium, the flight from Italy," namely, Pompey's flight to Dyrrachium, "the surrender of Spain, and the evils of this African war? I indeed have wished to be called Cæsar's soldier, and you have called me your Imperator. If it repents you of having done so, I give you back the compliment. Give me back my own name, lest it seem that in scorn you have called me by that title of honor." This is very spirited: and the merely rhetorical assertion by Cæsar that Curio thus spoke to his soldiers is in itself interesting, as showing us the way in which the legionaries were treated by their Commanders, and in which the greatest General, of that or of any age, thought it natural that a leader should address his troops. It is of value, also, as showing the difficulty of keeping any legion true to either side in a civil war, in which, on either side, the men must fight for a Commander they had learned to respect, and against a Commander they respected, the Commander in each case being a Roman Imperator. Curio, too, as we know, was a man who on such an occasion would use words. But that he used the words here put into his mouth, or any words like them, is very improbable. Cæsar was anxious to make the best apology he could for the gallant young friend who had perished in his cause, and has shown his love by making the man he loved memorable to all posterity.

But before the dark hour comes upon him the young man has a gleam of success, which had he really spoken the words put into his mouth by Cæsar, would have seemed to justify them. He attacks the army of his fellow-Roman, Varus, and beats it, driving it back into Utica. He then resolves to besiege the town, and Cæsar implies that he would have been successful through the Cæsarean sympathies of the townsmen, had it not been for the approach of the terrible Juba. Then comes a rumor which reaches Curio, and which reaches Varus too inside the town, that the Numidian King is hurrying to the scene with all his forces. He has finished another affair that he had on hand, and can now look to his Roman friends,—and to his Roman enemies. Juba craftily sends forward his Præfect, or Lieutenant, Sabura, with a small force of cavalry, and Curio is led to imagine that Juba has not come, and that Sabura has been sent with scanty aid to the relief of Varus. Surely he can give a good account of Sabura and that small body of Numidian horsemen. We see from the very first that Curio is doomed. Cæsar, in a few touching words, makes his apology. "The young man's youth had much to do with it, and his high spirit; his former success too, and his own faith in his own good fortune." There is no word of reproach. Curio makes another speech to his soldiers. "Hasten to your prey," he says, "hasten to your glory!" They do hasten,—after such a fashion that when the foremost of them reached Sabura's troops, the hindermost of them are scattered far back on the road. They are cut to pieces by Juba. Curio is invited by one of his officers to escape back to his tent. But Cæsar tells us that Curio in that last moment replied that having lost the army with which Cæsar had trusted him, he would never again look Cæsar in the face. That he did say some such words as these, and that they were repeated by that officer to Cæsar, is probable enough. "So fighting he is slain:"—and there is an end of the man whom Cæsar loved.

What then happened was very sad for a Roman army. Many hurry down to the ships at the sea; but there is so much terror, so much confusion, and things are so badly done, that but very few get over to Sicily. The remainder endeavor to give themselves up to Varus; after doing which, could they have done it, their position would not have been very bad. A Roman surrendering to a Roman would, at the worst, but find that he was compelled to change his party. But Juba comes up and claims them as his prey, and Varus does not dare to oppose the barbarian king. Juba kills the most of them, but sends a few, whom he thinks may serve his purpose and add to his glory, back to his own kingdom. In doing which Juba behaved no worse than Cæsar habitually behaved in Gaul; but Cæsar always writes as though not only a Roman must regard a Roman as more than a man, but as though also all others must so regard Romans. And by making such assertions in their own behalf, Romans were so regarded. We are then told that the barbarian King of Numidia rode into Utica triumphant, with Roman senators in his train; and the names of two special Roman Senators Cæsar sends down to posterity as having been among that base number. As far as we can spare them, they shall be spared.

Cæsar begins the last book of his last Commentary by telling us that this was the year in which he (Cæsar) was by the law permitted to name a Consul. He names Publius Servilius to act in conjunction with himself. The meaning of this is, that, as Cæsar had been created Dictator, Pompey having taken with him into Illyria the Consuls of the previous year. Cæsar was now the only magistrate under whose authority a Consul could be elected. No doubt he did choose the man, but the election was supposed to have been made in accordance with the form of the Republic. He remained at Rome as Dictator for eleven days, during which he made various laws, of which the chief object was to lessen the insecurity caused by the disruption of the ordinary course of things; and then he went down to Brindisi on the track of Pompey. He had twelve legions with him, but he was badly off for ships in which to transport them; and he owns that the health of the men is bad, an autumn in the south of Italy having been severe on men accustomed to the healthy climate of Gaul and the north of Spain. Pompey, he tells us, had had a whole year to prepare his army,—a whole year, without warfare, and had collected men and ships and money, and all that support which assent gives, from Asia and the Cyclades, from Corcyra, Athens, Bithynia, Cilicia, Phœnicia, Egypt, and the free states of Achaia. He had with him nine Roman legions, and is expecting two more with his father-in-law Scipio out of Syria. He has three thousand archers from Crete, from Sparta, and from Pontus; he has twelve hundred slingers, and he has seven thousand cavalry from Galatia, Cappadocia, and Thrace. A valorous Prince from Macedonia had brought him two hundred men, all mounted. Five hundred of Galatian and German cavalry, who had been left to overawe Ptolemy in Egypt, are brought to Pompey by the filial care of young Cnæus. He too had armed eight hundred of their own family retainers, and had brought them armed. Antiochus of Commagena sends him two hundred mounted archers,—mercenaries, however, not sent without promise of high payment. Dardani,—men from the land of old Troy, Bessi, from the banks of the Hebrus, Thessalians and Macedonians, have all been crowded together under Pompey's standard. We feel that Cæsar's mouth waters as he recounts them. But we feel also that he is preparing for the triumphant record in which he is about to tell us that all these swarms did he scatter to the winds of heaven with the handful of Roman legionaries which he at last succeeded in landing on the shores of Illyria. Pompey has also collected from all parts "frumenti vim maximam"—"a great power of corn indeed," as an Irishman would say, translating the words literally. And he has covered the seas with his ships, so as to hinder Cæsar from coming out of Italy. He has eight Vice-admirals to command his various fleets,—all of whom Cæsar names; and over them all as Admiral-in-Chief, is Bibulus, who was joint-consul with Cæsar before Cæsar went to Gaul, and who was so harassed during his Consulship by the Cæsareans that he shut himself up in his house, and allowed Cæsar to rule as sole Consul. Now he is about to take his revenge; but the vengeance of such an one as Bibulus cannot reach Cæsar.

Cæsar having led his legions to Brindisi, makes them a speech which almost beats in impudence anything that he ever said or did. He tells them that as they have now nearly finished all his work for him, they have only yet to lay low the Republic with Pompey the Great, and all the forces of the Republic—to which, however, have to be added King Ptolemy in Egypt, King Pharnaces in Asia, and King Juba in Numidia; they had better leave behind them at Brindisi all their little property, the spoils of former wars, so that they may pack the tighter in the boats in which he means to send them across to Illyria, if only they can escape the mercies of ex-Consul Admiral Bibulus. There is no suggestion that at any future time they will recover their property. For their future hopes they are to trust entirely to Cæsar's generosity. With one shout they declare their readiness to obey him. He takes over seven legions, escaping the dangers of those "rocks of evil fame," the Acroceraunia of which Horace tells us,—and escaping Bibulus also, who seems to have shut himself up in his ship as he did before in his house during the Consulship. Cæsar seems to have made the passage with the conviction that had he fallen into the hands of Bibulus everything would have been lost. And with ordinary precaution and diligence on the part of Bibulus such would have been eventually the result. Yet he makes the attempt—trusting to the Fortune of Cæsar and he succeeds. He lands at a place which he calls Palæste on the coast of Epirus, considerably to the south of Dyrrachium, in Illyria. At Dyrrachium Pompey had landed the year before, and there is now stored that wealth of provision of which Cæsar has spoken. But Bibulus at last determines to be active, and he does manage to fall upon the empty vessels which Cæsar sends back to fetch the remainder of his army. "Having come upon thirty of them, he falls upon them with all the wrath occasioned by his own want of circumspection and grief, and burns them. And in the same fire he kills the sailors and the masters of the vessels—hoping to deter others." Cæsar tells us, "by the severity of the punishment." After that we are not sorry to hear that he potters about on the seas very busy, but still incapable, and that he dies, as it seems, of a broken heart. He does indeed, catch one ship afterwards—not laden with soldiers, but coming on a private venture, with children, servants, and suchlike, dependants and followers of Cæsar's camp. All these, including the children, Bibulus slaughters, down to the smallest child. We have, however, to remember that the story is told by Cæsar, and that Cæsar did not love Bibulus.

Marc Antony has been left at Brindisi in command of the legions which Cæsar could not bring across at his first trip for want of sufficient ship-room, and is pressed very much by Cæsar to make the passage. There are attempts at treaties made, but as we read the account we feel that Cæsar is only obtaining the delay which is necessary to him till he shall have been joined by Antony. We are told how by this time the camps of Cæsar and Pompey have been brought so near together that they are separated only by the River Apsus—for Cæsar had moved northwards towards Pompey's stronghold. And the soldiers talked together across the stream: "nor, the while, was any weapon thrown—by compact between those who talked." Then Cæsar sends Vatinius, as his ambassador, down to the river to talk of peace; and Vatinius demands with a loud voice "whether it should not be allowed to citizens to send legates to citizens, to treat of peace—a thing that has been allowed even to deserters from the wilds of the Pyrenees and to robbers—especially with so excellent an object as to hinder citizens from fighting with citizens." This seems so reasonable, that a day is named, and Labienus—who has deserted from Cæsar and become Pompeian—comes to treat on one side of the river, and Vatinius on the other. But—so Cæsar tells the story himself—the Cæsarean soldiers throw their weapons at their old General. They probably cannot endure the voice or sight of one whom they regard as a renegade. Labienus escapes under the protection of those who are with him—but he is full of wrath against Cæsar. "After this," says he, "let us cease to speak of treaties, for there can be no peace for us till Cæsar's head has been brought to us." But the colloquies over the little stream no doubt answered Cæsar's purpose.

Cæsar is very anxious to get his legions over from Italy, and even scolds Antony for not bringing them. There is a story—which he does not tell himself—that he put himself into a small boat, intending to cross over to Brindisi in a storm, to hurry matters, and that he encouraged the awestruck master of the boat by reminding him that he would carry "Cæsar and his fortunes." The story goes on to say that the sailors attempted the trip, but were driven back by the tempest. At last there springs up a south wind, and Antony ventures with his flotilla, although the warships of Pompey still hold the sea, and guard the Illyrian coast. But Cæsar's General is successful, and the second half of the Cæsarean army is carried northward by favoring breezes towards the shore in the very sight of Pompey and his soldiers at Dyrrachium. Two ships, however, lag behind, and fall into the hands of one Otacilius, an officer belonging to Pompey. The two ships, one full of recruits and the other of veterans, agree to surrender, Otacilius having sworn that he will not hurt the men. "Here you may see," says Cæsar, "how much safety to men there is in presence of mind." The recruits do as they have undertaken, and give themselves up; whereupon Otacilius, altogether disregarding his oath, like a true Roman, kills every man of them. But the veterans, disregarding their word also, and knowing no doubt to a fraction the worth of the word of Otacilius, run their ship ashore in the night, and, with much fighting, get safe to Antony. Cæsar implies that the recruits even would have known better had they not been sea-sick; but that even bilge-water and bad weather combined had failed to touch the ancient courage of the veteran legionaries. They were still good men—"item conflictati et tempestatis et sentinæ vitiis."

We are then told how Metellus Scipio, coming out of Syria with his legions into Macedonia almost succeeds in robbing the temple of Diana of Ephesus on his way. He gets together a body of Senators, who are to give evidence that he counts the money fairly as he takes it out of the temple. But letters come from Pompey just as he is in the act, and he does not dare to delay his journey even to complete so pleasant a transaction. He comes to meet Pompey and to share his command at the great battle that must soon be fought. We hear, too, how Cæsar sends his Lieutenants into Thessaly and Ætolia and Macedonia, to try what friends he has there, to take cities, and to get food. He is now in a land which has seemed specially to belong to Pompey; but even here they have heard of Cæsar, and the Greeks are simply anxious to be friends with the strongest Roman of the day. They have to judge which will win, and to adhere to him. For the poor Greeks there is much difficulty in forming a judgment. Presently we shall see the way in which Cæsar gives a lesson on that subject to the citizens of Gomphi. In the mean time he joins his own forces to those lately brought by Antony out of Italy, and resolves that he will force Pompey to a fight.

We may divide the remainder of his last book of the second Commentary into two episodes,—the first being the story of what occurred within the lines at Petra, and the second the account of the crowning battle of Pharsalia. In the first Pompey was the victor,—but the victory, great as it was, has won from the world very little notice. In the second, as all the world knows, Cæsar was triumphant and henceforward dominant. And yet the affair at Petra should have made a Pharsalia unnecessary, and indeed impossible. Two reasons have conspired to make Pompey's complete success at Petra unimportant in the world's esteem. This Commentary was written not by Pompey, but by Cæsar; and, then, unfortunately for Pompey, Pharsalia was allowed to follow Petra. It is not very easy to unravel Cæsar's story of the doings of the two armies at Petra. Nor, were this ever so easy a task, would our limits or the purport of this volume allow us to attempt to give that narrative in full to our readers. Cæsar had managed to join the legions which he had himself brought from Italy with those which had crossed afterwards with Antony, and was now anxious for a battle. His men, though fewer in number than they who followed Pompey, were fit for fighting, and knew all the work of soldiering. Pompey's men were for the most part beginners;—but they were learning, and every week added to their experience was a week in Pompey's favor. With hope of forcing a battle, Cæsar managed to get his army between Dyrrachium, in which were kept all Pompey's stores and wealth of war, and the army of his opponent, so that Pompey, as regarded any approach by land was shut off from Dyrrachium. But the sea was open to him. His fleet was everywhere on the coast, while Cæsar had not a ship that could dare to show its bow upon the waters.

There was a steep rocky promontory some few miles north of Dyrrachium, from whence there was easy access to the sea, called Petra, or the rock. At this point Pompey could touch the sea, but between Petra and Dyrrachium Cæsar held the country. Here, on this rock, taking in for the use of his army a certain somewhat wide amount of pasturage at the foot of the rock, Pompey placed his army, and made intrenchments all round from sea to sea, fortifying himself as all Roman Generals knew how to do, with a bank and ditch and twenty-four turrets and earthworks that would make the place absolutely impregnable. The length of his lines was fifteen Roman miles,— more than thirteen English miles,— so that within his works he might have as much space as possible to give him grass for his horses. So placed, he had all the world at his back to feed him. Not only could he get at that wealth of stores which he had amassed at Dyrrachium, and which were safe from Cæsar, but the coasts of Greece, and Asia, and Egypt were open to his ships. Two things only were wanting to him,—sufficient grass for his horses, and water. The Illyrian country at his back was one so unproductive, being rough and mountainous, that the inhabitants themselves were in ordinary times fed upon imported corn. And Pompey, foreseeing something of what might happen, had taken care to empty the store-houses and to leave the town behind him destitute and impoverished. Nevertheless Cæsar, having got the body of his enemy, as it were, imprisoned at Petra, was determined to keep his prisoner fast. So round and in front of Pompey's lines, he also made other lines from sea to sea. He began by erecting turrets and placing small detachments on the little hills outside Pompey's lines, so as to prevent his enemy from getting the grass. Then he joined these towers by lines, and in this way surrounded the other lines, — thinking that so Pompey would not be able to send out his horsemen for forage; and again, that the horses inside at Petra might gradually be starved; and again "that the reputation,"— "auctoritatem,"—" which in the estimation of foreign nations belonged chiefly to Pompey in this war, would be lessened when the story should have been told over the world that Pompey had been besieged by Cæsar, and did not dare to fight."

We are, perhaps, too much disposed to think — reading our history cursorily —that Cæsar at this time was everybody, and that Pompey was hardly worthy to be his foe. Such passages in the Commentary as that above translated—they are not many, but a few suffice—show that this idea is erroneous. Up to this period in their joint courses Pompey had been the greater man: Cæsar had done very much, but Pompey had done more—and now he had on his side almost all that was wealthy and respectable in Rome. He led the Conservative party, and was still confident that he had only to bide his time, and that Cæsar must fall before him. Cæsar and Cæsareans were to him as the spirits of the Revolution were in France to Louis XVI., to Charles X., and to Louis-Philippe, before they had made their powers credible and formidable; as the Reform Bill and Catholic Emancipation were to such men as George IV. and Lord Eldon, while yet they could be opposed and postponed. It was impossible to Pompey that the sweepings of Rome, even with Cæsar and Cæsar's army to help them, should at least prevail over himself and over the Roman Senate. "He was said at that time," we are again translating Cæsar's words, "to have declared with boasts among his own people, that he would not himself deny that as a general he should be considered worthless if Cæsar's legions should now extricate themselves from the position in which they had rashly entangled themselves without very great loss"—"*maximo detrimento*"—loss that would amount wellnigh to destruction. And he was all but right in what he said. There was a great deal of fighting for the plots of grass and different bits of vantage-ground—fighting which must have taken place almost between the two lines. But Cæsar suffered under this disadvantage, that his works, being much the longest, required the greatest number of men to erect them and prolong them and keep them in order; whereas Pompey, who in this respect had the least to do, having the inner line, was provided with much the greater number of men to do it. Cæsar's men, being veterans, had always the advantage in the actual fighting; but in the mean time Pompey's untried solders were obtaining that experience which was so much needed by them. Nevertheless Pompey suffered very much. They could not get water on the rock, and when he attempted to sink wells, Cæsar so perverted the water-courses that the wells gave no water. Cæsar tells us that he even dammed up the streams, making little lakes to hold it, so that it should not trickle down in its underground courses to the comfort of his enemies; but we should have thought that any reservoirs so made must soon have overflown themselves, and have been useless for the intended purpose. In the mean time Cæsar's men had no bread but what was made of a certain wild cabbage—"chara"—which grew there, which they kneaded up with milk, and lived upon it cheerfully, though it was not very palatable. To show the Pompeians the sort of fare with which real veterans could be content to break their fasts, they threw loaves of this composition across the lines, for they were close together and could talk to each other, and the Pompeians did not hesitate to twit their enemies with their want of provisions. But the Cæsareans had plenty of water—and plenty of meat; and they assure Cæsar that they would rather eat the bark off the trees than allow the Pompeians to escape them.

But there was always this for Cæsar to fear—that Pompey should land a detachment behind his lines and attack him at the back. To hinder this Cæsar made another intrenchment, with ditch and bank, running at right angles from the shore, and was intending to join this to his main work by a transverse line of fortifications running along that short portion of the coast which lay between his first lines and the second, when there came upon him the disaster which nearly destroyed him. While he was digging his trenches and building his turrets the fighting was so frequent that, as Cæsar tells us, on one day there were six battles. Pompey lost two thousand legionaries, while Cæsar lost no more than twenty; but every Cæsarean engaged in a certain turret was wounded; and four officers lost their eyes. Cæsar estimates that thirty thousand arrows were thrown upon the men defending this tower, and tells us of one Scæva, an officer, who had two hundred and thirty holes made by these arrows in his own shield. We can only surmise that it must have been a very big shield, and that there must have been much trouble in counting the holes. Cæsar, however, was so much pleased that he gave Scæva a large sum of money—something over £500, and, allowing him to skip over six intermediate ranks, made him at once first centurion—or Primipilus of the legion. We remember no other record of such quick promotion—in prose. There is, indeed, the well-known case of a common sailor who did a gallant action and was made First-Lieutenant on the spot; but that is told in verse, and the common sailor was a lady.

Two perfidious Gauls to whom Cæsar had been very kind, but whom he had been obliged to check on account of certain gross peculations of which they had been guilty, though, as he tells us, he had not time to punish them, went over to Pompey, and told Pompey all the secrets of Cæsar's ditches, and forts, and mounds—finished and unfinished. Before that, Cæsar assures us, not a single man of his had gone over to the enemy, though many of the enemy had come to him. But these perfidious Gauls did a world of mischief. Pompey, hearing how far Cæsar was from having his works along the sea-shore finished, got together a huge fleet of boats, and succeeded at night in throwing a large body of his men ashore between Cæsar's two lines, thus dividing Cæsar's two forces, and coming upon them in their weakest point. Cæsar admits that there was a panic in his lines, and that the slaughter of his men was very great. It seems that the very size of his own works produced the ruin which befell them, for the different parts of them were divided one from another, so that the men in one position could not succor those in another. The affair ended in the total route of the Cæsarean army. Cæsar actually fled, and had Pompey followed him we must suppose that then there must be an end of Cæsar. He acknowledges that in the two battles fought on that day he lost 960 legionaries, 32 officers, and 32 standards. And then Cæsar tells us a story of Labienus, who had been his most trusted Lieutenant in the Gallic wars, but who had now gone over to Pompey, not choosing to fight against the Republic. Labienus demanded of Pompey the Cæsarean captives, and caused them all to be slaughtered, asking them with scorn whether veterans such as they were accustomed to run away. Cæsar is very angry with Labienus; but Labienus might have defended himself by saying that the slaughter of prisoners of war was a custom he had learned in Gaul. As for those words of scorn, Cæsar could hardly have heard them with his own ears, and we can understand that he should take delight in saying hard things of Labienus.

Pompey was at once proclaimed Imperator. And Pompey used the name, though the victory had, alas! been gained over his own fellow-countrymen. "So great was the effect of all this on the spirits and confidence of the Pompeians, that they thought no more of the carrying on of the war, but only of the victory they had gained." And then Cæsar throws scorn upon the Pompeians, making his own apology in the same words. "They did not care to remember that the small number of our soldiers was the cause of their triumph, or that the unevenness of the ground and narrowness of the defiles had anything to do with it; or the occupation of our lines, and the panic of our men between their double fortifications, or our army cut into two parts, so that one part could not help the other. Nor did they add to this the fact that our men, pressed as they were, could not engage themselves in a fair conflict, and that they indeed suffered more from their own numbers, and from the narrowness of the ravines, than from the enemy. Nor were the ordinary chances of war brought to mind,—how small matters, such as some unfounded suspicion, a sudden panic, a remembered superstition, may create great misfortune; nor how often the fault of a General, or the mistake of an officer may bring injury upon an army. But they spread abroad the report of the victory of that day throughout all the world, sending forth letters and tales as though they had conquered solely by their own valor, nor was it possible that there should after this be a reverse of their circumstances." Such was the affair of Petra, by which the relative position in the world-history of Cæsar and Pompey was very nearly made the reverse of what it is.

Cæsar now acknowledges that he is driven to change the whole plan of his campaign. He addresses a speech to his men, and explains to them that this defeat, like that of Gergovia, may lead to their future success. The victory at Alesia had sprung from the defeat of Gergovia, because the Gauls had been induced to fight; and from the reverses endured within the lines of Petra might come the same fortune;—for surely now the army of Pompey would not fear a battle. Some few officers he punishes and degrades. His own words respecting his army after their defeat are very touching. "So great a grief had come from this disaster upon the whole army, and so strong a desire of repairing its disgrace, that no one now desired the place of Tribune or Centurion in his legion; and all, by way of self-imposed punishment, subjected themselves to increased toil; and every man burned with a desire to fight. Some from the higher ranks were so stirred by Cæsar's speech, that they thought that they should stand their ground where they were and fight where they stood." But Cæsar was too good a General for that. He moves on towards the south-east, and in retreating gets the better of Pompey, who follows him with only half a heart. After a short while Pompey gives up the pursuit. His father-in-law, Scipio, has brought a great army from the east, and is in Thessaly. As we read this we cannot fail to remember how short a time since it was that Cæsar himself was Pompey's father-in-law, and that Pompey was Cæsar's friend because, with too uxorious a love, he clung to Julia, his young wife. Pompey now goes eastward to unite his army to that of Scipio, and Cæsar, making his way into Thessaly by a more southern route, joins certain forces under his Lieutenant Calvinus, who had been watching Scipio, and who barely escaped falling into Pompey's hands before he could reach Cæsar. But wherever fortune or chance could interfere, the Gods were always kind to Cæsar.

Then Cæsar tells us of his treatment of two towns in Thessaly, Gomphi, and Metropolis. Unluckily for the poor Gomphians. Cæsar reaches Gomphi first. Now the fame of Pompey's victory at Petra had been spread abroad; and the Gomphians, who, to give them their due,—would have been just as willing to favor Cæsar as Pompey, and who only wanted to be on the winning side that they might hold their little own in safety, believed that things were going badly with Cæsar. They therefore shut their gates against Cæsar, and sent off messengers to Pompey. They can hold their town against Cæsar for a little while, but Pompey must come quickly to their aid. Pompey comes by no means quick enough, and the Gomphians' capacity to hold their own is very short-lived. At about three o'clock in the afternoon Cæsar begins to besiege the town, and before sunset he has taken it, and given it to be sacked by his soldiers. The men of Metropolis were also going to shut their gates, but luckily they hear just in time what had happened at Gomphi, and open them instead. Whereupon Cæsar showers protection upon Metropolis; and all the other towns of Thessaly, hearing what had been done, also learn what Cæsar's favor means.

Pompey, having joined his army to that of Scipio, shares all his honors with his father-in-law. When we hear this we know that Pompey's position was not comfortable, and that he was under constraint. He was a man who would share his honor with no one unless driven to do so. And indeed his command at present was not a pleasant one. It was much for a Roman commander to have with him the Roman Senate, but the Senators so placed would be apt to be less obedient than trained soldiers. They even accuse him of keeping them in Thessaly because he likes to lord it over such followers. But they were, nevertheless, all certain that Cæsar was about to be destroyed; and, even in Pompey's camp, they quarrel over the rewards of victory which they think that they will enjoy at Rome when their oligarchy shall have been re-established by Pompey's arms.

Before the great day arrives Labienus again appears on the scene: and Cæsar puts into his mouth a speech which he of course intends us to compare with the result of the coming battle. "Do not think, O Pompey, that this is the army which conquers Gaul and Germany,"—where Labienus himself was second in command under Cæsar. "I was present at all those battles, and speak of a thing which I know. A very small party of that army remains. Many have perished, as a matter of course in so many battles. The autumn pestilence killed many in Italy. Many have gone home. Many have been left on the other shore. Have you not heard from our own friends who remained behind sick, that these cohorts of Cæsar's were made up at Brindisi?"—made up but the other day, Labienus implies. "This army, indeed has been renewed from levies in the two Gauls; but all that it had of strength perished in those two battles at Dyrrachium:" in the contests, that is, within the lines of Petra. Upon this Labienus swears that he will not sleep under canvas again until he sleeps as victor over Cæsar: and Pompey swears the same, and everybody swears. Then they all go away full of the coming victory. We daresay there was a great deal of false confidence: but as for the words which Cæsar puts into the mouth of Labienus, we know well how much cause Cæsar had to dislike Labienus, and we doubt whether they were ever spoken. At length the battle-field is chosen, near the town of Pharsalus, on the banks of the river Enipeus in Thessaly. The battle has acquired world-wide fame as that of Pharsalia, which we have been taught to regard as the name of the plain on which it was fought. Neither of these names occur in the Commentary, nor does that of the river: and the actual spot on which the great contest took place seems to be a matter of doubt even now. The ground is Turkish soil,—near to the mountains which separate modern Greece from Turkey and is not well adapted for the researches of historical travelers. Cæsar had been keeping his men on the march close to Pompey, till Pompey found that he could no longer abstain from fighting. Then came Labienus with his vaunts, and his oath,—and at length the day and the field were chosen. Cæsar at any rate was ready. At this time Cæsar was fifty-two years old, and Pompey was five years his elder.

Cæsar tells us that Pompey had 110 cohorts, or eleven legions. Had the legions been full, Pompey's army would have contained 66,000 legionaries: but Cæsar states their number at 45,000 or something over two-thirds of the full number. He does not forget to tell us once again that among these eleven were the two legions which he had given up in obedience to the demand of the Senate. Pompey himself, with these two very legions, placed himself on the left away from the river; and there also were all his auxiliaries,—not counted with the legionaries,—slingers, archers, and cavalry. Scipio commanded in the centre with the legions he had brought out of Syria. So Cæsar tells us. We learn from other sources that Lentulus commanded Pompey's right wing, lying on the river—and Domitius, whom we remember as trying to hold Marseilles against young Brutus and Trebonius, the left. Cæsar had 80 cohorts, or eight legions, which should have numbered 48,000 men had his legions been full—but, as he tells us, he led but 22,000 legionaries, so that his ranks were deficient by more than a half. As was his custom, he had his tenth legion to the right, away from the river. The ninth, terribly thinned by what had befallen it within the lines at Petra, joined to the eleventh, lay next the river, forming part of Cæsar's left wing. Antony commanded the left wing, Domitius Calvinus, whom Cæsar sometimes calls by one name and sometimes by the other, the centre,—and Sulla the right. Cæsar placed himself to the right, with his tenth legion, opposite to Pompey. As far as we can learn, there was but little in the nature of the ground to aid either of them:—and so the fight began.

There is not much complication, and perhaps no great interest, in the account of the actual battle as it is given by Cæsar. Cæsar makes a speech to his army, which was, as we have already learned, and as he tells us now, the accustomed thing to do. No falser speech was ever made by man, if he spoke the words which he himself reports. He first of all reminds them how they themselves are witnesses that he has done his best to insure peace;—and then he calls to their memory certain mock treaties as to peace; in which, when seekingly delay, he had pretended to engage himself and his enemy. He had never wasted, he told them, the blood of his soldiers, nor did he desire to deprive the Republic of either army—"alterutro exercitu"—of Pompey's army or of his own. They were both Roman, and far be it from him to destroy aught belonging to the Republic. We must acknowledge that Cæsar was always chary of Roman life and Roman blood. He would spare it when it could be spared; but he could spill it like water when the spilling of it was necessary to his end. He was very politic; but as for tenderness, —neither he nor any Roman knew what it was. Then there is a story of one Crastinus, who declares that whether dead or alive he will please Cæsar. He throws the first weapon against the enemy and does please Cæsar. But he has to please by his death, for he is killed in his effort. Pompey orders that his first rank shall not leave its order to advance, but shall receive the shock of Cæsar's attack. Cæsar points out to us that he is wrong in this, because the very excitement of a first attack gives increased energy and strength to the men. Cæsar's legionaries are told to attack, and they rush over the space intervening between the first ranks to do so. But they are so well trained that they pause and catch their breath before they throw their weapons. Then they throw their piles and draw their swords, and the ranks of the two armies are close pitted against each other. But Pompey had thought that he could win the battle, almost without calling on his legionaries for any exertion, by the simple strategic movement of his numerous cavalry and auxiliaries. He outnumbered Cæsar altogether, but in these arms he could overwhelm him with a cloud of horsemen and of archers. But Cæsar also had known of these clouds. He fought now as always with a triple rank of legionaries,—but behind his third rank,—or rather somewhat to their right shoulder,—he had drawn up a choice body of men picked from his third line, —a fourth line as it were,—whose business it was to stand against Pompey's clouds when the attempt should be made by these clouds upon their right flank. Cæsar's small body of cavalry did give way before the Pompeian clouds, and the horsemen and the archers and the slingers swept round upon Cæsar's flank. But they swept round upon destruction. Cæsar gave the word to that fourth line of picked men. "Illi—they," says Cæsar, "ran forward with the greatest rapidity, and with their standards in advance attacked the cavalry of Pompey with such violence that none of them could stand their ground;—so that all not only were forced from the ground, but being at once driven in panic, they sought the shelter of the highest mountains near them. And when they were thus removed, all the archers and the slingers, desolate and unarmed, without any one to take care of them, were killed in heaps." Such is Cæsar's account of Pompey's great attack of cavalry which was to win the battle without giving trouble to the legions.

Cæsar acknowledges that Pompey's legionaries drew their swords bravely and began their share of the fighting well. Then at once he tells us of the failure on the part of the cavalry and of the slaughter of the poor auxiliary slingers, and in the very next sentence give us to understand that the battle was won. Though Pompey's legions were so much more numerous than those of Cæsar, we were told that Cæsar's third line attacked the Pompeian legionaries when they were "defessi"—worn out. The few cohorts of picked men who in such marvelous manner had dispersed Pompey's clouds, following on their success, turned the flank of Pompey's legions and carried the day. That it was all as Cæsar says there can be little doubt. That he won the battle there can, we presume, be no doubt. Pompey at once flew to his camp and endeavored to defend it. But such defense was impossible, and Pompey was driven to seek succor in flight. He found a horse and a few companions, and did not stop till he was on the sea-shore. Then he got on board a provision-vessel, and was heard to complain that he had been betrayed by those very men from whose hands he had expected victory. We are told with much picturesque effect how Cæsar's men, hungry, accustomed to endurance, patient in all their want, found Pompey's camp prepared for victory, and decked in luxurious preparation for the senatorial victors. Couches were strewn, and plate was put out, and tables prepared, and the tents of these happy ones were adorned with fresh ivy. The senatorial happy ones have but a bad time of it, either perishing in their flight, or escaping into the desert solitudes of the mountains. Cæsar follows up his conquest, and on the day after the battle compels the great body of the fugitives to surrender at discretion. He surrounds them on the top of a hill and shuts them out from water, and they do surrender at discretion. With stretched-out hands, prone upon the earth, these late conquerors, the cream of the Roman power, who had so lately sworn to conquer ere they slept, weeping, beg for mercy. Cæsar, having said a few words to them of his clemency, gave them their lives. He recommends them to the care of his own men, and desires that they may neither be slaughtered nor robbed. Cæsar says he lost only 200 soldiers in that battle— and among them 30 officers, all brave men. That gallant Crastinus was among the 30. Of Pompey's army 15,000 had been killed, and 24,000 had surrendered! 180 standards and 9 eagles were taken and brought to Cæsar. The numbers seem to us to be almost incredible, whether we look at those given to us in regard to the conqueror or the conquered. Cæsar's account, however, of that day's work has hitherto been taken as authoratative, and it is too late now to question it. After this fashion was the battle of Pharsalia won, and the so-called Roman Republic brought to an end.

But Cæsar by no means thought that this work was done;—nor indeed was it nearly done. It was now clearly his first duty to pursue Pompey,—whom, should he escape, the outside provinces and distant allies of the Republic would soon supply with another army. "Cæsar thought that Pompey was to be pursued to the neglecting of all other things." In the mean time Pompey, who seems to have been panic-struck by his misfortune, fled with a few friends down the Ægean Sea, picked his young wife up at an island as he went, and made his way to Egypt. The story of his murder by those who had the young King of Egypt in their keeping is well-known and need not detain us. Cæsar tells it very shortly. Pompey sends to young Ptolemy for succor and assistance, trusting to past friendship between himself and the young King's father. Ptolemy is in the hands of eunuchs, adventurers, and cut-throat soldiers, and has no voice of his own in the matter. But these ruffians think it well to have Pompey out of the way, and therefore they murder him. Achillas, a royal satrap, and Septimius, a Roman soldier, go out to Pompey's vessel, as messengers from the King, and induce them to come down into their boat. Then, in the very sight of his wife, he is slaughtered, and his head is carried away as proof of the deed. Such was the end of Pompey, for whom no fortune had seemed to be too great, till Cæsar came upon the scene. We are told by the Roman poet, Lucan, who took the battle of Pharsalia as his difficult theme, that Cæsar could bear no superior, and Pompey no equal. The poet probably wished to make the latter the more magnanimous by the comparison. To us, as we examine the character of the two Generals, Cæsar seems at least as jealous of power as his son-in-law, and certainly was the more successful of the two in excluding all others from a share in the power which he coveted. Pompey in the triumvirate admitted his junior to more, as he must have felt it, than equal power: Cæsar in the triumvirate simply made a stepping-stone of the great man who was his elder. Pompey at Thessaly was forced to divide at least the name of his power with Scipio, his last father-in-law: but Cæsar never gave a shred of his mantle to be worn by another soldier.

In speaking, however, of the character of Pompey, and in comparing it with that of his greater rival, it may probably be said of him that in all his contests, both military and political, he was governed by a love of old Rome, and of the Republic as the greatest national institution which the world has ever known, and by a feeling which we call patriotism, and of which Cæsar was,—perhaps, we may say, too great to be capable. Pompey desired to lead, but to lead the beloved Republic. Cæsar, caring nothing for the things of old, with no reverence for the past, utterly destitute of that tenderness for our former footsteps which makes so many of us cling with passionate fondness to convicted errors, desired to create out of the dust of the Republic,—which fate and his genius allowed him to recast as he would,—something which should be better and truer than the Republic.

The last seven chapters of the third book of this Commentary form a commencement of the record of the Alexandrine war,—which, beyond those seven chapters, Cæsar himself did not write. That he should have written any Commentary amidst the necessary toils of war, and the perhaps more pressing emergencies of his political condition, is one of the marvels of human power. He tells us now, that having delayed but a few days in Asia, he followed Pompey first to Cyprus and then to Egypt, taking with him as his entire army three thousand two hundred men. "The rest, worn out with wounds, and battles, and toil, and the greatness of the journey, could not follow him." But he directed that legions should be made up for him from the remnants of Pompey's broken army, and, with a godlike trust in the obedience of absent vassals, he went on to Egypt. He tells us that he was kept in Alexandria by Etesian winds. But we know also that Cleopatra came to him at Alexandria, requiring his services in her contest for the crown of Egypt; and knowing at what price she bought them, we doubt the persistent malignity of the Etesian winds. Had Cleopatra been a swarthy Nubian, as some have portrayed her, Cæsar, we think, would have left Alexandria though the Etesian winds had blown in his very teeth. All winds filled Cæsar's sails. Cæsar gets possession of Cleopatra's brother Ptolemy, who, in accordance with their father's will, was to have reigned in conjunction with his sister, and the Alexandrians rise against him in great force. He slays Photinus, the servant of King Ptolemy, has his own ambassador slain, and burns the royal fleet of Egypt,—burning with it, unfortunately, the greater part of the royal library. "These things were the beginning of the Alexandrine war." These are the last words of Cæsar's last Commentary. See *Roman Wars*.

ROMANS.—Before the establishment of the mess at the Horse Guards, which was formerly paid out of the King's privy purse, and subsequently charged in the extraordinaries of the army, the Captain of the Guard at St. James's kept a table for the subalterns attached to that duty. In order to enable the Captains to support these expenses, a certain number of men were allowed to work in the metropolis, on condition that they left their pay in the hands of their Officers; these men were called *Romans*.

ROMAN WALL.—Traces are found in Great Britain of four great walls built by the Roman Conquerors. Two were built by Agricola, the first in A. D. 79, and the second in A. D. 81, extending from the Frith of Forth to the Frith of Clyde. As this proved insufficient to keep back the northern barbarians, Hadrian in A. D. 120 finished the most famous of all the walls, from the Solway to Newcastle on Tyne. This was 68 English miles in length. In A. D. 200 Severus built another wall a few yards above that of Hadrian, which was guarded by 10,000 men.

ROMAN WARS.—In the infancy of Rome, she had many wars but few conquests—in her maturity she had few wars and many conquests. When the power of Carthage failed, Rome no longer had a rival: her wars, or rather invasions, after that event, were generally of her own seeking; and they were many. Rome was no sooner able to say, "Carthage must be destroyed," than, in her heart, she also said, *the empire of Alexander shall be mine*. First Macedonia felt her grasp, and Perseus was hurled from the throne of Philip and Alexander, at which time she graciously gave the Greeks their liberty, *i. e.* gave them law.

Attalus, King of Pergamus, dying about this time, left his kingdom to the Romans, by will; or, in other words, seeing the world sink beneath their power, he preferred giving them a bloodless victory, and cloaked an ignoble dereliction of right under the specious name of a voluntary donation. Antiochus, the great King of Assyria, was destined next to fall before them. He was at this period the most powerful and opulent prince of all Alexander's successors; and had he accepted the advice and aid of Hannibal, there would have been at least a chance for his escaping the all-grasping power of Rome. But he, fearing lest, if anything should be done, Hannibal would have all the credit, was careful to go directly contrary to the advice of that General. The Romans defeated him almost without loss of blood—stripping him of great part of his dominions—triumphed over him—extorted from him an immense tribute, and left him only enough to grace the triumph of another campaign. Two other great cities shared the fate of Carthage, and nearly at the same time: Corinth, one of the noblest cities of Greece, was utterly destroyed by Mummius, the Consul, for offering some indignity to the Roman embassadors—and Numantia, the capital of Spain. This city after sustaining a siege of fourteen years, was reduced by Scipio. The inhabitants, being unable to hold out any longer, fired the city over their own heads, and all perished in the flames; and Spain became a Roman province.

The corruption of the senate, and the sedition and fall of the Gracchi, together with various disturbances next arise to view in tracing the history of Rome. Then follow the reduction of Numidia, and the civil wars in the republic, excited by the ambition of Marius and Sylla, which terminated in the perpetual dictatorship of the latter. But it will not comport with our present design to enter into a detail of these particular events. Rome was perhaps never more powerful or happy than in the days of Scipio Africanus, or about the times of the Punic wars. She then experienced great misfortunes and calamities; but those untoward events, instead of weakening or exhausting her, called forth, nay, even created new energies. From the invasion of Hannibal, she rose invincible: and while that consummate warrior held his ground in Italy, she sent armies into Spain, Africa, Greece and Macedon. A great part of those immense regions which Alexander subdued, soon shared the fate of the empire of Carthage; and in those days, with the Romans, to proclaim war was to insure a triumph—and to invade was to conquer.

When we look for a period in the Roman history, in which there is the greatest union of power, wisdom, virtue and happiness, it will doubtless be found not far from the times of which we are now speaking. The Romans, in earlier times of the republic, were more virtuous and patriotic than now—but then they were weak; in the Augustan age they were certainly more enlightened, scientific and polished—but then they were less brave; or if not less brave, their virtue was forever gone, and with it, the foundation of their prosperity and happiness. The conquest of Africa, Asia, and Greece at once poured into the coffers of Rome immense, incalculable riches. On this almost boundless tide of prosperity a set of men were soon seen floating, of a very different character from Cincinnatus, Fabricius and Regulus. To the most desperate bravery they united unbounded ambition; and to the strongest expression of regard to their country they united a total want of principle. The wealth of the world like a mighty river, poured into Rome; and many individuals acquired fortunes which transcended royal magnificence.

The elevation of Rome to such an astonishing height of power and splendor, drew to her men of parts, of taste, of ambition and enterprise—and in short, men of every description, and almost every nation. The descendants of the ancient Romans soon became few in comparison with the immense multitude, who by some means or other, acquired citizenship, or obtained a residence in Italy; and Rome herself experienced as great a change as the nations she conquered: for while she drew the arts, elegance and science from Greece, she drew wealth, luxury, effeminacy, and corruption from Asia and Africa, and she drew a swarm of hungry fortune hunters from every corner of the earth, who penetrated her inmost recesses—outnumbered and overwhelmed her ancient people—in short, conquered their conquerors, corrupted their morals, and put a final period to their liberties.

The civil wars of Rome which soon follow the period of which we have been speaking, unfold to the reader a spectacle equally dreadful and disgusting. Many persons who had witnessed the destruction of Carthage were still alive, and saw all Italy deluged in blood by Marius and Sylla. From the destruction of Carthage to the perpetual dictatorship of Sylla, was a little rising of seventy years. During the latter part of this period, Lucius Sylla, envying the power and glory of Caius Marius, involved the republic in a most bloody, disgraceful, and destructive war. After various turns which their affairs took in the progress of this eventful struggle—after they had destroyed half a million of men, including the best part of the Roman people—had humbled Rome and Italy—had shed the noblest blood, and prostrated the dignity of the republic, Sylla, an execrable monster of cruelty, tyranny and ambition, was able to triumph over virtue, liberty and justice. He seated himself quietly in the exercise of despotic power, and became perpetual dictator. Rome never saw another moment of freedom.

The Romans, in the times of Scipio, may be compared with the Greeks in the time of Themistocles, and the triumph of Greece over Persia, with that of Rome over Carthage. In both cases, the conquerors were corrupted by wealth, and inebriated by luxury. We might go further and say, that the Peloponnesian war, which succeeded the elevation of Greece, and laid the foundation of her ruin, resembled the civil wars of Rome, begun by Marius and Sylla—carried on by Cæsar and Pompey, and terminated by Augustus. But the firmness of the Roman character—the nature of their civil policy, and the immense extent of their conquests, enabled them still to be powerful, in spite of all their corruptions; and had they been otherwise, there seemed to be no nation near them who could have derived advantage from their weakness. They seem to have been raised up and endowed with universal dominion, that they might evidence to the world how far a nation can be happy, and how long she can exist without virtue or freedom.

The ambition of the demagogues as well as of the despots and tyrants of Rome, in one essential article, led them to promote the true and just policy of the empire: that was to attach the provinces as strongly as possible to the interest of Rome—to dissolve them down to one common mass—to preserve their extensive territories entire—to cement them together by various alliances, and to preserve the empire undivided. The strength of empires consists in their union. The Greeks wanting this, soon failed; and, in our own times, Poland, which ought, from her numerous advantages, to have been one of the most powerful kingdoms in the world, has exhibited a deplorable spectacle of weakness and misery, by means of her internal divisions. Our own country had well nigh been swallowed in the same gulf.

The Roman community, launched at once on such a sea of luxury, wealth, and glory, was variously affected. While all were struggling for eminence and power, it fortunately happened that the reins of government fell into strong and energetic hands. Of this description, generally speaking, were most of the first competitors, and of the triumvirates. The softening power of luxury—the sudden inundation of Grecian elegance and refinement, and the elevation of conscious greatness and empire, combined with her native gravity in forming the genius of Rome. About this period, it began to bud; soon after this was its fairest bloom and richest maturity. If the genius of Rome was of a heavier mould than that of Greece, it possessed a more commanding gravity; if it had less fire, it was more tranquil, majestic, and solemn; and more hearts will vibrate with pleasure to the plaintive and elegant notes of the Roman, than to the electric fulminations of the Grecian muse.

In the year 680 from the building of the city, the republic was freed from the tyranny of Sylla, by the death of that odious tyrant. But two men, of far more extensive views and refined ambition than either Marius or Sylla, were already prepared to run the same race. Cneus Pompey, had, by various arts, as well as by great abilities, become the most popular man in Rome, and was considered as the greatest commander in the Republic. Crassus possessed that authority and influence which great eloquence and immense wealth, combining with all the wiles of ambition, could procure him. He was the richest man in Rome. While Pompey, who warmly espoused the Marian faction, strove to gain the favor of the people by abrogating many of the tyrannical laws of Sylla, Crassus employed his amazing wealth in donations, distributions of corn among the poor, in public feasts and entertainments; and it is said that he supported, at his own private expense, the greatest part of the citizens for several months—expenditures sufficient to have exhausted the treasures of the greatest princes. In the progress of their contest for power, their animosities broke forth on every occasion, in opposition more or less direct, and by means more or less violent.

At this period, while the destinies of Rome seemed to hang in doubtful suspense, three characters appeared of very different complexions, but equally extraordinary, equally to be remembered, but with very different sensations, in posterity;—Catiline, Cicero, and Cæsar. One of these men procured for himself immortal fame by his atrocious villainy, one by his unrivalled eloquence, and one by his ambition, bravery, and good fortune. Julius Cæsar may be regarded as the greatest of the Roman commanders. In him the military genius of Rome displayed its utmost strength and perfection; but, as yet, he was not known in that group of great characters and personages, who, now inflamed with ambition, were preparing to carve and divide the world among them. Lucius Catiline is allowed by all writers to have possessed every quality of a great man but integrity and virtue; instead of which he held every principle, and practised every vice which could form a most infamous, atrocious and abandoned villain. Possessed of a body and mind equally strong and vigorous, he was bold, enterprising, and industrious. He hesitated at no cruelty to gratify his revenge—he abstained from no crime which could subserve his pleasures—he valued no labor or peril to gratify his ambition. Catiline perceiving himself not among the most favored rivals who were courting the mistress of the world, determined on getting her into his possession by violence. His end was the same as theirs, but his means were more unwarrantable. He planned and organized one of the deepest, most extensive and daring conspiracies recorded in history. The leading objects of his conspiracy were, to put out of the way by one general massacre, all who would be likely to oppose his measures—to pillage the city of Rome—to seize all public treasures, arsenals and stores to establish a despotic government—to revolutionize the whole republic, and to accomplish all these measures by an armed force.

This sanguinary plot was detected and crushed by Cicero, the great and justly celebrated orator of Rome. The accomplices of Catiline were seized and put to death; and Catiline himself, who had assembled an army of twelve thousand men, was encountered, defeated and slain. But if Rome escaped this threatening gulf, it was that she might fall into a snare, apparently less dreadful, but equally strong and conclusive as to her fate. Her days of virtue and glory were past; henceforth she was to be ruled with a rod of iron. The dissensions of Pompey and Crassus were quieted by the mediation of Cæsar, who stepped in between them, outwitted them both, and became the head of the first triumvirate. Having amicably agreed to govern in copartnership, Pompey chose Spain, Crassus chose the rich and luxurious provinces of Asia, and to Cæsar was allotted the powerful and warlike nation of Gaul, as yet unconquered. What was the result? Pompey basked for a moment in the splendors of Rome, and his fame was trumpeted by the eloquence of Cicero. Crassus was slain by the Parthians, endeavoring to enlarge his territories, and Cæsar conquered the Gauls in *a thousand battles*. Pompey could not bear an equal, nor Cæsar a superior. They were mutually jealous—they differed—they prepared for war. The Senate and nobility of Rome, and pride and strength of Italy sided with Pompey: Cæsar relies wholly on those veteran legions with whom he had subdued the fierce and martial tribes of Gaul and Germany. No civil war ever equalled this. It was a melancholy sight to see Rome given up to tyranny and blood—to see that august and venerable republic for ever abandoned to her evil genius. These were not the feeble bickerings of petty controversy; Marius and Sylla, the leaders of the former civil broils, bore little comparison with Cæsar at the head of his legions, or with the great Pompey, who could almost raise armies out of the earth by the *stamp of his foot*.

This eventful struggle was at length closed by the battle of Pharsalia, rendered truly famous by the grand object for which they fought—the greatness of the force employed on either side, and the transcendent reputation of both commanders. The Roman Empire was the prize; and both the armies and the Generals were the best the world could afford. Pompey was utterly defeated, and many of his army, won over by the magnanimous clemency and generosity of Cæsar, were content to change sides. The conduct of Pompey in this battle, which was to decide his fate, has ever been considered as strange and unaccountable. So far from displaying that courage, intrepidity, and fortitude, and those powers of command which he was supposed to possess, that, from the very first onset, he appeared like a man frightened out of his senses; he scarcely attempted to rally his men—was among the foremost that fled, and never made another effort to retrieve his cause. From facts so glaring, we are almost induced to believe that much of Pompey's greatness, as a soldier and commander, consisted in the elegant drawings of Cicero, and other partial writers. The true test of bravery, skill, and fortitude, is to see them displayed when they are most necessary—to see them shine in danger, surmount difficulty, and triumph over adversity. Yet no one can doubt that Pompey was a man of great and splendid talents: but who could equal Cæsar?—A man supereminent in the whole range of spiritual endowments. Nature seemed to scant him in nothing. Among philosophers, mathematicians, poets, and orators, he could shine. He could plan and execute—he could negotiate or fight—he could gain and improve an advantage. For seven years in his Gallic wars, his life was a continual series of fatigues and dear-bought victories: and no General, but one as great as Cæsar, could have encountered him without apprehension and dismay.

The battle of Pharsalia was fought 52 years before Christ, and 702 from the building of the city. Pompey fled an unhappy exile into Egypt, and was there miserably murdered by the command of Ptolemy. Thus the reins of government fell into the hands of Cæsar, and he was left undisputed master of the world. The clemency of Cæsar on this occasion was as illustrious as his victories had been. He entered into no measures against many persons, who, under professions of neutrality, had evidently sided with Pompey. He did nothing which bore any resemblance to the horrid proscriptions of Marius and Sylla. He endeavored, in most instances, to forget and forgive. But the reign and triumph of Julius Cæsar was short. He soon fell a sacrifice to that spirit of freedom and independence which had raised his country to her exalted rank: for though the demons of discord, ambition, and party rage, had now for a long period, aimed all their shafts at good and virtuous men—though torrents of the richest blood had flowed incessantly for many years, yet some men were still left whose constancy and virtue ever stemmed the strong current of the times. Cato and Cicero were still alive, whose stern virtues and commanding eloquence continued to remind the Romans of their better days. From the battle of Pharsalia to the death of Cæsar was eight years. During this period he went on and prospered. By a rapid series of journeys and expeditions he saw, awed and subjugated all places and all opposition. His arm pervaded, his vigilance detected, his spirit animated, his generosity won, and his power crushed in all directions. His great and active genius seemed universally to bear down all before him; but in reality not all: a plot at length was laid, as it were in his own bosom, which hurled him in a moment from the high summit whither he had climbed.

Brutus and Cassius, at the head of about sixty Senators, entered into a conspiracy to take him off by assassination. Their object was to arrest the progress of despotic power, to restore the authority of the senate, and the ancient forms of the republic; an object laudable in itself, but, alas, how far from being practicable! Their plot was deeply laid, but seems to have been carried into effect not without a wonderful concurrence of accident, or rather of providence. Whilst Cæsar was on his way to the senate house, where he was to perish, a slave, it is said, who had discovered the conspiracy, pressed forward in the crowd to apprise him of his danger, but could not get to him for the press. Another person put into his hands a paper, which would have saved him, containing an account of the conspiracy; this he handed to his secretary without breaking the seal. After he was seated in the senate house, the conspirators approached and despatched him with their daggers without resistance, and retired to the capitol, where they put themselves in a state of defence. Thus fell the first and doubtless the greatest of the Cæsars, in the 56th year of his age, and in the 8th of his sole administration. No Roman ever achieved more arduous enterprises than he. He rose to supreme power, in opposition to men of great abilities and of much greater resources than himself. Whatever standing he acquired, he maintained, and his enemies could only destroy him by treachery, under the mask of friendship. Rome did not owe to Cæsar the loss of her liberties; they were lost before he was born. He was allured to seize the dazzling prize, which to all observers, had evidently become the sport of fortune, and was liable to be grasped by him who was boldest and most lucky. Had Pompey prevailed over Cæsar, it is highly doubtful whether Rome would have experienced a happier destiny.

The fall of Cæsar seemed only to accelerate the establishment of imperial government. Octavius, the grand nephew of Cæsar, and heir, by will, to his fortunes and name, was soon at the head of a new triumvirate, viz. himself, Mark Antony, and Lepidus. This new triumvirate, proclaiming themselves the avengers of Cæsar, now hastened to make war upon the conspirators, whose army was headed by Brutus and Cassius. Had the Roman people desired their ancient liberty, which they certainly would had they understood the import of the word, or had they entertained any just notions of freedom, they now enjoyed an opportunity of regaining it: but so far from that, the triumvirate were able to excite the popular indignation against the conspirators, and in fact, gained the people over to their cause. The standard of liberty was deserted, and the wretched infatuated people were now employed in rivetting those chains which were never more to be broken. The conspirators were crushed with little trouble; and in shedding the blood of the last patriots of Rome, the sublime Cicero fell a victim to the merciless rage of Antony, and the base and cruel policy of Octavius. It soon appeared that the triumvirs had combined with no other view than as a present expedient, which was to be laid aside when occasion should offer. Accordingly Lepidus was very quickly rejected, and as he was neither a soldier nor a statesman, he had no means of redress. Antony and Octavius presently differed, and once more marshalled the forces of that mighty people under their hostile standards. Their quarrel was decided at the battle of Actium. A short time after which, Antony expired in Egypt, and left Octavius without a competitor.

In the 30th year before Christ, and 724th from the building of Rome, commenced the imperial reign of Octavius, under the titles, of Emperor and Augustus. Rome now became an empire in the more strict and proper sense of the word; and notwithstanding the degeneracy of the Roman people, it continued for several centuries to be the most powerful empire in the ancient world. The commotions and wars—the luxury and wealth—the corruptions and loss of public virtue among the Romans, did not extinguish but rather called forth and perfected their genius for literature. The sciences were assiduously cultivated, and men of learning received the warmest patronage and the amplest encouragement from those great and opulent men whose wealth was immense, and whose traffic was in states and kingdoms; indeed, many of those great men were themselves the favorites of the muses. They studied the liberal sciences and elegant arts with a diligence scarcely known in modern times. Scipio Africanus, according to the testimony of Cicero, was as eminent for mental improvement, as he was in the art of war. Cato was a man of great learning and wisdom; and those great men who composed the two triumvirates, especially the first, were highly accomplished in the liberal sciences.

When we consider that Cicero was a professional man—that for a course of years, many of the most important causes in the vast republic were ably managed by him—that he was a statesman and a great leader in the politics of his time—that he was, at times, a civil magistrate, a soldier, and a governor, and patron of provinces, we may truly be astonished at the extent and success of his studies. His voluminous writings which have come down to us, and which form the most perfect standard of classic excellence, leave us in doubt which to set foremost, whether the strength of his understanding, or the powers of his imagination—or which we shall admire most, his genius or industry. It is no partial admiration by which those writings are preserved: the united voice of all enlightened nations have declared their merit, and judged them worthy of immortality. The same may be said of the writings of Virgil, and Horace, and many others. But the approbation of men of taste and learning, in all nations has set the literary productions of the Augustan age above all panegyric. They will be read and admired so long as works of genius and taste are held in estimation. The Roman empire now appeared in its utmost splendor. Though less virtuous and happy, and probably less powerful than in former periods, yet the concentrated wealth of the world, the external pomp of so vast a monarchy, threw round her a dazzling glory which the most distant nations beheld with admiration and dread. Embassadors from remote kingdoms daily arrived to do homage, to court alliance, or solicit protection.

Augustus held the reins of government: there was no competitor—no rival. The people long fatigued with war, were very glad to enjoy peace, though under the reign of a despot. There was no Brutus nor Cassius to conspire or to assassinate. Cato was no more; and Cicero, one of the last luminaries of Rome, had been murdered, and his head and hands cut off and fixed upon the tribunal, where the thunders of his eloquence had so often struck terror to the hearts of tyrants. The spirit which animated the Romans in the days of Fabricius was gone for ever; liberty had taken her flight from the earth, or had retired to the sequestered bower of the savage, while gorgeous pride lifted her head to heaven, and trampled on innocence, equity, and law. Augustus was an artful, insidious tyrant: whilst one of the triumvirate, he had been careful to destroy all the virtuous men who had escaped the bloody proscriptions, the civil wars, and the violent commotions which were before his time. When his power was confirmed, he endeavored to fascinate the people—to lull them into security—to inebriate them with luxury—to dazzle them with his pomp and glory, and by all possible means to extinguish in them the true Roman spirit, and so to qualify and sweeten slavery itself, as to cause them to drink it down with a pleasing relish: he succeeded; for never was a people so changed in temper, habit, mode of thinking, and national character. But detraction itself cannot deny that Augustus was a General, a Statesman, and a very great man. Though void of the magnanimous spirit of Cincinnatus, Brutus, and Regulus, yet he affected to revere the character of the ancient Romans, and seemed desirous that a semblance of freedom should still mark the character of his countrymen. When he saw himself in the undisturbed possession of empire, the severities of his administration relaxed, and he held the reins of government with lenity, dignity and wisdom. Few monarchs have enjoyed a longer or more prosperous reign. His genius was less warlike than that of Julius Cæsar; yet in the course of his reign, he had various opportunities of showing himself capable of commanding armies and of directing very extensive military operations. But his greatness was of the tranquil and pacific kind, and he showed little ambition to enlarge his dominions. The reign of Augustus was active, energetic, and long. It was his boast that he found Rome built of brick, but that he left it built of marble.

The Roman empire, during a period of 210 years from the accession of Augustus to that of Commodus, contained the middle and southern parts of Europe, the northern parts of Africa, and the western parts of Asia. In the directions and advice of Augustus to his successor, it was warmly recommended that the empire should not be enlarged: accordingly, the weak and effeminate Emperors had no inclination nor ability to do it, and the valiant and warlike generally found business enough in defending what they already had; while the wise and prudent were sensibly impressed with the propriety of the advice of Augustus. The empire was, indeed, of vast extent; and if we cast our eyes upon a map, we shall directly see that it comprehended, as an elegant historian remarks, "the fairest part of the earth, and the most civilized portion of mankind." During this period, however, very considerable additions were made to the empire, and we believe, more or less in the three quarters of the globe. In Europe, the Gallic and German provinces were enlarged, the island of Great Britain was subdued, and several large countries on this side and beyond the Danube, as Illyrium, Dacia, Pannonia, &c. The Emperor Trajan, in order to prosecute the war with the Dacians, erected a stupendous bridge across the Danube; the ruins of which remain to this day, and afford a sublime specimen of ancient architecture.

The cruelty, depravity, folly, and enormous vices of the Emperors generally form a striking feature in this period. They seem to have been utterly lost to all sense of justice, honor or duty. Had they followed the examples of Julius or Augustus Cæsar, the Romans would scarcely have had reason to regret the establishment of a form of government which rescued them from deplorable wars and wasting revolutions, urged on by the rage of various powerful parties succeeding one another. Indeed, it is surprising that the illustrious examples of those great men should be deserted immediately, and so soon forgotten; and it can be accounted for in no other way than by supposing that the reins of government fell into the weakest and vilest of hands. When we consider the advantages the first Emperors of Rome possessed, it can scarcely be doubted that many of them were the lowest, the most detestable and abandoned villains that ever swayed a sceptre. The Kings of the Ottoman Turks, though barbarous and bloody tyrants, were almost without a stain in comparison with those "harpyfooted furies." The Henrys and Edwards of England; the Louises of France; the Gothic, and Chinese monarchs were sages, philosophers, philanthropists, and saints, in comparison with them; nor can we read the history of Rome without wondering how it was possible for that once powerful and magnanimous people to be so sunk and depraved as to endure the tyranny of such monsters, instead of hurling them with indignant scorn from the throne which they so deeply disgraced.

If the fate of Poland, in our own times, stands as a beacon exhibiting a dreadful testimony to the nations of the earth of the effects of bad government; we may certainly derive a still stronger testimony from this period of the Roman history. The wars of Marius and Sylla, of Cæsar and Pompey, and of Augustus and Antony, had demonstrated the power of individuals to enslave the State. Those wars had almost exterminated the ancient Romans—they had extinguished almost all the great and eminent families, and quite all the great men who dared to speak and act like Romans. At the same time an immense multitude of foreigners from all parts of the world poured into Rome; and the army, which always governed Rome, was composed of a mercenary rapacious crew, as void of public spirit as of all sense of justice and honor. An empire governed by a Prince as profligate and abandoned as weak and ignorant, and who was merely the tool of a mutinous, ill-disciplined, and vicious soldiery, must certainly experience the worst of governments; and must feel their worst effects: accordingly, the lustre of Rome faded—her power decayed—her virtue and happiness were for ever lost, and she was abandoned to every evil and calamity.

From various internal causes, the strength of the Roman empire declined greatly during the two first centuries of the Christian Era; she was not only absolutely but comparatively weaker. Many of the Asiatic provinces seemed only to observe a nominal subjection; and the Parthians, especially in that quarter, gained strength, rose and triumphed, and set Rome at defiance. The nations of Gaul and Germany grew strong, and often showed signs of revolt, and even indications that they were one day to trample upon the ashes of their conquerors.

The Romans soon gave melancholy proofs of the decay of learning, as well as of civility and politeness. We have spoken of the deplorable fate of Cicero. Augustus, under the infamous pretence of appeasing the resentment of Mark Antony, had murdered and mangled the great man. The crafty tyrant well knew how necessary it was for him to silence that eloquence which must have shaken his throne, and to exterminate that virtue which must have thrown continual embarrassments in the way of his ambitious schemes. Mæcenas, the great friend of Virgil and Horace, still lived; but he only lived as a flatterer, to form new modes of adulation, and to act the cringing parasite. In the course of the reign of the twelve Cæsars, the Roman horizon, which had been once illuminated with one immense constellation of poets, orators, philosophers, statesmen, heroes, and sages, was left in dreary darkness. And if we descend to the reign of Commodus, we shall see few lights on that once splendid horizon, but such as most resembled the horrid glare of tartarean fires. Yet the names of Seneca, Lucian, Pliny, Josephus, Quintilian, Tacitus, Juvenal, Plutarch, Justin, and Galen, were scattered down this tract of time; long after which Longinus flourished; and Marcus Aurelius, the Emperor, was a great philosopher, and an ornament of the republic of letters.

The nature and form of the Roman legion, a military establishment and grand instrument of the Roman power, by which Rome conquered and governed the world had been improved through every period of the republic, and greatly so by Julius Cæsar, as well as by some of his successors. The main strength of the legion consisted in a body of infantry, divided into ten cohorts and fifty-five companies, which companies were more or less full. Each cohort was commanded by a Prefect or Tribune, and each company by a Centurion. The first cohort, which always claimed the post of honor and carried the eagle, contained 1,105 soldiers, the most approved for bravery and fidelity. The remaining cohorts consisted each of 555; and the infantry of a legion, in its most improved state, amounted to 6,100 men. Their arms, which were uniform, consisted of a helmet with a lofty crest, a breastplate or coat of mail, greaves on their legs, and on their left arm a concave buckler, of an oval form, four feet in length and two and a half in breadth. The buckler was formed of light wood, covered with bull's hide and strengthened with plates of brass. The *pilum*, a long and heavy spear, was the most effective of the Roman weapons. With this they usually conquered. It was about six feet long, and terminated in a triangular point of steel eighteen inches in length. This dreadful javelin, when "launched from the vigor of a Roman arm," often pierced helmets, breast plates, and bucklers; nor was there any cavalry that chose to venture within its reach. When the pilum was thrown, which was commonly within the distance of ten or even six yards, the soldier drew his sword and closed with the enemy. The sword was a two-edged, short, well-tempered blade, fitted to strike or push, the latter of which the Romans were instructed to prefer.

The legion, in battle array, stood eight deep, preserving the distance of three feet between both the ranks and files; so that each one had a sufficient space to move and wield his arms in; and this loose order gave great celerity to their movements. It is remarked, perhaps justly, by Mr. Gibbon, that the strength of the phalanx was unable to contend with the activity of the legion. But could the phalanx of Alexander have contended with the legion of Julius Cæsar, each under the eye and animated by the spirit of those great commanders, a different conclusion perhaps might be drawn. A body of cavalry, consisting of ten troops or squadrons, was an essential appendage of each legion. The first troop of horse was the companion of the first cohort and consisted of 132 men. The other nine consisted each of 66 men, and were attached to the remaining nine cohorts. The cavalry of a complete legion amounted to 726 men. Their defensive arms were, a helmet, a very oblong shield, light boots, and a coat of mail. Their effective weapons were a javelin and a long broadsword. Thus the regular infantry and cavalry of a legion amounted to 6,826 men; besides which, several light armed troops, called auxiliaries, where attached to it, which, together with all the various attendants for baggage, &c, swelled each legion to upwards of 12,000 men. To every legion were assigned ten engines of the larger size, and fifty-five of the smaller, for throwing large stones and heavy darts. The force of these engines was such as to produce astonishing effects on walls and towers, and they are thought by some writers of note to have been little inferior in utility to cannon. The camp of two complete legions usually occupied an exact square of nearly 700 yards on each side. This spot was levelled by the pioneers, and the tents were then pitched in the form of regular, broad streets—the prætorium or General's quarters in the center. The whole square was then surrounded by a rampart 12 feet high, compactly formed of wood and earth, and also inclosed by a ditch 12 feet broad and deep. When this camp was to be left, it is incredible how soon the legions would be in motion. Their tents being struck and packed, each legionary loaded himself with his arms, kitchen furniture and provisions, sometimes for many days; and, with this weight, which says Mr. Gibbon, would oppress the delicacy of a modern soldier, they would march, by a regular step, 20 miles in six hours.

The military discipline of the Romans was exceedingly strict. They were accustomed to various athletic exercises; and their armor in running and leaping, was scarcely considered as an incumbrance. Such were some of the military arrangements of the Romans; and, in order to form some idea of their armed force, it may be observed, that the peace establishment of Adrian and his successors consisted of thirty of these formidable legions, which were usually stationed on the banks of large rivers, and along the frontiers of their extensive dominions. The author just cited says, that under the Emperors, the legions were more or less permanently stationed, as follows, viz. *three* legions in Britain—*sixteen* on the Rhine and Danube, where it was early discovered that most force was necessary—*eight* on the Euphrates—and in Egypt, Africa, and Spain, a single legion was sufficient for each. Besides all these, a powerful armed force was always stationed in Italy, to watch over the safety of the capital, and of the Emperor. These were called city cohorts and prætorian guards; and we shall see hereafter, that these troops were principally instrumental in the ruin of the empire.

From the fall of the Roman empire, a period of darkness ensued, equally dreadful for its length and for the number and greatness of its calamities upon mankind. To trace the history of those times, is like making a progress through chaos, amidst upper, nether, and surrounding darkness. We will first notice the fortunes of Constantinople, commonly called the Eastern, and in late periods of history, the Greek empire. The successors of Constantine, whom, in this article, it will be impossible for us even to name, were more fortunate in the east than in the west. The numberless swarms of barbarians, which, in these times, poured down from the north of Europe, generally directed their course more westwardly and inundated France, Spain, Italy, and even Africa. The empire of Constantinople was various in its extent; sometimes its territories were very extensive, and at others were limited almost to the city walls. But this city was destined to enjoy a great and almost peculiar felicity. It stood unrifled and unimpaired through all the storms and revolutions of the dark ages. It was never taken by the barbarians of the north, nor of the east. It was even fortunate enough to escape the rage of civil war, and to survive for many ages to triumph over the vices of its degenerate inhabitants; till, at length, it was taken by Mahomet II., Emperor of the Turks, in the year 1453,—977 years after the conquest of Rome by the Goths. During this long period, the reader will find few things in the history of Constantinople worthy of very particular notice. That empire neither abounded in heroes, philosophers, poets, orators, nor historians. Yet the preservation of that one city to so late a period, was certainly an importan link in the chain of events which restored the arts and sciences. The writers of the Middle Ages, and especially the Crusaders, speak in the highest terms of the greatness and splendor of Constantinople. Her final subjugation to the Turks appears to have been a just judgment of Providence upon her, since, though bearing the Christian name, she almost uniformly carried a hostile front to all Christian powers—made more wars upon them, and exercised more animosity towards them, than she did towards Pagans and Mahometans. If we except Constantinople, the whole of Europe, from the fall of Rome to the establishment of Charlemagne, resembled a troubled ocean. The most splendid cities, the most populous countries, and the most delightful regions of the earth, were harassed and overwhelmed with ruin and desolation. We naturally first turn our eyes toward Italy, whose wretched inhabitants were the severest sufferers of all. The historians of those times say that their sufferings exceeded all conception—that neither pens nor pencils can describe the barbarity, the rage, and the violence of their savage conquerors. All their effects were converted into plunder; their men of every age and character were put to the sword or dragged into slavery; their women subjected to the most brutal violence, and their cities and villages wrapped in flames.

We can give the reader no juster idea of the miseries of Rome, than by noticing to him, that during this period, that devoted city was besieged and taken by storm five times in the space of twenty years. Those northern invaders, after having conquered and in a measure destroyed the unwarlike inhabitants of the Roman provinces, fell with a fury upon one another, and several gloomy centuries were wasted away in the horrors of the most bloody and desolating war. The Mediterranean Sea did not secure the northern shores of Africa from those terrible invasions. An immense horde of Vandals found their way thither and settled in those fruitful countries. But their settlement, so far from taking a regular, consistent and pacific form, remained a perpetual scourge, and accomplished the utter ruin of those once opulent regions. Mankind in those unhappy times, seemed utterly lost to all mental improvement as well as to all sense of humanity. For several ages the whole human race scarcely produced one ornament, or could boast of one illustrious character to illumine the universal gloom, or to cast a partial beam of light through the intellectual chaos; so far from it, that those days were spent in destroying the noblest works of art and genius. A diligent search was made for the most valuable productions of antiquity, not to preserve and treasure up, but to demolish, to burn, and to destroy. Nor did barbarians alone pursue the work of destruction; the superstitions of the apostate Christian Church, in too many instances, lent their aid to that infernal work. In this cursory survey, it would be impossible to notice the slight shades of difference in the situation of the numerous provinces of the Roman empire. And as these times produced no historians, it would be arrogance to attempt to tell the reader what was going on,generally speaking,in the eastern parts of the world. We could say little more than that the empire of China stood firm in its strength, having already flourished for many ages. India and Persia have been subject to changes, divisions and revolutions from time immemorial—especially the former; and the Greek writers are, perhaps, the only historians who ever wrote correctly the Persian history. It was but partially known before, and has been far less so, since the Augustan age. The north of Europe was only known by the incredible swarms of barbarians which issued from it, and overwhelmed the civilized world. Of the history of Arabia we shall soon have occasion to speak; and concerning the immense interior of Asia, commonly called Tartary, the best of modern geographers are yet almost wholly ignorant, as also of the middle regions of Africa. The Island of Great Britain has been known in history since the time of its conquest by Julius Cæsar. The Britons made a formidable resistance to his arms, and were never but partially conquered. When the Roman empire fell, that island shared in the general calamities. The British called over to their aid the Saxons, a nation from Germany, to assist them against the fury of the Picts and Scots, by whom they were invaded. The Saxons, led by Hengist and Horsa,two powerful chieftains readily obeyed the call, and, according to the fashion of the age, came over in such numbers, as not only to repel the Picts and Scots,but to conquer and enslave the Britons themselves. They therefore settled in the southern part of the island, and at length erected themselves into seven petty but independent kingdoms, commonly called the Saxon heptarchy. These were at length united into one government by Egbert, who, about the year 800, reigned over them all and founded the English monarchy. This brings the English history to the close of the period which was to be the subject of the present article. Arabia forms the southwest corner of Asia. It is a tract of country considerably more than a thousand miles square, and is peninsulated by the Persian Gulf on the east, and the Red Sea on the west of it. This great country is supposed to have been peopled originally by the family of Ishmael the son of Abraham. Of Ishmael it was foretold, that he should be an archer,and that his hand should be against every man, and every man's hand against him. This prediction seems to have been fully accomplished in his posterity. The Arabs have ever been excellent horsemen and archers, formidable with the bow and the lance,and they have been wild men, and have dwelt in the desert. A singular circumstance in their history is, that they have never been conquered or subjugated by any nation, although it has been attempted successively by the Chaldeans, the Persians, the Romans, and in late ages, by the Turks. In the beginning of the seventh century,a fire broke out in Arabia,which for a while, threatened to involve in its flames all Europe and Asia. It is remarked by an able historian, as a wonderful synchronism, that the very same year in which the Roman pontiff was proclaimed universal bishop, Mahomet, the grand impostor, forged the Alcoran in a cave of Mecca. The usurpations of the Romish church were complete—the beast was at its full growth, and was then ready to begin his reign. It would thence seem probable, that the beast and the false prophet began and will end their career nearly together.

It is a matter of doubt, whether the great exploits and astonishing elevation of some men, are to be set down to the account of their extraordinary natural endowments, or to a favorable coincidence of events in the world around them. Mahomet, from an obscure parentage, birth and education,rose to a height, and with a rapidity, almost without a parallel. From the occupation of a tradesman he retired to a cave in Mecca, where he pretended he had frequent interviews with an angel, by whose assistance and direction he wrote the Koran on the plate bones of camels. He at length issued from the cave, and began to publish his mission to the people of Mecca. A storm was soon raised against him there, and he fled from Mecca to Medina, in Arabia. This flight the Mahometans call the *hegira*, and regard it as their grand epoch, as we do the birth of Christ. The followers of Mahomet soon became numerous—he subdued or rather revolutionized his native country, and, in a short time, all the neighboring countries. His religion spread with his arms, and was embraced wherever he conquered.

The Saracens, as Mahomet's followers were called, after his death still pursued their conquests; and, in a very short time, all the west of Asia, the north of Africa, and the south of Europe were overrun by this dreadful inundation; which, if possible, was more sanguinary and exterminating than that of the Goths and Vandals. A final stop however, was put to the progress of the Saracens in Europe by Charles Martel, who defeated them with great slaughter near the Pyrenees killing, it is said 370,000 of them in one day. This battle was fought in the year 734.

Mahomet declared himself to be the prophet of God, sent into the world to enlighten and reform mankind; and that he was clothed with greater light and powers than either Moses or Christ. His doctrines and morality were drawn from such sources as would best suit the prejudices, and obtain currency among the nations whom he conquered. They were extracted from the Jewish and Christian Scriptures—from oriental traditions—from the legendary trash of the rabbies, and indeed, from the inventive genius of Mahomet himself, whose knowledge of mankind enabled him to foresee how they might easiest be led and governed. He taught the unity of God, and the universality of his providence, or rather, in the strictest sense, the doctrines of the fatalist.

His scheme of morality allowed the full indulgence of the passions, being exactly suited to the most depraved mind; and he so managed the affairs of a future state, that they could have no influence in favor of virtue or in opposition to vice.

It was not without reason, that he relied on the natural disposition of men for the ultimate success of his doctrines, but his main arguments, for their propagation, were fire and sword.

The kingdoms of Europe in general, as to their extent and boundaries, seem to have been parcelled out by accident, or more properly by nature. Spain is marked out by oceans and mountains—France by oceans, mountains, and rivers—Germany and Italy in like manner. As early as the period under consideration, some remote vestages may be discovered of the present European establishments. Early in the sixth century, Clovis laid the foundation of the French monarchy; at which time the rage of emigration by nations had generally subsided, either because the wilds of Europe had poured forth all their daring spirits, or because a general repletion of the southern provinces had rendered a kind of reflux necessary. No part of Europe had oftener been traversed and ransacked than France; but as they found less plunder there, they generally pushed forward to other countries. The Franks at length made a settlement there, after having driven out and destroyed several Gothic nations, who had previously dispossessed the Romans and ancient Gauls. From the Franks the country is supposed to have obtained the name of France. The Franks, after maintaining long and bloody wars with subsequent invaders for several ages, at length found themselves united by a more regular form of government under Clovis, who is reckoned the founder of the first dynasty of French monarchs.

During the period now before us, the face of Europe was changed,as we have already stated, by the Gothic and Saracen eruptions. The first care of these barbarous invaders was to destroy and forever to obliterate the inhabitants, the institutions, the manners and customs of the countries which they subdued. A far more difficult task than this was to maintain their acquisitions against subsequent invaders: for the north of Europe, like an immense storehouse of nations, poured forth innumerable hordes, in rapid succession. These were equally hostile to each other, and knew nothing but to make war—to kill and ravage wherever they came. Whether it was owing, however, to the softening influence of mild climates, combined with the scattered rays of science, humanity, and order which had escaped the overwhelming flood of darkness; or whether to the imperceptible influence of various unknown causes upon individuals—the people in the south and west of Europe, instead of sinking into a savage state, began, in the sixth century, to assume a regular form of government, which, though bad in itself, yet, under the influence of a natural course of causes ultimately led on to the present state of Europe. The northern barbarians entertained a high sense of freedom, and each of them considered himself as entitled to a liberal share of whatever his tribe should conquer. Each great chieftain, therefore, granted out and divided the conquered lands to the high officers next himself, and they subdivided the same among their followers or vassals; under this express condition, that each man should do military service a certain part of his time to his immediate lord, and that each lord or great vassal of the court should also do military service to the Grand Chieftain or King. This division of property which prevailed in every part of Europe, was grounded wholly on military policy: it became, in fact, the only organized system of defense for several centuries, and has obtained the name of the *feudal system*. This system of property, government, and war, although it must be regarded as a happy change from a direful plunge of the human species into anarchy, and all the degradations of a savage state, yet was radically defective and certainly conduced to protract the ages of darkness. Still, however, it left room for the slow operation of causes which would naturally correct, improve, and elevate the human mind; and which would at length originate other causes, far more efficient and rapid in rending the veil of darkness, and once more ushering the nations into the light of science and civility. Those who would see this subject handled with great elegance and perspicuity, may find it in the first volume of Dr. Robertson's History of Charles V. We shall here only observe that the exorbitant power of the middle order was the grand defect of the feudal system. The great lords held the power of life and death over their own subjects; and also the right of making war in their own defense. Of course, if with such an extent of prerogative, they confederated, they always outweighed the King—if they were at war with each other, which was often the case, the King had no control over them, because it was impossible for him to raise or command an army without their assistance. On the one hand, therefore, the hands of the monarch were tied; and, the other, the lowest order were little better than abject slaves to their immediate governors. The feudal governments were at no great remove from the very worst of oligarchies. The want of power in the prince, and the force of the nation so divided, rendering them weak against invasion. This weakness was increased by the jealousies and turbulence of the great lords, who frequently occasioned civil wars, and at length reduced them to a state of anarchy, from which they could only be recovered and re-united by union, and a strong sense of common danger.

In the midst of the fluctuating waves of war, revolution, and anarchy, the powerful genius of Charlemagne erected a new empire in Europe; which, for a moment bid fair to cut short the reign of darkness, and re-establish those institutions which improve and adorn society. His dominion comprehended the fairest parts of Europe; France, Germany and Italy. This event took place in the beginning of the ninth century. But as nothing can be more uninteresting than the sterile histories of the wars and revolutions of the dark ages, so, even what is known of the battles, the sieges, the victories, the conquests, the elevation, and the grandeur of Charlemagne, will be little more improving to the reader of history, than to tell him that Charlemagne was a soldier of fortune—that he fought bravely, and was generally victorious; in a word, that he established a huge empire, consisting of a heterogeneous mass of crude materials—incongruous, disjointed members, and which he governed for several years not by any regular plan of civil policy, which the nations were then as incapable of receiving as of organizing, but by a strong military arm, which he wielded with dexterity and success; and that, when he expired, his empire fell into pieces. In justice, however, to this great monarch, it must be noticed that he was far from resembling the fierce, cruel, and barbarous chieftains of the Goths or Saracens. Instead of deserving the title of Attila, *the scourge of God, and the terror of men*, he is justly celebrated for cultivating the arts of peace—for encouraging men of learning and wisdom, and for promoting various important civil institutions. Perhaps, but for him, Europe had still remained under the cloud of Gothic ignorance. He merits an honorable rank among those great and powerful minds, which evinced the possibility of checking the strong current of the times; and, could he have lived and reigned for a century, he might have raised Europe from her degraded state. But time, and a long series of events, could only mature those seeds of order and virtue, which under his administration began to vegetate, but which, in a manner, disappeared with him, and left the world in still palpable darkness.

During the 283 years following the reign of Commodus, and up to the extinction of the Western Empire under Augustulus, there is little else to contemplate but the most deadly disorders, the most agonizing struggles, and the deepest and most ostensible decay. But an empire containing a hundred and twenty millions of people—founded in power, wealth and policy—strengthened by every auxiliary of human greatness—triumphing over all enemies, and elevated almost beyond the reach of invasion, could only perish by the gradual progress of internal disorder. The misfortunes of Rome sprung from her own bosom, and it can scarcely be said that she had enemies, till she had formed and trained them to the arts of war. In the 180th year of the Christian era, Commodus ascended the throne. No reign was more inauspicious than his, nor is the memory of any prince more deeply covered with infamy. He formed a perfect contrast to his illustrious father, Marcus Aurelius. It would be impossible in this compend to draw a character more black, detestable and depraved than that of Commodus. A detail of his vices would occupy more space than we can allow to the whole subject of this article. We can say but little more than that, during his reign, the administration of government was totally abandoned, and the numerous props of a falling empire, which had existed a century before this, were now no more. At the seat of government there was nothing but luxury, riot and murder. In the provinces, extreme disorder, rapacity, misery and revolt prevailed. On the frontiers, the burning of cities and the blood of thousands marked the footsteps of invasion. In Italy, disaffection, conspiracy, jealousy, terror, detestation, revenge, fury and despair, surrounded the throne—filled the capital—inspired every heart, and painted destruction on every face. In the army there was licentiousness, outrage, mutiny and desertion. The soldiers, in multitudes, forsook their standards, and in numberless and fierce banditti, infested the highways. The redress of wrongs and the recovery of rights expired with civil justice; and while the empire felt those strong but vain struggles, which were occasioned by the reaction of her natural force, her union, power, and military reputation vanished, and left her an immense chaos of discordant principles. An illustrious parentage gave high expectations of Commodus, but his conduct soon banished all hopes. He exhibited cruelties at which even Nero would have shuddered, and he was even more effeminate than Sardanapalus. It seems a pity, for the honor of humanity, that the name of so infamous a monster should have been preserved. His feeble and licentious reign produced calamities to his country, after his vices had destroyed him, and he was no more. He was no sooner taken off by a conspiracy, conducted by his favorite mistress, than the choice of the army and senate clothed with the imperial purple, Helvetius Pertinax. He was above 60 years of age had served under the illustrious Antonines—and was always noted equally for bravery and wisdom. He had risen from a private soldier, through all the grades of military honor to that of prætorian prefect. With modesty and reluctance he assumed the diadem, which he was destined to wear and to grace only long enough to demonstrate his merit, and to enroll his name amongst the most excellent of the Roman Emperors.

If the degenerate Romans discovered their mistake, in elevating to the throne a man whose administration was utterly repugnant to their wishes, he much sooner discovered his, in thinking it possible to renovate the empire, now going rapidly into an irrecoverable decline. The Roman armies, which under the Scipios had subdued Africa and Asia—which under Cæsar had extended the empire beyond the Danube, and which under Trajan had conquered beyond the Euphrates, were now the scorn and ridicule of the barbarians. Through a total want of discipline, all subordination was lost—all military spirit; nothing remained but discord, sedition and outrage. Pertinax commenced an administration vigorous, systematic and comprehensive. The empire, through her wide regions felt his power, and saw and revered the equity that marked all his movements. It was soon perceived that Pertinax would aim to suppress those irregularities and restore the discipline of the army to its ancient severity—that he would revive the institutions of civil justice, and retrieve the fallen dignity of the Roman name. But alas! his noble intentions and excellent schemes could not be effectuated by mortal prowess; the nation was too far gone—too deeply sunk in vice and luxury. The palace, the court, and the capital were filled and surrounded with a swarm of execrable villains, whom the vices of Commodus had rendered necessary—whom his weakness had emboldened, and the corruption of the times had furnished in abundance. His first care was to displace these—to exalt men to power who were worthy to rule, and to restrain and punish the insolence of the prætorian guards.

He had just entered on this salutary but arduous work, when he was informed, one day, that a mutiny was raising in the army. He had only time to walk to the gate of his palace, when he perceived a large body of soldiers rapidly advancing with angry clamors and menacing imprecations. As they drew near, he stood his ground and with a firm dignity demanded their business. Without making any reply, a Scythian soldier struck him dead at a blow. His head was severed from his body and carried on a pole to the camp; where immediately after the empire was offered at public sale to the highest bidder. It was bid off by a sordid wretch, who assumed the purple, but who, in a few days, suffered all the severities of the fate of Pertinax, without any of the pity and regret which will follow the memory of that great man to the latest posterity. It is a matter of regret that so little is known of Pertinax, that so few circumstances have escaped oblivion, which would more clearly elucidate his private character; and especially, that so short a time was allowed him for displaying the energy of command, the wisdom of legislation, and the greatness of man. Historians, however, unite in allowing him to rank with the most worthy men who ever governed Rome. His energy was guided by justice—his authority was tempered with sweetness, and all his supereminent qualities combined to form a character truly great and amiable. Were it safe, however at this distance of time, one might conjecture that he was too severe and hasty in his first essays of reformation. Had he, by some politic and impenetrable movement contrived to separate and remove to a distance his licentious soldiery, till he could have levied and disciplined an army to his mind, perhaps he might have enjoyed a longer and more fortunate reign. But what power can renovate a nation totally effeminate and corrupt! Pertinax, by his abilities and address, ascended from the lowest to the highest rank among men. His reverses were so numerous, great and sudden, that historians have given him the peculiar appellation of the *tennis ball of fortune.*

From the death of Pertinax till that of Augustulus, the last of the Roman Emperors of the West, was 282 years, during which time no less than fifty-six Emperors swayed the sceptre in succession. Their names it is not necessary to record; and for an account of their vices (for little more is recorded of them), the reader must be referred to the history of the decline of the Roman empire; on which part of history, Gibbon is the ablest and most elegant writer in our language. The artful and insidious endeavors of that writer to subvert Christianity, and to substitute, no one knows what, in its place, are obvious to every reader; yet his merit as a writer cannot be questioned; and although his opposition to Christianity betrayed him into many gross absurdities suited to the complexion of his prejudices, yet his history of the decline and fall of the Roman empire is one of the noblest of historical productions. So much has been already said concerning the decline of the Roman empire that the reader may be surprised when he understands that it stood upwards of two centuries after this period. But that empire could only die a lingering death. West of it lay the Atlantic Ocean, south lay Africa, which, since the fall of Carthage, was without power, east lay Asia, dissolved in luxury, always ready to be conquered, as soon as attacked, and enslaved as soon as invaded; and so far from subduing Rome that they were even too effeminate to maintain a form of government over themselves.

The barbarous nations which lay north of the empire were indeed numerous and warlike; but they could not subdue the Romans, till they had learned of them the art of war. And the power of Rome, under the Emperors, lay chiefly in the nothern provinces, where it was most needed. As we have already said, sixteen or twenty legions generally lay bordering on the Rhine and Danube. The barbarians, in these times, were generally poorly clothed and fed, and had few arms, as well as little knowledge of the art of war. Their invasions were like those of a hungry lion, whom fierce appetite impels to rush on the point of the spear, in order to seize its prey; and their chief difficulty was want of union. Their tribes were composed of warlike, fierce, impetuous spirits; but they were unsettled, barbarous, roving, independent, and jealous of the power of their chiefs, as well as tenacious of the honor of their tribes. Yet the nations composing the northern hive could not but experience a gradual improvement. Their proximity to a great and enlightened people, with whom they were at perpetual war—their strength of body—their intellectual vigor, and their ambition to acquire those arts which had so long rendered the Romans invincible, must, in time, have produced their natural and unavoidable effects. In the barbarian armies and countries there must have been a multitude of Romans; numbers having fled from justice, or induced to rove, from disgust at their own capricious and tyrannical government, would naturally seek an asylum in the wilds of Europe, and among a more free and equitable people. Numbers being detained there would, at length yield to necessity, and voluntarily remain in a land, whither they had been dragged as captives, assimilating by degrees to its customs and habits.

The Gauls and Germans, from the period now before us, composed the strength of the Roman armies; and great numbers of these nations, whom we shall indiscriminately call the Goths, and Vandals, and Huns, were now admitted into the Roman service, either as legionaries or auxiliaries. Some of them were promoted to the highest stations, both civil and military, and even wore the imperial diadem and purple. Many of these, either never had, or else lost all attachment to Rome; and rejoining their countrymen, carried and diffused among them the arts of war, and advantages of disciplined valor. From the reign of Commodus to the extinction of the Western Empire, history presents one uniform scene of disorder, vice and misery. We have almost constantly before our eyes, a great empire going rapidly to destruction under the influence of bad government. A very few of the Emperors, however, during this dreary period, were both able statesmen and commanders. Had it been their fortune to have reigned in happier times, and over a more virtuous people, their administrations would have done more important service to mankind. But their best measures and greatest exertions, seemed only to have the effect of medicines given to the sick after his disease has become incurable; they might a little procrastinate, but could not prevent the moment of dissolution. About the year of Christ 267, the Emperor Valerian was taken prisoner by the Persians, when no less than thirty persons in various parts of the empire assumed the imperial purple, with the titles of Cæsar and Augustus; and each of them endeavored to support his claims and titles by the sword. There can be no stronger proof than this of the extreme wretchedness of those times. All was tumult, war, distrust, cruelty and the most bloody revolutions. But there are two circumstances in the period of history now before us, which merit the particular attention of the reader, viz. the establishment of the Christian Religion throughout the empire, by means of the conversion of the Emperor Constantine, surnamed the Great; and his removal of the seat of government from Rome to the ancient city of Byzantium, which he rebuilt and called Constantinople, or the *City of Constantine.* We have already noticed the rapid spread of the Christian Religion. In the days of Constantine it had penetrated almost every part of the empire. No sooner, therefore, did that prince declare in favor of it, than it became the religion of the court, the capital, and soon of the empire itself. This was truly an amazing change, and forms one of the most memorable æras in ecclesiastical history; a meek and humble religion unknown to the world, or if known, despised and persecuted, set on foot by a few obscure persons in Judea, and propagated only by the force of rational conviction, spread and prevailed against all opposition overturned the altars and silenced the oracles of the heathen; and at last, through hosts of prejudices fortified by antiquity, and sanctioned by universal custom, made its way to the throne of the Cæsars. It was like a "stone cut out of a mountain without hands, becoming a great mountain and filling the whole earth." There are various accounts given, and various opinions formed, concerning the conversion of Constantine. Whether his mind was swayed by the power of truth, or by temporal, political and interested motives, is not easy to determine. It is related and believed by some that his conversion was miraculous. They say that he saw in the heavens the sign of the cross, with this inscription in radiant letters, *By this conquer*, and that upon this he immediately embraced Christianity. His life and conduct were by no means eminent for christian virtue, nor was he wholly free from crimes of the deepest die.

From this period the Christian Church was loaded with honor, wealth and power; nor did her virtues ever sustain a severer trial. The chief dignitaries of the empire could scarcely do less than imitate their master, and Christianity soon became a necessary qualification for public office. The church now no longer appeared in her ancient simplicity and purity; lords and princes were among her converts, and she was dressed in robes of state. Her ceremonies were increased—her forms of worship were loaded with pomp and splendor—her doctrines were intermingled with the senseless jargon of a philosophy equally absurd and vain; and the way seemed prepared, not only for the decay of Christian doctrine and morality, but of every science which distinguishes civilized from savage nations. After various wars and competitions, Constantine, in the year of Christ, 320, became sole master of the Roman empire. He certainly did whatever could be done, by an accomplished General and statesman, towards restoring the empire to its ancient glory. But, alas! he did not reign over the ancient Romans. His people had been often defeated, humbled, enslaved, and trampled in the dust. The true Roman spirit was long since utterly extinguished; and, as we had occasion to observe, Italy itself was filled with a mighty heterogeneous mass of population, of no fixed character. His strong genius for a moment sustained, but could not ultimately save, the falling fabric. The ambition of Constantine gave a more fatal blow to the Roman empire than even the vices of Commodus. To secure to himself a glory equal with that of Romulus, he formed the resolution of changing the seat of empire. The place upon which he pitched as a new capital, and which should immortalize his name was indeed well chosen. The ancient city of Byzantium enjoyed the finest port in the world, on the straits of Bosphorus, which communicate with those inland seas, whose shores are formed by the most opulent and delightful countries in Europe and Asia. Thither Constantine caused the wealth of the empire to be conveyed, and directly a new and splendid city arose which was able to rival ancient Rome. That proud capital, so long the mistress of empire suddenly became but a satellite, and was forsaken by honor, wealth, and glory; since the Emperor, and all who were devoted to his interest, used every possible means to exalt the new seat of empire.

This wound was deadly and incurable. It proved fatal not only to one city, but to the western empire. Rome was utterly abandoned by Constantine, nor was it much alleviated under his successors, among whom a permanent division of the empire taking place, Rome and Italy fell under the government of a series of weak, miserable, short-lived tyrants who rose by conspiracy and fell by murder in rapid succession; till, in the 476th year of the Christian Era, Augustulus, the last of the Roman Emperors, was conquered and dethroned by Odoacer, King of the Heruli, who, at the head of an immense army of barbarians, overran all Italy, and put a period to the western empire. Thus ended Rome, after having stood 1229 years: and when we consider the length of her duration, her character, and the nature and extent of her resources, we shall not hesitate to pronounce her the most powerful and important city which ever existed, and as standing at the head of the first rank of cities. But if this remark is true of Rome in the times of which we are now speaking, it will serve to awaken our admiration, when we consider that Rome survived even this shock; and, as though destined to bear rule, from being the head of a powerful empire, she soon became the head of an ecclesiastical institution not less powerful; she spread her wings over all Europe.

Rompu.

ROMPU.— In Heraldry, a term applied to a chevron when the upper part is taken off, and remains above it in the field.

RONCONE. The name given by some authors to the *ranseur*, a kind of partizan.

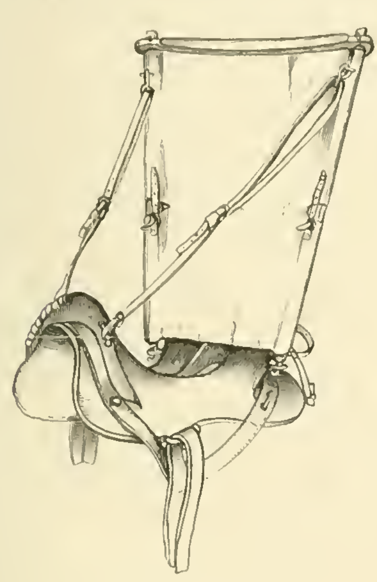
RONDACHE. In ancient warfare, a circular shield carried by foot-soldiers to protect the upper part of the person, having a slit in the upper part for seeing through, and another at the side for the point of the sword to pass through.

RONDEL. In fortification, a round tower, sometimes erected at the foot of a bastion.

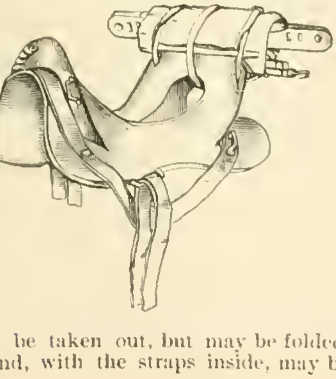
RONDELLE. A small round shield which was formerly used by light-armed infantry. It was about 1¼ feet in length. A *Rondellier* was an Archer or Pikeman who carried the *rondelle*.

RONFLEURS.— Frederick the Great applied this name to some 12-pounders of 22 calibers, weighing 32,00 pounds, which, before the battle of Leuthen, he had drawn from the neighboring fortress of Glogan. The charge for the gun was 5 pounds.

ROOKER AMBULANCE SADDLE.—An ordinary cavalry saddle, having an attachment consisting of two upright bars cut and hinged in the middle, a cross-bar at the top of the uprights to support the head, a canvas back, and two strong leather straps with buckles, so arranged as to support the apparatus



to be more or less inclined, to suit the rider. When the upright bars are placed in the canvas, they need



not again be taken out, but may be folded at the hinges, and, with the straps inside, may be rolled into a compact bundle and attached by the coat-straps to the cantle. The weight of the attachment is about 4½ pounds.

When intended to be used it may be thus adjusted: Unstrap it from the cantle and place the sick or wounded man in the saddle; insert the iron keys in the lower ends of the uprights in the eye-bolts, especially attached to the saddle for this purpose, on each side, near the base of the cantle; put on the cross-bar and key it; hook the straps to the eyelets in the upper parts of the uprights, having first buckled the lower ends of the straps into the staples in front of the pommel; then by the middle buckles elevate or depress the head, as may be required. An umbrella may be readily attached, though not an essential part of the apparatus. The form or arrangement of this contrivance is shown in the drawing. Although it possesses merit and would at times be of service, it has never been extensively used because of increasing the weight and number of articles a soldier has to carry.

ROPE.— Ropes are generally made of vegetable fibres, and differ only from twine in their much greater thickness. The fibre most commonly used is hemp; but large quantities of plantain fibre, called manila hemp, made from the leaf-stalks of *musa textilis*, are also employed, especially for the large ropes used for various purposes on board ships. Ropes consist of many thicknesses of yarn, which is spun by hand in various places called rope-walks. The spinner has a large bundle of the fibre loosely gathered around his waist, from which he pulls out a few fibres, and attaches them to a hook in the turning-wheel or whirl, which is stationary, and is worked by an assistant. Experience teaches him what number of fibres to draw out, and how to twist them so as to hold firmly on to the hook. He then walks slowly backward down the rope-ground, gradually drawing out or regulating the pulling out of the fibres so as to make an equal yarn, which receives the necessary twist from the whirl. When he has got to the end of tbe walk, another spinner takes the yarn from the hook of the whirl, and fixes it to a reel, which is then set in motion, and he attaches a second portion of hemp from his own supply to the hook, and proceeds down the walk as the previous one had done. In the meantime, the first spinner gradually walks up the ground, carefully guiding his length of yarn as it is wound on the reel. When he reaches the reel it stops, and he waits until the second spinner's length is completed. He then in his turn takes it off the hook, and twists it on to his own; and the reel being again started, receives the additional length from the second man, and so on until the full length required is made up. The next operation is called *warping*, and consists in stretching out the number of yarns required for a rope. These are all slightly twisted again separately, and stretched to an equal length. Then, if they are intended for tarred ropes, each yarn is drawn separately, either lengthwise or in a hank, through a kettle of hot tar. The superfluous tar is removed by drawing it through a hole lined with oakum. In the next process, called *laying*, two or more yarns are attached to hooks on a whirl, so that when it is turned they will be twisted together the contrary way of the original twist they received in the first spinning. When this is done it is called a strand. Then as many of these strands as are required for the rope are stretched at full length, and are attached at each end to whirls. One of the whirls has but one hook, to which all the strands are attached; the other has as many hooks as there are strands, one always being central, and a strand is attached to it. The whirls are then put in motion, but in opposite directions, and this causes the outer strands to be laid with great regularity and firmness around the central one. Such is the ordinary process of rope-making; but machines have been invented which produce ropes with such mathematical precision that the strength of the rope may be calculated with great exactness. Captain Huddart has the merit of effecting these improvements; and very few applications of mechanism are more beautiful in their details than those which he has worked out. They, however, do not alter the principle of the manufacture. Within the last few years a great improvement has been patented by Mr. Edward Sang of Edinburgh, and is now in profitable use in the large establishment of the Edinburgh and Leith Ropery Company. It consists of a machine which spins the yarn from material supplied as before by hand, but it does away with the long walk, and can be used in a small room.

Large ropes are either what is called *cable-laid* or *hawser-laid*. The former consists of three large strands, each made up of three smaller strands. A cable-laid rope of eight inches circumference is made up in this way of nine strands, each containing 37 original yarns, or altogether 333 yarns. A hawser-laid rope consists of only three strands, each containing a sufficient number of yarns to make up the required thickness. The numerous lives and the vast property depending on the efficiency of the ropes employed in shipping have caused a great amount of ingenuity and care to be brought to bear on the manufacture. One very great improvement of modern times has been the introduction of wire ropes, which are now extensively used in rigging ships, and for other purposes. They are generally made of iron wire, sometimes but not always galvanized. The twisting is effected in the same way as that in which the strands of a hempen rope are laid together.

The following table shows the weight which manila rope in daily use will sustain, simply and when rove in tackles. Hemp rope is about one-third stronger. Due allowance has been made for loss of strength by wear and tear. Look for the weight to be raised, or the next larger, in the column headed with the number of sheaves in the purchase of tackle. The circumference of the rope required will be found on the same line in the left-hand column.

Circumference in Inches.	Single.	Number of Sheaves in Purchase.

To ascertain the strain in pounds which a rope will bear without breaking, *multiply the square of the circumference by the tabular number*.

Description	Circumference.	White.		Tarred.	
		3-strand	4-strand	3-strand	4-strand
	Inches.				
Hemp......	2.5 to 6	1140	1330	850	1000
	6 to 8	1090	1260	825	940
Manila.....	2.5 to 6	810	950	....	....
	6 to 12	760	835	....	....

For ropes in *daily* use, the unit should be diminished *one-third* to meet the reduction in strength by wear and exposure. A safe general rule for all ropes is this: One-fourth the square of the circumference gives the breaking weight in tons of 2000 lbs. When using tackles, multiply the weight thus found by one-half the number of sheaves in the blocks. *Straps* are applied by passing them around the object, putting one bight through the other, and hooking to this; or, after putting it through, winding all the strap around the rope or spar, and hooking to both bights.

Ropes should be placed in the upper stories of buildings, coiled up and labeled; large ropes on skids, allowing free circulation of air; small ropes hung up to the joists, on pins or hooks. Ropes should not be coiled until perfectly dry; they should be uncoiled every year, and stretched out for several days in the dry season. Ropes long in store lose their strength. See *Blocks*, *Cordag*, and *Tackles*.

ROSARD SYSTEM OF FORTIFICATION.—In this system, the bastions and ravelins are retrenched, and the flanks are formed of good casemates, which secure the defense of the main ditch. The tenaillons and counter-guards, however, do not sufficiently cover the bastion and ravelin. The first covered-way has retrenched places of arms, and the second is defended by lunettes, which communicate with the place by means of galleries. The great defect of the system is the possibility of reaching the enceinte from the covered-way of the ravelin.

ROSE.—The heraldic rose is drawn in a conventional form, as in the drawing, and never with a stalk, except when expressly directed by the words of blazon. Being sometimes argent and sometimes gules, it cannot be designated proper: but when blazoned "barbed and seeded proper," it is meant that the barbs are to be green, and the seeds gold or yellow. The rose gules was the badge of the Plantagenets of the House of Lancaster, and the rose argent of that of York. The York rose was sometimes surrounded with rays as of the sun, termed *rose en soleil*. As a mark of cadency, the rose has been used as the difference of the seventh son.

Rose.

ROSE ENGINE.—A peculiar kind of turning lathe having special chucks for the production of those patterns of curved lines called by the French *rosettes*, from the slight resemblance which they bear to a full-blown rose, and hence the term *rose-engine*. The rose-engine lathe differs from the common lathe in this, that the center of the circle in which the work revolves is not a fixed point, but is made to oscillate with a slight motion while the work is revolving upon it, the tool being all the time stationary, and hence the figure will be "out of round," as the turners call it, or will deviate from the circular figure as much and as often as the motion is given to the center.

ROSETTES.—Two small bunches of ribbons, that were attached to the loops by which the gorget of an officer was suspended on his chest.

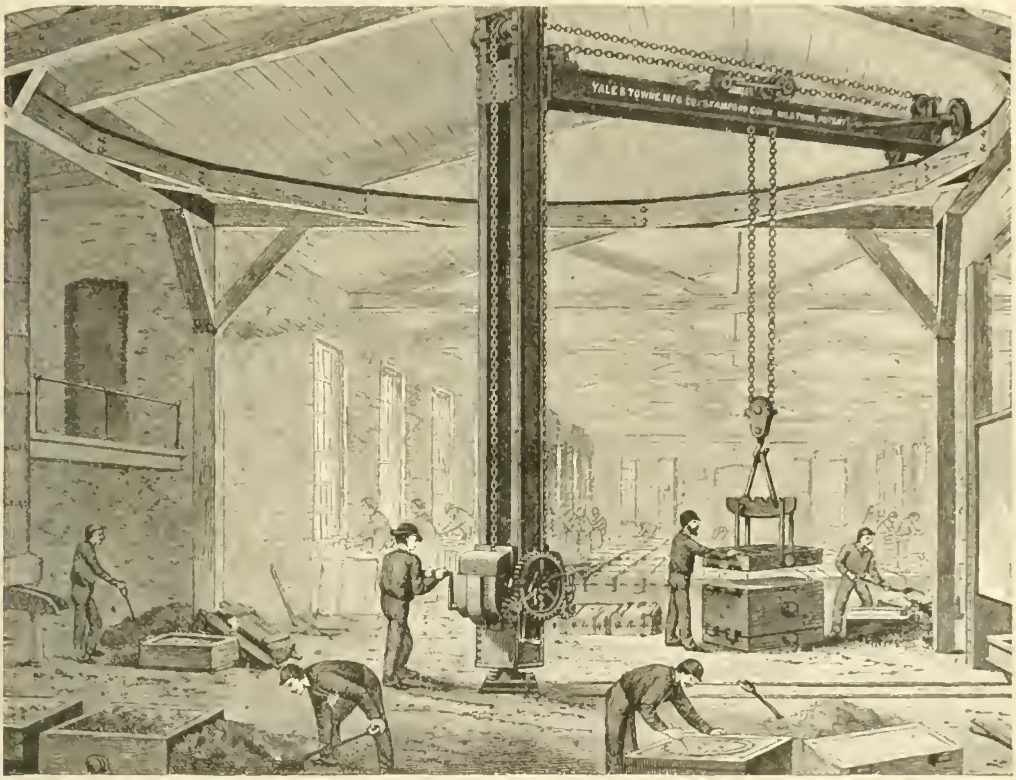
ROSIN. An exudation from trees belonging to the Coniferæ or fir tribe, and the residue left in the still, after the oil or spirit of turpentine has been distilled. It is very combustible, and is used in light-ball and carcass composition.

ROSS-SCHINDER.—A name given to foot-soldiers who were in the habit of using the *gisarme* or *glaive-gisarme* to hamstring the knights' horses.

ROSTER ROLLSTER. A fixed order preserved in military departments as the rotation in which individuals, companies, or larger bodies are called on to serve. In England, regiments proceed on foreign service according to the roster. In the United States, the following rules in regard to the roster apply to service both in garrison and in the field: All details of service should be by roster, but officers or enlisted men, when detailed, must serve whether roster be kept or not; having performed the service, they may appeal to superior authority if they deem themselves aggrieved. The duties performed by detail are of three classes: The *first class* comprises 1st, grand guards and outposts; 2d, interior guards, as of magazine, hospital, etc.; 3d, orderlies; 4th, police guards. The *second class* comprises—1st, detachments to protect laborers on military works, as field-works, communications, etc.; 2d, working parties on such works; 3d, detachments to protect fatigues. The *third class* comprises General Courts-Martial, and all fatigues, without arms, in or out of the camp. In the Cavalry, stable-guards form a separate roster, and count before fatigue.

The rosters are distinct for each class. Officers are named on them in the order of rank. The details are taken in succession in the order of the roster, beginning at the head. Lieutenants form one roster, and 1st and 2d Lieutenants are entered on it alternately. The senior 1st Lieutenant is the first on the roster; the senior 2d Lieutenant is the second, etc. The Captains form one roster, and are exempt from fatigues, except to superintend issues. A Captain commanding a battalion temporarily is exempt from detail, and duty falling to him passes. Lieutenant Colonels and Majors are on one roster. They may be detailed for duties of the first and second classes, when the importance of the guards and detachments requires it. Their roster is kept at division and brigade headquarters. In the company, sergeants, corporals, and privates form distinct rosters. Officers, non-commissioned officers, and soldiers take duties of the first class in the order stated, viz, the first, for the detail, takes the grand guards; the next, the interior guards; the last, the police guard; and the same rule in regard to the details and duties of the second class. In the details for the third class, the senior officer takes the largest party. The party first for detail takes the service out of camp.

When the officer whose tour it is, is not able to take it, or is not present at the hour of marching, the next after him takes it. When a guard has passed the chain of sentinels, or an interior guard has reached its post, the officer whose tour it was cannot then take it. He takes the tour of the officer who has taken his. When an officer is prevented by sickness from taking his tour, he becomes first for detail on being restored to duty, the general rule being that the officer longest off duty is the first for detail. These rules apply equally to non-commissioned officers and soldiers. Duties of the first and second classes are credited on the roster when the guards or detachments have passed the chain of sentinels, or an interior guard has reached its post; fatigue duties when the parties have passed the chain or begun the duties in camp. Every officer, non-commissioned officer, or soldier, on duty of the first class, or who is of the next detail for such duty, takes, when relieved, the duty of the second or third class that has fallen to him during that time, unless he has marched for detachment of more than twenty-four hours.



Rotary Bridge Crane.

ROSTHORN GUN METAL.—An alloy composed of

55.04 parts copper; 42.36 zinc; 1.77 iron; and 0.83 tin; or, according to another analysis, 57.63 copper; 40.22 tin; 1.86 iron; and 0.15 tin.

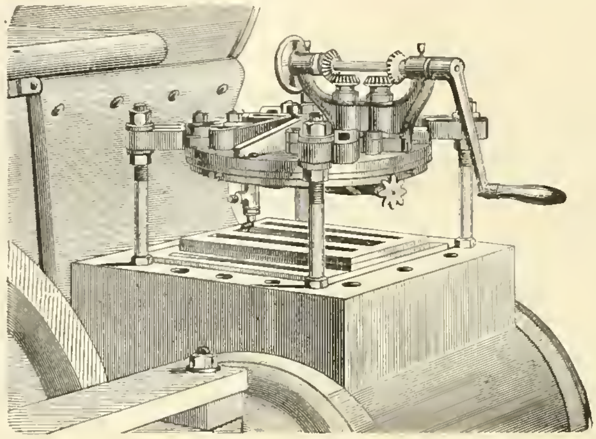
ROTARY BRIDGE CRANE.—A novel form of rotary crane possessing many advantages for certain kinds of work in foundries. It consists of a mast and jib, as in an ordinary jib crane, but is provided with a circular overhead track carrying the outer end of the jib, or the rotary bridge, so that the latter may easily have a much greater length than the jib of an ordinary jib crane, and so that all diagonal braces are dispensed with and the entire space under the bridge left unobstructed. Cranes of this construction are built of capacities from 3 to 12 tons for operation by hand, and of any desired capacity for operation by power.

The engraving on page 781 shows the manner of its arrangement. The frame consists of wrought-iron channel beams, the mast and the bridge each being composed of two such channel irons. The operating mechanism, for the operation by hand, is contained wholly within the two housings at the foot of the mast, and its construction and action are identical with those of the jib crane, to which a reference is made for further particulars. The same mechanism is also utilized for hoisting and lowering at several speeds, and for causing travel of the trolley in either direction upon the bridge. Rotation is effected by simply pushing or pulling the suspended load, except in cranes of large size, which are provided with a power mechanism for this purpose. The construction of the upper bearing of the crane, by which the head of the mast is carried, is such as to avoid any severe lateral strains upon the roof, the weight being carried, at one end of the bridge, by the mast, and at the other by the circular track which is supported from the ground by suitable posts.

This type of crane affords all the conveniences ot the ordinary jib crane, while avoiding the limitation in the vertical movement of the load imposed by the diagonal braces of the latter. It also avoids the severe lateral strains upon the building which result from the use of jib cranes, and thus dispenses with the heavy walls or bracing necessary, where jib cranes are employed, to afford the proper support of the upper end of the mast of such cranes. The posts supporting the circular track can easily be so placed as to cause little if any obstruction upon the floor, or, if the roof be stiff enough, the track may be hung directly from it without resorting to special posts. The bridge, being supported at both ends, can conveniently have much greater span than the jib of a jib crane, the outer end of which is necessarily overhung. With rotary bridge cranes of ordinary capacity a span of 50 feet is entirely feasible, and in this way the crane can be made to cover a circular floor 100 feet in diameter.

Cranes of this type can be adapted to heavy and light work of all kinds, especially in foundries, erecting shops, etc. When arranged for operation by power their capacity can be indefinitely extended. They are particularly applicable to existing buildings the shape of which does not adapt them to the application of traveling-cranes, and in which the construction does not adequately provide for the strains which would result from the use of the jib cranes. See *Bridge Crane*, *Cranes*, and *Jib Crane*.

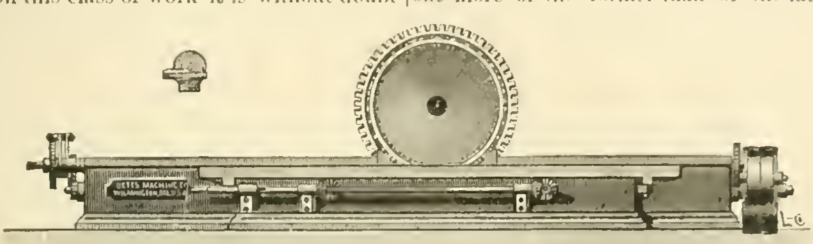
ROTARY PLANING-MACHINE.—This time and labor-saving machine, so constantly employed in the armory, is a comparatively recent invention. Its construction, and method of attachment and operation, are easily understood after an examination of the drawing herewith, representing the machine as made by Messrs. Manning, Maxwell & Moore, New York. The machine is especially adapted to facing



off valve seats, etc. It has two horizontal discs, the upper secured by radial arms, adjusted to suit the position of the studs in the valve seat; the lower, carrying the cutter and its slide, revolves freely against the upper, and is held in its place by a king bolt passing through its center. This lower plate is also secured by a circular gib upon its circumference, which admits of taking up the wear. It is an annular gear, having teeth cut on its inner periphery, from which it receives its rotary motion by means of its connection with the bevel gear and crank. The crank may be replaced by a pulley if power be convenient. The double bevel shaft acts like a back gear and admits of a change of speed. Either bevel is thrown into gear at pleasure by the movement of a pin in a slot operated by the hand wheel. If the outer bevel is in action, it gears directly into the lower plate; if the inner bevel, it is slow geared to the outer, and that to the plate. The revolving lower plate is fitted with a V slide and the tool post, and is fed by a screw and star wheel, arranged to give a large variation in the feed, from roughing to finishing, etc. The cutter is conveniently fed down by the operation of a nut on the cutter spindle acting against the tool post. The radial arms which secure this machine to the studs are so finished with slots as to give a wide range of adjustment. The nuts and their bearings, in the washers which jam the radial arms, are curved to admit of their being firmly secured without springing the machine, even though the studs should be a little out of line. In case the stud holes in a small valve seat should come inside the plates, four other radial arms are furnished with the machine, fitted with a T slot, and with a hole at the other end corresponding to the hole for the old stud, thus affording facilities for extreme cases.

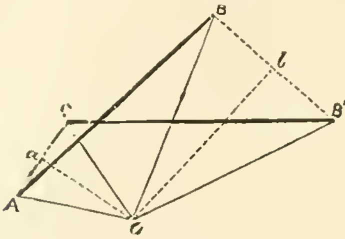
The points claimed for this tool are the great saving in time and labor over old methods; also a saving in files, and the fact that the job may be done accurately, as the plates may be set true with the unworn parts of the valve seat, and, consequently, the new face will be likewise true. It is readily seen that the work done is exactly in line with the travel of the valve stem, thereby preventing the yoke from slipping up and down the valve, as well as all extra friction on the valve stem. No more material need be removed than is absolutely necessary to true up, thus saving the seat. The work is done by a continuous cut, and the loss of time from the return motion of the ordinary planer avoided. There is also no breaking out of the edges. The saving claimed by the makers over the old methods is from 75 to 80 per cent., and 100 per cent. in files, as none need be used. After the seat is planed, the machine can be lifted off and placed on a table which is supplied with stationary adjusting columns and chuck for holding the valve, when the *valve* is planed. In many instances, when the work is done in round houses, the table is essential to a more perfect and satisfactory job. It is estimated that an ordinary locomotive valve seat can be thoroughly trued up in two hours. These machines are strong and well fitted up, are easily handled, and will be found an excellent tool in every respect. They are principally made in three sizes, 18, 22, and 26 inches.

The following drawing represents a machine specially designed for facing plain surfaces, in iron work, where large numbers of pieces of the same kind are used; on this class of work it is without doubt superior to any reciprocating planer that can be made; in many cases the finished work can be removed and replaced by new work while the machine is still facing at the opposite end. There are 28 cutters, in the 25-inch. machine shown, secured in a heavy plate wheel, banded with wrought iron, and driven by worm and worm-wheel; this plate wheel has a heavy steel spindle, and is carried in a traveling head on the bed plate, the work remaining stationary. It has an automatic variable feed, and the head is moved back by an independent countershaft. This machine will face a surface 25 inches high and 11 feet long. The 18-inch machine has 22 cutters, and will face a surface 18 inches high and 8 feet long. The 32-inch machine has 36 cutters, and will face a surface 32 inches high and 14 feet long. The weights of the machines are 12500, 8000, and 19225 pounds respectively.



ROTATION.—There is, perhaps, no elementary idea which has been the subject of so much popular misconception as that of rotation. This is probably due to the vagueness of the definitions commonly given. All motion that we can observe is *relative;* for instance, any fixed object on the earth's surface has a certain motion *relative* to the earth's axis, in consequence of the diurnal rotation; the earth itself has a certain motion *relative* to the sun, in consequence of its annual revolution; the sun has a certain motion *relative* to the so-called fixed stars; and it is possible that the whole stellar system may have a motion *relative* to something in space beyond its boundaries. Now, the motion of an object on the earth's surface differs according to the way it is measured: a passenger sitting in a railway carriage is *at rest* if his motion *relative* to the carriage be considered; he has the same motion as the carriage if it be measured *relative* to the rails; and if the carriage were running from East to West along a parallel of latitude, so as to complete the circuit in 24 hours, he would be at rest relative to the earth's axis. If, therefore, we wish to talk of *absolute* motion, it must be measured *relative* to FIXED points or directions; and in the violation of this obvious condition lies the error most commonly met with. Thus, to show that the earth rotates about its axis, we may observe its motion relatively to the line joining it with the moon; and we observe that the moon comes to the meridian at intervals of (roughly) 25 hours. Does the earth rotate in 25 hours? We know that it does not, and the error consists in treating as an *absolute* rotation, a rotation measured relative to a line—that joining the earth and moon—which is itself turning. If we take the intervals of the sun's crossing the meridian, we find 24 hours—a much closer approximation; but still not exact, because our line of reference—that joining the earth and sun—is slowly turning. Would we have an absolute measure, we must choose a *fixed* line, or one so nearly fixed that its motion will be absolutely insensible. Such is the line joining any fixed star with the earth, and the time of the earth's *absolute* rotation about its axis is $23^h\ 56^m\ 4.09^s$—the interval between culminations of the same fixed star. The difference between absolute and relative rotation in any planet gives rise to the difference between the *sidereal* and the *solar* day; and the planet's year contains just *one* more of the former than of the latter. Now, suppose for a moment that the earth were to revolve only $\frac{1}{366}$ part as fast as it now does, there would be *one sidereal* day in the year, and there would be *no* solar day at all—in other words, there would be *no* rotation of the earth with reference to the line joining it with the sun; that is, the earth would turn always the same side to the sun; yet it would be *absolutely* rotating about its axis once in a year. This is the case which we observe in the moon's motion relative to the earth, and we see at once that the moon must rotate *absolutely*—that is, with reference to fixed directions in space—in the exact time in which she completes one revolution about the earth. Those who say the moon does not rotate on her axis make precisely the same mistake as those who fancied that the earth is immovable, and that moon, sun, and stars revolve about it every day. There is a physical cause for this peculiarity in the moon's motion, which leads to very important consequences with reference to the future of the solar system.

Several elementary theorems regarding rotation may now be enunciated; but the proofs, though very simple, will be given merely in outline. Any displacement *whatever* given to a plane figure in its own plane—as to a sheet of paper lying on a table—is equivalent to a single rotation about a definite axis. Let A, B be any two points of the figure, and let them be displaced to A′, B′ respectively. Join AA′, BB′, and bisect them in *a* and *b* by perpendiculars meeting in O. Then, it is easy to show that (1.) OA′ = OA, OB′ = OB, and therefore O is the *same* point of the plane figure in its first and second positions. (2.) AOA′ = BOB′; and this is therefore the angle through which the whole has turned about the point O. If AA′ and BB′ are parallel, this construction fails; but in this case, if AB and A′B′ do *not* intersect, the motion is simply one of translation: if they do intersect, the point of intersection is the axis. Any number of successive rotations about different points constitute, of course, a displacement,



and are therefore reducible to one rotation. Two equal and opposite rotations about different points give rise to a mere translation. The first two of these propositions are true of figures on a sphere as well as on a plane surface; for the figure above has only to be drawn with great circles instead of straight lines, and the proof applies letter for letter. Only, here, the first case of exception cannot occur, because two great circles *must* intersect. Hence it follows that if the center of a sphere be fixed, any displacement whatever is equivalent to a rotation about some axis; that is, after any motion whatever of a rigid body, one point of which is fixed, there is always *one* line of particles which remains undisturbed. Hence rotations about any number of axes passing through the same fixed point may be compounded into one; and, generally, any motion whatever of a rigid body may be decomposed into two, one of which is a motion of translation of some chosen point, and the other rotation about some axis through that point. Thus, in the case of the moon, we have a motion of translation of its center in its orbit, and one of rotation about its axis; or we may combine them into a single rotation in the period of a lunar month about a fixed axis passing through the earth's center. Again, any displacement of a plane figure in its plane, or of a spherical figure on a sphere, may be produced by the rolling of a curve fixed in the figure upon another fixed on the plane or sphere. Hence, the most general motion of a body with reference to one point, consists in the rolling of a cone fixed in the body upon another fixed in space, their vertices being at the chosen point. To this, when the cones in question are right circular cones, belong the *precession* and *nutation* of the earth and of a top, the evolutions of an ill-thrown quoit, etc. See *Rotation of Projectiles*.

ROTATION OF PROJECTILES.—The principal cause of the deviation of a projectile is its rotation combined with the resistance of the air. It is proposed, in the first place, to show how rotation may be produced, and in the second, to show how rotation combined with the resistance of the air, produces deviation.

If the projectile be spherical and homogeneous, rotation is produced by the bounding or balloting of the ball in the bore, arising from the windage. In this case the axis of rotation is horizontal, and passes through the center of the ball; the direction of rotation depends on the side of the projectile which strikes the surface of the bore last; if it strike on the upper side, the front surface of the projectile will move upward; if on the lower side, this surface will move downward. The velocity of rotation from this cause depends on the windage, or depth of the indentations in the bore, the charge being the same. It has been found to be, for ordinary windage, about 30 feet for a 24 pdr. shell fired with $2\frac{1}{4}$ lbs. of powder.

If from the structure of the ball, or from some defect of manufacture, the center of gravity do not coincide with the center of figure, rotation generally takes place around the center of gravity. This arises from the fact that the resultant of the charge acts at the center of figure, while inertia, or resistance to motion, acts at the center of gravity, and is perpendicular to a plane containing the resultant of the charge and the centers of figure and gravity. For the same charge, the velocity of rotation is proportional to the lever arm, or perpendicular, let fall from the center of gravity to the resultant of the charge. Knowing the position of the center of gravity of the ball in the bore, it is easy to foretell the direction and velocity of rotation. In general terms, the front surface of the projectile moves toward the side of the bore on which the center of gravity is situated, and the velocity of rotation is greatest when the line joining the centers of gravity and figure is perpendicular to the axis of the bore.

The effect of rotation in producing deviation of projectiles may be studied under two heads: 1st. When the projectile is spherical and concentric. 2d. When it is spherical and eccentric.

The simplest case is that of a homogeneous spherical projectile, rotating around a vertical axis passing through the center of gravity.

Let *A B C D*, in Fig. 1, represent the great circle cut out of the sphere perpendicular to the axis of

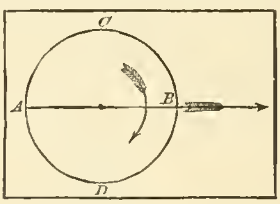


Fig. 1.

rotation, and suppose rotation to take place in the direction *A C B*, and the motion of translation in the direction *A B*; it is evident that each point of the circle moves in the direction *A B*, with a velocity which is equal to the velocity of translation, plus or minus the component of its velocity of rotation in the direction of the axis *A B*, which is equal to the projection of the arc over which the point moves in a unit of time on the line *A B*. The points *C* and *D* have the greatest velocity in the direction of this line, *A B*, and the points *A* and *B* the least. All the points in the semi-circle *A C B* rotate in a forward direction, and the components of their velocities of rotation must be added to that of translation; while the points in the semi-circle *B D A* move backward in rotation, and the components of their velocities must be subtracted from it. A body moving in the air draws with it a film of the particles which surround it, and these particles set in motion the adjacent particles, and so on from one layer to another: the number of particles set in motion and their reaction on the surface of the projectile, depend on the velocity of the moving surface; now it has been shown that the surface *A C B* moves with a greater velocity than the opposite side, the reaction, or pressure upon it, must be greater than upon the latter, and the projectile will be urged in the direction *C D*.

In Fig. 2, let *A C B D* represent the great circle cut out of an eccentric projectile perpendicular to

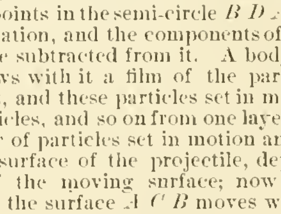

Fig. 2.

the axis of rotation, and containing the center of figure O, and the center of gravity O'. Suppose the motions of rotation and translation to take place as in the preceding case, it follows that the same cause will operate in this, as in the preceding case, to deviate the projectile in the direction *C D*; but there is another and more powerful cause operating to deviate the projectile in the same direction, and that is, the greater pressure on the side *A C B* arising from the greater surface offered to the air in consequence of the eccentricity. These phenomena may be easily illustrated by the very simple and ingenious apparatus devised by Prof. Magnus, of Berlin. Let *C*, in Fig. 3, represent a light brass cylinder, delicately suspended in a ring, and made to revolve very rapidly around its vertical axis, by means of a

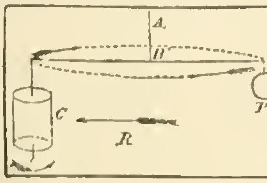

Fig. 3.

string, after the manner of a top; let this ring be suspended at the extremity of a wooden lever *B*, which, in turn, is suspended by a delicate wire from the ceiling, so that it may rotate freely in a horizontal direction; let *P* be a counterpoise, and *R* the direction of a strong current of air blowing upon the cylinder from a fan-blower. It is invariably found, that the axis of the cylinder will move in the opposite direction from the side which is moving toward the current of air from the blower (see direction of the arrows); but if there be no rotation of the cylinder the axis will remain stationary.

The following conclusions are obvious:—If a projectile be spherical and concentric, rotation takes place from contact with the surface of the bore around a horizontal axis, and the effect will be to shorten or lengthen the range, as the motion of the front surface is downward or upward.

If the projectile be eccentric, the motion of the front surface is generally toward the side on which the center of gravity is situated, and the deviation takes place in this direction.

The extent of the deviation for the same charge, depends on the position of the center of gravity; the horizontal deviation being the greatest when the centers of gravity and figure are in a horizontal plane, and the line which joins them is at right angles to the axis of the piece; the vertical deviation will be the greatest when these centers are in a vertical plane, and when the line which joins them is at right angles to the axis of the piece. If the axis of rotation coincide with the tangent to the trajectory throughout the flight, all points of the surface have the same velocity in the direction of the motion of translation, and there will be no deviation. This explains why it is that a rifle-projectile will move through the air more accurately than a projectile from a smooth-bored gun. See *Deviation, Initial Velocity of Rotation, Rotation*, and *Velocity of Rotation*.

ROTTBERG SYSTEM OF FORTIFICATION. This enceinte consists of a belt of isolated forts and cavaliers, the rampart of which is casemated. A casemated wall, situated in the ditch at the salient of the bastion adjoining the cavalier, serves to flank that work. The exterior fronts of the forts are covered by a couvre-face formed of a double covered-way; the inner one serving as reduit is secured against enfilade by a casemated bonnet. The ditch, which is partially wet, receives its defense from the cavalier and the flanks of the bastions. The ravelin and its reduit are casemated; but the casemates of the gorge of the reduit are opened to the rear to be exposed to the view of the place, whilst the ditch before the faces is defended by a reverse gallery constructed at the salient of the ravelin. On the capitals of the forts are casemated fleches with a covered-way capable of maintaining a protracted defense. The loss of one fort does not entail the fall of the others.

ROTTEN-STONE. A mineral consisting chiefly of alumina, with about 10 per cent of carbonaceous matter, and a little silica. It is supposed to be formed by decomposition of shale. It is found in Derbyshire, England, in Wales, and near Albany, in the State of New York. It is brown; either grayish, reddish, or blackish. It is soft, and easily scraped to powder, and is well-known to soldiers, being much used for cleaning and polishing brass and other metals.

ROUGE CROIX.—One of the pursuivants attaching to the heraldic establishment of England, generally allowed to be the most ancient, though the period of institution is uncertain. The title is derived from the Red Cross of St. George, the Patron Saint of England.

ROUGE DRAGON.—The title of a pursuivancy founded by Henry VII. on the day before his coronation. The name is taken from the supposed Ensign of Cadwaladyr, the last King of the Britons, ancestor of that Monarch. The red dragon was also sometimes used by Henry VII. as a supporter.

ROUGHING.—A mode of treating horse-shoes during slippery weather, when ice is lying on the ground. The old mode of carrying out this operation is considered an inconvenient and exceedingly injurious plan. A new method of roughing is recommended be Mr.George Fleming, a Veterinary Surgeon of the Royal Engineers, which consists in the insertion of a small, pointed, square plug of steel, measuring from 1 to 3 inches (nearly always the former) at the heel, and, if desirable, at the toe also of each shoe, in a simple square hole punched at these points. The result is stated to be most satisfactory, horses being enabled, in the most frosty state of the roads, to do their work as in ordinary weather. The army horses at Chatham were so roughed during the winter of 1875, and nothing could have been more satisfactory.

The term *roughing* is also applied to the action of a rasp on a fuse, to make it bite in the fuse-hole.

ROUGH RIDER.—In the artillery or cavalry, an Instructor of equitation, and assistant to the Riding-master. One is allowed to each troop or battery.

ROULEAUX. Round bundles of fascines, which are tied together. They serve to cover men when the works are pushed close to a besieged town, or to mask the head of a work.

ROULETTE.—An instrument used in engraving, mechanical drawing, and plotting, for making dotted lines. It has a wheel and points, which, for use on paper, is dipped into India-ink, so that the points impress a series of black dots or marks as the instrument passes over the paper. Different patterns of dots are used for national, state, county, and township lines, canals, roads, railways, etc. See *Dotting-pen*.

ROUND.—In artillery, a "round of ammunition" comprehends the charge of powder, the projectile, and the priming or friction tube. *To fire one or more rounds* is to discharge each gun in succession from a battery or a portion of it, until the turn comes round for the first gun to fire again. Light artillery can come into action and fire one round in 28 seconds, timing from the order "Action front," to the discharge of the piece; and in 15 seconds if the first cartridge and shot be carried in a box on the gun axle-tree.

ROUND-BAR.—In ordnance, a metallic cylinder, which has been reduced from a larger cylinder by rolling friction.

ROUND BULLET.—The object of small-arms is to attain animate objects; their projectiles are, therefore, made of lead, and are generally known as *bullets*. They are both round and oblong; but in consequence of the great improvements that were made of late, in adapting the principle of the rifle to small-arms, the oblong ball is now very generally used in all military services, the round bullet being chiefly retained for use in case-shot.

Round bullets are denominated by the number contained in a pound; this method is often used to express the caliber of small-arms; as, for instance, the caliber of the old musket was 17 to the pound. and the rifle was 32. In 1856, these two calibers were replaced by one 24 to the pound, that of the new rifle-musket. The number is sometimes prefixed to the word *gauge* in which case the rifle-musket would be called a 24 *gauge gun*. This mode, however, is principally used to designate sporting-arms.

The oblong bullet is denominated by its diameter and weight; for instance, the new rifle-musket ball has a diameter of 0.58 in., and it weighs 540 grains. See *Bullet*, *Oblong Bullet*, and *Projectiles*.

ROUNDEL.—1. A disk of iron having a central aperture, through which an assembling-bolt passes. It serves to separate the stock and cheeks. 2. A shield used by the Norman soldiers. 3. A semi-circular bastion in early fortification as introduced by Albert Dürer. This bastion was about 300 feet in diameter and contained roomy casemates for the troops. Also written *Roundelle*.

ROUNDHEADS.—A name given by the adherents of Charles I., during the English civil war, to the Puritans, or friends of the Parliament, who distinguished themselves by having their hair closely cut, while the Cavaliers wore theirs in long ringlets.

Roundle.

ROUNDLE—ROUNDLET.—In Heraldry, a general name given to charges of a circular form, which, in English Heraldry, have more special names indicative of their tinctures the roundle or being, for example, called a *bezant*; and the roundle gules, a *torteaux*.

ROUND POWDER.—In case of emergency, and when powder cannot be procured from the mills, it may be made, in a simple and expeditious manner, as follows: Fix a powder-barrel on a shaft passing through its two heads, the barrel having ledges on the inside; to prevent leakage, cover it with a close canvas glued on, and put the hoops over the canvas. Put into the barrel 10 lbs. of sulphur in lumps, and 10 lbs. of charcoal, with 60 lbs. of zinc balls or of small shot (down to No. 4, 0.014 in. in diameter nearly); turn it, by hand or otherwise, 30 revolutions in a minute. To 10 lbs. of this mixture thus pulverized, add 30 lbs. of nitre, and work it two hours with the balls; water the 40 lbs. of composition with 2 quarts of water, mixing it equally with the hands, and granulate with the graining-sieve. The grains thus made, not being pressed, are too soft. To make them hard, put them into a barrel having 5 or 6 ledges projecting about 0.4 in. inside; give it at first 8 revolutions in a minute, increasing gradually to 20. The compression will be proportionate to the charge in the barrel, which should not, however, be more than half full; continue this operation until the density is such that a cubic foot of the powder shall weigh 855 oz., the mean density of round powder; strike on the staves of the barrel from time to time, to prevent the adhesion of the powder. Sift the grains and dry the powder as usual. That which is too fine or too coarse is returned to the pulverizing-barrel. This powder is round, and the grain is sufficiently hard on the surface, but the interior is soft, which makes it unfit for keeping, and may cause it to burn slowly. This defect may be remedied by making the grains at first very small, and by rolling them on a sheet or in a barrel, watering them from time to time, and adding pulverized composition in small proportions; in this way, the grains will be formed by successive layers; they are then separated according to size, glazed and dried. It appears from experiments that the *simple incorporation* of the materials makes a powder which gives nearly as high ranges with cannon as grained powder. The incorporated dust from the rolling-barrel may be used in case of necessity. See *Gunpowder*.

ROUND ROBIN.—A name given to a protest or remonstrance signed by a number of persons in a circular form, so that no one shall be obliged to head the list. The Round Robin originated in France, and the name is derived from the words *rond*, round, and *ruban*, a ribbon.

ROUNDS.—An Officer, or Non-commissioned Officer who, attended by one or more men, visits the sentinels on post, in order to ascertain whether they are vigilant. The design of rounds is not only to visit the guards, and keep the sentinels alert, but likewise to discover what passes in the outworks, and beyond them. See *Grand Rounds* and *Visiting Rounds*.

ROUND-WIRE.—In ordnance, a metallic cylinder which has been reduced from a larger cylinder by rubbing friction.

ROUT.—To put to *rout* is to defeat and throw into confusion. It is not a retreat in good order, but also implies dispersion.

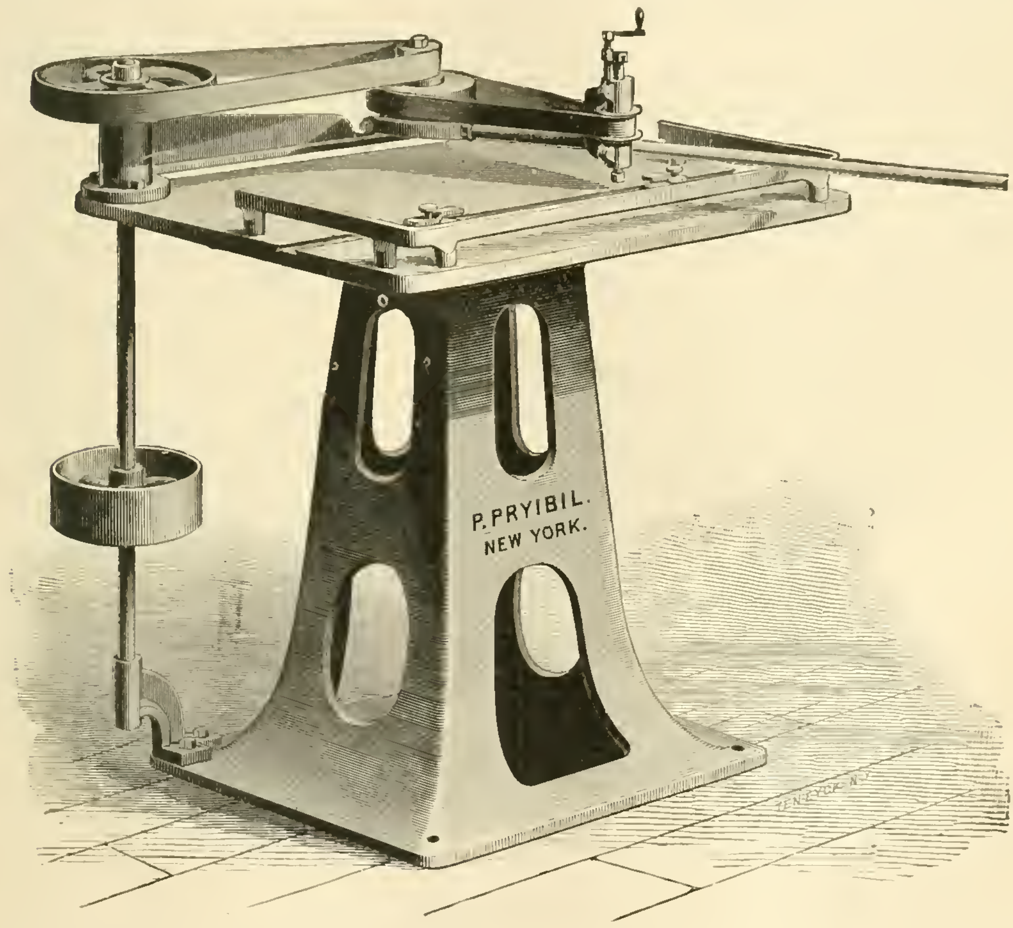
ROUTE.—An open road; the course of march of troops. Instruction for the march of detachments, specifying daily marches, the means of supply, are given from the headquarters of an army in the field, and are called marching *routes*.

ROUTE MARCHES.—Three marches are used in peace to conduct a body of troops from one station to another. They are used in war for the purpose of assembling the fractions of an army on its base of operations, of conducting troops through a district or country where there is no enemy, etc. The health, comfort and convenience of the troops are the principal things to be considered in arranging the details of their execution. When the body of troops to be moved is large it should be subdivided into smaller bodies, and these detachments are sent by different roads. Caution must be taken to prevent the crossing of the columns on the march, as one would then have to wait to allow the other to pass, and the delay caused to the waiting column would be irksome in the extreme. Since, in executing marches of this kind, there is no danger to be expected from an enemy, the precautions taken in the other kinds of marches to guard against attack may be omitted. Route marches are designated as *ordinary*, *forced* and *rail*, according to the manner in which they are made. The ordinary route march does not exceed 20 miles per day. Forced marches are extremely exhausting upon the troops and should not exceed 30 miles per day. They should only be resorted to in time of peace under pressing circumstances. They are much used in war, when a rapid concentration of troops is to be made, or when a strategical combination is to be effected. Railroads have become in recent years the great factor in rapid and cheap means of moving troops, and are of especial service when the time given to the troops to reach their destination is short, and the distance is great. The marches made by the several corps of the French army in 1805, by which this army was assembled upon the Rhine is an example in point. Napoleon issued his orders for the corps to move on three different routes, each of the seven corps being divided into three divisions, following each other on three successive days. The arrangements were perfect: all crossings of columns were avoided; the marches for each day were of proper length: the great natural routes were followed, and the detachments arrived in succession and without interference at their destination. See *Marches*.

ROUTE STEP.—A style of march, whereby the men carry their arms at will, keeping the muzzles elevated; they are not required to preserve silence, or to keep the step, but each man covers the file in his front. The column of fours is the habitual column of route. The route step is at the rate of from two miles and a half to three miles per hour. The column of fours being in march, to march in the *route step*, the Captain commands: 1. *Route step*, 2. MARCH. At the command *march*, the men carry their arms at will, keeping the muzzles elevated; they are not required to preserve silence, or to keep the step, but each man covers the file in his front. The ranks preserve the distance of thirty-two inches from each other. To resume the cadenced step, the Captain commands: 1. *Company*, 2. ATTENTION. At the second command, the arms are brought to the right shoulder, and the cadenced step is resumed. The company marching in line may also march in the route step, the rear rank falling back to thirty-two inches. The company in route step changes direction by the same commands as when in the cadenced step.

ROUTINE.—Capacity or the faculty of arranging; a certain method rather acquired by habit and practice than by study and rule. It signifies also a general custom or usage, established by habit, and followed mechanically.

machine for arsenal use. The spindle is of steel fitted to a steel tube with which it revolves, and in which it slides longitudinally. The wear is thus confined to the tube where it is easily taken up by means provided for the purpose, and the trouble experienced with machines where the spindle slides in the same bearings in which it revolves is wholly avoided. The spindle head is carried on a lever connected by a universal joint to a swinging arm. As this arm is strongly webbed and is provided with a long bearing on the outside of the sleeve forming the upper bearing for the vertical shaft at the corner of the machine, additional supports are dispensed with, and the table is left clear for the reception of large work. Through the agency of arm and lever the cutter can be easily brought to any part of the work. Both the spindle head and the stud carrying the intermediate pulley are movable, to enable them to be shifted to take up the slack of the belt. The spindle has a vertical adjustment of $1\frac{3}{8}$ inches, and the clamps are made double faced and reversible. Either a spring rest for keeping the cutter from the



ROUTING-MACHINE.—A shaping-machine which works by means of a router-cutter, adjustable itself and revolving above a bed with universal horizontal adjustment, so as to permit the cutter to follow along a traced line, and thus cut to a shape, or groove to a depth, the work upon the table. It is adapted for work in metal or stone; in the latter case, black diamonds are used. Paneling in relief or intaglio, raised or sunken carving, circular slotting, slotting, key-seating, beveling, and bordering may be done upon it.

The drawing shows a very convenient routing-machine for arsenal use. work until the lever is depressed, or a solid rest, as shown in the drawing, may be used, but the solid rest is safer and more convenient. The table will take on a plate 24×32 inches which can be completely routed without being shifted more than once. Six cutters, from $\frac{1}{16}$ to $\frac{1}{2}$ inch in diameter, and a tool box fitting the side of the body accompany each machine. An attachment for cutting straight lines is also used. The speed is 7,000 to 8,000 revolutions per minute.

ROWEL.—The pointed part of a riding spur, made in a circular form, with rays or points like a star.

ROYAL.—1 A small mortar which carries a shell whose diameter is 5.5 inches. It is mounted on a bed like other mortars. 2. In England, one of the soldiers of the first regiment of foot, called the *Royal*, and supposed to be the oldest regular corps in Europe.

ROYAL ARTILLERY INSTITUTION.—An establishment organized at Woolwich in the year 1838. The building was erected at government expense, and is supported partly by subscriptions from the officers of the regiment and partly by government. It contains a museum, lecture-room, laboratory, theatre, and printing press. Reports, *verbatim*, of all lectures which have been delivered are issued periodically to all its members. It is a repository for the sale of military books, stationery, etc.

ROYAL CORPS OF ENGINEERS.—A component portion of the Army of the British Empire. A similar Corps exists in all regular armies. It is the scientific and constructive branch, intrusted with the making and defending of all military *works*, and the attack and conquest of similar works belonging to an enemy. It is true that civilians are often employed to construct the buildings themselves, at a stated price; but the Military Engineers make the plans, and are responsible to the country for their efficiency. For a number of years past, contractors have been at work on fortifications at Portsmouth and in other parts of the kingdom, but on plans and under orders for which the Engineer Department of the Government is responsible.

The Royal Engineers of the United Kingdom form one Regiment or Corps. The officers, in time of peace, are scattered all over the world. There is no half-pay, except on *permanent* retirement; and no unemployed list. They have much wear and tear of earlier age than other officers. Their regular pay corresponds to the active pay of other officers of the same rank; but they exclusively receive in addition *extra* pay, amounting to one-half their ordinary pay when on duty at home, and equaling their ordinary pay when employed abroad or in the London district. There is an establishment of Engineers in each military command, to conduct and superintend all the military buildings and works. The entire force is under a particular Department of the War Office, that of the Inspector General of fortifications. Until the year 1763, the duties of Military Engineers were discharged by officers taken from the regular army. In that year, however, the Corps of Engineers was formed, greatly to the advantage of the military service. In 1783, it was made a *Royal* Corps, and a distinctive uniform adopted. Several companies of artificers were, in 1812, converted into sappers and miners, and placed under the Engineers.

The non-commissioned officers and privates of this valuable Corps are all workmen who have learned some mechanical trade; hence their skill in all constructive operations. The Ordnance Survey has been intrusted to the Corps. For many purposes the men are *lent*, they attend to special and peculiar work; and at such times their emolument is always increased. They often buy their discharge, in order to go into civil employments, when the prospects are very good. The men enlist for 12 years, with power to re-engage (if wanted) for nine more; but they can purchase their discharge at any time. They have to pay more for their discharge than other Corps in the army, having received more instruction at the national expense. Officers intended for the Engineers enter the Royal Military Academy as cadets by open competition, and pass out from time to time for commissions. When in the Corps, promotion is by seniority, the purchase system having never been introduced. The head-quarters are at Chatham, where there are Engineer Barracks. The Corps is grouped into battalions and companies. There are 432 officers of Royal Engineers serving in India, their subordinates being natives. See *Corps of Engineers*.

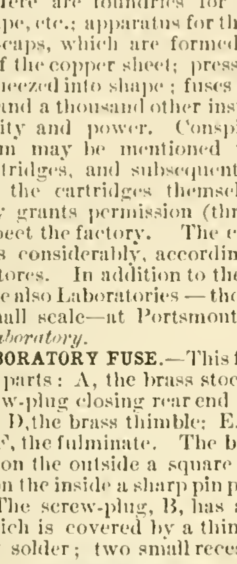
ROYAL ENGINEER INSTITUTION.—A similar Institution to that established by the royal artillery at Woolwich, but of older date (1813), and formed at Chatham. It contains a library of 12,000 volumes, and publishes yearly a volume of professional papers, with the view of conveying, to all members of the Institute, the knowledge and experience acquired by each officer of the corps. It publishes besides a small monthly paper, printed at the expense of the Institution.

ROYAL GUN FACTORIES.—Government establishments at Woolwich for the construction of great guns for the use of the British Army and Navy. For a very long period there had been at Woolwich a small factory for the manufacture of brass cannon, but guns of cast-iron were obtained from private foundries by contract. At last it was determined that Government should become in part its own gun-founder, and extensive work-shops were erected in 1855—6. The adoption of the Armstrong wrought-iron gun into general use in the service, in 1859, arrested the further making of cast-iron guns, and occasioned again a great expenditure in the erection of shops and costly machinery, which have since been adapted to other systems of wrought-iron ordnance adopted into the service under the name of "Woolwich." The factories may now fairly be regarded as among the most remarkable sights in the Kingdom. In each department, whatever the process, it is repeated over and over again, till long parallel lines of similar mills are seen, each busily fashioning a separate gun. Iron at red-heat is first wound round a solid core (representing the bore of the future gun), as tape might be round a pencil; and then by the action of successive blows from a steam-hammer (there is one of 100-tons), the strips are welded into a compact cylinder of wrought-iron of extreme density. This cylinder, after undergoing several heatings, and also poundings with the steam-hammer, is encompassed with wrought-iron rings of immense strength, which are shrunk on, and then transmitted to the boring mill. Here the proper caliber is imparted to it; in another department, the bore is rifled; in another, the outside of the gun is carefully turned; and in yet another, the whole is polished and browned. A gun is several weeks in its passage through these many processes. By the ingenuity of Sir William Armstrong, the Superintendent, and Dr. John Anderson, his able assistant, every part of the difficult manufacture has been reduced to a question of machinery. Many thousand guns have to this time been turned out complete of which upwards of 7,000 are now available for military and naval use. The cost of the guns as now made is, on an average, as follows: 12-pounder, £82; 20-pounder, £124; 40-pounder, £206; 70-pounder, £375; 35-ton gun, £2,156. The Royal Gun Factory at Woolwich was estimated to cost for 1878—9 the sum of £203,948, of which £5,242 were for management; £78,656 for the wages of artificers and laborers; £12,671 for buildings and machinery: and £104,190 for stores to be consumed in the manufacture of guns. Much of the machinery now used in the manufacture of guns was originally developed at the engineering and founding establishment of Sir William Armstrong & Co., at Elswick, which was for some time used as an auxiliary and supplement to the gun factory in Woolwich Arsenal, the guns being turned out at a contract price, payable after they had passed a rigid inspection. The connection between the Government and the Elswick firm ceased in 1863. See *Gun-making*.

ROYAL GUNPOWDER FACTORY.—The establishment at Waltham Abbey, in which much of the gunpowder required for the British Army and Navy is made. It is built on all the newest and most approved principles to insure safety, economy, and efficiency; but even here accidents occasionally happen in this dangerous manufacture, and roofs and sides, purposely left loose so as to offer but little resistance, are scattered to the winds. Between the different mills mud-banks are raised, and groves of trees thickly planted, to lessen the concussion, and, as far as possible, limit the catastrophe when one house is unfortunately exploded. A series of raised canals, at the same time, is ready to flood the whole place, or to afford a precarious shelter to the men employed, if time be available to make use of it. The charge for this factory for 1878-79 was £104,439, of which £20,692 were for management and wages, £19,696 for buildings, and £41,764 for raw material. There are about 200 workmen. When the gunpowder is made, it is sent down the Lea, to the magazines at Woolwich and Purfleet.

ROYAL LABORATORY.—An extensive military manufacturing department in Woolwich Arsenal. Although it has existed for many years, it was only in 1855 that the present very large establishment was organized. Here are foundries for the casting of shot, shell, grape, etc.; apparatus for the manufacture of percussion-caps, which are formed—hundreds at a time—out of the copper sheet; presses where rifle-bullets are squeezed into shape; fuses in all stages of manufacture and a thousand other instances of combined ingenuity and power. Conspicuous among the mechanism may be mentioned the making of paper for cartridges, and subsequently the making and filling of the cartridges themselves. Government liberally grants permission (through the War Office) to inspect the factory. The cost of the Laboratory varies considerably, according to the accumulation of stores. In addition to the Royal Laboratory, there are also Laboratories — though on a comparatively small scale—at Portsmouth and Devonport. See *Laboratory*.

ROYAL LABORATORY FUSE.—This fuse consists of the following parts: A, the brass stock or body; B, the brass screw-plug closing rear end of fuse; C, the lead plunger; D, the brass thimble; E, the brass safety-wire; and F, the fulminate. The body has a solid head, having on the outside a square recess for fuse wrench, and on the inside a sharp pin projecting from the center. The screw-plug, B, has a hole through its center which is covered by a thin disk of brass secured on by solder; two small recesses in the bot-



tom of the plug facilitate its insertion with a wrench. The lead plunger, C, has also a central hole through it, in the front end of which is placed the fulminate cap; the plunger has also two slight projections from its sides upon which rests the brass thimble, D. Running through holes in the heads of fuse body and thimble, and to one side of center and resting on top of the plunger, is the twisted safety-wire, E. In order to prevent the easy withdrawal of the safety-wire a small hole is bored into one side of fuse body and down to the hole through which the wire is inserted, and into this is poured melted lead. A strong cord facilitates the extraction of the wire before firing. Inserted in a loaded shell with the safety-wire removed, and meeting with a resisting object in flight, the plunger is thrown forward sheering off the shoulders; the fulminate striking the pin is ignited, the brass disk closing hole through screw plug is blown out, and the bursting-charge of shell ignited. See *Fuse*.

ROYAL MARINE ARTILLERY AND LIGHT INFANTRY.—I. A limited number of candidates will be nominated to compete for admission into the Royal Naval College, Greenwich, as probationary Lieutenants in the Royal Marines.

II. The examination will be conducted by the Civil Service Commissioners, and will be held once a year commencing on the second Wednesday in August.

III. No candidate will be eligible who is under 16½ or above 18 years of age on the 1st of October following the examination.

IV. Public notice will be given in May of each year of the number of vacancies, and of the number of candidates to be nominated to compete for them.

V. A candidate who qualifies, but is not successful in the competition, will be allowed to compete again at the next examination if not over age; but a candidate who fails to qualify will not be admitted to compete again; and no candidate will be allowed to compete more than twice.

VI. Every candidate will be required to be at least 5 feet 5 inches in height and to pass the medical examination according to the prescribed regulation, under the direction of the Medical Director General of the Navy. He must be in good health, and free from any physical defect of body, impediment of speech, defect of sight or hearing, and also from any predisposition to constitutional or hereditary disease, or weakness of any kind, and must be in all respects well developed, and active in proportion to his age. Any candidate rejected at the medical examination will, subject to the approval of the Board, be finally excluded from the Royal Marines.

VII. Each candidate, before the examination, will be required to produce the following certificates, viz.: (1) A registrar's certificate of birth, or declaration thereof made before a magistrate. (2) A certificate of good conduct for the two years previous from the masters of the schools at which he may have been educated; or, if educated at home, from his tutors, or the clergyman of the parish in which he has resided for that period. (3) A certificate of good health and physical development from the Medical Director General. (4) A certificate of height.

VIII. A candidate will be required to pass a preliminary examination in the following subjects, the maximum number of marks obtainable for each being as stated:—

	Marks.
1. Writing English from dictation correctly in a good legible hand No marks allowed.	
2. Arithmetic	300
3. Algebra (including quadratic equations and the three progressions)	500
4. Geometry (up to the standard of the sixth book of Euclid's Elements)	600
5. Plane trigonometry (including definitions, fundamental formulæ, and the solution of plane triangles)	600

IX. The further examination will be proceeded with immediately on the conclusion of the preliminary examination. Candidates who fail in the preliminary examination will be informed of their failure as soon as possible, and they will then be released from further attendance.

X. The subjects of the further examination and the maximum of marks obtainable for each subject will be as follows:

	Maximum Marks.
1. Applied mathematics (viz., elementary statics, dynamics, and hydrostatics)	1000
2. Physics (viz. sound, light, heat, magnetism, and electricity)	1000
3. Chemistry	600
4. Latin	1500
5. Greek	1000
6. English language and composition	1000
7. History, ancient and modern, with geography	1000
8. French	1000

9. German, Spanish, or Italian		1000
10. Drawing	Freehand	400
	Geometrical	400
		9900

XI. A candidate may be examined in as many of the above subjects as he chooses. A certain number, corresponding to a merely elementary knowledge, will be deducted from the marks gained by a candidate in each subject, except drawing and applied mathematics.

XII. To qualify, a candidate must pass to the satisfaction of the Civil Service Commissioners in the subjects specified in Par. VIII., and in two at least of the subjects of the further examination. He must also obtain such an aggregate of marks as shall indicate, in the judgment of the Commissioners, a competent amount of general proficiency.

XIII. The successful candidates will be appointed Lieutenants on probation. They will proceed to the Royal Naval College at Greenwich at the commencement of the season following the examination, viz. on the 1st of October.

XIV. At the end of the first session they will be examined, and commissions in the Light Infantry will be granted to all who shall pass a satisfactory examination. The dates of the commissions so granted will depend upon the number of marks obtained. Those who do not pass satisfactorily will be finally excluded from the Royal Marines.

XV. From those who pass highest at this examination, officers will be selected to qualify themselves to fill vacancies in the Royal Marine Artillery.

XVI. The officers thus selected will remain at the College a second session, at the end of which they will be examined, and, if they pass satisfactorily, will receive commissions in the Artillery.

XVII. Officers who fail to obtain commissions in the Artillery may retain their rank as Lieutenants in the Light Infantry.

XVIII. Artillery and infantry officers will be posted on the list of their respective corps in the order in which they pass their final examination at Greenwich.

XIX. Officers of the Royal Marines on probation will receive 5s. 3d. a day. Those who are permitted to remain a second session to qualify for the artillery will be allowed 1s. 6d. a day mess allowance during that session.

XX. Officers, on passing out, will join their respective divisions, and be instructed in their drill and military duties for service ashore and afloat.

XXI. Each successful candidate at the examination for entry must deposit the sum of £80 with the Accountant-General of the Navy before he can be appointed Lieutenant on probation for the Royal Marines, to provide for his equipment at the Royal Naval College and on joining his division.

XXII. The uniform for officers on probation will be a blue patrol jacket, blue working jacket, mess jacket, undress trowsers, sword, and forage cap.

ROYAL MARINES.—A body of men raised for service as soldiers, either on shore or on board ship, and placed under the control of the Board of Admiralty. The whole regiment is never afloat, only portions of it, the rest being stationed at some of the naval seaport towns. The Royal Marines were first raised in 1664, and have been considerably strengthened since the commencement of this century. They rank, when acting with the troops of the line, between the 49th and 50th regiments. The Royal Marines are a non-purchase corps, and the officers, as in the artillery and engineers, rise by seniority. The corps now possesses a marine force of artillery, consisting of 13 companies, which is a most effective and valuable body of men. The head-quarters of the Royal Marine Artillery are at Eastney, near Portsmouth. Many of the chief garrisons in the south of England have divisions of the Marines quartered in them, such as Woolwich, Chatham, Portsmouth, Plymouth. The strength of the corps amounts to 14,000 men and 287 officers. See *Marines*.

ROYAL MILITARY ACADEMY.—1. The Royal Military Academy at Woolwich is maintained for the purpose of affording a preparatory education to candidates for the Royal Artillery and Royal Engineers; this education will be chiefly technical, and will in no obligatory subject be carried beyond the point useful to both corps alike.

Regulations for Admission, etc.

2. Admission to the Royal Military Academy as cadets will be granted to the successful candidates at an open competitive examination. The examinations will be conducted by the Civil Service Commissioners, and held twice a year, December and July.

3. Notice will be given from time to time of the day and place of the examinations, and of the vacancies to be competed for at each examination.

4. The limits of age will be from sixteen to eighteen, the candidates being required to be within those limits on the 1st day of the January next following for the winter examination, and on the 1st of July for the summer examination.

5. Candidates for admission to the December or July examination must send to the Military Secretary, not less than one month before the 1st December or 1st July respectively, an application to be examined, accompanied by the following papers:—(*a*) An extract from the register of his birth, or in default, a declaration made by one of his parents or guardians before a magistrate, giving his exact age. (*b*) A certificate of good moral character, signed by a clergyman of the parish in which he has recently resided, or by the tutor or head of the school or college at which he has received his education for at least the two preceding years, or some other satisfactory proof of good moral character.

6. When a candidate who has once been examined applies to be examined again, he will only be required to forward a certificate as to moral character for the interval between the two examinations.

7. The number of trials allowed will not exceed three.

8. All candidates will be inspected by a Medical Board; and no candidate will be allowed to proceed to examination by the Civil Service Commissioners unless certified by the Board to be free from bodily defects or ailments, and in all respects, as to height and physical qualities, fit for her Majesty's service. Cases of exceptional shortness of stature will be referred to the War Office for special consideration.

9. A candidate will be required to satisfy the Civil Service Commissioners in the following subjects:—(1) Mathematics, viz. (*a*) arithmetic, and the use of common logarithms; (*b*) algebra, including equations, progressions, permutations and combinations, and the binomial theorem; (*c*) geometry, up to the standard of the sixth book of Euclid; (*d*) plane trigonometry, including the solution of triangles. (2) French, German or some other modern language, the examination being limited to translation from the language and grammatical questions. (3) Writing English correctly and in a good legible hand, from dictation, and English composition. (4) The elements of geometrical drawing, including the construction of plane scales and the use of simple mathematical instruments. (5) Geography. A thorough knowledge of each of the four branches of mathematics will be required. The Commissioners may, however, if they think fit, dispense with this preliminary examination, except as regards mathematics, English composition, and geometrical drawing, in the case of any candidate who has satisfied them on a previous occasion.

10. No marks will be allotted for the above preliminary examination excepting for mathematics (2000), for English composition (500), and for geometrical drawing (300).

11. The "further examination" will be proceeded with immediately on the conclusion of the "prelim-

inary examination." Candidates who fail in the preliminary examination will be informed of their failure as soon as possible, and they will then be released from further attendance.

12. The subjects of the further examination and the maximum number of marks obtainable for each subject will be as follows:

	Marks.
(1) Mathematics, viz. further questions and problems on the subjects of the qualifying examination, and the elements of the following subjects: theory of equations; analytical geometry; conic sections; solid geometry; differential and integral calculus; statics; and dynamics	4000
(2) English: English literature, limited to specified authors; and English history, limited to certain fixed periods; the authors and periods being notified beforehand	2000
(3) Classics, viz. Latin	2000
(3) Classics, viz. Greek	2000
(4) French, the examination to be partly colloquial	2000
(5) German, the examination to be partly colloquial	2000
(6) Any one of the following languages at the option of the candidate, viz. Italian, Russian, Spanish, or Hindostanee; the examination to be partly colloquial	2000
(7) Experimental sciences, viz. (a) chemistry and heat; or (b) electricity and magnetism	2000
(8) General and physical geography and geology	2000
(9) Drawing, free-hand	1000

Of these nine subjects, candidates will not be allowed to take up more than four, exclusive of drawing. In all the subjects, a very great importance will be attached to the accuracy in numerical results.

13. A certain number will be deducted from the marks gained by a candidate in each subject, except mathematics; and the remainders will be added to the marks gained by the candidate in the preliminary examination in mathematics, English composition, and geometrical drawing. The resulting total will determine the candidates place in the competitive list; the successful candidates being those who stand first on the list up to the number of vacancies competed for.

Optional Examination in Mathematics.—Detailed Syllabus.

14. Further questions and problems on the subjects of the qualifying examination. The theory of equations: first principles. Analytical geometry: problems on straight line and circle. Conic sections: elementary properties, with easy problems, both on the analytical and geometrical methods. Solid geometry: first principles, with easy exercises. Differential calculus. Differentiation of functions of one independent variable. Taylor's and Maclaurin's theorems: applications. Maxima and minima of functions of one independent variable. Method of infinitesimals: first principles, with easy applications. Tangents and normals to curves. Points of inflexion. Curvature of curves. Involutes and evolutes. Integral calculus. Elementary integrations. Integration considered as summation. Rectification and quadrature of plane curves. Statics: equilibrium of forces and couples in one plane. Friction: center of gravity; mechanical powers. Problems on elementary statics; the graphical or geometrical method of treating such problems should be studied as well as the analytical. No applications of the differential calculus to statics will be required. Dynamics: elementary principles; projectiles; motion of a heavy particle on a smooth curve; centrifugal force; simple pendulum. Problems and exercises. No applications of the differential calculus will be required.

Terms of Payment.

15. The terms of payment for cadets at the Royal Military Academy are regulated by the following articles of her Majesty's warrant of the 27th December, 1870, for the pay and promotion of the Army:

Payment for cadet. The payment to be contributed on behalf of a cadet shall be as follows, and shall be paid half-yearly in advance:—

	Annually. £
Queen's cadets (if any)	*Nil.*
For the son of an officer of the Army or Navy who has died in the service, and whose family is left in pecuniary distress (subject to the approval of the Secretary of State)	20
For the son of an officer below the rank of Colonel or Regimental Field Officer in the Army, and Captain or Commander in the Navy, or an Instructor at the Royal Military College or Staff College	40
For the son of a Colonel or Regimental Field-officer in the Army, or of a Captain or Commander in the Navy, or of a Professor at the Royal Military Academy, or Royal Military College, or Staff College	60
For the son of a General-officer who is not Colonel of a Regiment, or of a Vice or Rear-admiral	70
For the son of an Admiral or of a General-officer who is Colonel of a Regiment or in receipt of Indian Colonel's allowances	80
For the son of a private gentleman	125

Scale of payment, how computed.—In determining the rate of payment—

a. A General-officer on the half-pay of his last regimental commission shall pay in accordance with such regimental rank.

b. Officers who have sold their commissions shall be regarded as private gentlemen.

c. Officers on retired full or half-pay after 25 years' service, or officers of less than 25 years' service, if placed on half-pay by reduction of establishment, or on account of ill health, shall pay in accordance with their last substantive regimental rank. The cases of officers voluntarily retiring to half-pay before completing 25 years' service shall be specially considered.

d. Officers of the departments of the Army and Navy according to their relative rank, of the permanent staff of the militia, adjutants of the volunteer force, as well as Indian military and naval officers, shall be treated on the same terms as military or naval officers.

e. The sons of deceased officers shall be contributed for in accordance with the foregoing regulations in regard to the rank or classification of their fathers.

Sickness and rustication.—If a cadet be absent a whole term in consequence of sickness or rustication, a payment of £10 shall be required for the privilege of his name being kept on the rolls of the establishment, and for a vacancy being guaranteed at the commencement of the next term.

Orphans.—In the case of a cadet who is an orphan, whose annual contribution is only £20, the amount to be paid when absence extends over a whole term shall be determined by the Secretary of State.

Sickness.—If a cadet be absent from sickness during a portion of the term, his pay shall continue to be issued and credited to his account, but no refund of the contribution shall be permitted.

Rustication.—If a cadet be rusticated or removed during a term, his daily pay shall cease from the date on which he is sent away, and the contribution made for the half-year shall be forfeited.

Pay of cadet.—The pay of a cadet shall be 3s. a day. It is issued to cover the expenses of regimental clothing, messing, washing, and other contingencies. All other necessary expenses of this nature, as well as weekly pocket money, postage of letters, bootmakers' and tailors' bills for repairs, etc., which cannot be covered by his pay, shall be chargeable to his parent or guardian in addition to the regulated contribution.

Extra payments for cadets.—Each cadet on first joining shall be required to pay, in addition to the regulated contribution, a sum of £25 to cover the expenses of uniform, books, etc., and to bring with him the articles of clothing of which he will receive notice, and which must afterward be kept up at his own expense. He shall also be required to pay the regulated contribution in advance, for each half-year of the time during which he remains under instruction, and a deposit of £5 on account, for contingent expenses, which latter sum he shall be required to make up on returning to the Royal Military Academy after each vacation, to cover any expense that may be incurred on his account during the ensuing half-year.

Government and Organization.

16. The Field Marshal Commanding-in-Chief will be the President of the Royal Military Academy.

17. An independent inspection by a Board of Visitors, appointed by the Secretary of State for War, and reporting to him, will be made once a year. Such Visitors will not be a permanent body, but will not all be changed at the same time. The report of this Board will be presented to Parliament.

18. The Academy will be under the control of a Governor, a military man, selected with special reference to his qualifications for superintending both instruction and discipline, and appointed by and responsible to the Secretary of State for War, through the Field Marshal Commanding-in-Chief.

19. The Governor, by virtue of his office, will have local rank superior to that of any of the officers employed under him.

20. The tenure of the appointment is regulated by the following article of the royal warrant of the 27th December, 1870:—The appointment of Governor of the Royal Military Academy . . . . shall be for seven years, with power of re-appointment; but shall in all cases terminate after fourteen years, or at the age of sixty.

21. The Governor, with the approval of the Secretary of State for War, will have the power of appointing and removing the Professors and Instructors.

22. The organization will be on a military basis.

23. The Governor will be solely responsible for discipline and for the general superintendence of the studies,

24. He will be assisted in the arrangements of the studies by the Academy Board, composed of the Professors or Senior Instructors of the different branches. The head of each branch will have the general power of supervision and inspection over the studies of his department, with the duty of reporting on them to the Governor.

25. The Governor will from time to time assemble and confer with all the Professors and Instructors of each separate branch on matters relating to it.

26. The Governor will be assisted by a Staff-officer, not under the rank of Captain, who will be secretary and treasurer, and have charge of the records correspondence and accounts of the establishment, and make all local payments connected therewith, and receive the contributions for the cadets. This appointment will be for seven years, with power of re-appointment.

27. The cadets will form one company under a Captain, assisted by four Lieutenants, charged with the discipline out of studies and the drill, one of whom will be Adjutant and Quartermaster.

28. The Professors and Instructors may be either military men or civilians.

29. The Professors and Instructors will have certain limited powers of punishment, within and without the halls of study, at the discretion of the Governor, to whom they will report all punishments which they may inflict.

30. The Chaplain will be specially appointed by the Secretary of State, and will give instruction in classics.

31. The tenure of office of the Professors and Instructors is regulated by the following article of the royal warrant of 27th December 1870:—The Professors and Instructors at the Royal Military Academy shall be appointed for six years, with power of re-appointment. Their term of office shall not continue after the age of fifty-five, unless an extension be specially recommended by the Governor and approved by the Secretary of State.

32. No Professor or Instructor will be permitted to give private instruction to a cadet, either during the vacation or at any other time, or be allowed to prepare candidates for admission to the Academy.

33. The Governor will have the absolute power of rustication and removal, and also of sentencing a cadet for misconduct to lose places in the list of successful candidates for commissions; when expulsion is necessary, the case will be referred to the Secretary of State through the Field Marshal Commanding-in-Chief.

34. The name of any cadet expelled for misconduct will be recorded in the office of the Field Marshal Commanding-in-Chief, and will be made known to the First Lord of the Admiralty, and to the Secretary of State for India, in order to prevent his being admitted into her Majesty's naval, military, or Indian service.

35. A sword will be given at each final examination as a special reward for excellence in conduct.

36. The Governor will cause registers to be kept of all serious punishments awarded, and of the offences which have caused them.

37. He will inspect accounts of every description connected with the Academy, and certify those which require it.

Course of Instruction.

38. The length of the course of instruction will be two years and a half.

39. If any cadet fail to come up to the required standard at two examinations, or be found unable to qualify in his studies for a commission within three years, to be counted from the commencement of the term in which he first joins, or to acquire a sufficient proficiency in military exercises, he will be removed. No extension of the above period of three years will be granted on account of absence from any cause excepting illness. Cases of protracted absence on account of illness will be specially referred for decision to the Secretary of State for War through the Field Marshal Commanding-in-Chief.

40. The following subjects will form the course of obligatory studies:—(1) Mathematics, including a thorough knowledge of plane trigonometry; practical mechanics, with the application of mathematics to machinery. (2) Fortification, field and permanent; such a course as is suitable to cadets qualifying for the Artillery, and the requisite amount of geometrical drawing. (3) Artillery; such a course as is suitable to cadets qualifying for the Engineers. (4) Military drawing, with field sketching and reconnaissance. (5) Military history and geography. (6) French or German, at the student's choice. (7) Elementary chemistry and physics. (8) Drills and exercises.

41. In addition to the obligatory course, every cadet will be allowed, at his option, to take up certain voluntary subjects, viz.:—(1) Higher mathematics. (2) Higher portions of fortification. (3) Any of the following languages:—German or French, Italian, Russian, Spanish, or Hindostanee. (4) Free-hand, figure, and landscape drawing. (5) Higher chemistry. (6) Latin and (7) Greek; instructions in these subjects to be given by the Chaplain.

42. Marks will be assigned to the obligatory sub-

jects of instruction in the following proportions: Mathematics and mechanics, 7; fortification, 7; artillery, 5; military drawing and reconnaissance, 6; military history, etc., 3; one modern language, French or German, 2; elementary chemistry and physics, 2; drills and exercises manual, platoon, and company drill, ½; gymnastics, ½; riding and sword exercises, ½; artillery, 2; total 31½.

43. The voluntary subjects shall be valued as follows:—Higher mathematics, 5; higher fortification, 3; Latin, 2; Greek, 2; any of the following languages—French or German, Italian, Russian, Spanish, or Hindostanee, 2; freehand, figure, and landscape drawing, 2; higher chemistry, 2.

44. No obligatory subject shall gain a cadet any marks unless he obtain a minimum of one-half the marks in it.

45. No cadet will be ensured a commission unless he qualify by obtaining at least one-half marks in the obligatory course in mathematics and mechanics, fortification, and artillery, and one-half of the total aggregate of the marks allotted to all the obligatory subjects.

46. No voluntary subject shall gain a cadet any marks unless he obtain a minimum of at least one-third of the marks assigned to that portion of it in which he is examined. The marks gained in the voluntary subjects will be added to those obtained in the obligatory subjects to make a second total, according to which cadets shall be finally placed.

47. The periodical examinations will be entirely conducted by examiners independent of the Academy the whole of the marks except those reserved for note-books and drawing being allotted according to their results.

Staff of the Establishment.

48. The following will be the Staff of the establishment:—Governor, Secretary and Treasurer, Captain commanding company, 3 Lieutenants, Adjutant and Quartermaster, Medical Officer, Chaplain, 4 Professors and Instructors of mathematics and mechanics, 4 Professors and Instructors of fortification and geometrical drawing, 2 Professors and Instructors of artillery, 4 Professors and Instructors of military drawing, etc., and Professor and Instructor of military history and geography, 2 Professors and Instructors of French and German, 1 Professor and Instructor of figure and landscape drawing, and 1 Professor and Instructor of chemistry.

49. The pay and allowances of the officers are regulated by the following articles of her Majesty's warrant of the 27th December 1870:—The pay of the officers of the Royal Military Academy shall be as follows:

Governor, £1500 yearly, inclusive of all allowances except quarters, and in addition to his unattached pay as a General-officer or his pay as Colonel Commandant of royal artillery or royal engineers, in the event of his holding such rank; Secretary and Treasurer, not of lower rank than Captain, £400 yearly, inclusive of all allowances except quarters, and in addition to regimental pay; Captain of company, 12s. daily, and regimental pay (also forage allowance for one horse, quarters, fuel, and light, and 2 soldier servants); Lieutenants, each 4s. daily, and regimental pay (also quarters, fuel, and light, and 1 soldier servant); Adjutant and Quartermaster, 5s. daily, and regimental pay as Lieutenant (also quarters, fuel, and light, forage allowance for 1 horse, and 2 soldier servants); Surgeon, according to his rank in the Army Medical Department; Chaplain and Classical Instructor, £400 yearly, and quarters, fuel, and light; Professor of mathematics, if a civilian, £550 to £700 yearly, by a triennial increase of £50; Professor of mathematics, if an officer, £550 yearly, without increase; Instructors of mathematics, if civilians, £350 to £500 each yearly, by a triennial increase of £50; Instructors of mathematics, if officers, £450 yearly, without increase; Professor of fortification, £550 yearly; Instructors of fortification and geometrical drawing, each £450; Professor of artillery, £550; Instructors of artillery, £450; Professor of military drawing, £550; Instructors of military drawing, each, £450; Professor of military history, £500; Professor of French, £350; Professor of German, £350; Professor of landscape drawing, £350; and Professor of chemistry, £400.

The above scale of pay (and allowances) shall include all remuneration of every kind except any additional pay, beyond his ordinary regimental pay, to which an officer may be entitled by brevet rank or as a reward for distinguished service in the field, and no person hereafter to be appointed to any of the above appointments shall be entitled to pension or superannuation allowance for services in such appointment.

50. The appointments of Military Professors and Instructors are open to officers of all ranks.

51. No person whatever belonging to the Royal Military Academy is to receive a present from any cadet, or from the relations or friends of any cadet.

52. Commissions as Lieutenants in the royal artillery or royal engineers will be conferred upon candidates who qualify in accordance with Pars. 39 to 45.

53. The commissions of such Lieutenants as are recommended by the Governor of the Academy, and afterwards pass through their practical course at Woolwich and Chatham in a satisfactory manner, will be antedated 6 months.

ROYAL MILITARY ASYLUM.—An Educational Government Institution at Chelsea, near, but wholly distinct from, the Royal Hospital for pensioned soldiers. Its object is the suitable education for trade, etc., of 500 male children—generally orphans—of British soldiers. For these there are a model school and an infant school, and the boys have a complete military organization, with scarlet uniform, band, etc. As a result of their training, a large proportion of the pupils ultimately volunteer into the Army. The School was originally established in 1803 by the late Duke of York, whence it is still commonly known as the "Duke of York's School." Originally a similar school for soldiers' daughters was included but was not found to answer, and has been discontinued. Attached to the School is a training establishment for military schoolmasters, known as the Normal School. The total cost of the whole Institution is about £11,500 per annum.

ROYAL MILITARY COLLEGE AT SANDHURST.—

1. The Royal Military College is maintained for the purpose of affording a special military education to Sub-lieutenants of cavalry and infantry recently appointed, and to successful candidates in the competitive examinations for commissions.

2. The number of Sub-lieutenants admitted to the College will vary according to the requirements of the service.

3. The dates of admission will be the 10th of February and 10th of September in each year.

4. The College terms will be—(*a*) from the 10th of February to the 30th of July, with suspension of study during a fortnight at Easter; (*b*) from the 10th of September to the 15th of December. The intermediate periods will constitute the vacations.

5. The Commander-in-Chief will be the President of the Royal Military College.

6. The College will be under the command of a Governor, who will be solely responsible for discipline and for the general superintendence of the studies.

7. He will be assisted in the arrangement of the studies by a Board, composed of the Professors or Senior Instructors of the different branches. The head of each branch will have the general power of supervision and inspection over the studies in his department, with the duty of reporting on them to the Governor.

8. The Governor will be assisted by a Staff-officer, who will be responsible in his temporary absence for the charge of the establishment. This officer will

have the custody of the records and the correspondence of the College, and will give the Governor such assistance as he may require.

9. The Quartermaster will perform the duties of Acting Commissary.

10. The Sub-lieutenants, being commissioned officers, are under the Mutiny Act and Articles of War, and must conform to her Majesty's regulations in all respects. While resident at the College, they will be subject to such rules and regulations as are, or may be from time to time, established for the maintenance of good order and discipline.

11. The Governor will have the power of removing for a period not beyond the corresponding period in the next term any Sub-lieutenant guilty of insubordinate or ungentlemanlike conduct, or of repeated acts of irregularity, and will report the circumstances to his Royal Highness, the Field Marshal Commanding-in-Chief.

12. Sub-lieutenants reported for habitual inattention to their studies, or failing to pass satisfactorily through the probationary examination at the end of their first term, will be specially brought under the notice of his Royal Highness, with a view to their cases being considered as to the necessity of removal from the College.

13. In cases requiring more serious notice, a student if commissioned, will be liable, on the report of the Governor to his Royal Highness, to be removed from the service, or, if not commissioned, to be removed from the list of candidates awaiting their commissions.

14. Sub-lieutenants who misconduct themselves during their residence at the College will be liable to the forfeiture of the antedate to which they would otherwise be entitled in accordance with Par. 28. They will also, if temporarily removed from the College for misconduct, be liable, under the provisions of the royal warrant of the 15th of February, 1875, to the forfeiture of pay for such period as the Secretary of State may direct.

15. The Sub-lieutenants will be distributed in divisions of not less than 25, each division being under the immediate charge of one of the Professors or Instructors selected by the Governor.

16. The officers of divisions will be the channel of communication on all subjects between the Sub-lieutenants and the Governor. They will mess with their divisions, and will exercise a general superintendence over them, for which they will be responsible to the Governor.

17. During the hours of study the Sub-lieutenants will be under the charge of the Professors and Instructors, to whose orders they will be required to pay implicit obedience.

18. Sub-lieutenants will salute the Governor and Assistant to the Governor on all occasions, whether in or out of uniform, and the Professors and Instructors when on duty, on parade, or when under instruction.

19. The Sub-lieutenants will be required to appear at all times in uniform, except when on leave of absence, or otherwise exempted by the Governor.

20. The study undress may be worn at all times when Sub-lieutenants are under instruction, with the exception of riding or parade, when they will wear their undress uniform. The forage cap will be worn with the study undress.

21. The course of instruction for each Sub-lieutenant will last during two terms. The following will be the subjects of study:—(*a*) Queen's Regulations and Orders for the Army, regimental interior economy, accounts, and correspondence; (*b*) military law; (*c*) the elements of tactics; (*d*) field fortification, and the elements of permanent fortification; (*e*) military topography and reconnaissance; (*f*) infantry and field artillery drill, riding, and gymnastics.

22. At the end of the course the Sub-lieutenants will be required to pass an examination in the field and on paper, and those who pass the examination will be gazetted to regiments in which there may be vacancies for Sub-lieutenants, with a view to their completing the period of service required before they can be promoted to the rank of Lieutenant.

23. On the pass list of the examination prescribed in the foregoing paragraph, Sub-lieutenants will be placed in one of the three classes, according to their proficiency, as shown at the examination.

24. The examination will be qualifying, not competitive, and the candidates will be arranged alphabetically in each class.

25. The standard of qualifications for the respective classes will be decided upon from time to time by the Secretary of State for War, and announced to the Sub-lieutenants at the commencement of their course.

26. Marks will be allotted to the subjects in the following proportions:—Queen's Regulations, etc., $1\frac{1}{2}$; military law, 2; elements of tactics, 3; fortification, 3; military topography and reconnaissance, 3.

27. In tactics, fortification, and military topography and reconnaissance, one-fourth of the marks will be reserved for notes and drawings done during the course.

28. In accordance with the power vested in the Secretary of State by Art. 3 of the royal warrant of the 30th October, 1871, he has decided that the Lieutenants' commissions of officers who pass in the 1st class will be antedated two years; and those of officers who pass in the 2d class, 12 months. No antedate will be granted to officers who pass in the third class.

29. Every antedate will date back from two years subsequent to the date of the original commission as Sub-lieutenant. No commission as Lieutenant will be granted until the officer has served two years as Sub-lieutenant.

30. Under the provisions of that portion of Art. 3 of the royal warrant of the 30th of October, 1871, which is amended by the royal warrant of the 30th of January, 1875, Sub-lieutenants may be removed from the service if they fail to pass the examination at the Royal Military College within two years from the date of their commissions as Sub-lieutenants. They will be allowed to be re-examined once, at the Military College, provided two years from the date of their commissions as Sub-lieutenants shall not have expired.

31. In order to ensure due diligence during the whole period of residence, there will be a probationary examination at the end of the first term in the work of the term. No Sub-lieutenant will be permitted to reside for more than one year at the College, except in cases of protracted illness, or long absence from any unavoidable cause, or his being prevented from unavoidable cause from undergoing the final examination.

32. The mess-rooms, ante-rooms, and quarters of the Sub-lieutenants are furnished in all essentials by the government; plate, linen, and china, and every article of mess equipment, are supplied by the government, and no contributions on those accounts will be required from Sub-lieutenants.

33. The messes will be conducted in every respect like a regimental mess, with strict regard to economy.

34. All unmarried officers of the College will be required to mess with the Sub-lieutenants. Those officers who are married will mess with the Sub-lieutenants if required to do so by the Governor.

35. Sub-lieutenants will provide themselves, before they join the College, with the prescribed uniform, and with the books and instruments required for their instruction.

36. Sub-lieutenants will pay for their messing and washing. The amount due from each officer for his messing and washing will be paid by him monthly to the Paymaster of the College.

37. All Sub-lieutenants will be required to contribute a certain sum monthly to meet the expenses of a special laundry which has been found to be requisite.

38. No person whatever belonging to the Royal

Military College will receive a present from any Sub-lieutenant, or from the relations or friends of any Sub-lieutenant.

ROYAL REGIMENT OF ARTILLERY. A battalion usually comprises 8 companies. At a time when the number was 18,000, the regiment comprised 119 companies and troops, averaging somewhat over 150 men each. At other times, the companies have varied from 130 to 200 men each. The companies and battalions of foot-artillery are designated by ordinal numbers, such as '6th company, 12th battalion;' the troops of horse-artillery are designated by letters, such as 'D troop.' There are nominally, 5 officers for each company and troop; but some of these are usually absent on staff or brigade duties. In battles and sieges, a *brigade* of this artillery usually consists of either two or three companies, attached to a division of the regular army. Each company with its quota of guns and stores of all kinds, constitutes a *field-battery;* and each troop with its quota, constitutes a *horse-battery.* It has been proposed to abandon the terms *company* and *troop* altogether, as being properly applicable only to infantry and cavalry, and to use only the term *battery;* but this change has not yet taken place. Among the officers of the Royal Artillery, there are no Majors, Ensigns, or Cornets; equivalent services are rendered by officers otherwise designated. The men are chiefly classified as gunners and drivers.

The Army Estimates for 1859–60 will afford pretty correct information concerning the present state of the Royal Artillery.

Royal Foot Artillery.	
Commissioned Officers	918
Non-commissioned Officers	1,785
Rank and File	22,351
Royal Horse Artillery.	
Commissioned Officers	78
Non-commissioned Officers	148
Rank and File	2,120
Total,	27,400

Of this number, 8707 are placed at the disposal of the East Indies, to be paid for out of Indian revenues. There were also voted 5368 horses for the foot-artillery, and 1880 for the horse.

ROYAL SCOTS.—The regimental title given to the 1st Regiment of Foot. It is supposed to be the oldest regular corps in Europe; the men originally came from Scotland, and entered the French army, but afterwards returned to England in 1633, during the reign of Charles I., and then received the title of Royal Regiment of Foot.

ROYAL SMALL ARMS.—The following arms, etc., are manufactured at the Royal Small-arms Factory: 1. Martini-Henry rifles and carbines. 2. Triangular bayonets. 3. Sword-bayonets of various patterns. 4. The Enfield breech-loading revolver. 5. Lances. 6. Leather scabbards for triangular and sword bayonets. The details of the Martini-Henry system and the principal features of the Enfield revolver have been set forth in the articles Martini-Henry Rifle and Enfield Breech-loading Revolver. Inasmuch as these arms differ in many points of fabrication from the usual processes and operations employed in manufacturing small-arms, we herewith give a detailed description of the fabrication of the Martini-Henry rifle:

The barrel is made of soft or mild steel prepared by the "Siemens-Martin" process, this metal having been found to be of a very uniform nature. The barrel bars or molds are obtained by contract in lengths of 15 inches, the diameter for rifle bars being 1½ inch. The barrel bar is heated to a white heat and passed through the barrel rolling-mill, which consists of ten pairs of rolls arranged alternately horizontally and vertically, when it is drawn out in one heat to the full length required (about 36 inches), taper in form, and solid. It is next passed to the Ryder forging machine, where the "Knox form" is forged on the breech end and the barrel cut to length, then passed through a straightening machine, examined for straightness, and viewed as finished forged. The ends of the barrel are clamp-milled for size and length, and then drilled up about 1½ inch at each end, the diameter of the holes drilled being 0.430 inch. This operation is called "entering the bore," and is very carefully tested to see that

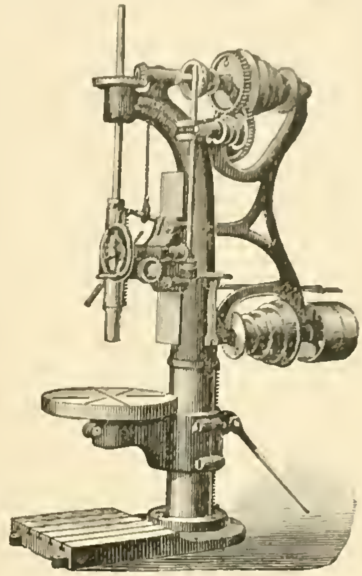


Fig. 1.

the starting of the bore is true and correct. The barrels are now ready for drilling.

The barrels while being drilled are placed vertically in a machine, Fig. 1, where they revolve with a speed of 300 revolutions per minute, the holes already made at each end acting as guides for the set of three drills used in this operation. The method of using these drills insures a long hole of small diameter being drilled perfectly true, and until this method was tried and adopted this was found to be a most difficult task: The drills consist of, first, "the core-drill," for roughly cutting away the metal. This is run in half an inch, when the barrel is taken out and emptied of swarf or cuttings by placing it over a jet-pipe, when a strong stream of washing liquor thoroughly clears out the bore. Another half inch is drilled in the same manner, and the bore again washed out. The second drill or half-round bit is now used. This drill is 0.430 inch in diameter, and having only a cut of 0.05 inch to make in clearing the hole, is run down the one inch the core-drill has cleared without any risk of deviating from the truth. The barrel is then again washed out and No. 3 drill made use of. This has a stock fitting the hole already bored, and ending in a small $\frac{3}{16}$ inch drill, which, being supported by the stock, drills away the center perfectly true with the axis of rotation, ready for the "core" or "roughing drill" to start again. If this system is rigidly carried out inch by inch it is possible to drill a hole three or four feet deep with an error of less than 0.005 inch. A set of drills consists of these three just described, and three sets of different lengths are used. When one-half of the barrel has been drilled, it is turned end for end, and the operation repeated until the holes meet in the center. This system of drilling originated at the Royal Small-arms Factory, and is not in extensive use elsewhere.

After drilling, the hole is broached out with long square bits, on one side of which a strip of oak is placed. Long strips of writing paper are evenly placed between the strip and bit, one upon another, and the bit is run through the barrel until the hole is broached out to the required diameter. This operation is more of a burnishing character than a cutting one, producing a fine, clear, polished surface, down which a shade is readily thrown by holding the barrel at the proper angle to the light. As shadows thrown off straight surfaces are projected in straight lines on any true surface on which they are thrown, the eye can be taught by practice to detect any inaccuracy in the bore of a barrel by the appearance of the edges of the shadow thrown down it. In order to insure absolute certainty that no barrel should be passed on for the exterior to be turned which had not the bore perfectly true, the following mechanical test has been devised, viz: A steel rod is stretched taut between two horizontally fixed head-stocks, having a collar in the center and at one end, which fit the bore loosely, so that the barrel can freely revolve on the rod. If the bore is straight, the end of the barrel where there is no collar on the rod will run perfectly true; but if not straight, it will revolve eccentrically, and its motion is easily detected by any unskilled person. Every barrel is passed through this test before the exterior is commenced upon. The bore is also tested for size by the collars on the rod.

The next operation is to support and hold the bore true while the outside is turned perfectly concentric with it. After a number of experiments to find out a means of fixing a *true turned bush* or collar on a rough exterior, the present method of running sulphur in a liquid state between the barrel and bush was adopted. By this means the exterior of a barrel can be turned perfectly true with the bore without injury to the inside. The barrel is placed vertically, when two plugs, whose centers coincide with the axis of the barrel are placed in the breech and muzzle; the bush is then held over it and melted sulphur is poured in between barrel and bush. This gives a bearing for the outside perfectly true with the bore. The barrel is next rough-turned, finished-turned, draw-polished, gauged, chambered for proof, and screw-thread cut in breech end, to take the "butts" used to close the breech during first proof. This system of turning a barrel enables its exterior to be brought to a definite size, and is greatly superior to the old method of grinding barrels on a large stone and afterwards striking them up. The barrels now undergo the first-proof test which is necessary in order to detect inferior quality of metal and flaws which do not appear on either the exterior or interior surfaces. The first-proof charge is 7½ drams of

sawn to length and brazed on. The barrel is now finished-bored and set, and is then ready for rifling.

The rifling is done with a cutter having a head of suitable form for the rifling required. This is fitted into a groove cut in a box about eight inches in length and fitting the bore. It is drawn through the barrel by a rod fastened to one end of the cutter box, the other end of the rod being coupled into the spindle of the head-stock or traversing saddle. On the spindle is a pinion geared into a sliding rack carried by the same saddle. The end of the rack is fitted to slide backward and forward along a fixed bar, which can be set at any angle necessary to rotate the spindle and cutter box to the amount of spiral required. From four to five cuts are needed for each groove, and the cutter is fed up by a screw tapped into the end of the cutter box, to which a rod is attached, which works through the center boss of a hand wheel. A spiral groove is cut along this rod, in which a feather fixed in the boss of the hand wheel slides, enabling the feed-screw to be screwed in or out by the hand wheel as required. An index is connected with the hand wheel, enabling the operator to read off the depth of cut. The barrel is fixed in a rotating chuck, which is divided so that any number of grooves required can be cut inside the bore. The rifling is of uniform twist of 1 in 22 inches, or one and a half turns in the length of bore (33 inches). The form of rifling is that known as the "Henry rifling;" the grooves are seven in numb r, and are 0.007 inch in depth.

The barrel is suspended inside a hollow rotating spindle by a plug inside the muzzle end, running on a plug fixed in headstock at the breech end. A guide-screw is securely fixed on the rotating spindle, and carries a nut fixed to traversing tool-holder, which holds a peculiar form of chasing tool. The teeth for cutting the screw-thread on the breech end are on the under side, so that, being set over the top of the rotating barrel, it can be lifted in and out of the thread which is being cut, in the shortest possible time and distance, without chopping the thread. The screw being entirely finished, the barrel is then driven from it, while the breech end of it is chambered up for the cartridge. The entire operation of boring and reaming is performed in the lathe represented in Fig. 2. The barrel is now breeched up to body, the action assembled for proof, and the rifle undergoes the second-proof test. The second-proof charge consists of 5 drams of powder, a bullet weighing 715 grains, and a cork made half an inch

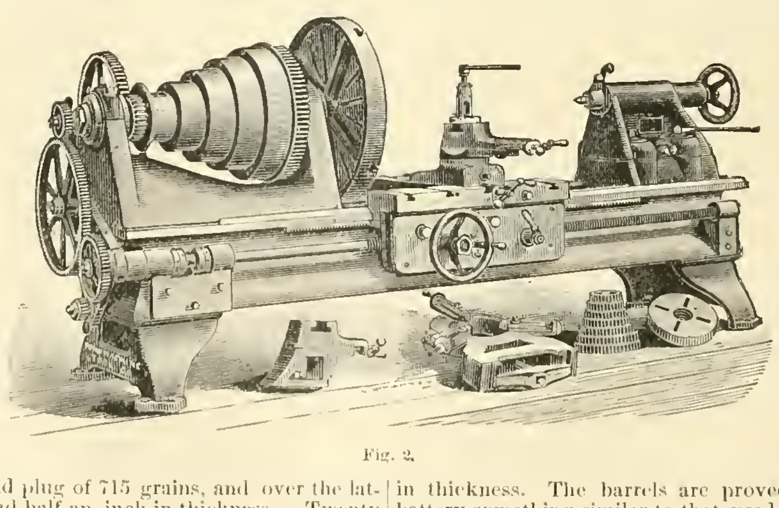

Fig. 2.

powder, a lead plug of 715 grains, and over the latter a cork wad half an inch in thickness. Twenty barrels are proved at the same time in a cast-iron proof battery.

The seat for the front sight is next cross-milled and dove-tailed, and the steel for the front sight is

in thickness. The barrels are proved in a proof battery something similar to that used for the first proof.

The back sight-bed is soldered on to the barrel, and also secured in its place by two screws. Both the back sight and front sight are adjusted and regulated from the axis of the bore, and when viewing the barrels for sighting the greatest care is taken to see that both sights are exactly in position. The body and barrel are browned separately, the following being the browning mixture at present in use:

Spirits of wine	5 ounces.
Spirits of nitre	8 "
Tincture of steel	8 "
Nitric acid	4 "
Sulphuric acid	3 "
Blue vitriol	4 "
Water	1 gallon.

The process is as follows: The barrels and bodies are first scalded in a solution of soda for twenty minutes and are then washed in a clean water. The browning mixture is applied, and they are placed in a damp heat for about one and a half hours, when they are scalded again, and when cool the rust is scratched off. This process is repeated four times, and then the barrels are cleaned off and oiled. The whole operation of browning requires about eight hours.

The body which is to contain the breech action is made from a specially tough class of mild steel. Bars of this metal, 4 or 5 feet in length and 2 inches by 1½ inch in section, are obtained by contract. The body is blocked direct off the end of the bar by five blows under a 15-cwt. steam-hammer. The first blow gives a rough figure, and measures off the quantity of metal required. The second blow fullers in the sides of the body, to displace the metal when working the hole through it. The third blow, by means of a chisel in

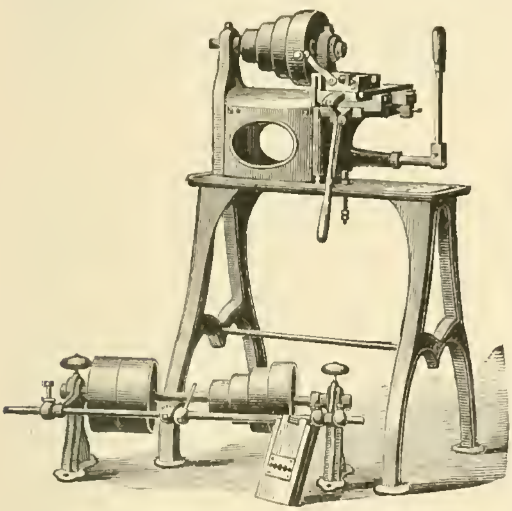

Fig. 3.

the upper die, splits the metal in the center, driving out the sides of the body to fill the die, and leaving the impression of the hole to be made through the body full size at the top. The fourth blow drives a full-sized drift, placed in the hole just made by the chisel, clean through, shearing down the sides, and driving through the small piece left at the bottom of the hole. The hole made through the body is now 3 inches by ⅞ inch by 2¾ inches, and the metal wasted is only 3½ oz. in weight. The fifth blow cuts the body off the bar. A mandrel is now driven in the hole, and a blow is struck upon the ends to square them up, when the body is ready for stamping. The body is reheated and a cold steel mandrel driven into it, when it is at once placed under a powerful steam-hammer. On the anvil of this hammer is the lower die of a pair, the impression cut in the pair of dies being that of the finished size of forged body. One heavy and sudden blow is given, with force sufficient to make the metal flow into every corner of the impression. If this is not done at the first blow, it cannot with safety be attempted by a second blow without reheating, as the surplus metal flows over between the faces of the dies in the form of a thin fin, chilled and black, and this would swallow up itself the force of a second blow and perhaps split one of the dies. The body is next annealed, scale pickled off, fin-trimmed, and passed as "finished forged."

The hole in the body is first drifted out by means of long slightly tapered drifts, which are drawn through it, and the hole produced in this manner is used as a starting point for all the subsequent operations. After drifting, four bodies are placed on a revolving cross-shaped fixing, the arms of which exactly fit the holes in the bodies, while a transverse slide carrying two tool-holders, one on each side, turns up both sides of the four bodies at one operation. This operation leaves the sides of the body equal in thickness and true with the center hole. Twelve bodies are next fixed on a revolving head, and the barrel ends are all cut square and true, the stock ends being treated in the same manner. The hole for the barrel is then drilled, tapped, and the burr thrown up by the tapping is smoothed down. The face is eased, so that when a gauge is screwed in it stands exactly true. The body is now placed in a drilling jeg, and the adjusted face is screwed tight up against a rib in the jeg, while the six axis holes of various sizes are drilled, three in each side. The drills run through hardened steel bushes fixed in the sides of the drilling jeg. These axis holes, after being tested for accuracy, become, in conjunction with the large hole in the body, the base points for the remaining operations.

A number of drilling-machines now operate to cut away the metal so as to form the socket to receive the stock butt. The hole is drilled and tapped to receive the screw end of the stock-bolt, which secures the butt in the socket. Pins in the axis holes in the left side of the body, hold it while the knuckle seat for breech-block is roughly cut out and the seat milled out square and true. A number of minor milling, drilling, and tapping operations bring the body into the shape and figure required, and it is then screwed on, or "breeched up," to the barrel. The barrel is now placed vertically with the end of the chamber resting on the collar of a plug, which enters and exactly fits the chamber, and the face of the barrel is drawn very tightly down on this collar by means of plugs pushed through axis holes in the body. Small mills are now run on a spindle through the block axis-hole and finish cutting out the knuckle seat of the block to a positive length from the face of the barrel. This length between the knuckle seat of the block and the face of the barrel is rigidly maintained, so as to insure that any block will interchange or fit in any body. In order to insure that this may be the case, each breeched-up barrel and body is accurately gauged with hardened steel gauge-blocks. Care is also taken to see that the striker hole, in the face of the gauge-block, coincides with the axis of the bore of barrel to insure the cap of the cartridge being struck in the center. The barrel and body are now passed on for assembling the action for second proof.

A particular form of emery wheel, called a "rim wheel," is employed for finishing up some of the components. Its use has enabled unskilled labor to take the place of a high class of skilled workmen, and the work is better finished. For instance, the slot of the back-sight leaf is first drifted to its true size. By this it is held in a fixing attached to a vertical axis, and both edges with cap attached can be passed across the face of the rim wheel, maintaining it perfectly true, and grinding the edges of the leaf and cap parallel to each other. The sides are done in the same manner. Having given a description of the processes of manufacture for the barrel, and body, it will be unnecessary to describe the manufacture of the other components. The method pursued in the manufacture of all is precisely that followed in the case of the body. All the parts are first of all forged in dies, the fin is trimmed off, they are pickled to remove scale, and then undergo numerous milling, drilling, and other machine operations until they are brought to the correct figure, when they are viewed, gauged, and either case-hardened, browned, blued, hardened, and tempered, etc., as the case may be. The barrels of carbines and pistols are treated in the same manner as the rifle barrel. In order to insure an absolute interchangeability of the various parts the most exact system of gauging is a necessity, and the strict view which is enforced prevents the possibility of any defective parts being assembled in an arm.

The blade of the triangular bayonet is made of tool or sharp steel, the socket of mild steel, the locking ring of wrought iron, and the locking-ring screw of steel. The blade and socket are welded together; the blade is tapered under a Ryder hammer, and then rolled out in segmental rolls to the required length

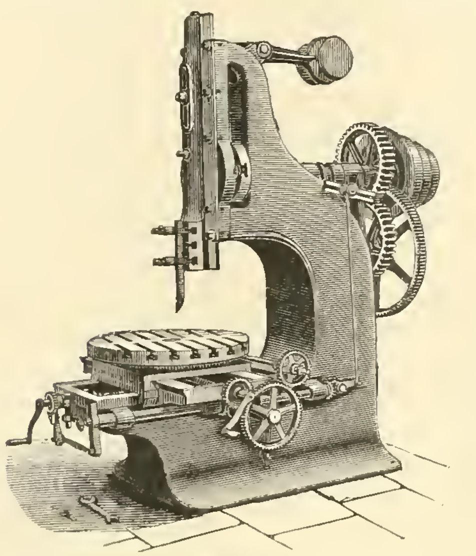

Fig. 4.

and a triangular figure. The socket is stamped to size and then goes through several machine operations, such as drilling, milling, slotting, etc. The blade is hardened and tempered, ground and polished, the socket being browned. The locking-ring is well blued, and its screw is case-hardened. The breech-block, lever, butt-plate, and iron screws are case-hardened. This is done by carefully packing them in iron boxes, in which they are surrounded with bone cuttings or animal charcoal. An iron plate is laid on the top of the box, and it is placed in a furnace and raised to a red heat. The length of time that the various articles are left in the furnace depends on the amount of case-hardening required; and when removed from the furnace they are chilled in a tank of cold water. They are then cleaned, oiled, and examined by gauges to ascertain whether the case-hardening has altered their form. The following components are hardened by being raised to a certain temperature and then cooled in oil. They are afterwards tempered by "blazing," that is by heating them again until the oil or suet with which they have been covered bursts into a flame: Striker, main-spring, indicator, extractor, sight-spring, catch-block spring, trigger-spring, block-axis pin, extractor-axis, sight-slide, and steel screws, etc. The following components are blued: Upper and lower bands, upper and lower band-pins, guard and band swivels, fore-end hook-screws, sight-leaf, lever catch-block and pin, guard, nose-cap, the rod-holder, etc. They are polished, cleaned with lime to remove all grease, and are then covered with powdered charcoal and raised to a temperature of about 550° Fahrenheit.

A milling-machine and a screw-head slotter combined, arranged for taking the short milling cuts, is shown in Fig. 3. The box-shaped head is placed on a planed iron table, which is surrounded by a groove to catch oil and chips. The cross slide is adjusted by a screw that projects in front, and squared by a wrench. The sliding-table is operated for a hand lever and the motion is gauged by an adjustable stop behind. A vertical movement is communicat-

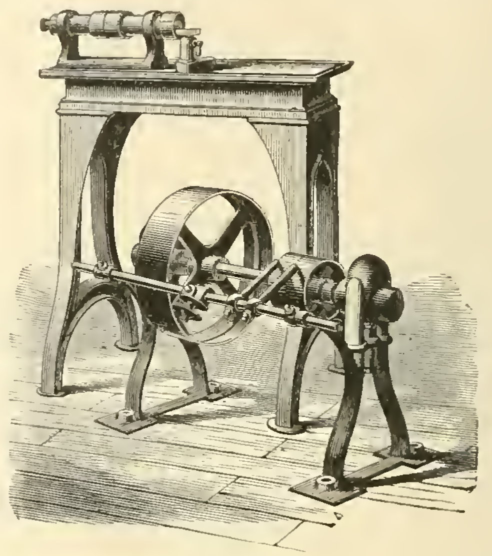

Fig. 5.

ed to the knee slide by means of a rack and gear, operated by a hand lever in front, as shown in the drawing. For slotting screws, a sliding vise is furnished, so arranged that the front or movable jaw tightens on the screw to be slotted by means of two springs under the jaw. The jaw is linked so that it is operated wholly by the hand lever which feeds the vise. With the machine with the lever vertical motion, screws can also be fed up under the saw which greatly increases its capacity. Counter-shaft has adjustable self-oiling hangers. Fig. 4, represents the usual form of slotting-machine, supplied with slotting-bar counter-balances, so as to run without jarring. It is driven by a variable crank, with quick, return motion; has bearing for slotting-bar adjustable vertically, to suit the different heights of work; has compound tables, with circular plate and centering stud; and the feed is self-acting, so as to be perfectly balanced. Fig. 5, represents the screw polishing machine, with bearings so inclosed as to entirely prevent the admission of the emery used for polishing the work. This is the peculiar property of this machine, and being specially adapted for polishing small parts of arms, etc., such as screws, studs, nuts, collars, etc., which are usually finished with oil and emery, its durability is thus secured. The counter-shaft of this machine has a speed of 450 turns per minute. The machines here described together with those illustrated and discussed in the article—Fabrication of fire-arms—will assist the reader in gaining a knowledge of light gun machinery. See *Enfield Breech-loading Revolver*, *Fabrication of Fire-arms*, *Martini-Henry Rifle*, and *Small-arms*.

ROYAL WARRANT.—An act of the Sovereign, authorising, for military purposes, the Secretary of State for War to issue Rules and Regulations for the guidance of the several Departments of the Army. Royal warrants, where the Army is concerned, relate to all matters touching the soldier, his pay, clothing, travelling, food, etc., and are issued from time to time, by the War Office, in Army Circulars, for the observance of all concerned.

RUBBERS.—Strong heavy files, generally made of an inferior kind of steel; they measure from 12 to 18 inches long, from ¾ inch to 2 inches on every side, and are made very convex or fish-bellied. Rubbers are only for coarse manufacturing purposes, when the object is rather to brighten the surface of the work than to give it any specific form. See *File*.

RUBBLE.—A common kind of masonry, in which the stones are irregular in size and shape. Walls faced with ashlar are generally packed with rubble at the back. Rubble is of various kinds, according to the amount of dressing given to the stones. Common rubble is built with stones left almost as they come from the quarry. Hammer-dressed rubble, is so called when the stones are squared with the mason's hammer; coursed rubble, when the stones are squared and equal in height, etc.

RUBEN AND FORNEROD COMBINATION-FUSES.—These two Swiss fuses are alike in principle, and differ only in that the larger one has two tiers of burning composition and is capable of burning 20 seconds, twice the length of time—as a time-fuse—that the smaller one can burn. The fuses consist of three principal parts, the body, A, the inertia igniter, B, and the percussion-fuse attachment, C. A and B constitute the time-fuse. The former is made of an alloy of equal parts of lead and tin, while, B, and C, are of brass. The body, A, is provided on its exterior with a screw-thread by means of which it is connected with the shell; the central cylindrical part is also provided with a screw-thread, into which fits the assembling screw of igniter, B, which binds all the different parts of the time-fuse together.

The body A of the larger fuse (Fig. 1,) is composed of three parts, *a*, *b*, *c*; the upper part *a*, or the

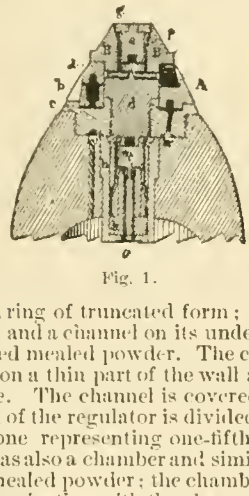

Fig. 1.

regulator, is a ring of truncated form; it has a priming chamber, and a channel on its under side, inclosing compressed mealed powder. The chamber opens externally upon a thin part of the wall and internally upon the core. The channel is covered by a disk of foil. The rim of the regulator is divided into 50 equal parts, each one representing one-fifth of a second. The part, *b*, has also a chamber and similar channel of compressed mealed powder; the chamber opening on top for communication with the channel of *a*, and on the outside for escape of gas, the outside opening being covered with wax. Between, *a*, and, *b*, and glued to the top of, *b*, is a washer of thick cloth, with a small hole through it just over opening to chamber of, *b*. The lower part, *c*, has on its under side a circular channel of rifle-powder covered by a perforated disk of copper—a piece of gauze separates the powder and copper ring; a vertical channel filled with rifle powder allows a communication between powder in, *b*, and the rifle powder in, *c*; separating, *b*, and, *c*, and glued to the top of latter, is a washer of cloth exactly similar to one separating, *a*, and, *b*. The outside rim of this piece is also graduated into 50 equal parts, each one reading one-fifth of a second.

The igniter, B, consists of the parts, *d*, *e*, *f*, and *g*; the stock, *d*, has a cylindrical cavity, at the center of the bottom of which projects a sharp pin-point; four radial holes at bottom of cavity allows the gas from igniter to escape and spread into a circular groove around the outside of the stock; a brass washer separates the hexagonal rim of the head of the stock from the regulator or part, *a*, of the body. At the bottom of the stock there is a cylindrical projecting cup filled with the same composition as that in the igniter, and also covered with a solution of rubber. The cylindrical plunger, *e*, has in the center of its base a recess which contains the fulminate priming, which is believed to be made of five parts chlorate of potassa, one of sulphide of antimony, and one of powdered glass, all coated with a solution of rubber; the crown-shaped spring, *f*, is stamped out of a thin piece of steel; it has four spring leaves; the bottom of the spring is shaped to fit the base of the plunger and to expose the fulminate in plunger; the screw-cap, *g*, closes the top of the stock, *d*; a hole through its center allows the cylindrical projection on top of plunger to pass through and centers the plunger in spring and cylindrical cavity of stock.

The percussion attachment, *C*, consists of five parts, *h*, *k*, *m*, *n*, *o*; the hollow cylindrical stock *h* has a solid bottom, pierced with a small central hole for passage of gas from the fulminating composition into the shell; this hole is closed by a piece of fine netting, or gauze, to prevent the powder in the shell from penetrating fuse-stock or body; a shoulder turned on its exterior fixes its position in the fuse-hole of shell; the cylindrical plunger, *k*, has through its axis a longitudinal channel, at the head of which is secured a sharp steel projecting point; forward movement of the plunger, except upon impact in flight, is prevented by a steel crown-shaped spring, *m*, similar to the one heretofore described. A hollow cylinder, *n*, centers the plunger and is long enough to permit the pin point to reach and pierce the fulminate on impact; the stock is closed by a brass ring, *o*, resting on a shoulder turned in top of stock.

The action of the combination is as follows: Upon the inflammation of the charge, the plunger is thrown back, the spring being compressed, and the plunger, with its fulminate, strikes the metallic point; the gas due to the consequent ignition passes through the openings in the wall of the tube, spreads into the circular groove around the outside of the tube, ignites the priming of the burning column, and thus causes the inflammation of the section of this column in contact with it; inflammation spreads along the

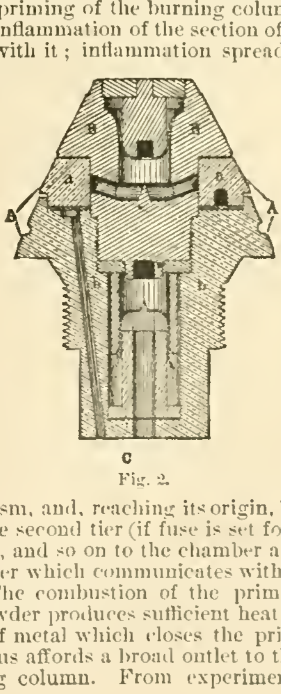

Fig. 2.

burning prism, and, reaching its origin, is communicated to the second tier (if fuse is set for more than 10 seconds), and so on to the chamber and recess of rifled powder which communicates with the powder in shell. The combustion of the priming of compressed powder produces sufficient heat to melt the thickness of metal which closes the priming-chamber, and thus affords a broad outlet to the gas from the burning column. From experiments made in

Switzerland, it is believed these fuses offer entire security against premature ignition, the shells being given the most violent shocks which could be received in transportation, loading, or unloading. The ignition is very certain, even with reduced charges.

Should the fuse strike any resisting object before the burning composition has reached the point to which the time-fuse was set, the plunger or percussion attachment, C, is thrown forward, the spring being compressed, and the pin point pierces the fulminate at base of igniter, B, and the gas resulting has direct access to bursting charge of the shell.

The smaller fuse shown in Fig. 2, has the same general features as the larger; it differs from it in that it has but one layer of composition, which burns 10 seconds. The body, A, is in two parts only; the regulator *a* with its circular groove of compressed mealed powder has on its outside rim 50 equal divisions representing fifths of seconds. The lower part of the, *b*, covers the percussion attachment, C, and has running vertically through one side a hole filled with rifle-powder; this is the channel of communication between burning composition of time-fuse and bursting charge of shell. The conical outside surface of the igniter, B, is roughened to facilitate turning of the assembling screw which binds the different parts of the fuse; by loosening and tightening this screw the regulator is set to the required time. The different parts of this fuse function as those of the larger fuse. See *Fuse*.

RUB-IRON.—A plate on a carriage or wagon-bed, against which the fore-wheel rubs when turning short, is called a *wheel-guard plate* in a field artillery-carriage; one is placed on each side of the stock.

RUFFLE.—A low vibrating sound, which is beat upon the drum, but not so loud as a roll. It is generally performed in paying military compliments to general officers, and at military funerals.

RULE BRITANNIA.—One of the national anthems of Great Britain, which has been described by Southey as "The political hymn of this country as long as she maintains her political power." Its original appearance was in a mask entitled *Alfred*, the words by James Thompson, the poet, and David Mallet, and the music by Dr. Arne, which was performed for the first time on Aug. 1, 1740, before Frederick, Prince of Wales, at his residence at Cliefden. The words of the ode are believed to be the composition of Mallet. *Alfred* was altered by Mallet in 1751, when three stanzas of *Rule Britannia* were omitted, and three others, by Lord Bolingbroke, substituted for them; but it is the ode in its original form that has taken root.

RULE NISI.—In the English and Irish courts of law, is a technical term denoting the first step in an interlocutory application to the Court, such as an application for a new trial. The usual course is for the party who takes the initiative to move, *ex parte*, for a *Rule Nisi*, *i. e.*, an order of the court that something shall be done, *unless* the opposite party, within a certain time, usually three or six days, show cause, *i.e.*, some good reason why the thing proposed should not be done. When the party obtains a rule nisi, he sends a copy of it to the other party, who must then, at the time appointed, show cause, and if the cause is deemed sufficient, the rule is discharged, *i. e.*, the application is refused; if the cause is insufficient, the rule is made absolute, *i. e.*, the opposite party is bound to do the thing asked, otherwise he will be liable to some disadvantage or to imprisonment according to the nature of the subject matter.

RULES OF FIRE.—Those for ordnance which fire horizontally, result from the knowledge of the *mean trajectory*, which, like the mean trajectory of the musket, comprises all the causes of error which can modify the fire; but the trajectory of artillery projectiles being more constant in its form, the results are more accurate, a consequence of the fact that as the caliber of the arm increases, each particular trajectory approaches more nearly the *mean trajectory*.

When *canister* is fired, the balls, having broken the case, escape in the form of a cone, and striking against each other, and against the sides of the piece, diverge more or less according to the distance; but the greater part of the balls are found to be near the center, and the *rules of fire* are still based upon the knowledge of the mean trajectory.

RUMP PARLIAMENT.—In order to bring about the condemnation of Charles I., Oliver Cromwell, on Dec. 6, 1648, sent two regiments, under the command of Colonel Pride, to coerce the House of Commons. Forty-one members of the "Long Parliament" who were favorable to accommodation were imprisoned in a lower room of the house, 160 were ordered to go home, and only 60 of the most violent of the Independents were admitted. The clearance was called *Pride's Purge*, and the privileged members ever afterward passed by the name of the *Rump*, forming, as it were, the fag-end of the "Long Parliament". This assembly, in conjunction with the army, brought about the arraignment, trial, and condemnatian of Charles I. Five years later the "Rump Parliament," forgetting that it was but the creature of the army, attempted to make a stand against certain demands on the part of the soldiers. The result was that Cromwell filled the House with armed men; the speaker was pulled out of the chair, the mace taken from the table, the room cleared, the door locked, and the Parliament declared to be dissolved. Supreme in the three Kingdoms, Cromwell convoked an assembly which assumed the title of Parliament, and acquired from the name of one of its most prominent members, a leather-seller, called Praisegod Barebones, the name of the *Barebones Parliament*. The Barebones Parliament, after subsisting five months, was dissolved, and Cromwell, raised to the dignity of Protector, convoked two Parliaments, and dissolved them for refusing to sanction his measures. On Oliver Cromwell's death, and Richard's succession to the Protectorate, the military Malcontents, coalescing with the Independents in Richard's Parliament, declared the expulsion of the Rump illegal, and restored that Assembly to its functions. With the revival of the Rump, its quarrel with the army revived; and the troops, again surrounding Westminster Hall, expelled it on Oct. 30, 1659, a provisional government of officers assuming the direction of affairs. But the general dissatisfaction having led to a coalition between the Presbyterians and Royalists, the army, unable to carry on the government, was reduced to the necessity of once more restoring the Rump, which had been twice ignominiously expelled. The advance of Monk, however, with the army of Scotland led to a general cry throughout the country for a Free Parliament. A number of the members who had been excluded by Pride's Purge reappearing in the House, placed the Independents in the minority; and on Mar. 16, 1660, the despised and derided Rump at last solemnly decreed its own dissolution. The most prominent members of the Rump Parliament were Vane and Hazlerig.

RUMSEY GUN.—A breech-loading rifle having a fixed chamber closed by a movable breech-block, which slides in the line of the barrel by indirect action, being moved by levers from below. The arm resembles in its general features the Winchester. Its peculiarity consists in having two magazine-tubes, one on each side of the barrel and beneath it. From these the cartridges are fed alternately into the corresponding carriers, which are moved up and down by levers operated by a sliding-rod. This rod is drawn to and from the operator by two thumb-pieces, one of which, for the right hand, is within the trigger-guard, and the other lies along the barrel in a position readily accessible by the fingers of the left hand when supporting the piece in the natural position of firing. The mechanism for communicating this reciprocal motion to the carrier levers, consists mainly of an oscillating lever lying between the other two, and its connections in the form of springs, stops, and pins, which are designed for directing the stroke on each of its sides alternately.

RUN.—The greatest degree of swiftness in marching. It is executed on the same principles as the *double-quick*, but with greater speed. In England, the *Running Drill* forms part of the training of a soldier. It comes under the head of gymnastic training, and is ordered to be carried out in all infantry regiments. The object of it is to make the men supple, active, and capable of bearing fatigue. On alternate days the men run with arms and accouterments.

RUNNING FIGHT.—A battle in which one party flees and the other pursues, but the party fleeing keeps up the contest.

RUNNING FIRE.—A constant fire of musketry or cannon.

RUNNING FUSE.—The running-fuses most used are those known in England as *Bickford's fuse*, and in this country as *Safety-fuse* and *Toy's fuse*. The common fuse ordinarily used in blasting with powder is of this kind. It consists essentially of a column of fine gunpowder enclosed in flax, hemp, or cotton, and made up with different coverings according to the use to which it is applied. When intended for immediate use on light work in dry ground, it is unprotected by additional coverings. When intended for use in wet ground or under water, it is covered with varnished tape or gutta-percha.

These fuses cause ignition by conveying flame to the charge to be exploded. They are somewhat uncertain in their rate of burning, but average about one yard in a minute. The ordinary varieties must be kept in a cool, dry place, and preserved from contact with grease or oil. The gutta-percha-covered varieties are liable to become injured by keeping, from the deterioration of the gutta-percha. Before using, care must be taken that cracking of the gutta-percha has not occurred. They should be able to resist water for twenty-four hours. See *Fuse*.

RUNNING THE GAUNTLET.—A punishment formerly enforced in the English Navy, and which was inflicted also on soldiers. The mode of procedure was as follows. When a soldier was sentenced to *run the gauntlet*, the regiment was paraded in two ranks, facing one another, each soldier having a switch in his hand, and as the criminal ran between the ranks naked from the waist upwards, he was lashed by the soldiers. While he ran the drum beat at each end of the ranks. Sometimes he ran three, five, or seven times, according to the nature of the offence. Happily such a barbarous punishment no longer disgraces that Army or Navy.

RUPTURE OF SHELLS.—When the charge of powder contained in a shell is inflamed, the gases developed expand into the cavity, the expansive force increasing and producing rupture when sufficient to overcome the tenacity of the metal. Rupture will take place in the direction of least resistance, or following the least thickness of metal. If the shell be spherical and homogeneous, and the cavity also be spherical and concentric with the exterior, the surface of rupture must be composed of lines normal to both the interior and exterior surfaces of the shell.

Let R be the radius of the exterior, and r the radius of the interior surface; T, the tenacity of the metal composing the shell, and p, the pressure of the gases on a unit of surface required to overcome the tenacity of the metal.

Let C be the radius of the circle in which the surface of rupture intersects the interior surface of the shell, or the *interior circle of rupture*. The effective pressure exerted on the area of this circle to produce rupture is equal to the sum of the components of all the normal pressures, acting on the spherical segment of which it is the base, taken perpendicularly to the plane of this circle; therefore πpC^2 is the pressure of the gases which tends to break the sphere.

Under this supposition, rupture should follow the surface of the frustum of a cone of which this circle is the smaller base. The surface of this frustum is equal to the difference of the surfaces of two cones whose common apex is at the center of the sphere. The base of the smaller is $2\pi C$, and its slant height r; its surface is therefore equal to πCr. The surface of the larger cone, whose generatrix is the radius of the exterior sphere, being to the smaller as R^2 is to r^2, will be $\pi Cr\frac{R^2}{r^2}$; and their difference, or the area of the surface of rupture, will then equal

$$\pi Cr\left(\frac{R^2}{r^2}-1\right).$$

If the pressure of the gases acted normally to the surface of rupture, or in the direction of the tenacity, this surface multiplied by T would give the total resistance, to which the pressure of the gases should be equal; but it acts obliquely, and to produce rupture should be increased by a quantity which depends upon the angle which the pressure makes with the normal. Denoting this quantity by d, we shall have the relation,

$$p\pi C^2=T\pi Cr\left(\frac{R^2}{r^2}-1\right)+d;$$

or,

$$p=T\frac{r}{C}\left(\frac{R^2}{r^2}-1\right)+\frac{d}{\pi C^2}$$

In this expression, the value of d is unknown, and cannot be practically determined, but it evidently diminishes as the direction of the pressure approaches the normal to the surface of rupture, and when they coincide, d becomes 0. At the same time C increases, and the value of p diminishes, until C becomes equal to r, its maximum value. Therefore, the section of easiest rupture of a hollow sphere passes through a great circle, and the pressure which is *in equilibrio* with the tenacity of the metal, will be given by making $C=r$, and $d=0$, in the foregoing formula, which will then become,

$$p=T\left(\frac{R^2}{r^2}-1\right)=T\left(\left(\frac{R}{r}\right)^2-1\right).$$

When the pressure is less than this value of p, the shell will resist rupture; when greater than this value, rupture will take place.

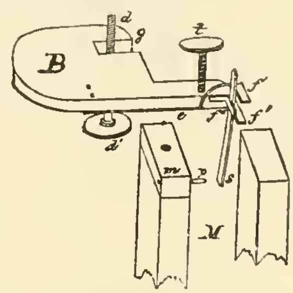
The required pressure being known, the corresponding density will result from Noble's formula,

$$p=14.63\frac{d}{1-ad};$$

this density multiplied by the weight of water that will fill the cavity gives the weight of the bursting charge. See *Projectiles* and *Shells*.

RUSE.—A trick or stratagem. The success of a ruse depends mainly on the Commander's knowledge of human nature in general, and of his opponent's character in particular. Its object is to deceive the enemy as to your designs. If you desire a general action, spread reports of the weakness of your army and appear to avoid one. If the contrary, put on a bold face, and appear desirous to engage. The employment of ruse or stratagem is particularly applicable to operations having for their object the forcing of any long line which it is impossible for an enemy to guard at all points, such as mountain ranges, rivers, entrenched lines, etc.

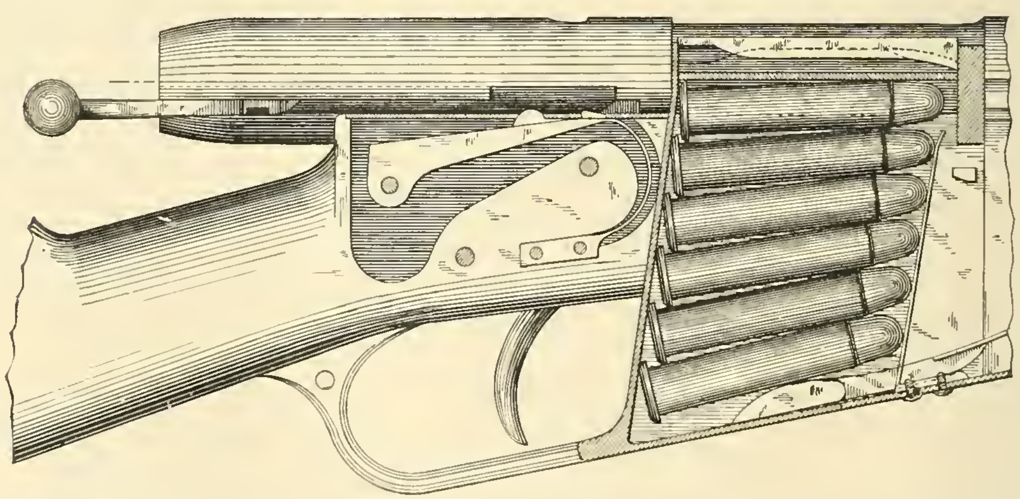
RUSSELL INTERRUPTER.—An electrical interrupter devised by Lieut. A. H. Russell, Ordnance Corps, U. S. Army, for the Schultz chronoscope. The change consists in replacing the detached mercury interrupter now in use by a light metallic spring, which is pressed against the tuning-fork on the inner side of one prong, making the fork its own interrupter when the electrical current is passed through it. The drawing shows the new device. *B*, is a brass plate which is fastened to the table by the screw, *d*, working through the slot, *g*, into the base of the clamp. This screw should have a milled head, as at, *d'*. Riveted or screwed to the plate *B* is an elastic strip, *e*, fitted with a screw, or simply with projections as at, *f'* to hold the spring, *s*. A screw, *t*, works through the plate, *B*, against the strip, *e*, thereby raising or lowering the end of the latter. By this means the spring, *s*, for which a piece of watch-spring may be used, can be pressed against the platinum point, *p*, fixed on the inner side of the counterpoise, *m*, of the tuning-fork. The fork and the spring are connected with the opposite poles of a galvanic battery, and the current is made and broken at, *p*, by the vibration of



the fork. For adjustment the plate, *B*, is slipped under the table and fastened by the screw, *d*, so that the spring, *s*, is just out of contact with the point, *p*. The wires being adjusted, the circuit is completed at, *p*, by a turn of the screw, *t*, and the electro-magnets becoming magnetized draw the prongs apart. This breaks contact at, *p*; the prong flies back and continues to vibrate, the contact being made and broken at every vibration A battery of four Bunsen's cells works the interrupter. The advantages of this device over the old interrupter are as follows: 1. The adjustments are exceedingly simple, and they require but little time, while with the detached mercury interrupter they are very delicate and difficult. 2. The manipulation is very simple and rapid, a mere turn of the screw producing vibration. 3. The use of the mercury cup is entirely avoided. 4. Extra electro-magnets for the interrupter are dispensed with, and the strength of the battery can be greatly reduced. 5. The arrangement is cheap and simple, and not easily deranged This interrupter has been in constant use for several years, and it has been practically and successfully tested with the machine.

RUSSELL MAGAZINE.—This magazine, devised for the Hotchkiss gun, is intended to provide for one continuous supply of the cartridges by the insertion of tin boxes containing five cartridges each in the channel of the butt-stock. Each box contains a spring, which assists gravity in producing a rapid descent of the cartridges. The feeding apparatus is a combination of a ratchet and spiral spring. To the inside of the magazine-tube springs are secured by solder. The oppo ite side of the tube is slotted for the reception of the sliding-bar or ratchet, to which springs are attached in a similar manner. Pivoted to the bar is an arm at the front of which is a projection, over which hooks a corresponding projection on the breech-bolt. When the breech-bolt is withdrawn the arm and ratchet are compelled to move with it until the projection rides under a beveled shoulder at the end of the groove in which it slides, when the arm is released and the magazine-spring returns it and the ratchet to their first position. It will thus be seen that the ratchet is moved automatically, being drawn back by the bolt and returned by the magazine-spring. When the ratchet is withdrawn each spring connected with it passes behind the head of the cartridge next in rear of it; when returned the cartridges are carried forward, the 2d replacing the 1st, which will have entered the chamber, the 3d the 2d, and so on. The magazine carries 9 cartridges.

RUSSELL MAGAZINE-GUN.—This gun devised by Lieut. A. H. Russell, Ordnance Corps, U. S. A., contains many features of novelty. The breech-closing bolt operates by a handle preferably at the side of the arm as in other bolt guns, but instead of a partial rotation of the bolt in locking and unlocking, the force applied to the handle is at all times in a direction nearly parallel with the bore of the barrel. The locking is effected by a cross-shaft in



the bolt a little longer than the diameter of the bolt, having cam-shaped ends which extend into seats in the receiver. In opening the breech these cam projections are turned by the first movement of the handle, which is a pivotal movement, until the bolt is unlocked, when a further backward movement of the handle gives a powerful cam action to start the cartridge, and at the same time slightly starts the firing-pin backward. The final closing movement has the same powerful action to seat the cartridge in its chamber. The magazine feeds the cartridge sidewise, either up through the bottom of the receiver, as in the Lee gun, or at the side of the receiver, and in the latter case a swinging pusher forces the upper one of the column of cartridges sidewise into the receiver in front of the bolt. Lieut. Russell has invented a very simple metallic feed case.

constructed of a single piece of bent sheet metal, which will contain just enough cartridges to fill the magazine of this gun, from which the magazine can be recharged as rapidly as a single cartridge could be placed in the receiver. These feed cases are little if any more costly than paper boxes, and are to be thrown away when empty. Capt. Livermore, U. S. A., has jointly with Lieut. Russell, made improvements in magazine arms, and has also invented a series of breech movements for small-arms. See *Magazine-gun*.

RUSSELL PRISM RANGE FINDER. This instrument is shown in perspective in Fig. 1. A is the prism, B the frame; *a*, *b*, *c*, *d*, and *e* are the apertures for observations; *l*, *l*, *l*, the clamps which retain the prism in place; and *m* is the ring to which the string may be attached. Near each aperture is shown an arrow-mark to indicate approximately the direction in which the observer should look into the prism. The aperture at *a* has two of these marks, the right-hand one for use in connection with the aperture *b* and the left-hand one with the aperture *c*. The aperture *e* is used in connection with *d*, *b* with *a*, and

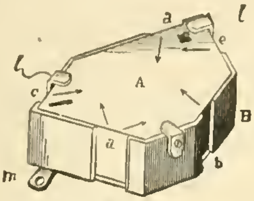

Fig. 1.

c also with *a*. A square, marked on the surface between the apertures *d* and *e*, indicates that they correspond to a right angle, and the acute-angle mark between the apertures *c* and *a* indicates their use together for laying off an acute angle. The apertures *a* and *b* are used together for laying off an obtuse angle. No handle is provided but the instrument is to be grasped by the sides between the thumb and forefinger, usually of the hand opposite the object seen by reflection. The tip of the finger should usually cover the aperture opposite to the one into which the observer is looking, in order to cut off colored rays which might interfere with clear vision. For ins-

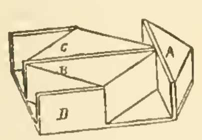

Fig. 2.

tance, while looking through *a* and obtaining the reflection through *b*, the observer should cover *e*; and while obtaining the reflection through *c* he should cover *d*; while looking into *d* he should cover *a*, &c. The proper image to be selected is easily found, as it remains steady, while other images which may be seen move very quickly when the prism is turned horizontally. The principles of reflection are the same as for the Weldon prism.

Three triangular prisms might be substituted for the one six-sided prism, and with this arrangement the method of observation might be learned rather more readily, as there would be no need of covering up the apertures, while the field of view would be somewhat enlarged. Fig. 2, shows such an arrangement: A, B, and C are triangular prisms made on the Weldon principle—A for a right angle, B and C for acute and obtuse supplementary angles respectively. The frame D supports the three prisms. It is doubtful, however, if any real or very great advantage would here obtain over the six-sided single-prism form. See *Nolan Range-finder*, *Pratt Range-finder*, *Telemeter*, *Watkin Range-finder*, and *Weldon Range-finder*.

RUSSENSTEIN SYSTEM OF FORTIFICATION.—This system closely follows Pagan. Only the bastions are very simple. Strong revetments are given to the escarps.

RUSSET LEATHER.—When new, russet leather equipments would be striking, but probably would not accord well with the plainness of our army uniforms. They would be rather conspicuous in the field and easily discolored, presenting an appearance the reverse of military spruceness. When repairs are made the new parts would form a striking contrast to the older ones since there is no blacking in this case to render them uniform in color. When new, russet leather would furnish handsome horse equipments, but the stains incident upon the sweating of the animal, rain, and the spattering of mud could not be easily effaced. Any endeavors to clean such harness would probably result in leaving areas of a murky reddish-brown color.

The question of whether the Army should be supplied with oak or hemlock-tanned leather has been agitated from time to time during and since the war. The government still clings to oak, and nearly all its specifications call for oak-tanned leather, notwithstanding the fact that the greater part of the leather used during the war was bad hemlock, rendered more worthless by attempts to make it imitate oak leather. A large portion of the leather sold to the government since the war has doubtless been hemlock. Of late years the methods of tanning with hemlock bark have improved with astonishing rapidity, and now it is the chief material used. During the past few years hemlock leather has risen greatly in the estimation of consumers. There can be no doubt that as now made it is a valuable product.

There are few Army officers who *know* anything about leather, and it is not possible for Army Inspectors, no matter how great their egotism may be, to detect imitations that defy the skill of expert tanners themselves. Lieutenant D. A. Lyle, U. S. Army, in a report made in 1877, urged that a mixed commission of Army officers, civil or mechanical engineers, and practical tanners be appointed by the government to make a scientific investigation into the relative merits of the several tannages and to determine definitely, if possible, for what purposes the different tannages could be advantageously used. These points should be settled in time of peace, when there is no pressing need for large supplies. See *Harness* and *Leather*.

RUSSIAN ARMY.—One of the chief Continental Armies of Europe. Early in 1870, a new Bill was submitted to the Emperor and the Imperial Council for the reorganization of the Russian Army, and by an Ukase dated November 16 of the same year, it became the military law of the country. This Bill lays down, as a first principle, that the defense of the Russian territory is a sacred duty incumbent on every Russian subject without distinction of class or position. Military service is therefore obligatory, and substitutes are not admitted into the ranks of the army. All young men who have attained the age of 20 are liable to be drawn as Conscripts. A drawing by lot takes place to decide who shall remain at home, after undergoing six week's training. These men, for 6 consecutive years, form part of the reserve. The duration of military service is fixed at 15 years, divided as follows: Four years under the Colors; two on Fourlough; nine in the Reserve, with the exception of the Horse Artillery, Cavalry, and Frontier Guards. The defence of the country is provided for by regular troops or Land Forces and National Legions. The *Land Forces* are composed of —1. The active army, completed by the annual Contingents; 2. The Reserves, composed of time-expired soldiers, called into the ranks in time of war; 3. The Cossacks; 4. Specially organized troops. The *National Legions* are composed of all the men not included in the regular army, but capable of bearing arms, from the age of 20 inclusive up to that of 40. They are divided into two classes:—1. Men destined to fill up the vacancies in the ranks of the army, or to complete the Reserve in case of paucity of numbers; 2. Men forming the Depots of the Legions. There are besides two classes of volunteers admitted into the army: young men who have completed their education in public shools, and those who have formed or still form part of the Legions. The former are bound to serve in the active army for 3 or 6 months or 2 years, according to their education and proficiency. Those who have, on drawing for the conscription, been exempted from joining the Colors are incorporated in the National Legions, and are compelled to go through an annual course of training. Other classes of individuals may also be exempted from service in the active army, such, for instance, as fathers of families: but they are liable to be called out in case of an insufficient supply of Conscripts.

Russia has a male population of 36 millions, and the number of young men who annually attain the age for being drawn in the conscription is set down at 600,000. Estimating the mortality of the men under 4 per cent., and those not on active duty at 2 per cent, the defensive forces of Russia have been computed as follows:—

Age.	Active Army.	Reserve.	Legionaries. 1st Series.	Legionaries. 2nd Series.
21	200,000	...	200,000	...
22	192,000	...	196,000	...
23	184,000	...	192,000	...
24	177,000	...	188,000	...
25	170,000	...	184,000	...
26	163,000	...	180,000	...
27	...	157,000	...	176,000
28	...	154,000	...	172,000
29	...	151,000	...	169,000
30	...	148,000	...	166,000
31	...	145,000	...	163,000
32	...	142,000	...	160,000
33	...	139,000	...	157,000
34	...	136,000	...	154,000
35	...	133,000	...	151,000
36	...	...	..	275,000
37	...	...	...	269,000
38	...	...	...	263,000

Making, without counting the time-expired soldiers, 5,806,000 men. The active army, it will be seen, is set down at 1,086,000 men. In time of peace, however, this number is not kept under arms, for although in special branches the duration of the service is fixed at 7 years, the Infantry is generally discharged during the last 2 years of service; so that the army may really be set down at 700,000 men under the colors, and 300,000 more on furlough. As an adjunct to this army of 1,000,000 of men, the first class of legionaries comprises 1,140,000 men, all of whom may be called upon to fill up the ranks. The reserve is composed of 1,305,000 men, and by the time this part of the law comes in force, they will be all good, solid troops, having passed through the ranks of the army. The second class of legionaries, as shown in the above table, is composed of 2,275,000 men, all of whom will be trained to the use of arms when drawn by the conscription, and they will count amongst them nearly half a million of time expired troops. The Russian peace footing is estimated to have been increased by about 50,000 men in 1875. The troops reinforced are chiefly the Cavalry and Horse Artillery, who have been put on a permanent war footing, and, being mostly stationed along railway lines in the western provinces, are ready for immediate action in the field.

The Russian Territory is divided into 14 military districts; the country occupied by the Cossacks of the Don forms a separate district, with a special organization. The permanent army is divided into 47 divisions of infantry, 7 brigades of rifles, 10 divisions of cavalry, 50 brigades of field artillery, 26 batteries of horse artillery, 5 brigades of engineers; the numerical strength of the whole active army may be put down in peace time at 33,043 officers and 735,539 men, and in time of war at 43,355 officers and 1,358,672 men. The infantry is composed of 12 regiments of the guard, 16 regiments of grenadiers, 4 Caucasian regiments, 4 battalions of rifles of the guard, 20 of rifles of the line, 4 Caucasian and 4 Turkestan rifles, and 148 regiments of infantry, giving a total of 196 regiments of the line. These are massed into 3 divisions of infantry of the guard, 4 of grenadiers, 40 of infantry, and 7 brigades of rifles. The division in the Russian army is the highest unit, there being no *Corps d'armée* except in the guards. Each division of infantry is composed of 2 brigades, each brigade of 2 regiments of 3 battalions each, with the exception of the 2 brigades of the 4 Caucasian divisions, which have 3 regiments. Each battalion is composed of 4 companies. The cavalry is divided into active cavalry and reserve squadrons. The active cavalry comprises 10 regiments of the guard, 77 of the line (including 21 of Cossacks), and 4 of Caucasian troops. The guards are composed of 4 regiments of cuirassiers, 2 of lancers, 2 of hussars, 1 of grenadiers, and 1 of Cossacks. The Russian cavalry is divided into 20 divisions, viz. 4 of the guards (3 mixed and 1 division of Cossacks), 14 of the line, and 2 of Caucasian cavalry. Each division comprises 4 regiments divided into 2 brigades: 1 of lancers, 1 of dragoons, 1 of hussars, and 1 of Cossacks; each regiment having the same number. Thus the 1st division contains the 1st hussars, the 1st lancers, etc. Each brigade of cavalry of the guard has 2 regiments; the 2nd division has 3 brigades. Each regiment has 4 squadrons, with a strength of 224 combatants.

The reserve squadrons, whose duty in time of peace is to train horses and provide their regiments with them, will in time of war fill the vacancies produced by the campaign.

The field artillery is composed as follows:

Batteries of 9-prs..	141 with	1128 guns and	3384 wagons.
Batteries of 4 prs..	94 "	752 " "	1504 "
Batteries of mitrailleurs ..	47 "	376 " "	762 "
Giving a total of ..	282 "	2256 " "	5650 "

Each brigade of foot artillery is composed of 6 batteries (3 batteries of 9-prs., 2 of 4-prs. and 1 of mitrailleurs). The horse artillery of the regular army is composed of 21 batteries and 5 batteries of the guard, 2 depot and 1 instruction batteries; each battery is formed of 6 guns. The organization of these batteries into brigades has been changed with the exception of those of the guard, which are still formed into 1 brigade. Throughout the rest of the army, 2 batteries are attached to each division of cavalry, and come under the immediate command of the Divisional Commander. These will, however, be soon increased to 6 batteries of the guard (1 Cossack), and 28 batteries of ordinary horse artillery (7 Cossack), of 8 guns each. There will be besides 14 Cossack batteries in reserve. The 5 brigades of engineers comprise 1 battalion of sappers of the guard, 1 of grenadiers, and 9 of sappers and miners, total, 11 battalions; 6 half-battalions of pontoon train. There were at the time of the reorganization of the army 3 classes of troops which did not belong to the active army: (1) the *Local* or *Sedentary Troops* (25 battalions of garrison infantry, and 18 battalions of infantry of the line); (2) the Interior Service Troops (71 battalions); and (3) the Reserve Troops (72 Battalions of the line, 10 of rifles, 56 squadrons of cavalry, 6 brigades of artillery, and 4 battalions of sappers). In the military districts of Russia in Asia, the present organization has been maintained for the local troops; but in the other districts they have been reorganized, and form now 29 regiments of 4 companies each of garrison infantry, and 199 battalions of depot troops. When the army is mobilised, the strength of the depot battalions is raised to 1000 men each by means of the men of the 1st class of the militia. On war breaking out, the 2nd class of the militia will be formed into 164 infantry battalions of 4 companies each and with a nominal strength of 1000 men. The duty of these battalions will be to keep up the communications and guard the rear of the army in the field and to garrison the towns. The *Cossack troops* are divided into regiments and *sotnias* (sections of 100 men); the strength of each regiment varies according to the number of *sotnias* called out. The whole male population is obliged to serve. By an order issued in 1872, the Cossacks have been formed into a body of men perfectly organized in time of peace, easily assembled and added to the cavalry divisions in time of war. Under the new arrangements they will supply 62 regiments and 22 batteries in time of war. In peace time they have 21 regiments and 8 horse batteries under arms. The strength of the Cossacks lies between 50,000 and 55,000 men, with a reserve of 30,000 more.

The supreme command of the Russian army is vested in the Emperor, with a War Ministry under him. This Ministry is divided into *bureaux*, including a war council of permanent committees, who deal with all the technical questions appertaining to the different branches of the service. The mode in Russia of officering the army does not differ much from that of other Continental Armies. The young men who decide on a military career proceed at the age of 16 to one of the military schools, whence, at the age of 19 or 20, having passed an examination, they obtain an ensigncy, and then follow the various grades without further examination. A second captaincy is reached in about 8 years' service, and then merit can gain the epaulettes of a General in a very short time. Candidates for the Staff have to pass through the Nicholas Staff Academy. The Russian infantry is armed with Berdan breech-loading rifle.

The cavalry of the Russian army consists of two divisions of cavalry of the Guard, seven of the Line, and one of the Caucasus; the first division of the Guard contains seven regiments, that of the Caucasus four, all other six regiments. Each is composed of four squadrons; thus there are 56 regiments, or 224 squadrons, of regular cavalry in the army. With the exception of those of the Guard and of the Caucasus, each division consists of two regiments of dragoons, two of lancers, and two of hussars. All dragoons, and the rear rank in hussar and lancer regiments, are armed with Berdan's breech-loading carbine. Cuirassiers, hussars and lancers, and all non-commissioned officers, with Smith and Wesson's breech-loading revolver. Dragoons are armed with a long rifle of the Krinker converted pattern—eventually they will be served out with Berdan's—they carry 32 rounds each. All mounted troops wear a sabre, varying in shape and weight for the different branches. There are two establishments for cavalry, namely, the War, and the Peace; in the former there are 128 men per squadron, in the latter 112 men.

The generally recognised constitution of a brigade of artillery is four battalions of eight guns each. To each division of infantry there is attached a brigade, consisting of two 9-pounders and two 4-pounders. The Grenadier Artillery Brigade of the Caucasus has three mountain batteries in addition, and 19th, 20th, and 21st Causasian Divisions have an extra 4-pounder attached to them. The Horse Artillery Brigade of the Guard consists of five 4-pounder batteries. The other seven Horse Brigades have but two batteries of the same caliber: there are thus—

48 Batteries, rifled	... ...	9-pounders,
105 " "	... ...	4-pounders,
4 " "	... ...	3-pounders,
18 Horse Batteries, rifled	...	4-pounders,

and it is intended to raise 50 mitrailleuse batteries. The guns are mostly bronze, Krupp's breech-loaders, the weight of the 4-pounders being $6\frac{3}{4}$ cwt., of the 9-pounders, $12\frac{1}{4}$. The smaller gun carries 130, the larger 120 rounds of ammunition. The fuses are mostly percussion; the time-fuse is, however, being rapidly introduced into the service. The larger gun is frequently used as a siege piece, its projectile weighing 30 lbs. All non-commissioned officers and gunners are armed with short dragoon sword and breech-loading revolver, for which they carry 12 rounds in a small pouch.

The Corps of Engineers in the Russian army consists of "Sappers and Miners" and "Pontoniers;" the former include engineer field parks, siege parks, telegraph parks, whilst the latter merely the bridging corps. There are 11 battalions of sappers, and six half-battalions of pontoniers; each of these latter carries sufficient pontoon boats to make a bridge 700 feet in length. As in the infantry, so in the sappers, each battalion is composed of four companies; the peace and war establishment being entirely distinct. The Infantry of the Russian army consists of three divisions of Guards, four of Grenadiers, 41 of the Line, and seven brigades of Rifles; each division is composed of four regiments, those of the Guards numbered according to their division, those of the Grenadiers from 1 to 16, whilst those of the Line run from 1 to 164; the regiments of regular Rifles are styled numerically from 1 to 20; the brigades of Turkestan and the Caucasus have territorial designations. Each regiment is composed of three battalions except in the case of those from 73 to 84 inclusive, which have four battalions. These are again subdivided into five companies, four of the Line, one of Rifles—these latter companies, on service, are amalgamated and form an extra battalion styled the Combined Rifle Battalion. Battalions have four separate establishments, viz.:—1. The War Establishment. 2. The Increased Peace Establishment. 3. The Peace Establishment. 4. The Cadre Establishment. The total strength of the Russian Infantry is 188 regiments, consisting of 580 battalions, with 32 rifle battalions in addition, making a total of 612 battalions of the regular army; but

there are also 48 frontier battalions of irregular troops. Eventually the whole of the infantry will be armed with the Berdan rifle, which as yet, however, has only been served out to the division of the Guard, and Grenadier division, and Rifle battalions. The Krinka and Earle rifles now are the principal weapons in use. Every soldier carries, in two pouches, 60 rounds. Forty rounds in addition are carried by the regimental train, and 60 more by the army reserve train. Non-commissioned officers of line battalions, and all ranks in the Guard and Grenadier divisions, carry a short, two-edged sword in addition to the bayonet, which is invariably fixed when troops are on the move.

We will give a brief account of the campaign of 1828-29. To the military student, it will be a proof that it does not do in these days of the breech-loader and the spade to rehearse the tactics of our fathers; and that, after all as Napoleon pithily expressed it, "God favors the heaviest battalions." In December, 1827, Russia then being at war with Persia, the feud between the Sultan and the Czar that had been slumbering for many years broke out. Hastily concluding a peace with the Shah on the 6th February, Paskiewitch, Governor General and Commander-in-Chief of the Caucasus, commenced preparations for the subjugation of Armenia. Irrespective of the natural wish to extend her conquests completely round the Black Sea, a campaign in Anatolia necessarily must form a portion of the plan of any war waged between the Porte and Russia. The vast resources Turkey possesses in her Asiatic provinces enable the Sultan to recruit his forces to an almost unlimited extent from the hardy mountaineers of Armenia, consequently the aim and object of the Russian War Minister is, by decisively attacking the Ottoman on this side, to hinder men from being despatched to Europe to swell the armies there. The forces at the disposal of Paskiewitch for his operations amounted at this time to 51 battalions of infantry, 11 squadrons of cavalry, 17 regiments of Cossacks, 12½ batteries of artillery, numbering 154 guns. The policy of Persia, in spite of the recent peace, was still undefined, and it was thought more than probable she would take advantage of the fact of Russia's complications, and once more declare war. She had only just ceded to the Czar two rich provinces, and paid a very heavy war contribution, so Paskiewitch deemed it advisable to be quite prepared for her entering into an alliance offensive and defensive with the Turk. To guard against any coalition of troops, the Russian General organised a corps under Pankratieff, consisting of six battalions, two regiments of Cossacks, and sixteen guns, which he posted at Khoi, in Persian territory, be it minded. Another evil has to be guarded against in all wars between Russia and Turkey, and that is insurrection in the Caucasian provinces. They were, it was known, ripe for revolt, and it was rumored Mahomedan emissaries had been travelling through the Abkhasian and Mingrelian country, endeavoring to incite the people to rise. To guard against this, Paskiewitch occupied the Caucasian country with fifteen battalions, three squadrons of cavalry, forty-two guns, and four regiments of Cossacks. Thus there were left for the expeditionary army—30 battalions, 8 squadrons of cavalry, 11 regiments of Cossacks, 96 guns. The ports of Poti and Batoum were, as for many years they had been, the object of Russia's desire; consequently, Paskiewitch detailed one column to act on the shores of the Black Sea whilst, with the remainder of his army, he determined to operate in two columns: the main or central one advancing by the Allaghoz chain was to reduce the frontier towns of Akhalzik, Akhalkalaki, Hertwitz, Kars, and Ardahan; whilst the left corps, pushing across the Ararat range, was to subjugate the province of Bayazid, and guard the flank against the attacks of the Kurds, who, it was known, attracted by "loot," would swoop down from Van and Moosh. In fact, the corps operating on Poti and on Bayazid were acting as wings of the main army advancing into Armenia. The right, or Batoum army, was placed under the command of Major General Hesse, and consisted of—8 battalions of infantry, 14 field guns, 1 regiment of Cossacks.

The left, or Bayazid column, was under the order of Tchavachavadzi, the reigning prince of the Abkhasians, and numbered 3 battalions of infantry, 8 field pieces, 1 regiment of Cossacks. Whilst at Natschevan keeping open free communication between the left wing and main army were posted 2 battalions. Paskiewitch himself commanded the main column, which was to be massed in the neighbor-

hood of Goomri, and amounted to 18 battalions of infantry, 9 squadrons of cavalry, 7 regiments of Cossacks, 56 field guns. The Russian commander felt that his forces were too weak for him to hope to reduce Erzeroum in one campaign, for prior to an advance across the Soghanly range, it would be necessary to seize all the fortified places, many of them very strongly garrisoned, in the provinces of Kars, of Akhalzik, and of Bayazid. He therefore determined to devote his whole time to subjugate these districts, leaving the conquest of Armenia to the following year. There were many reasons in favor of Goomri being chosen as the base of operations in Armenia. In the first place, the ground between it and Kars was open, and feasible for the movements of large bodies of troops; in the second place, it enabled a blow to be struck at one of the main Turkish fortresses, without exposing the Russian frontier to the danger of an attack; and thirdly, it threatened the flank of any army advancing by the Soghanly range to the relief of Ardahan or Akhalzik. There were other minor reasons, too, which led to the selection of Goomri: it was in a central position, and easily furnished with supplies; the siege train, quartered at Erivan, could more easily be moved by this road than any other; and lastly, the subjugation of Kars gave the Russians possession of the large valley watered by the Kars and Arpa rivers, with an abundance of grain and forage. Then, as now, the Ottoman organisation was ill adapted for offensive warfare, and it never seemed to have struck Paskiewitch that the Turks could plan a counter-stroke.

Prior to commencing operations, the Russian Commander-in-Chief threw forward a detachment under Major General Popoff to Suram, to guard the defiles of Bordjom. This force numbered 3 battalions, 608 Cossacks, 4 guns, and formed a connecting link with Hesse's troops on the Batoum line. Thus on the 12th of June, all preparations being complete, Paskiewitch massed his troops at Goomri, which now consisted of but 15 battalions of infantry, 8 squadrons of cavalry, 6 regiments of Cossacks, 52 guns. crossed the Arpa Tchai, carrying with him in his vast commissariat train forty days' provisions. He halted that day at Tikhniss, in Turkish territory, and the next morning moved to Maskni, encountering slight opposition from a small party of Turkish horse. A brief reconnaissance of the fortress of Kars induced the Russian General to determine on attacking Kars on the southern face, the northern and eastern being too precipitous to admit of assault, or, of the construction of regular siege works. Moreover, the oc-

Great pains were taken to arrange a good commissariat establishment, the organization of which the Commander-in-Chief himself took in hand; and in May he had already succeeded in collecting at Goomri—Government wagons, 530; hired arabas, 540; pack animals, 2,250; whilst in the vast storehouses at Goomri and in its immediate vicinity, he had stored for transport—12,000 sacks of biscuits, 1,000 sacks of barley, four thousand sacks of wheat, 4,000 casks of salt meat, 1,100 gallons of brandy. More than 3,000 men were hired to assist in the commissariat train; an extremely liberal scale of wages, coupled with firm supervision, ensured good work. Field hospitals were established, one at Goomri for 300; one at Tsalki for 200 sick. An ambulance train for the movable columns was organized, numbering sixty-six specially-constructed *fourgons;* there were two companies of trained hospital orderlies to aid the surgeons in their work, whilst a large corps of litter-bearers were also organized. Let us now turn to the Turkish Army, of which, we regret to say, we can find no such detailed account as of the Russian. The most strenuous exertions were made, not only to strengthen the garrisons of all the fortresses, but also to organize an army for offensive operations. For this purpose—during the early spring—the chief of the Karakapaks reconnoitered the whole course of the Arpa River, as well as the passes through the Bordjom range, all of which were held by strong detachments of irregular troops. Akhalkalaki was held by 1,000 Lazi volunteers; Ardahan was occupied by upwards of 2,000 regular soldiers; Akhalzik was reinforced by a large detachment of cavalry; and Kars, considered the key of Armenia, besides being furnished with a garrison of 15,000 infantry to man the walls, was further strengthened by a brigade of 3,000 cavalry, with fourteen field guns. Van was garrisoned by 15,000 men; Bayazid by 1,000; whilst a corps of 40,000 was being organized by Halib Pasha with which to take the offensive. The religious feeling of the multitude being worked up by the Moolahs, recruits came forward in great numbers, and it seemed evident that the Porte would be able to crush the Russian forces by sheer dint of numbers. On the 14th of June, Paskiewitch, advancing from Goomri, cupation of ground on the south-east face cuts off communication more completely with Erzeroum. Consequently, on the 17th, Paskiewitch moved *via* Azatkui to Magardjik, where he halted for the night, and the following day advanced to Kitcik-kui; but during this march his flank was exposed to attack, and the Turkish commander was not slow to take advantage of the opportunity presented him: he made a vigorous sortie, which for some time promised success; but the conduct of his irregular Kurds and Karakapaks threw the main force into confusion, and he was eventually compelled to retire with heavy loss, the casualties amongst the Russians amounting to twelve killed and thirty-nine wounded. On the 20th of June the siege park reached Paskiewitch, and enabled him to commence his offensive operations against the city. At the same time he was aware that Kiossa Mahomed Pasha was advancing in all haste to relieve the fortress, so he threw up some field works on the banks of the Kars river to guard his left flank. On the 22nd of June, covering the work by a feigned attack on the citadel, Paskiewitch opened his first parallel, and on the 23rd assaulted the place on the south and south-western faces with numerous columns. At 8 A. M. he was in possession of the enceinte, when the Pasha surrendered the citadel with 151 guns, and 11,000 men became prisoners of war. Kiossa Mahomed Pasha, hearing of the fall of Kars, abandoned his intention of crossing the Soghanly, and moved north towards Hoonkiar-Dooz. Paskiewitch now determined to capture Akhalkalaki. For this purpose he left Kars, with a strong garrison, under General Bergmann, and on the 17th of July, moving to Zaim, and thence, by the eastern shore of Lake Tchildar, to Ghegh Dagh. On the 22nd, he sent Colonel Abukoff to the commander of the fortress of Akhalkalaki with a flag of truce, to demand the surrender of the place. This was fired on, and that officer killed. On the 24th, Paskiewitch assaulted the town and captured it, with fourteen guns and 300 men. The Russian soldiers, infuriated at the conduct of the Turks for having fired on their flag of truce, slew upwards of 600 men. Without losing a moment of time, the Russian General detached the chief of his staff, General Sacken, to Hertweiz, which surrendered without firing a shot. Thirteen guns and 300 men fell with the place. General Hesse, in the meantime, with the right column,had captured Poti,with forty-three guns, thirteen standards, and 2,000 men. By the capture of Akhalkalaki and Kars the routes by the Bordjom mountains and Arpa-Tchai were now opened to the Russians; and on the 26th of July the much needed reinforcements reached Paskiewitch from Tsalki and Goomri. On the 1st of August, the Russian Commander learned that the Osmanli forces had reached Ardahan and were moving forward intending to attack him. The Russians, nothing loath to accept battle, advanced towards Akhalzik, reaching Koltchi-kui on the 3d inst. On the 5th, he attacked the troops and drove them back, but Kiossa Mahomed Pasha was able to effect his junction with the garrison of Akhalzik, where now were encamped 30,000 men. On the ninth, after a hard battle, in which the Russians were victorious, the Turks abandoned their guns and fled towards Ardahan. On the 10th, Paskiewitch commenced the siege of Akhalzik, and by the 12th had completed the investment of the place. On the 15th, breach-batteries were opened, and on the 16th of August, after a desperate fight, the place was captured. The garrison fought with the most determined valor, and it is computed that upwards of 5,000 men were slain in the defence. Out of 400 artillerymen who manned the guns on its walls, but 50 were left to tell the tale. Thirteen hundred Lazis out of a body of 1,800 recently raised were slain. Sixty-seven guns, and fifty-two standards, were captured; the Russian loss being only 128 killed and 495 wounded. In consequence of the heroism displayed by the defence, Paskiewitch permitted the garrison of the citadel to march out with all the honors of war. On the 18th the Russian Marshal determined to reduce Aitzkui, and despatched Colonel Vidbelski, with five companies and six guns, to effect this. The place surrendered, with twenty-four pieces of artillery, without attempting a defence.

In the meantime orders had been sent to Bergmann, in Kars, to move on Ardahan, and the Commander-in-Chief, on the 18th inst., directed Mouravieff to march for the same place. This officer, however, learned on his road there that the fortress had capitulated to Bergmann on the 16th inst. The left column in the meantime had been equally successful. Having subjugated the whole province of Bayazid, with the exception of the citadel, which was left masked. Prince Tchavachavadzi had marched as far as Toprak Kale. He had been reinforced by two battalions and four guns from Khoi, and Bergmann had also sent a force down from Kars to keep open communication with him. On the 20th September, the Prince, finding that his flank was threatened by the Pasha of Moosh, at the head of a large body of Kurds, determined to recapture Bayazid, and hold it. For this purpose he returned, and attacked a body of 3,000 Kurds, who were covering the place, when the garrison fled, and with the loss of but ten men Bayazid, with his twelve guns, and three standards, fell into the hands of the Russians.

Early in September, the Prince, having made all arrangements for the government of the province, advanced into Alashgird plain, seized the fort of Toprak Kale which was occupied by Kurds during his absence, and busied himself with collecting supplies on the fertile district.

On the 19th inst., the Pasha of Moosh having advanced to Grakon; the Prince determined to attack him, and on the following day defeated him, with a loss of 600 men,his own casualties amounting to sixty-seven. On the 28th,finding that the Pasha of Van was rousing all the Kurds in the district, and fearing that his communications might be cut off, he retired on Bayazid. Winter now setting in, Paskiewitch felt that his forces were far too weak to attempt the subjugation of Erzeroum in one campaign. He therefore left strong garrisons in the principal towns, and returned with the main portion of his army to Russian territory. General Berbutoff was left in command at Akhalzik with 2,300 infantry, 326 cavalry, and four guns. Bergmann was left at Kars with 2,400 infantry, and 280 cavalry, and twelve guns; whilst Pankratieff occupied Bayazid and the neighboring towns with 8,000 men, 376 cavalry, and eighteen guns. Thus, with a force of 20,000 infantry, 5,000 cavalry, and ninety-six guns, Paskiewitch had completely conquered the provinces of Kars, Akhalzik, Bayazid, and Poti in the short space of five months, had captured three fortresses and several fortified towns, 313 guns, and 8,000 prisoners graced the Russian General's triumph, whilst his own casualties only amounted to 3,200 killed and wounded. As may be imagined, the greatest consternation reigned at Constantinople. On learning of the reverses in Armenia, the Generals in command were immediately disgraced, and two new officers who were in favor at court were sent to supersede them.

Every effort was made to raise the army in Anatolia. Envoys were sent to Persia to endeavor to draw her into the war, and emissaries were despatched to Abkhasia, Ghuriel, and Mingrelia, to stir up revolt there.

The plan of the new Turkish Generals, Salegh and Hakki Pashas was as follows. An army of 80,000 men and 66 guns was to be massed at Erzeroum, and advanced *via* the Soghanly range on Kars; whilst a second army of 50,000 men and 50 guns was to be massed on Van to act on the Russian flank.

In February, Paskiewitch heard that the Turks were advancing on Akhalzik, and he at once detached Mouravieff to Suram with six battalions and eighteen guns to cover that fortress, whilst General Hesse was directed to suppress the insurrection in Ghuriel as promptly as possible.

On the 28th of February, Osman Bey entered the city of Akhalzik. The garrison retired into the citadel, and there succeeded in keeping him at bay. The Turks, with their usual ferocity, commenced a system of carnage, and, as at Bayazid in these latter days, so at Akhalzik in 1829, every Christian inhabitant was slain.

Mouravieff in the meantime pushed forward with vigor to relieve the place, and on the 28th attacked the Turks, defeated them with a loss of 3,000 men, and relieved the garrison.

Hesse, after some sharp skirmishes in which his casualties amounted to 187 men, succeeded in suppressing the rebellion in Ghuriel. The snow having cleared away, and the roads being tolerably practicable for troops, in April Paskiewitch determined to renew his operations for the subjugation of Erzeroum. Pankratieff, at Bayazid, was directed to proceed with four battalions and twelve guns to Katchewenk on the Arpa-Tchai, whilst Paskiewitch, on the 19th of May having settled the difficulty with Persia, rejoined head-quarters at Akhalkalaki, and none too soon, for he here learned that the Turks had 15,000 men near Ardahan, marching to the relief of that fortress, whilst 50,000 men were at Hassan Kale, on the western slopes of the Soghanly Dagh. On the 25th May, Pankratieff was directed to march on Karadjuran, near Kars, to cover that fortress Paskiewitch at the same time pushed forward to Beghli Ahmed. Salegh Pasha had now reached the Soghanly. Finding that the majority of the Russians were at Kars, he determined to move towards Akhalzik, Mouravieff was sent to counteract this movement to Tsurskab; and on the 2d of June this General attacked the Turkish forces, defeated them, and took one gun and 1,200 prisoners. The Osmanli being thus checked in their advance on the northern road, Paskiewitch felt free to concentrate all his troops and advance on Erzeroum. This movement was carried out in three columns, the right under the command of Mouravieff, the left under the command of Pankratieff, and the third under the Commander-in-Chief; the two roads leading from Kars and Erzeroum diverge at Kotanli and meet again at

Kuipri Kui, the first or southernmost road passing through Sara Kamysh, Mellidooz, and Khorassan, whilst the second or northernmost road passes by Deli Mussa, Kara Orghan, and Zewin. Salegh Pasha, at the head of the main body of the Turkish army, barred the northernmost road on the Zewin Dooz; whilst Hakki Pasha, with 1,300 infantry, 7,000 cavalry, and sixteen guns, took up the entrenched position on the Mellidooz plateau. Just where the road ascends from the Sara Kamysh defile, a knoll in the centre of the plateau commands all the roads, and this was strongly intrenched by the Turks. On the 11th of June, Paskiewitch, who determined to advance by the northern road, sent forward strong parties of cavalry to patrol the Sara Kamysh defile, and thus draw off attention from his main attack. Burtsoff, with 2,00 infantry, was now sent into the defile, whilst the Commander-in-Chief, with 14,000 men and fifty guns, moved towards the Tchakir Baba. On the 13th of June, Burtsoff made a threatened attack on Hakki Pasha's camp. Fearing assault, this General drew in all the outposts, and thus the Russian Commander-in-Chief was enabled to cross the Soghanly Range without firing a shot. On the 17th inst., however, Osman Pasha, with 1,200 men, was detached to Bardez to reconnoitre, and on the 17th he was attacked by Mouravieff and driven back, not on his own army, but on Salegh Pasha's forces at Zewin. Further concealment now was useless, and Paskiewitch determined to attack the Turkish Commander-in-Chief, who was posted on the Zewin plateau with 40,000 men. Pankratieff was sent to the left bank of the Chansu to prevent Hakki Pasha falling back and joining his chief, and Burtsoff was warned to attack the Mellidooz position directly the Turks showed a disposition to abandon it. On the 19th, Paskiewitch, passing Kanli, descended towards Zewin; Salegh Pasha advanced to meet him, but was driven back into his entrenched position, which was immediately attacked by the Russians, who drove the Turks off in complete disorder, captured 500 prisoners and twelve guns. The following day, Paskiewitch, leaving a force at Zewin, and crossing the Chansu, ascended the Kara Orghan to attack Hakki Pasha at Mellidooz. After a sharp fight, the Turks were defeated, the commander and fifteen guns being taken.

Being aware that promptitude constitutes half the battle in fighting with Oriental nations, Paskiewitch set off in pursuit of the Turks, and on the 23d inst. reached Kuipri Kui, which he found to have been abandoned. He at once placed himself at the head of a flying column of cavalry, eighteen horse-artillery guns, and dashed on Hassan Kale. So close was the pursuit, that Selegh Pasha had only just time to escape from the place, leaving twenty-nine guns in the hands of the Russians. On the 24th the whole of the Russian army concentrated at Hassan Kale, and a *parlementaire* was sent in to the Governor of Erzeroum, demanding its surrender. This was refused; so on the 25th Paskiewitch advanced to the Nabitchai stream, and on the 27th seized the Devi Boyun heights unmolested. On the 28th the city surrendered, a slight skirmish taking place between the excited soldiery in the citadel and the Russian troops as they entered the town, 150 guns, four Pashas, and about eight thousand prisoners falling into the hands of the Russian General. Thus, in five short weeks from the commencement of the campaign, Paskiewitch had been enabled to effect his object. He subsequently moved towards Trebizond, and occupied Baiboort. Insurrections among the Laziz, however, broke out, and this, coupled with the badness of the roads, prevented him advancing further than Gumish Khane. In August the Treaty of Adrianople having been duly signed, the Russians evacuated all the conquered provinces with the exception of Akhalzik, Akhalkalaki, and Kars.

The frontier line was laid down afresh, and has remained unaltered since those days. In the war of 1855, Kars capitulated to Mouravieff, Paskiewitch's Lieutenant; but by the Treaty of Paris, in 1856, it was again ceded to the Turks. It is not our province to speculate on the future of Armenia, but we doubt if an instance has occurred in the history of any nation, of a province twice conquered at the point of the sword, having been twice ceded by a stroke of the pen.

RUSSIAN BERDAN RIFLE. A breech-loading small-arm having a fixed chamber closed by a movable breech-block, which rotates about a horizontal axis at 90° to the axis of the barrel, lying above the axis of the barrel, and in front. The piece is opened by drawing back the locking-bolt to its full extent, thereby cocking the piece, and then throwing the breech-block upward and forward by the handle on its side. It is closed by shutting the breech-block, and is locked by the friction of the rear face of the breech-block against the recoil-shoulder on the locking-bolt guide, against which the longitudinal motion of the hinge-strap slide, to which the block is attached, allows it bodily to slide under the influence of the discharge. It is also held in place by the entrance of the locking-bolt into the counter-bore of the firing-pin hole when the piece is fired. In drawing back the locking-bolt to open the piece it compresses the spiral mainspring which surrounds it, and riding over the point of the spring-sear is caught by it and retained against the tension of the mainspring when the support of the hand is withdrawn. When released through the trigger in the usual way it is impelled against the firing-pin, and so discharges the piece. Extraction is accomplished by an extractor swinging on the joint-screw and struck above its center of motion by the forward end of the breech-block near the completion of its movement in opening. Ejection is caused by accelerating the movement of the extractor by the ejector-spring, one end of which has a solid bearing on the hinge-strap slide, and the other resting on the extractor above the center of motion; as the shell passes out it is deflected by the beveled surface of the ejector-stud, and is thrown clear of the piece.

RUSSIAN BRIDGE.—The Russians use in their bridge equipages a very light kind of ponton formed of a frame-work covered with canvas. The frame is composed of two side-frames, constructed of 4″ scantling. These two frames are connected below by movable transoms, with tenons at each end which fit into mortises in the bottom sills, and above by two transoms, one at each end, which are laid on the top string-pieces, about 2 feet from the ends, and lashed to them. The canvas cover is stretched over the bottom, sides, and ends, brought over the ends, and lashed to the top transoms. It is secured along the sides of the top string-pieces by small nails, passing through eyelet holes along the edges of the cloth. It is 10¾′ wide, 30′ long in the middle, 23′ long along the edges, and is painted black on both sides. A plank is laid along the bottom for the pontoneers to stand on, and the cables are attached to the top transoms. There are special supports for the hand-ropes. The *Birago* trestle and abutments are used with these pontons.

RUSSIAN FUSE.—This fuse consists of a fuse-plug made of a mixture of lead and tin, conical in shape, the head of which projects beyond the external surface of the shell, and of a paper fuse, filled with fine powder rammed hard, which is introduced into the fuse-plug just before firing. There are two sets of these fuses, and three lengths in each, which burn in the first set, 2¾″, 4″, and 5″, and in the second 3¼″, 4½″, and 5½″.

These were the fuses used by the Russians in the Crimea, since which a new system has been adopted, in which the fuse-plug is made of papier mâché, and the fuse-tube of lead.

RUSSIAN GOVERNMENT.—With the abolition of serfdom, Old Russia disappeared for ever, and New

Russia arose from its grave. The old distinction of classes into nobles and bondsmen was merged into that beautiful weapon of constitutional despotism, known on the Continent as universal compulsory service in the army. Henceforth, instead of fighting for their King, Emperor, or Czar, the people of such happy lands now fight for their country only. It is true, the common populace is so blinded by its prejudices, that it is apt not to understand the difference as long as the country is under the immediate and irresponsible control of its whilom Sovereign; and Russia forms no exception to this rule. Consequently, though the form has somewhat changed, the material remains the same; and where it has altered it has been sagaciously made use of to fit into the new order of things, and to form an integral portion of the new system. Thus the result of abolishing serfage was the creation of a fresh national feeling; the ex-bondsmen felt that he had a stake in his newly-acquired soil; whilst, on the other hand, the noble felt that a new danger was threatening him by the growth of this national consciousness and the growing conviction in the ex-serf that he really was a unit in the empire, and that many units piled up on the top of the other, amounted to a very considerable sum, and no mean force if united in action. To counterbalance these ideas it was necessary to shape certain grooves for the new national feeling to run in. Thus three principal channels were fashioned. 1. Compulsory military service. 2. The institution of communal self-government. 3. The reunion of the Schismatics and other dissidents under the paternal care of the Orthodox Greek Church, as represented by the Holy Synod, as represented by the Czar, who in turn represents the Diety himself, in Russia. These grooves having been duly fashioned, the next thing to be done was to furnish a reservoir for them to run into—a vast reservoir that would contain the national food for long years to come, and prevent its overflowing the channels cut for it, and causing serious damage at home. This great goal was set up in the shape of Panslavism; the object of Panslavism being the reunion of all the various Slav races in Austria, in Prussia, and in Turkey, under the sceptre of him who rules at St. Petersburg. The attention of the freshly-made freeman was thus to be diverted from home matters to foreign affairs, and his black bread spread with the butter of glory abroad rather than with the fat of the land at home, for which it appears that the noble has a remarkable fancy. Of the working of this new system, of the bad that exists, and the good that is latent in the communal system; of the atrocities of the Holy Synod; of the burden the armys imposes upon the nation, we shall speak in the proper place. The above rapid sketch is simply designed to give in a few words the character of the change that has come over Russia, and made her again an enemy and a standing menace to the peace of Europe, and the cause of liberty, commerce, and progress. And if, as Gœthe says, "The gods against ignorance battle in vain," it may well be imagined what a very formidable task Europe has before her, when she shall be called upon to wage war against the bottomless ignorance of eighty million souls, all well armed with breech-loaders and Krupp guns. Under such circumstances, it may well be asked why Europe should submit to a continual threat in order to enable a Muscovite nobility to preserve their station against those principles of individual liberty and local self-government they are so proud of pointing to as the lever that is to raise Slavonic Russia on the ruins of an effete western civilization, and to regenerate the sluggish blood of worn-out Europe? In short, why should Europe allow the Russian leaders and rulers to impede the development of liberty at home, by imposing a tyrannic rule on races abroad, under the catch-penny title of national glory? Is the country too small and too poor to support its teeming population? Is it a kind of magnified Montenegro, that must perforce extend its boundaries to feed its starving population? If so, there would, perhaps, be some excuse for its periodical attacks on somebody or other—on the Khan of Khiva yesterday, the Sultan of Turkey today, and probably the Shah of Persia to-morrow. But we find exactly the contrary to be the case; for whilst Europeans count their inhabitants to the square mile in some cases by thousands, and inmost cases by the hundred, we find in Russia a population of about ten to the square mile. Let any one try to stretch his imagination to the wonderful extent of fancying himself in the possession of 309,760 square yards of soil—or the use of it—and he will have an accurate idea of the position of the Russian in his native land. Is there any biped, be he white, yellow, or black, belonging to the working classes—to the classes to whom labor is a necessity—who would not be satisfied with such a possession, or at any rate be content to increase it by legitimate means, and thus in possession of material independence, would not also be in possession of his moral independence, and defy the intrigues of those who will not work themselves, but buy up streams of living blood and bushels of money in exchange for a few tinsel tatters of impalpable, evanescent glory?

The reply is self-evident; so self-evident that the Russian government has never propounded the question, and works upon a system by which they hope it will never be proposed. What this system is we now propose showing, for it is the most important element foreign nations have to consider in their relations with Russia. It is the government that does everything, without consulting the people. There is no appeal to the nation. What the Czar and his Nobles decree has to be performed, and is performed in the same unreasoning, slavish spirit of obedience, which the liberation of the serfs has in no way changed. In dealing with Russia, we have to deal with a crafty, unprincipled, Asiatic government, and a mass of ignorance in all things that concern the Russian's relations with foreign nations and ideas. Not that there are not communities upon communities who cultivate the soil in peace, and successfully; whose villages are all that could be desired from an agricultural and social point of view. Of these there are many; and there is an amount of good nature and common sense in the Russian peasant that only needs time and opportunity for development to make him one of the most peaceable and industrious of men. But just for this very reason, *because* he has the capacity for attaining material and moral independence, the vast army of drones do all they can to stifle these good qualities in a mass of bigotry, ignorance, and superstition. Be it well understood—what we find to protest against is not the mere existence of the people of Russia, but of the Russian government, which is a great deal worse than the Turkish rule, and for the simple reason that the Russian government has not the same excuse which the Turkish has, of being a weak government that has fallen into the hands of the Jews and Greeks. The Russians discovered that the Crimean war had opened the eyes of the people to the fact, that Russia was not altogether the blessed paradise her rulers tried to make them believe, and that an entire re-constitution of the government system was necessary to satisfy the growing discontent. How to do this and yet alter nothing; how to give liberty and yet at the same time to curtail it, was no easy task. But it was accomplished. The Czar, whose official title is Autocrat—Self-ruler—of all the Russias, is the fountain-head of all legislation. All laws proceed from him; he alone makes them; he alone can unmake them. This is done as follows:—All decrees of the Czar published by the Senate are Laws; all decrees published by other departments of the State are only to be regarded as decrees; and theoretically, disobedience to these decrees, or ukases, can only be punished when such punishment can be legally justified, and it is proved that the ukase in question was known to the culprit. As a matter of fact, there is, practically, no distinction between the two. Administrative ukase, or imperial senatorial law, they both amount to the same thing, and center in the irresponsible Czar.

The executive power is also in the hands of the Czar, and all departments act in his name. The Minister of Police, for instance, is responsible to no one but the Czar. A man disappears; and inquiries show that he has been arrested by the police; there the matter ends, and it depends entirely upon the police or the Czar whether or not he ever reappears. Life under such circumstances would be unsupportable, were it not that the communes retain a species of self-government that invests them with a show of liberty. Of the nature of such liberty suffice it to say that the system is based on the principle, not of a division of property, as the Socialists try to make out, but upon the division of the use of the soil, which is a very different matter altogether. It is, in short, a system that fully employs the spare time and all the spare brains of the peasantry to carry out, and prevents them from agitating for that representation of the people in the councils of the nation, which is the first step to liberty. To keep the peasantry in this circumscribed oasis of local liberty in the commune, or *mir*, and prevent their union with each other in the cause of universal and general liberty, is, of course, the chief object and aim of the nobility. Compulsory service is one of these means. The church affords another. To bring all the various sects of Russia under the control of the parish priest and Holy Synod, who can command the assistance of the civil authorities and of the military authorities, is the great object, for the prompt attainment of which such measures have been taken as those that furnished the material for the Blue Book published recently by the British Government. An imperial ukase was published in 1871, subjecting all the heterodox, or dissenting, churches to the authority of the Holy Synod. This is equivalent to an act of parliament, in England, placing all the Nonconformists, Catholics and Jews under the administration and authority of the Church of England. Thus the Uniates were ordered to conform in all respects to the habits of the Orthodox clergy—to alter their churches in conformity with the system adopted by the Orthodox church. Priests who complied with these instructions were to be compensated for any pecuniary losses; disobedient priests to be transferred to some other place, or banished. An inquisitorial commission sat in permanence at Siedlce, before which the clergy were summoned from time to time, and examined as to their conduct. These measures were energetically enforced, but met with great resistance, especially on the part of the inhabitants of Chelm, Lublin, Popil, and Siedlce. On hearing of this, Count Tolstoi gave strict orders that the necessary measures were to be enforced with the utmost rigor, and no benches, organs, rosaries, mass-bells, etc., to be allowed in the churches under any pretense whatever. Most of the clergy yielded; the peasantry, however, refused to obey the tyrannical order, and many conflicts, resulting in loss of life, occurred in many places. At Myncieviez, the peasants defended their church by force, but were defeated by the Cossacks, and every one of the congregation summoned to sign forthwith a declaration of his conversion to the Orthodox church. On their refusing, every man received fifty strokes of the knout, every woman twenty-five, and every child, irrespective of age or sex, ten blows. One woman, who was especially energetic in her refusal, received more than one hundred blows, and is described as having her flesh completely mashed. These brutalities were taking place just at the same time of the wedding of the Duke and Duchess of Edinburgh, and created so painful a feeling at St. Petersburgh that they were suspended for a time. In fact, so great was the indignation aroused amongst the foreign community, that it was openly wondered at that an English prince could ally himself with a power guilty of such atrocities; and it is said, on apparently good authority, that the coolness between the Duke of Edinburgh and the Russian royal family is due to a very energetic expression of opinion by the Duke on the subject. This was in January, 1874. In February the atrocities recommenced; villages were occupied by troops of Cossacks who plundered the wretched peasants, and "hunted them down" when they took refuge and bivouacked in the forests. Fines to a large amount were imposed upon the congregation, their crops trampled down, and, in one case, six hundred married men banished to Cherson (on the 14th of February, 1876), and employed in hard labor—stone-breaking—all day long, whilst their wives and families remained at home, with a number of Cossacks quartered upon them. Under such circumstances, it is not surprising to read, in Count Tolstoi's report (1877), that no less than 237,000 Russian subjects saw the error of their ways in 1876, and were converted to the Orthodox faith.

Having thus undergone a preliminary preparation for their subsequent complete subjection to the autocrat government, which is supposed to represent paternal solicitude and authority, the Russian is then put into the drilling machine provided by the military system, and which ever afterwards holds him in its iron grasp. When the man who stole a loaf excused the act by saying he must live, the Magistrate appropriately replied that he did not see the necessity at all. On the same principle, the existence of the Russian is only regarded as a necessity in so far as he forms an element in the army which keeps the government and its friends on its legs. Consequently it is necessary that the army should be subjected to the strictest discipline, and be as perfect as possible. A sketch of the machine is therefore necessary to understand the working of the system. See *Russian Army*.

There is, unquestionably, a falling-off in the rigid bearing, in the smart performance of movements that used formerly to be a characteristic feature of Russian infantry. There is, perhaps, a little too much of the french *laisser-aller*; and as regards the drill for action in loose order, it is performed without either the precision or dash of the Prussian or Austrian armies. Respecting the cavalry, all that can be said is, that the addition of the Cossacks has deprived it, to some extent, of its gallant and soldierly bearing. The regulars have learnt from the Cossacks their bad habits. The teams of the artillery are excellent, and the movements rapid. There is, however, a great dearth of men able to lay a gun. The distinction between divisional and corps artillery appears to be unknown.—The most important element in an army is its officers; and here great changes have been effected of late years. Formerly, a great many officers got a commission through mere favor; but this abuse has been reformed by the able War Minister, General Milutine. No man can now obtain a commission without undergoing a strict examination. To promote the means of military education, General Milutine created "Junker," or, as we should say, Cadet Schools. These schools, since their creation, have turned out upwards of 10,000 candidates for commissions, and 2,000 cadets duly qualified for commissions now pass through them every year; they remain at the disposition of the State, and get appointments as vacancies occur. In spite of many praiseworthy efforts to raise it, the intellectual level of the officers is not high; but they know the routine of their business thoroughly well, and are regarded generally with respect and affection by their men. As to the question, "Has Russia a General?" it would be difficult to answer it. The march to Khiva, and the more recent campaign in Central Asia, has not revealed the existence of any man of genius in the Russian ranks.

In time of peace the Russian infantry has no ready-formed reserve, with the exception of the skeleton of a battalion of the Reserve Regiment of the Guard, which has to be created in time of war. There is something quite peculiar about this regiment which requires little detail to be made intelligible. When the decree is issued for the mobilisation of the army, it becomes necessary to create 164 battalions of reserves—that is to say, one battalion for each infantry regiment, with the exception of the Guards and the Grenadiers. This latter is the sole four-battalion reserve regiment to be created in case of war: it consists of twelve line companies and four companies of Rifles, the reserve battalions having no Rifle companies. Up to the present time, there exists no machinery in the Russian service for the formation of infantry reserves in peace-time: all that is provided is, that in the event of the formation of a reserve being deemed advisable, a Field-officer, and four officers of lower rank, together with a Quartermaster and two clerks belonging to the active or local troops, should be transferred to these reserve battalions. An intention, however, is entertained of drawing up the cadres thoroughly on paper in time of peace; but as there are really no cadres at the command of the government, the question yet remains unsettled. The strength of the reserve battalions of the line and the Guards is estimated at 960 men. To provide the requisite reserves in the event of mobilisation would require 168 battalions, and an effective of 168,000 men. When the mobilisation is decreed, 192 depot battalions are created for the supply of men to the line, and nine depot battalions for the Rifles. But a mobilization in Russia is a matter of no very small difficulty, on account of the extent and scanty population of the territory, as well as the scarcity of communication, and the precautions which require to be taken against the population in Poland and other provinces. The country, indeed, is divided into a certain number of recruiting districts; but as the corps belonging to these districts are generally quartered elsewere, when the order for mobilisation goes forth, there is a *chassez-croisez* of men and horses all over the empire. As regards the artillery, its mobilisation requires a supplement of 40,000 horses. Under the most favorable circumstances, the mobilisation of the Russian army cannot be effected under from five to six weeks. Such, in few words, is the character of official Russia. But there is another Russia—the Russia of the masses,—unofficial Russia, which slowly, but surely, is modifying and influencing the government and its principles; so that, even in the army, there is a marked difference between the old generation and the younger, that is much in favor of the latter.

Down to the time of the Crimean war, Russia was an earthly paradise for all diplomatists of the old school. Enjoying great social consideration, and living in an almost constant round of splendid festivities, they had only very light and very simple duties to perform. They never required to undertake such complicated operations as calculating the strength of political parties or the force of public opinion. All the springs of government were to be found within a radius of a mile from the Winter Palace; and beyond this small enchanted circle there was nothing for a diplomatist to observe. The Czar and his Ministers worked the great machine as they pleased, free from control and extraneous advice, and the nation confined itself to unquestioning obedience. If any voice did happen to rise from the crowd, it was very soon silenced. Once, in a moment of heroic self-forgetfulness, a rash newspaper editor ventured timidly to hint that some new seats in the imperial garden were not quite in perfect taste; but the all-seeing eye of the press-censor was upon him, and he was severely punished for venturing to criticise seats that had been fortunate enough to obtain the imperial approval! These halcyon days for old-fashioned diplomatists and statesmen of the Metternich type are now beginning to be numbered amongst the things of the past. The Czar, though still as autocratic as ever in the legal sense of the term, no longer drives the machine by his own unaided energy. There are still, it is true, no regularly constituted political parties, no National Assembly; but the great silent inert mass, composed of eighty millions of human beings, has begun to show, here and there symptoms of human intelligence and human will, and the government is no longer at liberty to act entirely as it pleases. Russia has now, in fact, many of the blessings which belong to advanced political development, and which complicate enormously the art of government. There is a press which, though liable to be gagged occasionally, criticises things much more important than rustic seats in imperial gardens; and a public which, though enthusiastically loyal to the head of the State, insists sometimes on having opinions of its own. There was a Slavonic Committee which supplied the Servians with a Commander-in-Chief, and sent several thousand volunteers to fight the Turks; and there are even secret societies which aim at overthrowing the government and inaugurating a Socialistic millennium. In a word, this is the unofficial Russia, which exercises a certain influence on the government, and which must therefore be taken into consideration by diplomatists and statesmen in their endeavors to forecast the policy of the country.

Between St. Petersburg and Moscow their exists an antagonism of long standing. Ever since its foundation, St. Petersburg has striven to be a European city and to adopt all the products of West-European civilization. Moscow, on the contrary, strives to be distinctively Russian, and affects to look down on her younger rival as a half-caste *parvenu*. Abandoned by the imperial family and the heads of administration, she glories in her ancient monuments and her ancient spirit, and boasts that she still holds the first place in the veneration and love of the Russian people. All Moscovites are more or less imbued with this Platonic hostility to the capital on the Neva, and love to reproach its inhabitants—the Ministers and other official dignitaries not excepted—with gross ignorance of Russia and the true Russian character, but when they come to discuss the present and future of their country, they are by no means unanimous. We easily distinguish amongst them two groups or *coteries*, holding peculiar views, which distinguish them from each other. The one is composed of the Slavophils, the other may be called the Moscovites proper. These groups are often confounded, and the confusion is excusable, for many worthy Moscovites themselves do not clearly distinguish between the two and consider that they belong to both; but in reality there is a decided distinction, for the leaders are by no means at one, and do not generally entertain very friendly relations. The chief difference may be briefly stated. The Slavophils are the representatives of the old Russian orthodox spirit. They idealize and admire ancient Russia condemn the sweeping reforms of Peter the Great, and the foreign principles of administration in vogue since his time, profess an inordinate admiration for the uneducated, uncorrupted peasantry, aspire to the creation of a specifically Russian culture on the basis of the Slavonic character and Eastern orthodoxy, are deeply imbued with Slavonic patriotism, and hope to see some day a great Slavonic federation or Panslavonic empire. With regard to questions of home policy, they are adherents of the Mir, or Rural Commune, with its periodical reallotment of the sand, advocate the fostering of native industries by means of protective tariffs, desire the elimination of the German element and German influence from the administration, and would like to see the church emancipated from the supervision and control of the State. The party of the Moscovites proper is at once more modern in its conceptions and more modest in its aims. Though desiring equally to see the German influence eliminated from the administration, it has no feeling of hostility to Peter the Great and Western culture, and no sentimental love of ancient Russia. It thinks that Russia ought to adopt all manner of civilization and enlightenment from Western Europe, and shows no sympathy with institutions simply because they are specially Russian. On the contrary, it holds that the social and political development of the country must be fundamentally the same as that of the West-European nations, and hails with delight all reforms conceived in the West-European spirit. Whilst the Slavophils believe that the mission of Russia is to develop certain very abstruse principles which are supposed to be hidden in the Slavonic nature and in Greek orthodoxy, this party —less dreamy and wiser in its generation think that Russia should develop her institutions by the light of modern experience, and extend her political influence by the same means as other nations.

In ordinary times the influence of the Moscovite spirit, as represented by these two parties, is very small. The Petersburgians look upon it with kindly condescensions as an amiable provincialism, and some Russians are rather proud of it, as they are of the old picturesque buildings of the Kremlin; but it has little practical significance. The Slavophils, with their mystical principles, which have an interest for those who study the philosophy of history rather than for practical administrators stand apart from the busy crowd in a region of philosophical abstraction. If they indulge in any practical activity, it takes the form of educating young Bulgarians or sending ecclesiastical vestments and sacred vessels to the Slavs of Turkey and Austria. All this, however, is changed when certain political complications arise. As soon as the Eastern question is raised, and Russia finds herself in antagonism with Western Europe, Moscow always comes prominently to the front, as the representative of Holy Russia and of the genuine national spirit. Words which at ordinary seasons would only provoke a smile are now listened to with attention and respect. For the moment the two sections of Moscovite society combine. The Slavophils declare that the time has come for emancipating the Slavonic brethren, and protecting them against the insidious influences of Western Europe; whilst the more moderate party urge the government to uphold the honor of the country, and maintain legitimate Russian influence in the Slavonic world. In view of the national danger, the government well thinks it necessary to know the real sentiments of the people, and considers that Moscow is the truest representative of these sentiments. The Czar visits the ancient capital, and the inhabitants show him unbounded devotion—humbly urging him, in more or less disguised language, to impregnate himself with the genuine national spirit, to close his ears to the seductive voice of foreign counsellors, and to act as a Czar who can rely implicitly on the boundless devotion and self-sacrifice of his loyal subjects. Though his Majesty may be a man of cool head and unimpulsive character, he cannot remain wholly impervious to the patriotic excitement. It was during one of those visits that Alexander II. pronounced the famous speech, in which he pledged himself to act independently, if the powers would not act with him, for the protection of the Christians in Turkey.

Thus we see, though autocracy is still unshaken in Russia, that section of unofficial Russia which is represented by Moscow exercises a certain influence on the imperial government, and consequently its views and aims are worthy of attention. Now the bulwark of unofficial Russia of the masses—is undoubtedly the Zemstvo. It is impossible to translate this word Zemstvo by any other phrase than local government. But the very existence of such an institution, hedged in as it is, and as we have already seen, by the government and its autocratic principles, is in itself a most remarkable feature; and it is from this institution that the future, not only of Russia, but of all the Slavonic races, is expected to blossom forth in a perfection so far distant that it must be regarded as Utopian at any rate, as far as Europe is concerned, as it presupposes the possession of an abundance of ground that does not exist in Europe in sufficient quantity to allow of each individual holding his own acres, whether personally or communally.

The Zemstvo was instituted in 1864. There is a provincial Zemstvo and a district Zemstvo. Each district Zemstvo consists of a Zemstvo Assembly and a Zemstvo Executive. The Assembly consists of the landowners of the district and members chosen by the municipal and country communities. Neither the Governor nor Vice-Governor of the district can be a member of the Zemstvo. Nor can any member of the government nor lawyers be elected. The term of office is three years. The Executive is chosen by the Assembly, and consists of a President and two Assistants, who are paid by the Assembly. The Executive thus has to carry out the orders of the Assembly, and depends upon it entirely. The provincial Zemstvo is constituted in a precisely similar manner, divided into an Assembly and an Executive. Both Zemstvos meet once a year.

By this means the government has transferred a great burden from its own shoulders to those of the people, which has accordingly no small sum to pay for the privilege. The people are placed in a condition thereby—and it is part of their duty— to provide for their material and moral progress; but at the same time, in making these concessions, the government has not ceded one jot of its own rights. The Zemstvo may build hospitals, appoint surgeons and doctors, construct roads, and open schools, all at its own expense. But further than this it cannot go. On the policy of the central government, it has but the smallest, if indeed any, influence. Still, as we said before, the development of the Zemstvo is the only hope the Russian has of progressing; and, though slowly, it is doing its work. Thus there was a debate recently in one of the Ural Zemstvos, when a proposal was brought forward by a Colonel Steinfeldt, to award an increase to the school funds of 15,000 roubles. The proposal was supported by one peasant only, and that peasant an ex-serf. He said —"It has been fully proved that, with the education of the laborer, his wealth also increases. Even for this reason alone, it would be the duty of the Zemstvo to promote the cause of education by all the means in its power. Those who say that the existing town schools suffice, and that we have no need of primary village schools, forget that the case is the same for us as with the buffet here in the ante-chamber. It is open to all: quite true! But, it does not suit our pockets. We do not want champagne and Strasburg pies." But, in spite of the sturdy peasant's good common sense, the proposition was almost unanimously rejected. Nor are such matters confined to the remote districts of the Ural. The Zemstvo of Odessa, for instance, can only boast of thirteen schools, with 500 pupils upon which it expends a sum of 6,000 to 7,000 roubles; whilst the sale of playing-cards, which is a monopoly of the Zemstvo, brought in a net profit of 32,000 roubles. But then gambling is a vice to which the Russians, especially the higher classes, are notoriously addicted, more so than in any other country. Still it is satisfactory to find even one peasant endeavoring to promote the cause of education. Some of the seed has fallen on good ground. On the other hand, nothing exemplifies the spirit in which the government instituted and regards the Zemstvo so much as the fact, that when several Zemstvos endeavored to introduce compulsory education, the home ministry placed its veto on the proposal, saying—"All compulsion prevents, but does not forward, the development of the good!"

Of the country which is thus governed, we find that European Russia comprises 2,261,657 sq. miles, with a population of 78,281,447; Asiatic Russia, 6,170,882 sq. miles, with a population of 7,229,495: forming a total of 8,432,549 sq. miles, with a population of 85,510,942. Gifted with an almost boundless territory, with enormous tracts of land yet unreclaimed from the primitive wilderness, with mines which yield prolific stores of wealth, what a power of expansion such a population must necessarily possess! What will that population be within a century? What, even in the year 1900? Evidently an enormous, perhaps irresistible, power for good or for evil. A solid foundation for European despotism, or a glorious aid to that rationally free and constitutional government which appears to be so safe and wise in action. Russia may abandon a policy which exhausts the energies of the people, in adding to its already overgrown dominions countries it cannot benefit by; but its present Czar does not seem to have forgotten the ambitious lessons of Peter and Catherine, whilst directing his attention to promoting the prosperity of the vast empire he possesses. Russia, with all her craft and crime, has yet been the pioneer of civilization in the sterile and savage north: it is now time that she should rest in her dazzling and feverish progress, and, turning back her eyes on the lands and peoples she has subdued, devote herself to cultivating the one, and elevating the other. Her nobles and officers are among the most polished gentlemen of Europe; but her people are yet scarcely more than semi-Asiatic hordes, deeply plunged in barbarism and superstition, and almost as much an anomaly in Europe as the Turks. In political, as well as in social progress, it may be certainly pronounced that "The bells of time are ringing changes fast."

The present age is one of transition for Russia. She cannot continue into the future that which she was in the past. Nature cries aloud, in tones of commanding eloquence, to empires as well as to men—"Advance, or perish!" The statesmen of Russia are too wise to remain insensible to an injunction which is as unalterable as destiny, as "unshunnable as death." Should their successors be blind to the great problem which will stand before them for solution, the works of an empire's progress and redemption will be done in other ways. Czardom is not necessarily eternal; and revolution may accomplish what the slow and silent progress of genial reforms could not effect. In spite of political statistics and ominous inferences, we have great hope for the future of Russia. The young giant is wilful and sullen, but we think he is growing wiser, though it may not appear so at the present moment.

RUSSIAN GUN.—The Russian artillery may be said to be in a transition state, experiments being continually carried on if not to change its matériel, to modify the present ordnance so as to allow that branch of the army at least to bear comparison with that adopted or on the point of being adopted by other armies. The guns of the Russian artillery are 4-pr. and 9-pr. B. L. R. guns for the most part of bronze. The 4-pr., of 3.3 inch caliber fires a projectile weighing 12lbs. The 9-pr. gun which forms three-fifths of its actual armament, fires a shell weighing 24 lbs. with a charge of 2.69 lbs., and possesses an initial velocity of 1060 feet only. Experiments have been made of late with steel guns of the Krupp system, as well as with the 9-pr. modified. The improvement made in that gun by means of casting the metal in metallic molds and then chilling it, have enabled it to obtain an initial velocity of 1369 feet. It differs slightly from the old 9-pr., the dimensions of the chambers being made to allow the use of a charge of 7.23 lbs. of powder. The projectile is provided with 2 belts of copper in lieu of a leaden coat. In order to obtain a flatter trajectory in long ranges, a truncated shot-bottom similar to one proposed by Whitworth has been tried. The weight of the gun and that of the projectile are the same as in the old 9-pr. See *Russian Rifling*.

RUSSIAN LIFE SAVING ROCKET.—The Russian Life-saving Rocket is made of sheet iron, about one-tenth (0″.1.) of an inch in thickness. The body is a cylindrical tube, closed at the front end by a metallic head, held in position by four short screws. The rear end is closed by a diaphragm, which is perforated by six vents or fuse holes, equidistant circumferentially, whose centers are on the circumference of a circle concentric with the diaphragm. An axial hole in the diaphragm has a female screw thread cut on its interior surface to engage the male thread on the rocket stick. The body is fastened to the perforated disk by crimping and by short iron pins. The cylinder is filled with rocket composition The body of the stick is made of light wood, cylindrical near the base and tapering to the front, forming the frustum of a cone. The front end of the stick, which screws into the rocket, is made of wrought iron, hollow at its base for the insertion of the wooden body. The latter is held in place by screws. The rear end of the body is rounded, and on one side carries a strong iron hook, about five (5″) inches in length, with its point turned towards the front, and curved slightly outwards from the axis of the stick. A curved steel spring is placed between the point of the hook and the shank strap to prevent the egress of the ring of the rocket chain after firing. This hook is bolted to the wooden body of the rocket stick. When prepared for packing, the rocket sticks are screwed into the rockets and the fuse holes or vents are covered by disks of water-proof tarred cloth. The diameter of the disk is enough larger than that of the rocket to admit of its being folded over the end of the rocket and secured by several turns of twine, tied tightly around it. The whole rocket, except the wooden body, is then treated with a coat of black paint. The cap or disk must be cut away before firing, in order to expose the fuse holes.

The principal dimensions and weights are as follows:

	Inches.	Centimeters.
Rocket body { Length	25.25	64.12
Rocket body { Exterior diameter	3.2	8.13
Rocket body { Interior diameter	3.0	7.62
Total length of rocket	27.2	69.08
Total length of rocket stick	29.2	74.16
Total length of rocket and stick	55.5	140.97
Length filled with composition	23.1	58.67
Maximum diameter of stick	2.8	7.11
Diameter of vents or fuse holes	0.6	1.52
Number of vents, six		
	Pounds.	Kilos.
Average weight of rocket and stick	25.5	11.56

The rocket stand is a rectangular tube of sheet-iron mounted upon a wooden tripod. The cross-section of the tube is square with one of its diagonals situated in a vertical plane when the stand is in position for use. This hollow parallelopipedonal tube is formed from a single piece of sheet-iron. The longitudinal faces forming the lower edge do not join to complete the regular figure, except for two (2″) inches at the lower end, but are bent outwards from each other, forming two parallel flanges. These flanges are 1″.7 wide, and have a space half an inch wide between them throughout their length, which serves as a channel for the grappling hook on the under side of the rocket-stick to slide in when the rocket is fired. It is also necessary for the same purpose in placing the rocket in position before firing. The rear end of the square tube is bound and strengthened by a band of strap iron 2″ wide and one-tenth (0″.1) of an inch thick. The front end of the tube is reinforced in a similar manner, but with this difference: The band at its lower edge has a cylindrical tube 1″.7 in diameter, projecting to the front 2″.3, for the purpose of holding the ring of the rocket chain. This short tube embraces the front ends of the flanges of the body, and has a longitudinal slot, corresponding in width to the space between the flanges along its upper surface to permit the passage of the rocket hook. A rectangular notch 1''.1 deep is cut in the lower side to accommodate the upper link of the rocket chain when the ring is placed over the projecting tube. Near the middle of the longitudinal bottom flange on the right-hand side of the body tube is attached a rectangular brass plate, 10'' long and 1''.6 wide, with a lug and eye-hole projecting from its under edge near the middle. Through this eye-hole passes the horizontal axis. In a corresponding position on the left side is a semicircular brass plate attached to the other flange. The arc of this plate is graduated into degrees, in order to indicate the elevation of the axis of the main tube. A lug and eye-hole at the center of this arc admits of the insertion of the horizontal axis. A slotted brass support with holes pierced through the upper ends of the vertical arms sustains the horizontal axis that carries the rocket tube and its graduated arc. A clamp screw passes through this support from the right side and clamps the arc in any given position. All motion in altitude within the limits of the scale is governed by this screw. The lower end of the support terminates in a cylindrical tenon 3''.2 in length and 1''.2 in diameter, which fits in a corresponding hole in the tripod head. Two elliptical openings opposite to each other, are made in the upper sides of the tube for the insertion of the port-fire to ignite the rocket composition.

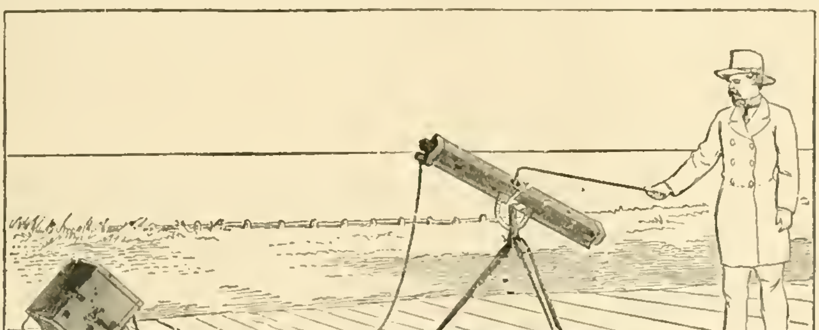
The following are the principal dimensions, weights, etc., of the stand:

		Inches.	Centimeters.
Total length of rocket-tube		53.3	135.38
Cross-section, square.	Exterior	4.3	10.92
	Interior	4.1	10.41
Weight of rocket stand		39.0	17.69
Weight of rocket chain		4.625	2.17
Weight of port fire handle		0.5625	0.25
Total weight without packing box		44.1875 =	20.13
Weight of coil of rocket line		62.0	28.12

A port-fire holder or firing staff accompanies the rocket stand. It is a simple wooden handle with a bent head of brass. The brass head is hollow and is slitted on the sides so as to form a rude clamp. The port-fire is inserted in the split end of the head and then ignited in the usual manner. The rocket-chain is a hand-made iron chain, six feet in length, terminated at one end by a ring two inches in diameter. The ring is placed over the tubular projection on the front end of the rocket stand in firing. The other end of the chain is fastened to the end of the rocket line. The rocket line is a loosely-twisted hemp-line about the size of the No. 8 or No. 9 service lines.

The following is the method of using:—The rocket stand is taken from the box, the legs of the tripod extended, and the stand placed at the firing point. The index being clamped at zero on the graduated arc, the tripod is leveled by the eye by making the axis of the rocket tube horizontal. This can only be done approximately; then loosen the lower clamp screw and swing the stand around until it points in the desired direction. Clamp the vertical spindle and by turning the upper clamp screw to the left the required elevation may be given; after which the screw must be tightened, in order to retain the tube in place. Take a rocket from its box, tear off the cap over the vents, insert the rocket, base first into the rectangular tube with the hook on the stick gliding down between the flanges on the lower side of the tube. When the hook strikes the band at the lower end of the rocket tube, the rocket is in position for firing. Place the fakes or the faking box in front of the stand, put the ring of the chain over the cylindrical tubular projection on the front end of the stand, letting the chain attached to the line hang below. Stand clear of the line, and, with a port-fire inserted in the holder, advance and ignite the rocket by thrusting the port-fire gently through one of the elliptical openings in the rocket tube. Care must be taken not to disturb the aim. An instant after the composition in the base of the rocket is ignited, the latter leaps forward guided by the rocket tube, and as it leaves the tube the hook engages the ring of the chain attached to the line and carries out the chain and line. The chain should be fastened to the line before wanted for use. See *Life-saving Rockets*.

RUSSIAN PRINCIPALITIES.—The period that extends from ten hundred and fifty-four, the year of Iaroslaf's death, to twelve hundred and twenty-four the year of the first appearance of the Tatars, or, to take the French chronology, from the reign of Henry the First to the death of Philip Augustus, is one of the most confused and troubled in Russian history. As the barbarian custom of division continued to prevail over the Byzantine ideal of political unity,



the national territory was ceaselessly partitioned. The princely anarchy of Eastern Europe has its parallel in the feudal anarchy of the West. M. Pogodin reckons during this period sixty-four principalities which had an existence more or less prolonged, two hundred and ninety-three princes who disputed the throne of Kief and other domains, and eighty-three civil wars, in some of which the whole country was engaged. There were, besides, foreign wars to augment this enormous mass of historical facts. Against the Polovtsui alone the chroniclers mention eighteen campaigns, while these barbarians made no less than forty-six invasions of Russia. It is impossible to follow the national chroniclers in the minute details of their annals; we will only treat of the principalities which lasted some time, and of the facts which were most important. The ancient names of the Slav tribes have everywhere disappeared, or remain only in the names of some of the towns, for example that of the Polotchané in Polotsk, and that of the Severiané in Novgorod-Severski. The elements of which Russia was now composed were no longer tribes, but principalities. We hear no more of the Krivitchi or the Drevliané, but of the principalities of Smolensk and Volhynia. These little states were perpetually dismembered at each new partition between the sons of a prince, and then were reconstituted to be divided anew into appanages. Notwithstanding all these vicissitudes, some of them maintained a steady existence, corresponding to certain topographical or ethnographical conditions. Without speaking of the distant principality of Tmutorakan, situated at the foot of the Caucasus in the center of Turkish and Circassian tribes, and reckoning eight successive princes, the following are the great divisions of Russia from the eleventh to the thirteenth century :—

The principality of Smolensk occupied the important territory which is, as it were, the central point in the mountain system of Russia. It comprehends the ancient forest of Okof, where three of the largest Russian rivers, the Volga, the Dnieper, and the Dwina, take their rise. Hence the political importance of Smolensk, attested by all the wars to gain possession of it; hence also, its commercial prosperity. It is noticeable that all its towns were built on one or other of these three great rivers; therefore the entire commerce of ancient Russia passed through its hands. Besides Smolensk we must mention Mojaïsk, Viasma, and Toropets, which was the capital of a secondary principality, the property of two celebrated princes, Mstislaf the Brave and Mstislaf the Bold. The principality of Kief was *Rus*, Russia in the strict sense of the word. Its situation on the Dnieper, the neighborhood of the Greek Empire, the fertility of the Black Land, long secured to this state the supremacy over the Russian principalities. On the south it bordered directly on the nomads of the steppe, against whom her princes were forced to raise a barrier of frontier towns. They often took these barbarians into their pay, granted them lands, and constituted them into military colonies. The principality of Pereiaslavl was a dependence of Kief; Vuishegorod, Bielgorod, Tripoli, Torshok, were at times erected into principalities for princes of the same family. On the tributaries of the right bank of the Dnieper, notably the Soja, the Desna, and the Seïm, extended the two principalities of Tchernigof, with Starodub and Lubetch; and also of Novgorod-Severski, with Putivl, Kursk, and Briansk. The principality of Tchernigof, which reached towards the Upper Oka, had therefore one foot in the basin of the Volga; its princes, the Olgovitchi, were the most formidable rivals of Kief. The princes of Severski were always engaged in war with the Polovtsui, their neighbors on the south. It was a prince of Severski whose exploits against these barbarians formed the subject of a sort of epic poem, called the Song of Igor, or the Account of Igor's Expedition.

Another principality, whose very existence consisted in endless war against the nomads, was the double principality of Riazan and Murom, the principal towns of which were Riazan, Murom, Pereiaslavl-Riazanski, situated on the Oka, Kolomna at the junction of the Moskova with the Oka, and Pronsk on the Prona. The Upper Don formed its western boundary. This principality was placed in the very heart of the Muromians and Meshtcheraki, Finnish tribes. The reputation of its inhabitants, who were reckoned extremely warlike in their character, and rough and brutal in their manners, was no doubt partly the result of the mixture of the Russian race with the ancient inhabitants of the country, and of their perpetual and bloody struggle with the nomad tribes. The double principalities of Suzdal, with their towns of Suzdal, Rostof, Iurief-Polski on the Kolosha, Vladimir on the Kliazma, Iaroslavl, and Pereiaslavl-Zalieski, were situated on the Volga and the Oka amongst the thickest of northern forests, and in the middle of the Finnish tribes of Muromians, Meria, Vesui, and Tcheremisa. Although placed at the farthest extremity of the Russian world, Suzdal exercised an important influence over it. We shall find its princes now establishing a certain political authority over Novgorod and the Russia of the Lakes, the result of a double economic dependence; now intervening victoriously in the quarrels of the Russia of the Dnieper. The Suzdalians were rough and warlike, like the Riazanese. Already we can distinguish among these two people the characteristics of a new nationality. That which divides them from the Kievans and the men of Novgorod-Severski, occupied like themselves in the great war with the barbarians, is the fact that the Russians of the Dnieper sometimes mingled their blood with that of their enemies and becamed fused with the nomad, essentially mobile Turkish races, whilst the Russians of the Oka and the Volga united with the Finnish tribes, who were agricultural and essentially sedentary. This distinction between the two foreign elements that entered the Slav blood has doubtless contributed to the difference in the characters of the two branches of the Russian race. From the eleventh to the thirteenth century, in passing from the basin of the Dnieper to the basin of the Volga, we can already watch the formation of Great and Little Russia.

The principalities of Kief, Tchernigof, Novgorod-Severski, Riazan, Murom, and Suzdal, situated on the side of the steppe with its devastating hordes, formed the frontier states of Russia. The same part to play on the northwest, opposite the Lithuanians, Letts, and Tchudi, fell to the principality of Polotsk which occupied the basin of the Dwina; and to the republican principalities of Novgorod and Pskof on the Lakes Ilmen and Peïpus. To the principality of Polotsk, that of Minsk was attached which lay in the basin of the Dnieper. The possession of Minsk was often disputed by the Grand Princes of Kief. To Novgorod belonged the towns of Torjok, Volok-Lamski, Izborsk, and Veliki-Luki, which were at times capitals of particular states. Southeast Russia comprehended: Volhynia, in the fan-shaped distribution of rivers formed by the Pripet and its tributaries, with Vladimir-in-Volhynia, Lutsk, Turof, Brest and even Lublin, which is certainly Polish; Gallicia proper, or Red Russia, in the basins of the San, the Dniester, and the Pripet, whose ancient inhabitants, the White Kroats, seem to have sprung from the stock of the Danubian Slavs. Her chief towns were Galitch, founded by Vladimirko about eleven hundred and forty-four, Peremuisl, Terebovl, and Zvenigorod. The neighborhood of Hungary and Poland gave a special character to these principalities, as well as a more advanced civilization. The epic songs speak of Gallicia, the native land of the hero Diuk Stepanovitch, as a fabulously rich country. The Account of Igor's Expedition gives us a high idea of the power of these princes. "Iaroslaf Osmomuisl of Gallicia!" cried the poet to one of them, "thou art seated very high on thy throne of wrought gold; with thy regiments of iron thou sustainest the Carpathians; thou closest the gates of the Danube; thou barrest the way to the King of Hungary; thou openest at thy will the gates of Kief, and with thine arrows thou strikest from afar!"

The disposition of these fifteen or sixteen principalities confirms all that we have said about the essential unity of the configuration of the Russian soil. Not one of the river basins forms an isolated and closed region. There is no line of heights to establish barriers between them or political frontiers. The greater number of the Russian principalities belong to the basin of the Dnieper, but extend everywhere beyond its limits. The principality of Kief, with Pereiaslavl, is nearly the only one completely confined within it; but Volhynia puts the basin of the Dnieper in communication with those of the Bug and the Vistula, Polotsk with the basins of the Dnieper and the Dwina, Novgorod-Severski with the basin of the Don, Tchernigof and Smolensk with the basin of the Volga. Watercourses everywhere established communications between the principalities. Already Russia, though broken up into appanages, had the germs of a great united empire. The slight cohesion of nearly all the states, and their frequent dismemberments, prevented them from ever becoming the homes of real nationalities. The principalities of Smolensk, Tchernigof, and Riazan have never possessed as definite an historic existence as the duchy of Bretagne or the county of Toulouse in France, or the duchies of Saxony, Suabia, and Bavaria in Germany.

The interests of the princes, their desire to create appanages for each of their children, caused a fresh division of the Russian territory at the death of every sovereign. There was, however, a certain cohesion in the midst of all these vicissitudes. There was a unity of race and language, the more sensible, notwithstanding all dialectic differences, because the Russian people was surrounded everywhere, except at the southwest, by entirely strange races, Lithuanians, Tchudi, Finns, Turks, Magyars. There was a unity of religion; the Russians differed from nearly all their neighbors, for in contrast with the Western Slavs, Poles, Tcheki, and Moravians, they represented a particular form of Christianity, not owning any tie to Rome, and rejecting Latin as the language of the Church. There was the unity of historical development, as up to that time the Russo-Slavs had all followed the same road, had accepted Greek civilization, submitted to the Variagi, pursued certain great enterprises in common,—such as the expeditions against Byzantium and the war with the nomads. Finally there was political unity, since after all, in Gallicia as in Novgorod, on the Dnieper as in the forests of Suzdal, it was the same family that filled the thrones. All these princes descended from Rurik, Saint Vladimir, and Iaroslaf the Great. The fact that the wars that laid waste the country were civil wars, was a new proof of this unity. The different parts of Russia could not consider themselves strangers one to the other, when they saw the Princes of Tchernigof and Suzdal taking up arms to prove which of them was the eldest, and which consequently had most right to the title of Grand Prince and the throne of Kief. There were descendants of Rurik who governed, successively, the remotest States of Russia, and who, after having reigned at Tmutorakan on the Straits of Ienikale, at Novgorod the Great, at Toropets, in the country of Smolensk, ended by establishing their right to reign at Kief. In spite of the division into appanages, Kief continued to be the center of Russia. It was there that Oleg and Igor had reigned, that Vladimir had baptized his people, and Iaroslaf had established the metropolis of the faith, of arts, and of national civilization. It is not surprising that it should have been more fiercely disputed than all the other Russian cities. Russia had many princes; but she had only one Grand Prince, the one that reigned at Kief. He had a recognized supremacy over the others which he owed not only to the importance of his capital, but to his position as eldest of the royal family. Kief, the mother of all cities, was always to belong to the eldest of the descendants of Rurik; this was the consequence of the patriarchal system of the Slavs, as was the custom of division. When the Grand Prince of Kief died, his son was not his rightful heir; but his uncle or brother, or whichever of the Princes was the eldest. Then the whole of Russia, from the Baltic to the Black Sea, held itself in readiness to support the claims of this or that candidate. It was the same with the other principalities, where the possessors of different appanages aspired to reign in the metropolis of the region. The civil wars, then, themselves strengthened the sentiment of the Russian unity. What were they, after all, but family quarrels?

The persistent conflict between the Byzantine law, by which the son inherited the possessions of the father, and the old national laws of the Slavs which caused them to pass to the eldest of all the family, was an inexhaustible source of civil wars. Even had the law been perfectly clear, the princes were not always disposed to recognize it. Thus, although the eldest of Iaroslaf's sons had in his favor the formal will of his father, giving him the throne of Kief, and though Iaroslaf on his death-bed had desired his other sons to respect their elder brother as they had done their parent, and look on him as their father, Isiaslaf at once found his brother Sviatoslaf ready to take up arms and overturn his throne. He was obliged in ten hundred and seventy-three to seek refuge at the Court of Henry the Fourth of Germany, who sent an embassy to Kief, commanding Sviatoslaf to restore the throne to Isiaslaf. Sviatoslaf received the German envoys with such courtesy, made them such a display of his treasures and riches, that, dazzled by the gold, they adopted a pacific policy. Henry the Fourth himself, disarmed by the liberalities of the Russian Prince, spoke no more of chastising the usurper. Isiaslaf did not return to Kief till after the death of his rival in ten hundred and seventy-six. When his own death took place, in ten hundred and seventy-eight, his son Sviatopolk did not succeed him immediately. It was necessary that all the heirs of Iaroslaf should be exhausted. Vsevolod, a brother of Isiaslaf, whose daughter married the Emperor Henry the Fourth or Henry the Fifth—it is not quite certain which—reigned for fifteen years, from ten hundred and seventy-eight until ten hundred and ninety-three. In accordance with the same principle, it was not the son of Vsevolod, Vladimir Monomakh, who succeeded his father; but after the crown had been worn by a new generation of princes, it returned to the blood of Isiaslaf. Vladimir Monomakh made no opposition to the claims of Sviatopolk Isiaslavitch. "His father was older than mine," he said, "and reigned first in Kief," so he quitted the principality which he had governed with his father, and valiantly defended against the barbarians. But every one was not so respectful to the national law as Vladimir Monomakh.

Two terrible civil wars desolated Russia in the reign of the Grand Prince Sviatopolk, between ten hundred and ninety-three and eleven hundred and thirteen: one about the principality of Tchernigof, the other about Volhynia and Red Russia. Sviatoslaf had enjoyed Tchernigof as his share, to which Tmutorakan in the Taurid, Murom and Riazan in the Finn country, were annexed. Isiaslaf and Vsevolod, Grand Princes of Kief, had despoiled the sons of Sviatoslaf, their brother, depriving them of the rich territory of Tchernigof, and only leaving them Tmutorakan and the Finnish country. Even Vladimir Monomakh, whom we have seen so disinterested, had accepted a share of the spoil. The injured princes were not people to bear this meekly, especially the elder, Oleg Sviatoslavitch, one of the most energetic men of the eleventh century. He called the terrible Polovtsui to his aid, and subjected Russia to frightful ravages. Vladimir Monomakh was moved by these misfortunes; he wrote a touching letter to Oleg, expressing his sorrow for having accepted Tchernigof. At his instigation a Congress of Princes met at Lutbetch, on the Dnieper, in ten hundred and ninety-seven. Seated on the same carpet, they resolved to put an end to the civil wars that handed the country as a prey to the barbarians. Oleg recovered Tchernigof, and promised to unite with the Grand Prince of Kief and Vladimir Monomakh against the Polovtsui. The treaty was ratified by the oath of each prince, who kissed the cross and swore, "that henceforth the Russian land shall be considered as the country of all; and whoso shall dare to arm himself against his brother becomes our common enemy."

In Volhynia the prince, David, was at war with his nephews, Vasilko and Volodar. The Congress of Lubetch had divided the disputed territories between them, but scarcely was the treaty ratified than David went to the Grand Prince Sviatopolk and persuaded him that Vasilko had a design on his life. With the light faith habitual to the men of that date, the Grand Prince joined David in framing a plot to attract Vasilko to Kief on the occasion of a religious festival. When he arrived he was loaded with chains, and the Grand Prince convoked the boyars and citizens of Kief, to denounce the projects of Vasilko. "Prince," replied the boyars, much embarrassed, "thy tranquility is dear to us. Vasilko merits death, if it is true that he is thine enemy: but if he is calumniated by David, God will avenge on David the blood of the innocent." Thereon the Grand Prince delivered Vasilko to his enemy David who put out his eyes. The other descendants of Iaroslaf the First were indignant at this crime. Vladimir Monomakh united with Oleg of Tchernigof, his ancient enemy, and marched against Sviatopolk. The people and clergy of Kief succeeded in preventing a civil war between the Grand Prince and the confederates of Lubetch. Sviatopolk was forced to disavow David, and swear to join the avengers of Vasilko. David defended himself with vigor, and summoned to his help, first the Poles, and then the Hungarians. At last a new congress was assembled at Vititchevo in the year eleven hundred, on the left bank of the Dnieper, a town of which a deserted ruin is all that now remains. As a punishment for his crime, David was deprived of his principality of Vladimir in Volhynia, and had to content himself with four small towns. After the new settlement of this affair, Monomakh led the other princes against the Polovtsui, and inflicted on them a bloody defeat; seventeen of their khans remained on the field of battle. One khan who was made prisoner offered a ransom to Monomakh; but the prince showed how deeply he felt the injuries of the Christians,—he refused the gold, and cut the brigand chief in pieces.

When Sviatopolk died, the Kievans unanimously declared they would have no Grand Prince but Vladimir Monomakh. Vladimir declined the honor, alleging the claims of Oleg and his brothers to the throne of Kief. During these negotiations a sedition broke out in the city, and the Jews, whom Sviatopolk had made the instruments of his fiscal exactions, were pillaged. Monomakh was forced to yield to the prayers of the citizens. During his reign, from eleven hundred and thirteen until eleven hundred and twenty-five, he obtained great successes against the Polovtsui, and Petchenegi, the Torki, the Tcherkesui, and other nomads. He gave an asylum to the remains of the Khazarui, who built on the Oster, not far from Tchernigof, the town of Belovega. The ruins of this city that remain to-day prove that this Finnish people, eminently capable of culture, and already civilized by the Greeks, were further advanced in the arts of construction and fortification than even the Russians themselves. According to one tradition, Monomakh also made war on the Emperor Alexis Comnenus, a Russian army invaded Thrace, and the Bishop of Ephesus is said to have brought gifts to Kief, among others a cup of carnelian that had belonged to Augustus, besides a crown and a throne, still preserved in the Museum at Moscow, under the name of the crown and throne of Monomakh. It is now known that they never belonged to Vladimir, but it was the policy of his descendants, the Tsars of Moscow, to propagate this legend. It was of consequence to them to prove that these tokens of their power were traceable to their Kievan ancestor, and that the Russian Monomakh, grandson of the Greek Monomachus, had been solemnly crowned by the Bishop of Ephesus as Sovereign of Russia. The Grand Prince made his authority felt in other parts of Russia. A Prince of Minsk, who had the temerity to kindle a civil war, was promptly dethroned, and died in captivity at Kief. The Novgorodians saw many of their boyars kept as hostages, or else exiled. The Prince of Vladimir in Volhynia was deposed, and his states given to a son of the Grand Prince.

Monomakh has left us a curious paper of instructions that he compiled for his sons, and in which he gives them much good advice, enforced by examples drawn from his own life. "It is neither fasting, nor solitude, nor the monastic life, that will procure you the life eternal,—it is well-doing. Do not forget the poor, but nourish them. Do not bury your riches in the bosom of the earth, for that is contrary to the precepts of Christianity. Be a father to the orphans, judge the cause of widows yourself. . . . . Put to death no one, be he innocent or guilty, for nothing is more sacred than the soul of a Christian. . . . . Love your wives, but beware lest they get the power over you. When you have learnt anything useful, try to preserve it in your memory, and strive ceaselessly to get knowledge. Without ever leaving his palace, my father spoke five languages, a thing that foreigners admire in us. . . . . I have made altogether twenty-three campaigns without counting those of minor importance. I have concluded nineteen treaties of peace with the Polovtsui, taken at least a hundred of their princes prisoners, and afterwards restored them to liberty: besides more than two hundred whom I threw into the rivers. No one has travelled more rapidly that I. If I left Tchernigof very early in the morning, I arrived at Kief before vespers. Sometimes in the middle of the thickest forest I caught wild horses myself, and bound them together with my own hands. How many times I have been thrown from the saddle by buffaloes, struck by the horns of the deer, trampled under foot by the elands! A furious boar once tore my sword from my belt; my saddle was rent by a bear, which threw my horse down under me! How many falls I had from my horse in my youth, when, heedless of danger, I broke my head, I wounded my arms and legs! But the Lord watched over me!" Vladimir completed the establishment of the Slav race in Suzdal, and founded a city on the Kliazma that bore his name, and that was destined to play a great part. Such, in the beginning of the twelfth century, when Louis the Sixth was fighting with his barons of the Isle de France, was the ideal of a Grand Prince of Russia.

Of the sons of Vladimir Monomakh, Iuri Dolgoruki became the father of the princes of Suzdal and Moscow, and Mstislaf the father of the princes of Galitch and Kief. These two branches were often at enmity, and it was their rivalry that struck the final blow at the prosperity of Kief. When Isiaslaf, son of Mstislaf, was called to the throne in eleven hundred and forty-six by the inhabitants of the capital, his uncle, Iuri Dolgoruki, put forward his rights as the eldest of the family. Kief, which had been already many times taken and retaken in the strife between the descendants of Oleg of Tchernigof and the descendants of Vladimir Monomakh, was fated to be disputed anew between the uncle and the nephew. It was almost a war between the Old and New Russia, the Russia of the Dnieper and that of the Volga. The princes of Suzdal, who dwelt afar in the forests in the northwest, establishing their rule over the remnants of the Finnish races, were to become greater and greater strangers to Kievan Russia. If they still coveted the "mother of Russian cities," because the title of Grand Prince was attached to it, they at least began to obey and to venerate it less than the other princes.

Iuri Dolgoruki found an ally against Isiaslaf in one of the Olgovitchi, Sviatoslaf, who thirsted to avenge his brother Igor, dethroned and kept prisoner in Kief by the Grand Prince. The Kievans hesitated to support the sovereign they had chosen; they hated the Olgovitchi, but in their attachment to the blood of Monomakh they respected his son and his grand-son equally. "We are ready" they said to Isiaslaf, "we and our children, to make war on the sons of Oleg. But Iuri is your uncle, and can we dare to raise our hands against the son of Monomakh?" After the war had lasted some time, a decisive battle was fought. At the battle of Pereiaslavl Isiaslaf was completely defeated, and took refuge, with two attendants, in Kief. The inhabitants, who had lost many citizens in this war, declared they were unable to stand a siege. The Grand Prince then abandoned his capital to Iuri Dolgoruki, and retired to Vladimir in Volhynia, whence he demanded help from his brother in-law, the King of Hungary, and the Kings of Poland and Bohemia. With these reinforcements he surprised Kief, and nearly made his uncle prisoner. Understanding that the national law was against him, he opposed eldest with eldest, and declared himself the partisan of another son of Monomakh, the old Viatcheslaf, Prince of Turof. He was proclaimed Grand Prince of Kief, adopted his nephew Isiaslaf as his heir, and during his reign, from eleven hundred and fifty to eleven hundred and fifty-four, gave splendid fêtes to the Russians and Hungarians. Iuri returned to the charge, and was beaten under the walls of Kief. Each of these princes had taken barbarians into his pay: Iuri, the Polovtsui; Isiaslaf, the Black Caps, that is, the Torki the Petchenegi, and the Berendians.

The obstinate Prince of Suzdal did not allow himself to be discouraged by this check. The old Viatcheslaf, who only desired peace and quiet, in vain addressed him letters, setting forth his rights as the eldest. "I had already a beard when you entered the world," he said. Iuri proved himself intractable, and went into Gallicia to effect a junction with his ally, Vladimirko, Prince of Galitch. This Vladimirko had violated the oath he had taken and confirmed by kissing the cross. When they reproached him, he said, with a sneer, "It was such a little cross!" To prevent this dangerous co-operation, Isiaslaf, without waiting the expected arrival of the Hungarians, began the pursuit of Iuri, and came up with him on the borders of the Rut, a small tributary of the Dnieper. A bloody battle was fought, where he himself was wounded and thrown from his horse, but the Suzdalians and their allies the Polovtsui were completely defeated in eleven hundred and fifty-one. Isiaslaf survived this victory only three years. After his death and that of Viatcheslaf, Kief passed from hand to hand. Iuri finally reached the supreme object of his desires. He made his entry into the capital in eleven hundred and fifty-five, and had the consolation of dying Grand Prince of Kief, at the moment that a league was being formed for his expulsion, in eleven hundred and fifty-seven. "I thank thee, great God," cried one of the confederates on learning the news, "for having spared us, by the sudden death of our enemy, the obligation of shedding his blood!" The confederates entered the town; one of them assumed the title of Grand Prince, the others divided his territories. Henceforth there existed no grand principality, properly speaking and with the growing power of Suzdal, Kief ceased to be the capital of Russia. A final disaster was still reserved for it.

In eleven hundred and sixty-nine Andrei Bogoliubski, son of Iuri Dolgoruki, and Prince of Suzdal, being disaffected to Mstislaf, Prince of Kief, formed against him a coalition of eleven princes. He confided to his son Mstislaf and his voïevod Boris an immense army of Rostovians, Vladimirians, and Suzdalians to march against Kief. This time the Russia of the forests triumphed over the Russia of the steppes, and after a three days' siege Kief was taken by assault. "This mother of Russian cities," says Karamsin, "had been many times besieged and oppressed. She had often opened her Golden Gate to her enemies, but none had ever yet entered by force. To their eternal shame, the victors forgot that they too were Russians! During three days not only the houses, but the monasteries, churches, and even the temples of Saint Sophia and the Tithe, were given over to pillage. The precious images, the priestly ornaments, the books, and the bells, all were taken away."

From this time the lot of the capital of Saint Vladimir, pillaged and dishonored by his descendants, ceases to have a general interest for Russia. Like other parts of Slavonia, it has its princes, but the heads of the reigning families of Smolensk, Tchernigof, and Galitch assume the once unique title of Grand Prince. The center of Russia is changed. It is now in the basin of the Volga, at Suzdal. Many causes conspired to render the disaster of eleven hundred and sixty-nine irremediable. The chronic civil wars of this part of Russia, and the multitudes and growing power of the nomad hordes, rendered the banks of the Dnieper uninhabitable. In twelve hundred and three Kief was again sacked by the Polovtsui, whom the Olgovitchi of Tchernigof had taken into their pay. On this soil, incessantly the prey of war and invasion, it was impossible to found a lasting order of things; it was impossible that a regular system of government should be established, —that civilization should develop and maintain itself. Less richly endowed by nature, and less civilized, the Russia of the forests was at least more tranquil. It was there that a grand principality was formed, called to fulfil high destinies, but which, unhappily, was to be separated for three hundred years, by the southern steppes and the nomads who dwelt there, from the Black Sea; that is, from Byzantine and Western civilization. See *Russian Republics.*

RUSSIAN REPUBLICS.—Novgorod has been, from the most remote antiquity, the political center of the Russia of the northwest. The origin of the Slavs of the Ilmen, who laid the foundations of it, is still uncertain. Some learned Russians, such as M. Kostomarof, suppose them to belong to the Slavs of the south, others to the Slavs of the Baltic; others, again, like M. Bielaef and M. Ilovaiski, make them a branch of the Krivitch or Smolensk Slavs. We find the Novgorodians, at the opening of Russian history, at the head of the confederation of tribes which first expelled and then recalled the Variagi to reign over Russia. Novgorod, from very ancient times, was divided into two parts, separated by the course of the Volkhof, which rises in Lake Ilmen and falls into the Ladoga. On the right bank was the side of St. Sophia, where Iaroslaf the Great built his celebrated cathedral; where the Novgorod kreml was situated, enclosing both the palaces of the Archbishop and the Prince; and where the famous Russian monument was consecrated in eighteen hundred and sixty-two. On the left bank is the side of commerce, with its Court of Iaroslaf; the bridge which joins the two halves of the city is celebrated in the annals of Novgorod. The side of Saint Sophia includes the Nerevsky or Nerevian quarter, as well as those of Zagorodni, or the suburbs, and of the potters. The side of commerce comprised the quarters of the carpenters and Slavs. Ancient documents also speak of a Prussian or Lithuanian quarter. Some of these names seem to indicate that many races have concurred, as in ancient Rome, to form the city of Novgorod. Gilbert of Lannoy, who visited the republic about fourteen hundred and thirteen, has left us this description of it: "Novgorod is a prodigiously large town, situated in a beautiful plain, in the midst of vast forests. The soil is low, subject to inundations, marshy in places. The town is surrounded by imperfect ramparts, formed of gabions; the towers are of stone." Portions of these ramparts still exist, and allow us to form an idea of the immense extent of the ancient city. The kreml forms its acropolis. The cathedral has preserved its frescoes of the twelfth century; the pillars painted with images of saints on a golden ground: the imposing figure of Christ on the cupola; the banner of the Virgin, which was to revive the courage of the besieged, on the ramparts; the tomb of St. Vladimir Iaroslavitch, of the Archbishop Nikita, by whose prayers a fire was extinguished, of Mstislaf the Brave, the devoted defender of Novgorod, and of many other saints and illustrious people. Without counting the tributary cities of Novgorod, such as Pskof, Ladoga, Izborsk, Veliki-Luki, Staraia-Rusa, or Old Russia, Torjok, Biejitchi, its primitive territory was divided into five counties, which included the land to the south of the lakes Ladoga and Onega. Its conquests formed five bailiwicks or cantons, occupying the whole of Northern Russia, and extending as far as Siberia. These bailiwicks were the Zavolotché, or the land lying beyond the canton, between the Onega and the Mezen: Russian Lapland: Permia, on the Upper Kama; Petchora, on the river of the same name: and Iugria, on the other side of the Ural Mountains To these we must add Ingria, Karelia, and part of Livonia and Esthonia.

Novgorod, which had summoned the Variag Princes, was too powerful, with one hundred thousand inhabitants and three hundred thousand subjects, to allow itself to be tyrannized over. An ancient tradition speaks vaguely of a revolt against Rurik the Old under the hero Vadim. Sviatoslaf, the conqueror of the Bulgaria of the Danube, undertook to govern it by mere agents, but Novgorod insisted on having one of his sons for its prince. "If you do not come to reign over us," said the citizens, "we shall know how to find ourselves other princes." Iaroslaf the Great, as a reward for their devotion, accorded them immense privileges, of which no record can be found, but which are constantly invoked by the Novgorodians, as were the true or false charters of Charles the Great by the German cities. These republicans could not exist without a prince, but they rarely kept one long. The assembly of the citizens, the *vetché*, convoked by the bell in the Court of Iaroslaf, was the real sovereign. The republic called itself "My Lord Novgorod the Great." "Who can equal God and the great Novgorod?" was a popular saying. From the distance of the city from the Russia of the Dnieper, and its position towards the Baltic and Western Europe, it took little part in the civil wars of which Kief was the object and the center. The Novgorodians profited by this in a certain sense; for, in the midst of the strifes of princes and of frequent changes in the grand principality, no sovereign was strong enough to give them a master. They could choose between princes of the rival families. It could impose conditions on him whom they chose to reign over them. If discontented with his management, they expelled the prince and his band of antrustions. According to the accustomed formula, "they made a reverence, and showed him the way" to leave Novgorod. Sometimes, to hinder his evil designs, they kept him prisoner in the Archbishop's palace, and it was left to his successor to set him at liberty. Often a revolution was accompanied by a general pillage of the partisans of the fallen prince, and they were even drowned in the Volkhof. A Grand Prince of Kief, Sviatopolk wished to force his son on them. "Send him here," said the Novgorodians, "if he has a spare head." The princes themselves contributed to the frequent changes of reign. They felt themselves only half-rulers in Novgorod, so they accepted any other appanage with joy. Thus, in eleven hundred and thirty-two, Vsevolod Gabriel abandoned Novgorod to reign at Pereiaslavl. When his hopes of Kief were crushed, and he wished to return to Novgorod, the citizens rejected him. "You forgot your oath to die with us, you have sought another principality; go were you will." Presently they thought better of it, and took him back. Four years afterwards he was again obliged to fly. In a great vetché, to which the citizens of Pskof and Ladoga were summoned, they solemnly condemned the exile, after reading the heads of very characteristic accusations: "He took no care of the poorer people; he desired to establish himself at Pereiaslavl; at the battle of Mount Idanof, against the men of Suzdal, he and his drujina were the first to leave the battle-field; he was fickle in the quarrels of the princes, sometimes uniting with the Prince of Tchernigof, sometimes with the opposite party."

The power of a Prince of Novgorod rested not only on his drujina, which always followed his fortunes, and on his family relations with this or that powerful principality, but also on a party formed for him in the heart of the republic. It was when the opposing party grew too strong that he was dethroned, and popular vengeance exercised on his adherents. Novgorod being above all a great commercial city, its divisions were frequently caused by diverging economic interests. Among the citizens, some were occupied in trade with the Volga and the East, others with the Dnieper and Greece. The former naturally sought the alliance of the Princes of Suzdal, masters of the great Oriental artery: the latter that of the Princes of Kief or Tchernigof, masters of the road to the south. Each of the two parties tried to establish a prince of the family whose protection they sought. If he fell, yet succeeded in escaping from the town, he would try to regain his throne by the arms of his family, or to install himself and his drujina either at Pskof, like Vsevolod-Gabriel, who became prince of that town, or at Torjok, like Iaroslaf of Suzdal, and thence he would blockade and starve the great city. The Prince of Suzdal was soon the most formidable neighbor of Novgorod. We have seen that Andrei Bogoliubski sent an army against it, then that his nephew Iaroslaf besieged his ancient subjects till Mstislaf the Bold freed them by the battle of Lipetsk in twelve hundred and sixteen. He was the son of Mstislaf the Brave, who had defended them against Vsevolod Big-Nest, and against Suzdal and the Tchudi. The remains of "the Brave" rest at Saint Sophia, in a bronze sarcophagus. His son, "the Bold," was of far too restless a nature to die also at Novgorod. He reduced the principality to order, and then assembled the citizens in the court of Iaroslaf and said to them, "I salute Saint Sophia, the tomb of my father, and you, Novgorodians. I am going to reconquer Galitch from the strangers, but I shall never forget you. I hope I may lie by the tomb of my father, in Saint Sophia." The Novgorodians in vain entreated him to stay. This was in twelve hundred and eighteen. We have seen him use his last armies in the troubles of the southeast, and die Prince of Galitch.

After his departure the republic summoned his nephew, Sviatoslaf to the throne; but he could not come to terms with the magistrates and a populace equally turbulent. The posadnik, Tverdislaf, caused one of the boyars of Novgorod to be arrested. This was the signal for a general rising; some took the part of the boyar, others that of the posadnik. During eight days the bell of the kreml sounded. Finally both factions buckled on their cuirasses and drew their swords. Tverdislaf raised his eyes to Saint Sophia, and cried, "I shall fall first in the battle, or God will justify me by giving the victory to my brothers." Ten men only perished in this skirmish, and then peace was re-established. The prince, who accused Tverdislaf of being the cause of the trouble, demanded that he should be deposed. The vetché inquired what crime he had committed. "None," replied the prince, "but it is my will." "I am satisfied," exclamed the posadnik, "as they do not accuse me of any fault; as to you, my brothers, you can dispose alike of posadniki and princes." The assembly then gave their decision. "Prince, as you do not accuse the posadnik of any fault, remember that you have sworn to depose no magistrate without trial. He will remain our posadnik, we will not deliver him to you." On this Sviatoslaf quitted Novgorod, in twelve hundred and nineteen. He was replaced by Vsevolod, one of his brothers, who was expelled two years later. The Suzdalian party having made some progress, they recalled the same Iaroslaf who was beaten at Lipetsk, but the Princes of Suzdal were too absolute in their ideas to be able to agree with the Novgorodians. Iaroslaf was again put to flight, and replaced by Vsevolod of Smolensk, who was expelled in his turn. The Grand Prince of Suzdal now interposed, levied a contribution on Novgorod, and a prince of Tchernigof was imposed on them, who hastened in twelve hundred and twenty-five to return to the south of Russia. In seven years the Novgorodians had five times changed their rulers. Iaroslaf himself came back for a third and even a fourth time. A famine so much reduced the Novgorodians that forty-two thousand corpses were buried in two cemeteries alone. These proud citizens implored strangers to take them as slaves for the price of a morsel of bread. The same year a fire destroyed the whole of one quarter of Novgorod. The calamities subdued their turbulence. Iaroslaf succeeded in governing them despotically till he was called to fill the throne of the Grand Prince in twelve hundred and thirty-six. He left them, as their prince, his son, Alexander Nevski.

From the fact that no dynasty of princes could establish itself at Novgorod, that no princely band could take a place among the native aristocracy, it follows that the republic kept its ancient liberties and customs intact under the short reigns of its rulers. In all Russian cities, it is true, the country existed side by side with the Prince and boyars, the assembly of citizens side by side with the Prince's men, and the native militia side by side with the foreign drujina; but at Novgorod the country, the veteché, and the municipal militia had retained more vigor than elsewhere. The town was more powerful than the Prince, who reigned by virtue of a constitution, traces of which may be observed, no doubt, in other regions of Russia, but which is found in its original form at Novgorod alone. Each new monarch was compelled to take an oath, by which he bound himself to observe the laws and privileges of Iaroslaf the Great. This constitution, like the *pacta conventa* of Poland, signified distrust, and was intended to limit the power of the Prince and his men. The revenues to which he had a right, and which formed his civil list, were carefully limited, as also were his judicial and political functions. He levied tribute on certain cantons, and was entitled to the commutation for crimes as well as to certain fines. In some bailiwicks he had his lieutenant, and Novgorod had its own. He could not execute justice without help of the posadnik, nor reverse any judgment; nor, above all, take the suit beyond Novgorod. This was what the Novgorodians feared most, and with reason. The day when the people of Novgorod bethought themselves of appealing to the tribunal of the Grand Prince of Moscow was fatal to the independence of the republic. In the conflicts between the men of the prince and those of the city, a mixed court delivered judgment. The Prince, no more than his men, could acquire villages in the territory of Novgorod, nor create colonies. He was forbidden to hunt in the woods of Staraïa Rusa except in the autumn, and had to reap his harvests at a specified season. Though they thus mistrusted their Prince, the Novgorodians had need of him to moderate the ancient Slav anarchy. As in the days of Rurik, "family armed itself against family, and there was no justice." In Novgorod the veteché had more extensive powers, and acted more regularly than in the other Russian cities. It was the veteche which nominated and expelled princes, imprisoned them in the archiepiscopal palace, and formally accused them; elected and deposed the Archbishops, decided peace and war, judged the State criminals. According to the old Slav custom, preserved in Poland till the fall of the republic, the decisions were always made, not by a majority, but by unanimity of voices. It was a kind of *liberum veto*. The majority had the resource of drowning the minority in the Volkhof. The Prince as well as the posadnik, the boyars as well as the people, had the right of convoking the veteché. It met sometimes in the Court of Iaroslaf, sometimes in Saint Sophia's. As Poland had its confederations, its "diets under the shield," Novgorod occasionally saw on the banks of the Volkhof two rival and hostile assemblies, which often came to blows on the bridge. Before being submitted to the general assembly, the questions were sometimes deliberated in a smaller council, composed of notable citizens, of acting or past magistrates.

The chief Novgorodian magistrates were, first, the posadnik, called by contemporary German writers the burgomaster, who was changed nearly as often as the Prince. The posadnik was chosen from some of the influential families, one of which alone gave a dozen posadniki to Novgorod. The first magistrate was charged to defend civic privileges, and shared with the Prince the judicial power and the right of distributing the taxes. He governed the city, commanded its army, directed its diplomacy, sealed the acts with its seal. The second officer was the *tuisatski*, who was a military chief, a Colonel who had the Captains of the town militia under his orders. He had a special tribunal, and seems to have been specially intrusted with the defence of the rights of the people, thus recalling the Roman Tribunes. And besides the Captains there was a *starosta*, a sort of district Mayor, for each quarter of the town.

The chief document of the Novgorodian law is the *Letter of Justice*, of which the definite publication may be placed at fourteen hundred and seventy-one. It contains the same principles as the Code of Iaroslaf the Great. As in all the early Germanic and Scandinavian laws, we find the right of private revenge, the fixed price of blood, the "boot," or fine for injury inflicted, the oath admitted as evidence, the judgment of God, the judicial duel, which was still resorted to by Novgorod even after its decadence, in the sixteenth century. We also find records of corporal punishments. The thief was to be branded; on the second relapse into crime, he was to be hung. Territorial property acquires a greater importance, and, a sure evidence of Muscovite influence, a second court of appeal is admitted, —the appeal to the tribunal of the Grand Prince.

From a social point of view, the constitution of Novgorod presents other analogies with the constitution of Poland. Great inequality then existed between the different classes of society. An aristocracy of boyars had ultimately formed itself, whose internal quarrels agitated the town. Below the boyars came the *dieti boyarskié*, a kind of inferior nobility; then the different classes of citizens, the merchantmen, the *black people*, and the peasants. The merchants formed an association of their own, a sort of guild, round the Church of Saint John. Military societies also existed, bands of independent adventurers or followers of some boyar who, impelled by hunger or a restless spirit, sought adventures afar on the great rivers of Northern Russia, pillaging alike friends and enemies, or establishing military colonies in the midst of Tchud or Finnish tribes.

The soil of Novgorod was sandy, marshy, and unproductive: hence the famines and pestilences that so often depopulated the country. Novgorod was forced to extend itself in order to live; it became therefore a commercial and colonizing city. In the tenth century Konstantin relates how the Slavs left Nemogard, or Novgorod, descended the Dnieper by Milinisca, or Smolensk, Teliutza, or Lubetch, Tchernigof, Vuishegorod, Kief, and Vititchevo; crossed the Cataracts of the Dnieper, passed the naval stations of Saint Gregory and Saint Etherius, at the mouth of the river, and spread themselves over all the shores of the Greek Empire. The Oriental coins and jewels found in the barrows of the Ilmen show that the Novgorodians had an early and extensive commerce with the East. We see them exchange iron and weapons for the precious metals found by the Iugrians in the mines of the Urals. They traded with the Baltic Slavs; and when the latter lost their independence, and a flourishing center, Wisby, was formed in the Isle of Gothland, Novgorod turned to this side also. In the twelfth century there was a Gothic market and a Variag Church at Novgorod, and a Novgorodian Church in Gothland. When the Germans began to dispute the commerce of the Baltic with the Scandinavians, Novgorod became the seat of a German market, which finally absorbed the Gothic one. When the Hanse League became the mistress of the North, we find the Germans established not only at Novgorod, but at Pskof and Ladoga, at all the outlets of the network of Novgorodian lakes. There they obtained considerable privileges, even the right to acquire pasture-land. They were masters, and at home in their fortified markets, in their stockade of thick planks, where no Russian had the right to penetrate without their leave. This German trading company was governed by the most narrow and exclusive ideas. No Russian was allowed to belong to the company, nor to carry the wares of a German, an Englishman, a Walloon, or a Fleming. The company authorized a wholesale commerce only, and, to maintain its goods at a high price, it forbade imports beyond a certain amount. "In a word," says a German writer, Riesenkampf, in "Der Deutsche Hof," "during three centuries the Hanse League held a monopoly of all the external commerce of Northern Russia. If we inquire what profit or loss it brought this country, we must recognize that, thanks to it, Novgorod and Pskof were deprived of a free commerce with the West. Russia, in order to satisfy the first wants of civilization, fell into a state of complete independence. It was abandoned to the good pleasure and pitiless egotism of the German merchants."

The ecclesiastical constitution of Novgorod presents a special character. In the rest of Russia the clergy was Russian orthodox. At Novgorod it was Novgorodian before everything. It was only in the twelfth century that the Slavs of Ilmen, who had been the last to be converted, could have an Archbishop that was neither Greek nor Kievan, but of their own race. From that time the Archbishop was elected by the citizens, by the vetché. Without waiting to be invested by the metropolitan bishop at Kief, he was at once installed in his episcopal palace. He was one of the great personages, the first dignitary of the republic. In public acts his name was placed before the others. "With the blessing of Archbishop Moses," says one letter-patent, "posadnik Daniel and tuisatski Abraham salute you." He had a superiority over the Prince on the ground of being a native of the country, whilst the descendant of Rurik was a foreigner. In return, the revenues of the Archbishop, the treasures of Saint Sophia, were at the service of the republic. In the fourteenth century we find an Archbishop building at his own expense a kreml of stone. In the fifteenth century the riches of the cathedral were employed to ransom the Russian prisoners captured by the Lithuanians. The Church of Novgorod was essentially a national church; the ecclesiastics took part in the temporal affairs, the laity in the spiritual. In the fourteenth century the vetché put to death the heretical *strigolniki*, proscribed ancient superstitions, and burnt the sorcerers. As the citizens of Novgorod nominated their Archbishop, they could also depose him. The orthodox religion extended with the Novgorod colonization among the Finnish tribes. In opposition to the Finns, the interests of the Church and the republic were identical. It was religion that contributed to the splendor of the city, and that specially profited by its wealth. Novgorod was full of churches and monasteries, founded by the piety of private individuals. Novgorod, which had shaken off the political supremacy of Kief, wished also to free itself from its religious domination, and no longer to be obliged to seek on the Dnieper the investiture of its Archbishop, but to make him an independent metropolitan. It failed. When Moscow became of importance, she threatened not only the political, but the religious supremacy of Novgorod. Religion was, in the hands of the Muscovite Princes, an instrument of government. The Novgorodian prelate always made common cause with his fellow-citizens, and endured with them their master's bursts of anger.

The literature of Novgorod was as national as the Church herself. The pious chronicles of the Novgorodian convents shared all the quarrels and all the passions of their fellow-citizens. "Even their style," says M. Bestujef, "reflects vividly the active, business-like character of the Novgorodians. It is short, and sparing of words; but their narratives embrace more completely than those of other Russian countries all the phases of actual life. They are the historians, not merely of the princes, and boyars, but of the whole city. The lives of the saints are the lives of Novgorodian saints; the miracles they relate are to the glory of the city. They tell for example, that Christ appeared to the artist charged with the paintings under the dome of Saint Sophia, and said to him: 'Do not represent me with my hand extended for blessing, but with my hand closed, because in it I hold Novgorod, and when it is opened it will be the end of the city.'" The tale of the panic excited among the soldiers of Andrei Bogoliubski by the image of the Virgin wounded by a Suzdalian arrow was spread abroad. Novgorod has its own cycle of epic songs. Its heroes are not those of the Kievan poems. There is Vasili Buslaévitch; the bold boyar, who with his faithful drujina stood up to his knees in blood on the bridge of Volkhof, holding in check all the muzhiki of Novgorod, whom he had defied to combat. Vasili Buslaévitch is the true type of these proud adventurers, who knew neither friend nor enemy,—a true Novgorodian oligarch, a hero of civil war. Still more popular was Sadko, the rich merchant, a kind of Novgorodian Sindbad or Ulysses, a worthy representative of a people of merchants and adventurers, who sought his fortune on the waves. A tempest rose, and men drew lots to decide who should be sacrificed to the wrath of the gods. Sadko threw a little wooden ring into the water, the others flung in iron rings: O prodigy! the others swam, his sank. He obeyed his destiny, and threw himself into the waves, but he was received in the palace of the king of the sea, who tested him in various ways and wished him to marry his daughter. Then suddenly Sadko found himself on the shore with great treasures, but what were these compared to the treasures of the city? "They see that I am a rich merchant of Novgorod, but Novgorod is still richer than I."

Of all the towns subject to Novgorod, Pskof was the most important. On the point formed by the junction of the Pskova and the Velikaía rises its kreml, with its crumbling ramparts, its ruined gates and towers. These once famous walls are to-day a mass of ruins, and the street-boys amuse themselves by throwing stones in the Pskova to frighten the laundresses. Pskof is only a poor little place with ten thousand souls. Scarcely anything remains of its past splendor save the Cathedral of the Trinity at one end of the kreml. There rest in metal coffins the bones of the best-loved princes, Vsevolod-Gabriel and Dovmont, a converted Lithuanian who came in the thirteenth century to defend the republic against his own compatriots. The old town still has many churches and monasteries; the distant view of it is beautiful, and on fête days the dead city seems to awake at the chimes of its innumerable bells, which ring as merrily as in the days of its glorious past. Nestor makes Pskof the native land of Saint Olga. Its whole history is summed up in those two facts: first, the struggle against the Tchudi, and, later, against the Germans of Livonia; second, its efforts to become free from Novgorod. The independence of the city was ultimately secured by its wealth and commerce. The first Prince who ruled it as a separate State, Vsevolod-Gabriel, was expelled by his subjects, and therefore was welcomed with the greater eagerness by the Pskovians. When the Suzdalian party ruled at Novgorod, it was generally the contrary party that triumphed in Pskof. About twelve hundred and fourteen the little republic contracted an offensive and defensive alliance with the Germans; Pskof undertook to help them against the Lithuanians, and they were to support Pskof against Novgorod. This was playing rather a dangerous game. In twelve hundred and forty, one Tverdillo delivered the city up to the Livonians, and it was not set free till twelve hundred and forty-two. From this moment Pskof ceased to mix in the civil wars of Novgorod. It had enough to do with its own affairs and its struggle against the Germans, Swedes and Lithuanians. It also claimed the title "My Lord Pskof the Great;" but it was only in thirteen hundred and forty-eight that the Novgorodians, needing its help against Magnus, King of Sweden, formally recognized its independence, by the treaty of Bolstof, and concluded a bond of fraternal friendship. Novgorod became the elder brother, and Pskof the younger. The organization of Pskof is almost that of its ancient metropolis. We again find the Prince, the Vetché, the division into quarters, up to the number of six, each one having its Mayor.

In the twelfth century a new Novgorodian colony was founded between the Kama and the Viatka, which remained a republic until the fifteenth century. "This distant country," says M. Bestujef-Riumin, "is still quite Novgorodian. When the traveller has passed the Viatka, he meets with a peculiar mode of constructing the huts. There are no longer whole lines of hovels joined one to the other, as on this side of the river, but there is a high house, where the court, rooms, and offices are surrounded by a rampart of pales, and united under the same roof: in a word, it is a Novgorodian house. You hear the Novgorodian dialect; you see the Novgorodian cap. It is the Novgorod colonization still living." In eleven hundred and seventy-four some adventurers from the Great Republic came from the Kama to the Viatka, and advanced from east to west, and founded a colony on this river, which is to-day the village of Nikulitsuin. Another band defeated the Tcheremisa, and on their territory raised Koshkarof, at present called Kotelnitch. Then the two bands reunited, and penetrated into the Votiak country. On the right bank of the Viatka, on the summit of a high mountain, they perceived a city surrounded by a rampart and a ditch, which contained one of the sanctuaries of the people. As pious as the companions of Cortez and Pizarro, the Russian adventurers prepared themselves for the assault by a fast of several days, then invoked Saints Boris and Gleb, and captured the town. Next, at the mouth of the Khluinovitsa, in the Viatka, not very far off, they built the city of Khluinof, which became, under the name of Viatka, the capital of all the colonies. It had no walls, but the houses, built close together, formed an unbroken rampart against the enemy, a wall and defence. At the news of this success, other colonists flocked from Novgorod and the forests of the north, and founded other centers of population. These bold pioneers had more than once to reunite, sometimes against the aboriginal Finns or the Tatar invaders, sometimes against the pretensions of Novgorod, or the Grand Prince of Moscow. We find among them, as in the metropolis, boyars, merchants and citizens. They had voievodui or atamans for their military chiefs. Their spirit of religious independence equalled their political independence. Jonas, Metropolitan of Moscow, writes angrily about the indocility of their clergy, and avenges himself by blaming their morals. "Your spiritual sons," he writes to the priests of Viatka, "live contrary to the law. They have five, six, or even seven wives. And you dare to bless these marriages."

In this connection, we will briefly review the battles of the Kalka, of Riazan, of Kolomna, and of the Sit, and the influence of the Tatars on Russian development. Up to this time the history of Russia has presented some analogy with that of the West. Slavonia, like Gaul, had received Roman civilization and Christianity from the South. The Northmen had brought it an organization which recalls that of the Germans; and it had enjoyed a certain semblance of unity under Iaroslaf, like the West under Charles the Great, while it was afterwards dismembered and divided like France in feudal times. But in the thirteenth century Russia suffered an unprecedented misfortune; it was invaded and subjugated by Asiatic hordes. This fatal event contributed quite as much as the disadvantage of the soil and the climate to retard its development by many centuries. "Nature," as M. Soloviof says, "has been a step-mother to Russia"; fate was another step-mother.

"In those times," say the Russian chroniclers, "there came upon us for our sins, unknown nations. No one could tell their origin, whence they came, what religion they professed. God alone knew why they were, God and perhaps wise men learned in books." When we think of the horror of the whole of Europe at the arrival of the Mongols, and the anguish of a Frederick, of a Saint Louis, an Innocent the Fourth, we may imagine the terror of the Russians. They bore the first shock of those mysterious foemen, who were, so the people whispered, Gog and Magog, who, according to Joinville, "were to come at the end of the world, when Antichrist is to destroy everything." The Ta-ta, or Tatars, seem to have been a tribe of the great Mongol race, living at the foot of the Altai, who in spite of their long-continued discords frequently found means to lay waste China by their invasions. The portrait drawn of them recalls in many ways those already traced by Chinese, Latin, and Greek authors, of the Huns, the Avars, and other nomad peoples of former invasions. "The Ta-tzis, or the Das," says a Chinese writer of the thirteenth century, "occupy themselves exclusively with their flocks; they go wandering ceaselessly from pasture to pasture, from river to river. They are ignorant of the nature of a town or a wall. They are unacquainted with writing and books: their treaties are concluded orally. From infancy they are accustomed to ride, to aim their arrows at rats and birds, and thus acquire the courage essential to their life of wars and rapine. They have neither religious ceremonies nor judicial institutions. From the Prince to the lowest among the people all feed upon the flesh of the animals the skins of which they use for clothing. The strongest among them have the largest and fattest morsels at feasts; the old men are put off with the fragments that are left. They respect nothing but strength and bravery; age and weakness they despise. When the father dies, the son marries his youngest wives." A Mussulman writer adds, that they adore the sun, and practise polygamy and the community of wives. This pastoral people did not take an interest in any phenomenon of nature except the growth of grass. The names they gave to their months were suggested by the different aspects of the prairie. Born horsemen, they had no infantry in war. They were ignorant of the art of sieges. "But," says a Chinese author, "when they wish to take a town, they fall on the suburban villages. Each leader seizes ten men, and every prisoner is forced to carry a certain quantity of wood, stones, and other materials. The use these for filling up fosses, or digging trenches. In the capture of a town the loss of ten thousand men was thought nothing. No place could resist them. After a siege all the population was massacred, without distinction of old or young, rich or poor, beautiful or ugly, those who resisted or those who yielded; no distinguished person escaped death, if a defence was attempted." It was these rough tribes that Temutchin, or Genghis Khan, who ruled from eleven hundred and fifty-four until twelve hundred and twenty-seven, succeeded in uniting into one nation after forty years of obscure struggles. Then in a general congress of their princes he proclaimed himself Emperor, and declared that, as there was only one sun in heaven, there ought to be only one Emperor on the earth. At the head of their forces he conquered Mantchuria, the kingdom of Tangut, Northern China, Turkestan, and Great Bokhara, which never recovered from this disaster, and the plains of Western Asia as far as the Crimea. When he died, he left to be divided between his four sons the largest empire that ever existed. It was during his conquest of Bokhara that his Lieutenant Tchep and Subudaï-bagadur subdued in their passage a multitude of Turkish peoples, passed the Caspian by its southern shore, invaded Georgia and the Caucasus, and in the southern steppes of Russia came in contact with the Polovtsui.

The hereditary enemies of the Russians proper, the Polovtsui, asked the Christian Princes for help against these Mongols and Turks, who were their brothers by a common origin. "They have taken our country," said they to the descendants of Saint Vladimir; "to-morrow they will take yours." Mstislaf the Bold, then Prince of Galitch, persuaded all the dynasties of Southern Russia to take up arms against the Tatars; his nephew Daniel, Prince of Volhynia, Mstislaf Romanovitch, Grand Prince of Kief, Oleg of Kursk, Mstislaf of Tchernigof, Vladimir of Smolensk, Vsevolod, for a short time Prince of Novgorod, responded to his appeal. To cement his alliance with the Russians, Basti, khan of the Polovtsui, embraced orthodoxy. The Russian army had already arrived on the Lower Dnieper, when the Tatar ambassadors made their appearance. "We have come by God's command against our slaves and grooms, the accursed Polovtsui. Be at peace with us; we have no quarrel with you." The Russians with the promptitude and thoughtlessness that characterized the men of that time, put the ambassadors to death. They then went farther into the steppe, and encountered the Asiatic hordes on the Kalka, a small river running into the Sea of Azof. The Russian chivalry on this memorable day showed the same disorder and the same ill-advised eagerness as the French chivalry at the opening of the English wars. Mstislaf the Bold, Daniel of Galitch, and Oleg of Kursk were the first to rush into the midst of the infidels, without waiting for the Princes of Kief, and even without giving them warning, in order to gain for themselves the honors of victory. In the middle of the combat the Polovtsui were seized with a panic and fell back on the Russian ranks, thus throwing them into disorder. The rout became general, and the leaders spurred on their steeds in hopes of reaching the Dnieper.

Six princes and seventy of the chief boyars, or voievodui, remained on the field of battle. It was the Crecy and Poitiers of the Russian chivalry. Hardly a tenth of the army escaped; the Kievans alone left ten thousand dead. The Grand Prince of Kief, however, Mstislaf Romanovitch, still occupied a fortified camp on the banks of the Kalka. Abandoned by the rest of the army, he tried to defend himself. The Tatars offered to make terms; he might retire on payment of a ransom for himself and his drujina. He capitulated, and the conditions were broken. His guard was massacred, and he and his two sons-in-law were stifled under planks. The Tatars held their festivals over the inanimate bodies in twelve hundred and twenty-four. After this thunderbolt, which struck terror into the whole of Russia, the Tatars paused and returned to the East. Nothing more was heard of them. Thirteen years passed, during which the princes reverted to their perpetual discords. Those in the northeast had given no help to the Russians of the Dnieper; perhaps the Grand Prince, Iuri the Second of Suzdal, may have rejoiced over the humiliation of the Kievans and Gallicians. The Mongols were forgotten; the chronicles, however, are filled with fatal presages in the midst of scarcity, famine and pestilence, of incendiaries in the towns and calamities of all sorts, they remark on the comet of twelve hundred and twenty-four, the earthquake and eclipse of the sun of twelve hundred and thirty.

The Tatars were busy finishing the conquest of China, but presently one of the sons of Genghis, Ugudei or Oktai, sent his nephew Batui to the West. As the reflux of the Polovtsui had announced the invasion of twelve hundred and twenty-four, that of the Saxin nomads, a tribe akin to the Khirghiz, who took refuge on the lands of the Bulgarians of the Volga, warned men of a new irruption of the Tatars, and indicated its direction. It was no longer South Russia, but Suzdalian Russia that was threatened. In twelve hundred and thirty-seven Batui conquered the Great City, capital of the half-civilized Bulgarui, who were, like the Polovtsui, ancient enemies of Russia, and who were to be included in its ruin. Bolgary was given up to the flames, and its inhabitants were put to the sword. The Tatars next plunged into the deep forests of the Volga, and sent a sorcerer and two officers as envoys to the Princes of Riazan. The three princes of Riazan, those of Pronsk, Kolomna, Moscow, and Murom advanced to meet them. "If you want peace," said the Tatars, "give us the tenth of your goods." "When we are dead," replied the Russian Princes, "you can have the whole." Though abandoned by the princes of Tchernigof and the Grand Prince Iuri the Second, of whom they had implored help, the dynasty of Riazan accepted the unequal struggle. They were completely crushed; nearly all their princes remained on the field of battle. Legend has embellished their fate. It is told how Feodor preferred to die rather than see his young wife, Euphrasia, the spoil of Batui, and how, on learning his fate, she threw herself and her son from the window of her chamber. Oleg the Handsome, found still alive on the battle-field, repelled the caresses, the attention, and religion of the khan, and was cut in pieces. Riazan was immediately taken by assault, sacked, and burned. All the towns of the principality suffered the same fate. It was now the turn of the Grand Prince, for the Russia of the northeast had not even the honor of falling in a great battle like the Russia of the southwest, united for once against the common enemy. The Suzdalian army, commanded by a son of Iuri the Second, was beaten on the day of Kolomna, on the Oka. The Tatars burned Moscow, then besieged Vladimir on the Kliazma, which Iuri the Second had abandoned to seek for help in the North. His two sons were charged with the defence of the capital. Princes and boyars, feeling there was no alternative but death or servitude, prepared to die. The princesses and all the nobles prayed Bishop Metrophanes to give them the tonsure; and when the Tatars rushed into the town by all its gates, the vanquished retired into the cathedral, where they perished, men and women, in a general conflagration. Suzdal, Rostof, Iaroslavl, fourteen towns, a multitude of villages in the Grand Principality, were all given over to the flames in twelve hundred and thirty-eight. The Tatars then went to seek the Grand Prince, who was encamped on the Sit, almost on the frontier of the possessions of Novgorod. Iuri the Second could neither avenge his people nor his family. After the battle the Bishop of Rostof found his headless corpse. His nephew Vasilko, who was taken prisoner, was stabbed for refusing to serve Batui. The immense Tatar army, after having sacked Tver, took Torjok; there "the Russian heads fell beneath the sword of the Tatars as grass beneath the scythe." The territory of Novgorod was invaded; the great republic trembled, but the deep forests and the swollen rivers delayed Batui. The invading flood reached the Cross of Ignatius, about fifty miles from Novgorod, then returned to the Southeast. On the way the small town of Kozelsk, near Kaluga, checked the Tatars for so long and inflicted on them so much loss, that it was called by them the wicked town. Its population was exterminated, and the prince, Vasili, still a child, was "drowned in blood."

The two following years were spent by the Tatars in ravaging Southern Europe. They burnt Pereiaslaf, and Tchernigof, defended with desperation by its princes. Next Mangu, grandson of Genghis Khan, marched against the famous town of Kief, whose name resounded through the east and in the books of the Arab writers. From the left bank of the Dnieper the barbarian admired the great city on the heights of the right bank, towering over the wide river with its white walls and towers adorned by Byzantine artists, and innumerable churches with cupolas of gold and silver. Mangu offered the Kievans terms of surrender; the fate of Riazan, of Tchernigof, of Vladimir, the capitals of powerful states, announced to them the lot that awaited them in case of refusal, yet the Kievans dared to massacre the envoys of the khan. Mikhail, their Grand Prince, fled; his rival, Daniel of Galitch, did not care to remain. On hearing the report of Mangu, Batui came to assault Kief with the bulk of his army. The grinding of the wooden chariots, the bellowings of the buffaloes, the cries of the camels, the neighing of the horses, the howlings of the Tatars, rendered it impossible, says the annalist, to hear your own voice in the town. The Tatars assailed the Polish Gate, and knocked down the walls with a battering-ram. "The Kievans, supported by the brave Dmitri, a Gallician boyar, defended the fallen ramparts till the end of the day, then retreated to the Church of the Tithe, which they surrounded by a palisade. The last defenders of Kief found themselves grouped around the tomb of Iaroslaf. Next day they perished. The khan gave the boyar his life, but 'the Mother of Russian cities' was sacked. This third pillage, which took place in twelve hundred and forty, was the most terrible. Even the tombs were not respected. All that remains of the Church of the Tithe is a few fragments of mosaic in the Museum at Kief. Saint Sophia and the Monastery of the Catacombs were delivered up to be plundered." Volhynia and Gallicia still remained, but their princes could not defend them, and Russia found itself, with the exception of Novgorod and the northwest country, under the Tatar yoke. The princes had fled or were dead; hundreds of thousands of Russians were dragged into captivity. Men saw the wives of boyars, "who had never known work, who a short time ago had been clothed in rich garments, adorned with jewels and collars of gold, surrounded with slaves, now reduced to be the slaves of barbarians and their wives, turning the wheel of the mill, and preparing their coarse food."

If we look for the causes which rendered the defeat of the brave Russian nation so complete, we may, with Karamsin, indicate the following:— Though the Tatars were not more advanced, from a military point of view, than the Russians, who had made war in Greece and in the West against the most warlike and civilized people of Europe, yet they had an enormous superiority of numbers. Batui probably had with him five hundred thousand warriors. This immense army moved like one man; it could successively annihilate the small armies of the princes, or the militia of the towns, which presented themselves one at a time to its blows. The Tatars had found Russia divided against itself. Even though Russia had wished to form a confederation, the sudden irruption of an army entirely composed of horsemen did not leave it time. In the tribes ruled by Batui every man was a soldier; in Russia the nobles and citizens alone bore arms; the peasants, who formed the bulk of the population, allowed themselves to be stabbed or bound without resistance. It was not by a weak nation that Russia was conquered. The Tatar-Mongols, under Genghis Khan, had filled the East with the glory of their name, and subdued nearly all Asia. They arrived, proud of their exploits, animated by the recollection of a hundred victories, and reinforced by the numerous peoples they had vanquished, and hurried with them to the West. When the Princes of Galitch, of Volhynia, and of Kief arrived as fugitives in Poland and Hungary, Europe was terror-stricken. The Pope, whose support had been claimed by the Prince of Galitch, summoned Christendom to arms. Louis the Ninth prepared for a crusade. Frederick the Second, as Emperor, wrote to the sovereigns of the West: "This is the moment to open the eyes of body and soul, now that the brave princes on whom we reckoned are dead or in slavery." The Tatars invaded Hungary, gave battle to the Poles in Liegnitz in Silesia, had their progress a long while arrested by the courageous defense of Olmutz in Moravia, by the Tchek voievod, Iaroslaf, and stopped finally, learning that a large army, commanded by the King of Bohemia and the Dukes of Austria and Karinthia, was approaching. The news of the death of Oktai, second Emperor of all the Tatars, in China, recalled Batui from the West, and during the long march from Germany his army necessarily diminished in number. The Tatars were no longer in the vast plains of Asia and Eastern Europe, but in a broken hilly country, bristling with fortresses, defended by a population more dense and a chivalry more numerous than those of Russia. To sum up, all the fury of the Mongol tempest spent itself on the Slavonic race. It was the Russians who fought at the Kalka, at Kolomna, at the Sit; the Poles and Silesians at Liegnitz; the Bohemians and Moravians at Olmutz. The Germans suffered nothing from the invasion of the Mongols but the fear of it. It exhausted itself principally on those plains of Russia which seem a continuation of the steppes of Asia. Only in Russian history did the invasion produce great results. About the same time Batui built on one of the arms of the Lower Volga a city called Sarai, or the Castle, which became the capital of a powerful Tatar Empire, the Golden Horde, extending from the Ural and Caspian to the mouth of the Danube. The Golden Horde was formed not only of Tatar-Mongols, or Nogais, who even now survive in the Northern Crimea, but particularly of the remains of ancient nomads, such as the Petchenegi and Polovtsui, whose descendants seem to be the present Kalmucks and Bashkirs; of Turkish tribes tending to be sedentary, like the Tatars of Astrakhan in the present day; and of the Finnish populations already established in the country, and which mixed with the invaders. Oktai, Kuiuk, and Mangu, the first three successors of Genghis Khan, elected by all the Mongol Princes, took the title of Great Khans, and the Golden Horde recognized their authority; but under his fourth successor, Khubulai, who usurped the throne and established himself in China, this bond of vassalage was broken. The Golden Horde became an independent state in twelve hundred and sixty. United and powerful under the terrible Batui, who died in twelve hundred and fifty-five, it fell to pieces under his successors; but in the fourteenth century the Khan Uzbek reunited it anew, and gave the Horde a second period of prosperity. The Tatars, who were pagans when they entered Russia, embraced the faith of Islam about twelve hundred and seventy-two, and became its most formidable apostles.

Iaroslaf, after his defeat at Lipetsk, entered Suzdal on the tragic death of his brother, the Grand

Prince Iuri the Second, in twelve hundred and thirty-eight, and found his inheritance in the most deplorable condition. The towns and villages were burnt, the country and roads covered with unburied corpses; the survivors were hiding in the woods. He recalled the fugitives and began to rebuild. Batui, who had completed the devastation of South Russia, summoned Iaroslaf to do him homage at Sarai, on the Volga. Iaroslaf was received there with distinction. Batui confirmed his title of Grand Prince, but invited him to go in person to the Great Khan, supreme chief of the Mongol nation, who lived on the banks of the river Sakhalian, or Amur. To do this was to cross the whole of Russia and Asia. Iaroslaf bent his knees to the new master of the world, Oktai, succeeded in refuting the accusations brought against him by a Russian boyar, and obtained a new confirmation of his title. On his return, in twelve hundred and forty-six, he died in the desert of exhaustion, and his faithful servants brought his body back to Vladimir. His son Andrei succeeded him at Suzdal, and ruled until twelve hundred and fifty-two. His other son, Alexander, reigned at Novgorod the Great. Alexander was as brave as he was intelligent. He was the hero of the North, and yet he forced himself to accept the necessary humiliations of his terrible situation. In his youth we see him fighting with all the enemies of Novgorod, Livonian knights and Tchudi, Swedes and Finns. The Novgorodians found themselves at issue with the Scandinavians on the subject of their possessions on the Neva and the Gulf of Finland. As they had helped the natives to resist the Latin faith, King John obtained the promise of Gregory the Ninth that a crusade, with plenary indulgences, should be preached against the Great Republic and its protégés, the pagans of the Baltic. His son-in-law, Birger, with an army of Scandinavians, Finns, and Western Crusaders, took the command of the forces, and sent word to the Prince of Novgorod, "Defend yourself, if you can: and know that I am already in your provinces." The Russians on their side, feeling that they were fighting for orthodoxy, opposed the Latin crusade with a Greek one. Alexander humbled himself in Saint Sophia, received the benediction of the Archbishop Spiridion, and addressed an energetic harangue to his warriors. He had no time to await reinforcements from Suzdal. He attacked the Swedish camp, which was situated on the Ijora, one of the southern affluents of the Neva, which had given its name to Ingria. Alexander won a brilliant victory, which gained him his surname of Nevski, and the honor of becoming one of the patrons of Saint Petersburg under Peter the Great, the second conqueror of the Swedes. By the orders of his great successor, his bones repose in the Monastery of Alexander Nevski. The battle of the Neva was preserved in a dramatic legend. An Ingrian chief told Alexander how, on the eve of the combat, he had seen a mysterious barque, manned by two warriors with shining brows, glide through the night. They were Boris and Gleb, who came to the rescue of their young kinsman. Other accounts have preserved to us the individual exploits of the Russian heroes—Gabriel, Skuilaf of Novgorod, James of Polotsk, Sabas, who threw down the tent of Birger, and Alexander Nevski himself, who with a stroke of the lance "imprinted his seal on his face." Notwithstanding the triumph of such a service, Alexander and the Novgorodians could not agree; a short time after he retired to Pereiaslavl-Zalieski. The proud republicans soon had reason to regret the exile of this second Camillus. The Order of the Swordbearers, the indefatigable enemy of orthodoxy, took Pskof, their alley: the Germans imposed tribute on the Vojané, vassals of Novgorod, constructed the fortress of Koporié on the territory of the Neva, took the Russian town of Tessof in Esthonia, and pillaged the merchants of Novgorod within seventeen miles of their ramparts. During this time the Tchudi and the Lithuanians captured the peasants, and the cattle of the citizens. At last Alexander allowed himself to be touched by the prayers of the Archbishop and the people, assembled an army, expelled the Germans from Koporié, and next from Pskof, hung as traitors the captive Vojané and Tchudi, and put to death six knights who fell into his hands. This war between the two races and two religions was cruel and pitiless. The law of nations was hardly recognized. More than once Germans and Russians slew the ambassadors of the other side. Alexander Nevski finally gave battle to the Livonian knights on the ice of Lake Peipus, killed four hundred of them, took fifty prisoners, and exterminated a multitude of Tchudi. Such was the Battle of the Ice, which took place in twelve hundred and forty-two. He returned in triumph to Novgorod, dragging with him his prisoners loaded with irons. The Grand Master expected to see Alexander at the gates of Riga, and implored help of Denmark. The Prince of Novgorod, satisfied with having delivered Pskof, concluded peace, recovered certain districts, and consented to the exchange of prisoners. At this time Innocent the Fourth, deceived by false information, addressed a bull to Alexander, as a devoted son of the Church, assuring him that his father Iaroslaf, while dying among the Horde, had desired to submit himself to the throne of Saint Peter. Two Cardinals brought him this letter from the Pope in twelve hundred and fifty-one.

It is this hero of the Neva and Lake Peipus, this vanquisher of the Scandinavians and the Livonian knights, that we are presently to see grovelling at the feet of a barbarian. Alexander Nevski perceived that in presence of this immense and brutal force of the Mongols, all resistance was madness, all pride ruin. To brave them was to complete the overthrow of Russia. His conduct may not have been chivalrous, but it was wise and humane. Alexander disdained to play the hero at the expense of his people, like his brother Andrei of Suzdal, who was immediately obliged to fly, abandoning his country to the vengeance of the Tatars. The Prince of Novgorod was the only prince in Russia who had kept his independence, but he knew Batui's hands could extend as far as the Ilmen. "God has subjected many peoples to me," wrote the barbarian to him: "will you alone refuse to recognize my power? If you wish to keep your land come to me; you will see the splendor and glory of my sway." Then Alexander went to Sarai with his brother Andrei, who was disputing the Grand Principality of Vladimir with his uncle, Sviatoslaf. Batui declared that fame had not exaggerated the merit of Alexander, that he far excelled the common run of Russian Princes. He enjoined the two brothers to show themselves, like their father Iaroslaf, at the Great Horde; they returned from it in twelve hundred and fifty seven. Kuiuk had confirmed the one in the possession of Vladimir, and the other in that of Novgorod, adding to it all South Russia and Kief. The year twelve hundred and sixty put Alexander's patience and also his politic obedience to the Tatars to the proof. Ulavtchi, to whom the Khan Berkai had confided the affairs of all Russia, demanded that Novgorod should submit to the census and pay tribute. It was the hero of the Neva who was charged with the humiliating and dangerous mission of persuading Novgorod. When the posadnik expressed in the vetché the opinion that it was necessary to submit to the strongest, the people raised a terrible cry and murdered him. Vasili himself, Alexander's son, declared against a father "who brought servitude to free men," and retired to the Pskovians. It needed a soul of iron temper to resist the universal disapprobation and counsel the Novgorodians to the commission of the cowardly though necessary act. Alexander arrested his son, and punished with death or mutilation the boyars who had led him into the revolt. The vetché decided to refuse the tribute, and sent back the Mongol ambassadors with presents. However, on the rumor of the approach of the Tatars, they repented, and Alexander could announce to the enemy that Novgorod submitted to the census. But when they saw the officer of the khan at work, the population revolted again, and the Prince was obliged to keep guard on the officers night and day. In vain the boyars advised the citizens to give in: assembled around Saint Sophia, the people declared they would die for liberty and honor. Alexander then threatened to quit the city with his men, and abandon it to the full vengeance of the khan. This menace conquered the pride of the Novgorodians. The Mongols and their agents were allowed to go, register in hand, from house to house in the humiliated and silent city to make the list of the inhabitants. "The boyars," says Karamsin, "might still be vain of their rank and their riches, but the simple citizens had lost with their national honor their most precious possession."

In Suzdal also Alexander found himself in the presence of insolent victors and exasperated subjects. In twelve hundred and sixty-two the inhabitants of Vladimir, of Suzdal, and of Rostof all arose against the collectors of the Tatar impost. The people of Iaroslavl slew one renegade named Zozim a former monk, who had become a Moslem fanatic. Terrible reprisals were sure to follow. Alexander set out with presents for the Horde at the risk of leaving his head there. He had likewise to excuse himself for having refused the Mongols a body of the auxiliary Russians, wishing at least to spare the blood and the religious scruples of his subjects. It is a remarkable fact that, over the most profound humiliations of the Russian nationality, the contemporary history always throws a ray of glory. At the moment that Alexander went to prostrate himself at Sarai, the Suzdalian army, united to that of Novgorod, and commanded by his son Dmitri, defeated the Livonian knights, and took Dorpat by assault. The Khan Berkai gave Alexander a kind greeting, accepted his explanations, dispensed with the promised contingent, but kept him for a year near his Court. Alexander's health broke down; on his return he died before reaching Vladimir. When the news arrived at his Capital, the Metropolitan Kirill, who was finishing the liturgy, turned towards the faithful, and said: "Learn, my dear children, that the Sun of Russia is set." "We are lost," cried the people, breaking forth into sobs. Alexander by this policy of resignation, which his chivalrous heroism does not permit us to despise, had secured some repose for exhausted Russia. By his victories over his enemies of the West he had given it some glory, and hindered it from despairing under the most crushing tyranny, material and moral, which a European people had ever suffered.

The Mongol khans, after having devastated and abased Russia, did not introduce any direct political change. They left to each country its laws, its courts of justice, its natural chiefs. The house of Andrei Bogoliubski continued to reign in Suzdal, that of Daniel Romanovitch in Galitch and Volhynia, the Olgovitchi in Tchernigof, and the descendants of Rogvolod the Variag at Polotsk. Novgorod might continue to expel and recall its princes, and the dynasties of the South to dispute the throne of Kief. The Russian states found themselves under the Mongol yoke, in much the same situation as that of the Christians of the Greco-Slav peninsula three centuries later, under the Ottomans. The Russians remained in possession of all their lands, which their nomad conquerors, encamped on the steppes of the East and South, disdained. They were like their Danubian kinsmen, a sort of rayahs, over whom the authority of the khans was exerted with more or less rigor, but whom their conquerors never tried in any way to Tatarize. Let us see in what consisted the obligations of the vanquished, and their relations with their conquerors, during the Mongol yoke.

The Russian Princes were forced to visit the Horde either as evidence of their submission, or to give the khan opportunity of judging their disputes. We have seen how they had to go, not only to the khan of the Golden Horde, but often also to the Grand Khan at the extremity of Asia, on the borders of the Sakhalian or Amur. They met there the chiefs of the Mongol, Tatar, Thibetan, and Bokharian hordes, and sometimes the ambassador of the Caliph of Bagdad, of the Pope, or of the King of France. The Grand Khans tried to play off against each other these ambassadors, who were astounded to meet at his Court. Mangu Khan desired Saint Louis to recognize him as the master of the world, "for," said he, "when the universe has saluted me as sovereign, a happy tranquillity will reign on the earth." In the case of refusal, "neither deep seas nor inaccessible mountains" would place the King of France beyond the power of his wrath. To the princes of Asia and Russia he displayed the presents of the King of France, affecting to consider them as tributes and signs of submission. "We will send for him to confound you," he said to them, and Joinville assures us that this threat, and "the fear of the King of France," decided many to throw themselves on his mercy. This journey to the Grand Horde was terrible. The road went through deserts; or countries once rich, but changed by the Tatars into vast wastes. Few who went returned. Planus Carpinus, envoy of Innocent the Fourth, saw in the steppes of the Kirghiz the dry bones of the boyars of the unhappy Iaroslaf, who had died of thirst in the sand Planus Carpinus thus describes the Batui's Court on the Volga: "It is crowded and brilliant. His army consists of six hundred thousand men, one hundred and fifty thousand of whom are Tatars, and four hundred and fifty thousand strangers, Christians as well as infidels. On Good Friday we were conducted to his tent, between two fires, because the Tatars pretend that a fire purifies everything, and robs even poison of its danger. We had to make many prostrations, and enter the tent without touching the threshold. Batui was on his throne with one of his wives; his brothers, his children, and the Tatar lords were seated on benches; the rest of the assembly were on the ground, the men on the right, the women on the left.... The khan and the lords of the Court emptied from time to time cups of gold and silver, while the musicians made the air ring with their melodies. Batui has a bright complexion; he is affable with his men, but inspires general terror." The Court of the Grand Khan was still more magnificent. Planus Carpinus found there a Russian named Kum, who was the favorite and special goldsmith of Gaiuk or Kuiuk, and Rubruquis discovered a Parisian goldsmith, named Guillaume. Much money was needed for success either at the Court of the Grand Khan or of Batui. Presents had to be distributed to the Tatar Princes, to the favorites above all, to the wives and the mother of the khan. At this terrible tribunal the Russian Princes had to struggle with intrigues and corruption; the heads of the pleaders were often the stakes of these dreadful trials. The most dangerous enemies they encountered at the Tatar Court were not the barbarians, but the Russians, their rivals. The history of the Russian Princes at the Horde of Sarai in twelve hundred and forty-six, and Mikhail of Tver in thirteen hundred and nineteen, the one assassinated by the renegade Doman, the other by the renegade Romanets, at the instigation and under the eyes of the Grand Prince of Moscow.

The conquered people were obliged to pay a capitation tax, which weighed as heavily on the poor as on the rich. The tribute was paid either in money or in furs; those who were unable to furnish it became slaves. The khans had for some time farmed out this revenue to some Khiva merchants, who collected it with the utmost rigor, and whom they protected by appointing superior agents called *baskaki*, with strong guards to support them. The excesses of these tax-gatherers excited many revolts: in twelve hundred and sixty-two, that of Suzdal; in twelve hundred and eighty-four, that of Kursk; in thirteen hundred and eighteen, that of Kolomna; in thirteen hundred and twenty-seven, that of Tver, where the inhabitants slew the baskak Shevkal, and brought upon themselves frightful reprisals. Later, the Princes of Moscow themselves farmed not only the tax from their own subjects, but also from neighboring countries. They became the farmers-general of the invaders. This was the origin of both their riches and their power.

Besides the tribute, the Russians had to furnish to their master the blood-tax, a military contingent. Already at the time of the Huns and Avars, we have seen Slavs and Goths accompanying the Asiatic hordes, forming their vanguards, and being as it were the hounds of Baian. In the thirteenth century the Russian Princes furnished to the Tatars select troops, especially a solid infantry, and marched in their armies each at the head of his drujina. It was thus that in twelve hundred and seventy-six Boris of Rostof, Gleb of Biélozersk, Feodor of Iaroslavl, and Andrei of Gorodets followed Mangu Khan in a war against the tribes of the Caucasus, and sacked Dediakof in Daghestan, the capital of the Iasui. The Mongols scrupulously reserved to them their part of the booty. The same Russian Princes took part in an expedition against an adventurer named Lachan by the Greek historians, formerly a keeper of pigs, who had raised Bulgaria. The descendants of Monomakh behaved still more dishonorably in the troubles in the interior of Russia. They excited the Mongols against their countrymen and aided the invaders. Prince Andrei, son of Alexander Nevski, in twelve hundred and eighty-one, in concert with the Tatars, pillaged the provinces of Vladimir, Suzdal, Murom, Moscow, and Pereiaslavl, which he was disputing with Dmitri, his elder brother. He helped the barbarians to profane churches and convents. In thirteen hundred and twenty-seven it was the Princes of Moscow and Suzdal who directed the military execution against Tver. In twelve hundred and eighty-four two of the Olgovitchi reigned in the land of Kursk; one of them, Oleg, put the other to death in the name of the khan. Servitude had so much abased all characters, that even the annalists share the general degradation. They blame, not Oleg the murderer, but Sviatoslaf the victim. Was it not his unbridled conduct that caused the anger of the khan? No prince could ascend the throne without having received the investiture and the *iarluik*, or letters-patent, from the khan. The proud Novgorodians themselves rejected Mikhail, their Prince, saying, "It is true that we have chosen Mikhail, but on the condition that he should show us the iarluik." No Russian State dared to make war without being authorized by the khan. In twelve hundred and sixty-nine the Novgorodians asked leave to march against Revel. In thirteen hundred and three, in an assembly of princes, and in the presence of the Metropolitan Maximus, a decree of the Khan Tokhta was read, enjoining the princes to put an end to their dissensions, and to content themselves with their appanages, it being the will of the Grand Khan that the Grand Principality should enjoy peace. When the Mongol ambassadors brought a letter from their sovereign, the Russian Princes were obliged to meet them on foot, prostrate themselves, spread precious carpets under their feet, present them with a cup filled with gold pieces, and listen, kneeling, while the iarluik was being read.

Even when the Tatars had conquered the Russians, they respected their bravery. Matrimonial alliances were contracted between their princes. About twelve hundred and seventy-two Gleb, Prince of Biélozersk, took a wife out of the khan's family, which already professed Christianity, and Feodor of Riazan became the son-in-law of the khan of the Nogais, who assigned to the young couple a palace in Sarai. In thirteen hundred and eighteen the Grand Prince Iuri married a sister of Uzbek Khan, Kontchaka, who was baptized by the name of Agatha. Towards the end of the fourteenth century the Tatars were no longer the rude shepherds of the steppes. Mingled with sedentary and more cultivated races, they rebuilt fresh cities on the ruins of those they had destroyed: Kruim in the Crimea, Kazan, Astrakhan, and Sarai. They had acquired a taste for luxury and magnificence, honored the national poets who sang their exploits, piqued themselves on their chivalry and even on their gallantry. Notwithstanding the difference of religion, a reconciliation was taking place between the aristocracy of the two countries, between the Russian and the Tatar Princes. The Russian historians are not entirely agreed as to the nature and degree of influence exerted by the Mongol yoke on the Russian development. Karamsin and M. Kostomarof believe it to have been considerable. "Perhaps," says the former, "our national character still presents some blots which are derived from the Mongol barbarism." M. Soloviof, on the contrary, affirms that the Tatars hardly influenced it more than the Petchenegi or Polovtsui. M. Bestujef-Riumin estimates the influence to have been specially exerted on the financial administration and military organization. On one side the Tatars established the capitation-tax, which has remained in the financial system of Russia; on the other, the conquered race had a natural tendency to adopt the military system of the victors. The Russian or Mongol Princes formed a caste of soldiers henceforth quite distinct from Western chivalry, to which the Russian heroes of the twelfth century belonged. The warriors of Daniel of Galitch, it is said, astounded the Poles and Hungarians by the Oriental character of their equipment. Short stirrups, very high saddles, a long caftan, or floating dress, a sort of turban surmounted by an aigret, sabers and poniards in their belts, a bow and arrows,—such was the military costume of a Russian Prince of the fifteenth century. On the other side, many of the peculiarities in which the Mongol influence is thought traceable may be attributed as well or better to purely Slav traditions, or imitations of Byzantine manners. If the Muscovite Princes inclined to autocracy, it was not that they formed themselves on the model of the Grand Khans, but that they naturally adopted imperial ideas of absolutism imported from Constantinople. It is always the Roman Emperor of Tsargrad, and not the leader of Asiatic shepherds, who is their typical monarch. If from this time the Russian penal law makes more frequent use of the pain of death and corporal punishment, it is not only the result of imitation of the Tatars, but of the ever-growing influence of Byzantine laws, and the progressive triumph of their principles over those of the ancient Code of Iaroslaf. Now these laws so very easily admitted torture, flogging, mutilation, and the stake, that there is no need to explain anything by Mongol usages. The habit of prostration, that of beating the forehead, of affecting a servile submission, is certainly Oriental, but it is also Byzantine. The seclusion of women was common in ancient Russia, the customs of which were moulded by Greek missionaries, and the Russian terem was derived from the Hellenic plan of women's quarters, rather than from the Oriental harem; all the more because the Tatar women, before the conversion of the Mongols to Islamism, do not appear to have been secluded. If the Russians of the seventeenth century seem strange to us in their long robes and Oriental fashions, we must remember that the French and Italians of the fifteenth century, dressed by Venetian merchants, displayed the same taste. But in France fashions made advances, while in Russia, isolated from the rest of Europe, they remained stationary.

From a social point of view, two Russian expressions seem to date from the Tatar invasion: *tchernui*, or the black people, to designate the lower orders; and *krestianin*, signifying the peasant, that is, the typical Christian, who was always a stranger to the Mongol customs adopted for a short time by the aristocracy. As to the amount of Mongol or Tatar blood mixed with the blood of the Russians, it must have been very small: the aristocracy of the two countries may have contracted marriages, a certain number of Tatar Princes may have become Russian Princes by their conversion to orthodoxy, but the two races, as a whole, remained strangers. Even to-day, while the native Finns continue to be Russified, the Tatar cantons, even though converted to Christianity, are still Tatar. If the Mongol yoke influenced Russian development, it is very indirectly. By separating Russia from the West, by making it a political dependency of Asia, it perpetuated in the country that Byzantine half-civilization whose inferiority to European civilization became daily more obvious. If the Russians of the seventeenth century differ so much from Western nations, it is above all because they have remained at the point whence all set out. Again, the Tatar conquest also favored indirectly the establishment of absolute power. The Muscovite Princes, responsible to the kahn for the public tranquility and the collection of the tax, being all the while watched and supported by the baskaki, could the more easily annihilate the independence of the towns, the resistance of the subordinate princes, the turbulence of the boyars, and the privileges of the free peasants. The Grand Prince of Moscow had no consideration for his subjects because no man had any consideration for him, and because his life was always at stake. The Mongol tyranny bore with a terrible weight upon all the Russian hierarchy, and subjected more closely the nobles to the princes and the peasants to the nobles. "The Princes of Moscow," says Karamsin, "took the humble title of servants of the khans, and it was by this means that they became powerful monarchs." No doubt under any circumstances the Russian principalities would have ended by losing themselves in the same dominion, but Russian unity would have been made like French unity, without the entire destruction of local autonomies, the privileges of the towns, and the rights of the subjects. It was the crushing weight of the Mongol domination that stifled all the germs of political liberty. We may say, with Mr. Wallace, that "the first Tsars of Muscovy were the political descendants, not of Russian Princes, but of Tatar khans." The third indirect result of the conquest was the growth of the power and riches of the Church. In spite of the saintly legends about the martyrdom of certain princes, the Tatars were a tolerant nation. Rubruquis saw in the presence of the Grand Khan Mangu, Nestorians, Mussulmans, and Shamans celebrating their own particular form of worship. Kuink had a Christian chapel near his palace; Khubilai regularly took part in the feast of Easter. In twelve hundred and sixty-one the Khan of Sarai authorized the erection of a church and an orthodox bishopric in his Capital. The Mongols had no sectarian hatred against bishops and priests. With a sure political instinct, the Tatars, very like the Sultans of Stambul, understood that all these men could excite or calm the people. After the first fury of the conquest was passed, they applied themselves to gaining them over. They excepted priests and monks from the capitation-tax; they received them well at the Horde, and gave pardons at their intercession. They settled disputes of orthodox prelates, and established peace in the Church as well as in the State. In thirteen hundred and thirteen the Khan Uzbek, at the prayer of Peter, Metropolitan of Moscow, confirmed the privileges of the Church, and forbade that it should be deprived of its possessions, "for," says the edict, "these possessions are sacred, because they belong to men whose prayers preserve our lives and strengthen our armies." The right of justice was formally granted to the Church. Sacrilege was punished by death. The convents also increased in numbers and riches. They filled enormously: were they not the safest asylums? Their peasants and servants multiplied: was not the protection of the Church the surest? Gifts of land were showered on them, as in France in the year ten hundred. It was thus that the great ecclesiastical patrimony of Russia was founded, a wealthy reserve of revenues and capital, on which more than once in national crises the Russian sovereigns were glad to draw. The Church, which, even in its weakness, had steadily tended to unity and autocracy, was to place at the service of the crown a power which had become enormous. The Metropolitans of Moscow were almost always the faithful allies of the Grand Princes. See *Russian Army*, *Russian Government*, and *Russian Principalities*.

RUSSIAN RIFLING.—The Russians have adopted the French rifling for heavy ordnance. They have, however, had rifled several of their smaller fortress-guns with six grooves, and their field-pieces have been rifled in a similar manner; but, instead of placing the studs in pairs, and having twelve of them, they use only six placed alternately. Their rifling has an equal twist, and the grooves are slightly narrowed at the bottom. In the field-pieces they are sloped off, on one side to allow the projectile, the bearings of which are also sloped off, to wedge itself tightly; but these slight modifications possess no advantage over the fittings adopted for the French service.

More recently the Russians have adopted both the centering and the compressing systems of rifling with their steel ordnance.

RUST.—Oxide of iron, which forms on the surface of iron from exposure to atmospheric influence or contact with acid. The following forms a good preservative against rust, and is a good composition for guns when packed in boxes for transit, viz., one part white lead, seven parts tallow.

Among metal-workers and particularly among the skilled artisans engaged in the production of small-arms the perfection of a cheap, simple and, at the same time, reliable, process of coating the smaller parts—as for instance, in the guns, the functional pieces of the systems—for the prevention of rust, has been the subject of study and experiment for very many years. When it is considered that so inconsiderable a War Establishment as that of the United States demands the manufacture of some 30,000 Springfield rifles *per annum* to keep up the reasonable complement in reserve, and that private manufactures year by year average an aggregate of ten times that number of military and sporting arms, the value of the suggested improvement is most sensibly appreciated. The essays which have been made in this country and Europe, in the direction of protecting steel and iron against the corroding effects of air and moisture, have involved experiments with paints, varnishes, glazes, enamels, galvanizing, electro-depositing, and finally, the magnetic-oxide coating process, which up to the present time seems to claim the best results. This last named process was the discovery, some ten years back, of Prof. Barff, and is generally termed the "Barff-ing." The Barff theory subjects the parts to be treated to the action of super-heated steam, in a retort or chamber, until such a temperature is reached as will assure the oxydization demanded. The discovery is now controlled by the Bower-Barff Co., an English organization which has an agency in the United States. Besides the Bower-Barff there have been two or three processes, in the direction of anti-rust coating by oxide, practically developed in this country, but, we understand, without satisfactory results. Though there is no question of the value of the Barff-ing process as applied to large bodies of iron and steel, its difficulties and uncertainties in treating small pieces, like the action and the limb-work of gun systems, have thus far, we believe, deterred the manufacturers from its adoption. The interchangeable theory of small-arms production demands a mathematically correct and uniform preservation of the contour, proportion and volume of each part, and such possible incidents as the erection of scale on the metal, the distortion of lines, or the expansion or shrinkage of volume, through too great heat or inexpert handling, are of course not to be entertained. For some months past it has been not altogether a secret in ordnance circles that the very vexatious problem of coating gun parts with oxide, in such manner as to assure not only an excellent color but entire protection against corrosive influences, has been solved through the very intelligent and patient experimenting of Colonel A. R. Buffington, Commandant of the National Armory at Springfield.

The information in our possession at present as to Colonel Buffington's process, from the *Army and Navy Journal*, is derived from a correspondent who has been for many years a manufacturer of machine plant and special tools for gun-making and an expert in the selection and treatment of metals. We learn that the experiments, which have proceeded by slow degrees from the plane of investigation to that of practical application, have been of long continuance, and that the testing has been of a character exceptionally severe and thorough. In pursuing his experiments Colonel Buffington has always kept in view the practical rather than the theoretical, and the result of his work is the formulated system of an industrial expert rather than the more ambitious but less available scheme of a consulting engineer. "Every one skilled in the art of ash or baked bluing processes and the time and care required for the acid process of barrel browning," says the correspondent, "will be pleased to learn that by immersing and keeping the parts in such a condition for six minutes, in a bath of saltpeter, 10 parts, and of black oxide of manganese, 1 part, heated to about 600 degrees Far., a beautiful blue black color will be secured which will wear equal to, if not better than, the best acid process." The operation requires no skilled labor, a cast-iron pot deep enough to cover the parts to be treated, arranged in such manner that a uniform heat can be maintained, being the only apparatus needed. At the National Armory, they are using this process for all the gun-parts formerly blued—such as butt-plates, trigger-guards, bands, tips, etc. They are also treating the bayonets, and are about to try the process with the barrels. Especially notable is the fact that this process will not prejudicially affect the spring temper, and will draw case-hardened parts, requiring toughness, to the proper spring temper. The economical advantage is thus differentiated between the old process and the new—the old barrel browning by acid requires at least four and better six days time, while the new process consumes six minutes—the former demanding an expert and the latter a laborer. The Bartling process, as is well known, takes from ten to fourteen hours, with the constant liability of doing a positive or permanent damage to pieces thus treated.

It will be seen from the foregoing that, though Colonel Buffington's process is applicable both for browning and anti-corrosive purposes, it has not yet been applied to the parts of the action, other than the springs. The very economical results of the new process are thus far most pronounced, the saving of time and labor being considerable. We now look for a trial of the anti-rust virtues or the process upon the bolt-action and limb-work of the several repeating rifles. Should Colonel Buffington have merely succeeded in substituting a new formula for the old uncertain bluing and browning processes, he will have scored a success; if he has at last hit upon a real anti-rust treatment he has gained a victory.

Rustre.

RUSTRE.—In Heraldry, one of the subordinaries, consisting of a lozenge with a circular opening pierced in its center. Ancient armor was sometimes composed of rustres sewed on cloth.

RUSTRED ARMOR.—Armor of the Middle Ages, composed of flat oval rings sewed on quilted leather or linen and overlapping each other half way.

RYSWICK.—The Peace of Ryswick was a treaty concluded in 1697 at Ryswick, a Dutch village between Delft and the Hague, which was signed by France, England, and Spain on Sept. 20, and by Germany on Oct. 30. It put an end to the sanguinary contest in which England had been engaged with France. It has been often said that the only equivalent then received by England for all the treasure she had transmitted to the Continent, and for all the blood which had been shed there, was an acknowledgment of William's title by the King of France; but it must not be forgot how much the Allies were benefited by the check given to the gigantic power and overweening ambition of France.
