CANADA

CHAPTER I

THE GREAT DOMINION

If you look at a map of North America, you will see that the whole northern half of it is one vast extent, coloured perhaps in red, and stretching north from the boundary of the United States to the Arctic Ocean ; you will see that it is deeply indented by the great Hudson Bay on the north, and the Gulf of St. Lawrence on the east ; that it has an outline projecting into many bold headlands, and a coast washed by three oceans, fringed with countless islands, great and small.

This is Canada, a land that comprises fully one-third of the 12,000,000 square miles of the British Empire, thirty times as large as England, Ireland, and Scotland combined—not much less in area, in fact, than the whole of Europe. You may realize its breadth by thinking that if you were to get on a train at Halifax on the east, on Monday morning, and travel by the Imperial limited—a very fast train—day and night without stopping, you would not reach Vancouver on the west coast till Saturday morning. In the course of this long journey you would pass through eight large pro-

Canada

vinces—Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba, Saskatchewan, Alberta, and British Columbia—and you would still miss the island province, Prince Edward, and the great northern territories. Here is the heritage of the Anglo-Saxon race, a new nation in the part of the greatest Empire in the world, being fashioned and built up with marvellous rapidity.

We will try to give our readers a few pictures of this new land. A country whose southern parts are in the same latitude as Marseilles, and whose northern is hidden in the everlasting silence of Arctic ice, naturally presents a great variety of physical features, climatic productions, and occupations, and this bewildering variety is increased by difference in age. Down in the east the Tercentenary last year marked the passing of 300 years since Champlain first landed; in the north and west it is rare to find a native born.

There are only about 6,000,000 people in this large domain, and the settled parts and the large cities are mostly along the south, while the northern areas are in many parts covered by great forests, in which still live the moose and the elk, the grizzly bear and the wolf, while the splash of the hunter's paddle follows his line of beaver or otter-traps, or the tap of the prospector's hammer searching for silver or gold, has long been the only echo of the white man. Northern tribes of Indians still build their tepees beside the waters of far inland lakes, and follow the pathless way of river and stream.

There are no forests in the southern districts of Manitoba, Saskatchewan, and Alberta. Here is one

The Great Dominion

open plain, grassy meadow or ploughed land as far as eye can see, the prairie.

The southern part of Ontario, Quebec, and the province of Nova Scotia, are, in appearance, much like England, studded as they are with large towns, prosperous and old-settled farms, and numerous thriving orchards and vineyards. If the rolling, wide prairies, reaching as far as the eye can pierce in every direction, is the chief feature of the provinces of Manitoba, Saskatchewan, and Alberta, the majestic river, St. Lawrence, is the chief feature of the province of Quebec, and four big lakes, or rather inland seas, are the principal feature of Ontario. It is between two of these large lakes, Ontario and Erie, on the one side, and a third larger lake, Huron, on the other, that the above-mentioned garden-like part of the province of Ontario is situated. The fourth lake, Superior, the biggest of all—nearly as big as all Scotland, in fact—lies farther to the west, and stretches for 400 miles along the south of Ontario. There is yet a fifth big lake, closely connected with these four—namely, Michigan—but it belongs to the United States rather than to Canada.

“Domed with the azure of heaven,
Floored with a pavement of pearl,
Clothed all about with a brightness
Soft as the eyes of a girl ;

“Girt with a magical girdle,
Rimmed with a vapour of rest—
These are the inland waters,
These are the lakes of the West.”

Canada

CHAPTER II

THE FAR WEST

THE province of British Columbia, which is separated from the rest of Canada by the great range of Rocky Mountains, is itself a "sea" of tumbled mountains, which reach all the way from the Rockies to the Pacific Ocean, and, like the northern portion of the Dominion, is covered with forests. Here again there are several large rivers, such as the Fraser and Columbia, and a great many lakes. British Columbia is an exceptionally highly favoured region. Not only is she rich in natural resources—minerals, fish, lumber, and fruit—but she can boast of scenery which can vie with that of Norway, as with that of Scotland, and with the scenery of Switzerland.

Take, for instance, the Grand Cañon of the Fraser River. This is "a narrow gorge, where the river winds its tortuous way between great broken walls of granite, dashing against the huge black boulders which lie in its path, covering them with white foam and spray. As the cañon expands, the scene is varied by glimpses of Chinese gold-washers on the gravel-bars, or Squamish Indians fishing with dip-nets from the rocks for salmon, while here and there are scattered drying-frames, painted with red flesh of the salmon, and fantastic decorated Indian graves give a weird touch to the scene. Here the mountains of the coast range, where the river passes, rise to heights varying from 6,000

The Far West

9,000 feet above the level of the sea. They are extremely rugged and densely wooded, the south and western slopes especially, luxuriantly covered with the characteristic growth peculiar to the humid climate."

Although the interior of British Columbia is a sea of mountains, like an ocean suddenly turned into stone when in the grip of a mighty tempest, the hollows between the broken mountain-crests consist of a number of long narrow valleys, many of them filled wholly or in part with lakes. On a still, peaceful day in summer or early autumn nothing in the world can be lovelier than one of these lakes—Kootenay, Slocan, Arrow, Okanagan. The face of the water is like a sheet of highly polished steel, of a pure greenish-black colour, and every tree and stone, and every hut, on the mountain-sides around, and even every cloud in the sky above, is reflected on it with marvellous distinctness. The hollows of the mountains are filled with a soft but rich purple haze, or it may be a scarf of white, fleecy cloud hangs across the shoulders of the mountains, while another veil of delicate lace-work drapes their crests. As you gaze at the witching beauty of the scene, you feel your heart soften towards the great mountains. You imagine they do not know how to frown or be angry. You think it would be impossible for storm or tempest ever to rage or ravage against them. Mountains, forests, green pasture-lands, blossoming orchards, the lake itself—the whole scene is so wonderfully peaceful, so gloriously lovely.

The bare walls of rock, sprinkled with forest trees, the jagged, pinnacled outlines of the mountain-tops,

Canada

the cappings of perpetual snow which frame in some of these lakes, recall to the observer the stern grandeur of the Norwegian fjords ; while the little towns and orchards which cling to the foot of the mountains conjure up unforgotten visions of Lucerne and Tignes and similar beauty spots of Switzerland.

Apostrophizing any one of the little towns on the shore of any one of these beautiful sheets of water, one might say :

“The pearly lustre of thy sky
Will vie with that of fabled Greece.
Thy air—a buoyant purity !
Thou fold'st thy hands in perfect peace—
The innocent peace of the newly-born,
The stillness that heralds th' awakening morn.

“Sweet crystal waters bathe thy knees,
And hold a steel-bright mirror out,
Reflecting mountains, sky, and trees
Till dimpled by the leaping trout.
Thy lake—it is playful and wayward of mood,
Like maiden coquettish who's over-woo'd.”

Among the most striking features of the interior of British Columbia are the Selkirk and Purcell ranges which wheel round the northern end of Lake Kootenai and stretch some distance down its eastern side. The lofty, rugged, sharp-cut peaks of these ranges “reach up and break most of the heavy rain-clouds which blow from the Pacific. There is therefore more rain and more snow, and consequently the soil receives more moisture, and the growth of forest and farm is more dense. The lower slopes, beneath the snow-line, especially where the bare rock refuses to sustain life, are clothed

The Far West

with impenetrable forests of spruce, cedar, and hemlock, of which the underbrush is the most difficult barrier to exploration."

"These characteristics give more richness and contrast in the colour. On a clear day the snow-capped summits and crested peaks, tinged, perhaps, with the crimson glow of the setting sun, glisten and sparkle with dazzling brilliancy. Great luminous spears of transparent blue ice cut down into the dark rich green of the forest, which is blended into the warmer tints of shrubbery and foliage in the foreground. Great castellated crags of white and green rock break through the velvet mantle of forest. Blueberry bushes and alders, with white-flowered rhododendrons, adorn with delicate tracery the trailing skirts of the forest, and rich-tinted red, purple, and yellow wild-flowers nestle in the fringe. All this, rising against the clear blue of the sky, while soft veils of mist rise from the valleys, floating across the face of the mountains, or break and hang in fleecy tassels upon the edges of cliffs and crags, makes a study in colour and grandeur beyond the power of human artist to depict or poet to describe."

This description applies almost equally to the Rocky Mountains, the backbone that stretches from north to south of the continent, the gigantic barrier which separates the flat prairies from the broken coast districts.

In Canada they all wear glistening snow-caps, while glaciers of enormous extent rest in their awful cañons, and their hoary sides are laced with the most beautiful green-blue mountain torrents which leap from dizzy heights in cascades of dazzling beauty. Some of the

Canada

most imposing scenery of the Rockies is enclosed within the great National Park at Banff, an area of 5,732 square miles of mountains, and here is a great game preserve, where are found bear, moose, elk, deer, mountain sheep and goats, and many smaller animals. No one may shoot or trap here, and it is expected that the number of wild animals will greatly increase. There is, too, a large herd of buffalo maintained in the park.

In the forests, on the slopes, grows the famous Douglas fir, which reaches a great size and height; trees 30 feet across the trunk are not uncommon, and there is one in Stanley Park, Vancouver, which your cabman is sure to show you should you visit that city, which has a hole in the trunk so large that parties of tourists stand in it to be photographed. The climate is so mild that winter is replaced by a rainy season, and roses bloom outside all the year round. This makes the famous Okanagan and Kootenay valleys so suitable for fruit-culture.

Victoria is the capital of British Columbia. It is situated on Vancouver Island, on the Pacific, and its climate and natural beauty have made it the home of choice for many English families retiring from service in the Orient, and so it is the most English of Canadian cities. Vancouver is the commercial capital, it is the terminus of the Canadian Pacific Railway, and from its fine harbour steamship lines run to China, Japan, and Australia. Prince Rupert is a new port farther north, and is the western terminus of the Grand Trunk Pacific Railway now being built across the continent.

British Columbia has been called a "little paradise

MOUNTAIN SCENERY NEAR HOWE SOUND BRITISH COLUMBIA PAGE 4.

T. Moser Martin, N.Y.C.

The Far West

on earth," and if beauty of scenery, and the poetry of Nature, and the contentment, prosperity, and happiness of man can anywhere combine to make a spot on this earth anything approaching to a paradise, assuredly that spot is to be found in the fairest province of the Dominion of Canada. And how many of the names of the little towns which cling to the feet of the mountains mirrored in these lakes have not only musical, but richly poetic names! Who can listen to such words as Kelowna, Summerland, Nelson, Vernon, Castlegar, Halcyon, Mara, Kootenay, Slocan, Okanagan, without feeling a thrill of poetic delight? Were these names as familiar to the mind as are Lomond, Katrine, Leven, Blair Athole, Glencoe, Inveraray, Oban, they would not fail to conjure up as many pictures of surpassing scenic beauty as do those pearls of the Scottish Highlands, especially as in many respects the physical features of the two regions are somewhat alike.

And the coast districts of British Columbia are every bit as remarkable as the mountainous lake districts of the interior. They, too, bear more than a superficial resemblance to the west coast of Scotland. Like the latter, the western shore of British Columbia is cut into deeply by the ocean. Like the west of Scotland, again, the numerous bays and fjords are rock-bound, and long and winding. And, once more, like that same Scottish ocean marge, the Pacific coast of this Canadian province is thickly studded with islands, varying in size from a tiny dot of rock to Vancouver Island, which is about half as big as Ireland, and studded with mountains which rise up to from 6,000 to 7,500 feet.

Canada

CHAPTER III

HOME-LIFE IN CANADA

THE English visitor to a Canadian city finds things much as they are at home: there are different names for articles in common use; the hotel elevator goes faster than the lift at home; the trams are street-cars, the streets are not so clean; the traffic is not so well managed; and the public buildings and parks are newer, and lack the grace and beauty of the old land architecture. The houses all have verandas, on which, in summer, the people spend a great part of their time, even eating and sleeping there; and most of the houses have lawns unprotected from the street by walls or fences. The houses are kept much warmer in winter than is the English custom, and ice is everywhere used in the summer. All well-to-do people in the towns, and many in the country, have telephones. Other minor differences there are, but you would soon feel quite at home in a Canadian house.

The stranger visiting a Canadian town is at once struck by the keenness of the local enthusiasm. That is to say, the people who live in that town are immensely proud of it, and consider it the finest and best place to live in in all the world. They are very fond of pointing out the advantages which it enjoys, and never neglect the smallest opportunity of boasting of its beauty or wealth or public spirit, or whatever it may be that it excels in. The governing authorities of the town, as

Home-Life in Canada

the Mayor and Town Council, vote money from time to time expressly to advertise their town, in the hope of attracting strangers to come and live there. Then the citizens form themselves into clubs for the purpose of helping the population to reach as soon as possible 20,000, or 50,000, or 100,000, as the case may be; and these clubs bear the strange titles of the Twenty Thousand Club, the Fifty Thousand Club, the Hundred Thousand Club, and so on.

The houses in the towns, and even many houses in the country, are not considered properly furnished if they have not the telephone fitted up inside them. The Canadians—women, and even children, as well as business men—use the telephone pretty well every day of their lives. Does a lady want to know how her neighbour's little girl's cut finger is getting on, she rings her neighbour up on the " 'phone." A lady does her shopping at the grocery store, or orders her joint for dinner "over the 'phone." A boy asks his class-mate how much history they have to learn for their home-lesson to-night. Indeed, in a Canadian home the telephone is used as much and as frequently as the poker is for stirring the fire on a cold winter's day in any English home.

In many of the thinly inhabited districts the place where people meet and gossip and pick up the news of what is happening in the country-side is not the weekly market or the church, because very often neither the one nor the other exists, but it is the "store." This is not a barn or similar building in which people put their hay or corn or other produce till they wish to sell it.

Canada

The word means "a shop," and the country store, the focus and centre of the life of the district, is almost always a shop where pretty nearly every conceivable thing is sold, from iron wedges (for splitting logs) to oranges, from ready-made suits of clothes to note-paper. And the storekeeper is nearly always the postmaster as well. Thus, if you want to find out all about a district, you are most likely to obtain the information you seek from the storekeeper. He can tell you what land or what farms there are for sale in the locality, and the prices that are being asked. He knows the names of everybody within a range of a good many miles, and often knows a great deal more about people than their names alone.

In the older parts of the country, life on the farm is much the same as elsewhere; the houses are built of stone and brick, with verandas and lawns, heated by furnaces, and furnished with all that comfort, even luxury, demands. But far back in the newer parts of Ontario or New Brunswick we see in a small clearing in the forest or on the edge of a lake or stream the "log-cabin," with the blue smoke curling up from the chimney at one end. If we come up to the door we are sure of a welcome; that is the rule in the wilderness. We enter, to find the house of two rooms, and perhaps an attic above; the big iron stove for both cooking and heating stands at one end, and the rifle, guns, and fishing-tackle, and the dried skins on the wall, tell of the pleasures of forest life. Perhaps the owner greets you with a fine Scotch or Yorkshire "twang," and you need feel no surprise if you see last month's *Punch* or the

Home-Life in Canada

Weekly Times lying on the table. These hardy settlers make their living in part by the battle with the forest, in part by what they shoot or trap, but largely by working in the winter for the large lumber (timber) companies who have bought the pine in the woods from the Government ; sometimes, too, they act as guides in the summer and autumn for the tourists or amateur huntsmen. Their life teaches them to be strong, active, and self-reliant, with a fine disdain for the city man, who is so helpless on the trail or in a canoe.)

On the prairie the life is quite different. Here the settler is content with the little wooden cabin of double boards with tar-paper between, which he erects himself; his supplies he brings in the form of flour, bacon, and canned goods from the nearest town many miles away. His nearest neighbour may be ten miles away, his railway-station twenty ; all around to the horizon stretches a vast plain, like the sea. His horses are hobbled at night to keep them from straying, for there are no fences ; he cuts their hay for the winter in the "slews" or "swales"—low-lying, marshy spots on the prairie. He is fortunate if there is within reasonable distance a poplar thicket, where he can cut some fire-wood. From morn to night he follows the plough through the rich black soil, which has waited for it from time immemorial ; his whole life is the wheat. A lonely, hard existence, but the reward comes so fast that in a few years of good crops he may spend his winters in the South, while his sons and daughters attend college.

Canada

Now, a peep at the home of the "habitant"—the French-Canadian farmer in the Province of Quebec. A tiny white house in the shadow of a little church, whose spire is tipped with a golden cross, overlooking a mighty river; a narrow strip of farm, every inch in cultivation; a group of many dark-eyed children chattering in a picturesque patois; you close your eyes and you are in Brittany. Hard-working, home-loving, religious, but light-hearted, these people preserve throughout centuries without change the virtues and customs, the speech and the religion of their ancestors. They grow most of what they eat; they make everything they wear; and little money means wealth. Their sons are found in the factory towns of the New England States, and in the lumber woods of the North.

"We leev very quiet 'way back on de contree:
Don't put on same style lak de big village."

or—

"De fader of me was habitant farmer,
My gran'fadder too, and hecs fader also.
Dey don't mak' no monee, but dat isn't funny,
For it's not easy get everything, you must know,"

as Drummond the habitant poet quaintly says.

Most of the schools in Canada are public, which means just the opposite to what it means to the English boy who knows Rugby, Eton, or Harrow; they are like English Board-schools, free to all, and attended by both boys and girls. Then there are high schools, where students may be prepared for college, and there are private schools, corresponding to the English public schools; of these the oldest and most noted is Upper

Home-Life in Canada

Canada College, which is like the Eton of Canada. There are Universities in all the provinces, and Toronto and McGill University in Montreal are as large as the great Universities at home.

The English boy or girl coming to Canada will find the money quite different from what he has been accustomed to ; it is measured in dollars, and a dollar is about equal to four shillings. There are 100 cents in a dollar, and there is a copper coin for 1 cent, value one halfpenny, usually called a "copper," and silver coins for 5, 10, 25, and 50 cents ; but for large sums bank-notes in denominations of 1, 2, 5, 10 dollars and more are used. As the decimal system is used, it is really simpler than pounds, shillings, and pence, and one soon becomes accustomed to it, though for some time one fears that one is paying too much, especially as prices for small articles are often higher in Canada.

CHAPTER IV

WINTER SPORTS

As soon as the ground is covered with snow, and the snow gets hard enough, every boy and girl in Canada fetches out his or her flexible flyer, bob-sleigh, or other form of child's sleigh, and dragging it to the top of an incline, sets it off gliding to the bottom.

The flexible flyer is a small sleigh that will not carry more than one big child or two very small ones. The

Canada

rider lies stretched out on the sleigh, flat on his stomach, with his legs sticking out behind. A bob-sleigh is larger—often made, in fact, by fastening a piece of board across two sleighs running one behind the other. The riders on this go down in a sitting attitude, with their legs sticking out on each side of them, while one of them steers with his feet. And jolly fun it is to see them flying down like an express train, laughing and shouting, with red, rosy cheeks and bright, sparkling eyes. What matters an occasional spill in the snow? That only adds to the fun, and makes the game all the merrier.

While the children enjoy this “coasting,” as they call it, the young men strap on their snowshoes and race across fields and fences, leaping or rolling over the latter, until they arrive at some appointed inn, where they partake of a good meal, with plenty of singing of rousing, lusty choruses and other kinds of jollification. Then on they strap their snowshoes again, and, with many a whoop and shout, stretch out in Indian file on their homeward journey. If there is no moon they carry torches, and the ruddy, flickering light adds picturesqueness to the long belted blankets or tunics and tasselled tuques of the snowshoe runners.

“A pretty picture it is as the snowshoers turn down into a gully, some slipping, some recovering from a threatened upset by a feat of balancing, and then, still in Indian file, getting over the fence, every man in his own peculiar way. Some take it at a leap, others climb it cautiously; some roll over sideways in a lump, pitching feet and snowshoes before them. Some are

MUSKOKA LAKE. PAGE 21.

T. Mowbray Martin R.C.S.D.

Winter Sports

too slowly careful, and, catching a shoe on the top rail, measure their full length in the snow. There is no stopping here, for we are far from road and railroad, out in the open country, with several miles of field before us, and twenty fences in the way. Most of the farmers, with fellow-feeling, have left a few rails down, so that there is no obstruction. But a tramp is as tame without a tumble as without a fence, so here goes for your five feet ten! Never was there charger could take a high fence like a snowshoer! As an old song of the Montreal Snowshoers' Club runs:

“Men may talk of steam and railroads,
But too well our comrades know
We can beat the fastest engines
In a night tramp on the snow.
They may puff, sir, they may blow, sir,
They may whistle, they may scream—
Gently dipping, lightly tipping,
Snowshoes leave behind the steam!”

It is the dry snow, the bracing air, and the clear skies of the Canadian winter season that, combined with the exercise, produce this great exhilaration of spirits, and set up an equally great—appetite.

Ladies take part in this sport as well as men. Indeed, they also share in the tobogganing and the ice-hockey; in the former along with their brothers and friends, and in the latter in separate clubs.

But the favourite winter sport is ice-hockey. The game is carried on under cover in large halls, the floor of which can be artificially flooded and frozen. In this way a smooth, level expanse of ice is secured, a thing

Canada

that can be seldom got out of doors owing to the great quantity of snow that lies on the ground. The game is played pretty much as hockey is on grass ; the ball or disc the players chase is called a "puck," and they make it skim along the ice with hockey-sticks of the usual shape.

The hockey matches between rival cities are affairs of the greatest interest to the inhabitants. A large number of deeply interested sympathizers always accompany the team that goes to play away from home—in fact, the enthusiasm and excitement reach quite as high a pitch as they do in England over a successful team of local football players. The great trophy of Canadian ice-hockey is the Stanley Cup, which was first competed for in 1893, and has been competed for every year since, except in 1898. The winning teams have generally been furnished by Montreal or Winnipeg, though sometimes the winners have come from Toronto, Ottawa, and other cities. Two games are played, and all the goals obtained by the one club are added together and put against the total number of goals gained by the other club. The holders of the cup keep it until they are defeated, and they have to play whenever challenged. Since 1906 the cup has been held by the Montreal Wanderers.

A Canadian, Mr. W. George Beers, in describing Canada as a winter resort, thus writes: "The Province of Quebec must bear the palm of transforming winter into a national season of healthy enjoyment, and Montreal is the metropolis of the Snow King. You can have delightful days and weeks in Toronto, where ice-

Winter Sports

boating is brought to perfection, and the splendid bay is alive with the skaters and the winter sailors ; or in curling or skating rink, or with a snowshoe club when they meet in Queen's Park for a tramp to Carleton, you may get a good company, and, at any rate, thorough pleasure. Kingston has its grand bay, its glorious toboggan slides on Fort Henry, its magnificent scope for sham fights on the ice, its skating, curling, snowshoeing, and its splendid roads. Halifax has its pleasant society, its lively winter brimful of everything the season in Canada is famed for. Quebec, ever glorious, kissing the skies up at its old citadel, is just the same rare old city, with its delightful mixture of ancient and modern, French and English ; its vivacious ponies and its happy-go-lucky cariole drivers ; its rinks and its rollicking ; its songs and its superstitions ; its toboggan hill at Montmorenci, which Nature has erected every year since the Falls first rolled over the cliffs ; its hills and hollows and its historic surroundings ; its agreeable French-English society, the most charming brotherhood that ever shook hands over the past.

The first snowfall in Canada is an intoxicant. Boys go snow mad. Montreal has a temporary insanity. The houses are prepared for the visit of King North Wind, and the Canadians are the only people in the world who know how to keep warm outdoors as well as indoors. The streets are gay with life and laughter, and everybody seems determined to make the most of the great carnival. Business goes to the dogs. There is a mighty march of tourists and towns-

Canada

people crunching over the crisp snow, and a constant jingle of sleigh-bells. If you go to any of the toboggan slides you will witness a sight that thrills the onlooker as well as the tobogganist. The natural hills were formerly the only resort, but someone introduced the Russian idea of erecting a high wooden structure, up one side of which you drag your toboggan, and down the other side of which you fly like a rocket. These artificial slides are the more popular, as they are easier of ascent, and can be made so as to avoid *cahots*, or bumps. The hills are lit by torches stuck in the snow on each side of the track, and huge bonfires are kept burning, around which gather picturesque groups. Perhaps of all sports of the carnival this is the most generally enjoyed by visitors. Some of the slides are very steep, and look dangerous, and the sensation of rushing down the hill on the thin strip of basswood is one never to be forgotten."

"How did you like it?" asked a Canadian girl of an American visitor, whom she had steered down the steepest slide.

"Oh, I wouldn't have missed it for a hundred dollars!"

"You'll try it again, won't you?"

"Not for a thousand dollars."

Perhaps to some whose breath seems to be whisked from their bodies this is the first reflection, but the fondness grows by practice.

Another famous winter sport is the national Scottish pastime of curling, and even when transplanted to the colder climate of Canada, the power which this

Winter Sports

sport possesses of firing sedate temperaments, and heating them to the ebullition-point of enthusiasm, suffers not one whit of diminution. Your Canadian devotee of the "roaring game" of "stane" and "tee" waxes every bit as excited over it as his Scottish associate.

A French habitant having witnessed a game at Quebec for the first time in his life, thus described it: "I saw to-day a gang of Scotchmen throwing on the ice large iron balls shaped like bombshells, after which they yelled, 'Soop ! soop !' laughing like fools; and I really think they were fools."

Nor is the summer without its delight. All who can, make the Red Indian their model, and turn back to the aboriginal life. Summer homes or camps in the forest are built on the islands which dot the many inland lakes, and the long days are spent in canoeing, sailing, bathing, and fishing, while at night bonfires are built on the shores, all gather round, and to the twang of the banjo or guitar old college choruses are sung or stories are told. Moonlight in Muskoka is a fairyland memory to those who have known it, and to these lakes alone resort 20,000 summer visitors from Canada or their neighbours from the South.

Others choose canoeing trips, after the manner of the old "Coureurs de bois." With Indian guides, weeks are spent in following the chains of rivers and lakes, linked by portages (carrying-spaces), where all turn to and "tote" canoe and stores across. At night, after a supper of fish just pulled out of the lake and cooked on the camp-fire, the sleep in a tent on a bed of

Canada

spruce boughs is a glorious treat to the city man or maid.

In the cities games of all sorts are played. Everywhere baseball, the national game of the United States, is to be seen, and lacrosse, the national game of Canada, adopted from the Indians, is a great favourite ; cricket, tennis, polo, golf, and bowls, all known games, are played with the greatest fervour. In track athletics and in aquatic sports, Canadians have been seen to good advantage in many English contests.

CHAPTER V

FIFTY BELOW ZERO

So long as there is no wind the cold in Canada is, on the whole, not disagreeable. The air is, as a rule, so dry and still that the cold is exhilarating rather than painful. Even when the thermometer drops as low as 50° or 55° below zero—that is to say, when there is as much as 80° to 90° of frost in all—a man will be able to take his coat off and keep himself warm at an active occupation such as wood-cutting. Very often, in fact, you only know that it is freezing as hard as it actually is by hearing the crisp crunch, crunch of the snow under your own feet, or under the hoofs of your horses. When properly dressed, with moccasins and thick woollen stockings on your feet and legs, thick warm underclothing, and a heavy “mackinaw,” or frieze

Fifty below Zero

jacket, worn over a jersey, mitts—*i.e.*, gloves without fingers—and a tuque, or a fur cap pulled well down over your ears, you can generally defy the cold, and so long as you are active you will not feel it anything like so much as you would expect.

But when the wind blows it is altogether different, and the cold finds its way in all round you, even through the thickest clothing. Indeed, when the temperature is very low, and it begins to snow hard, it is dangerous to be out of doors. The violent snowstorms which sometimes come on at such times are known as “blizzards,” and they are greatly dreaded. The air grows black, the snow turns into frozen particles of ice, with sharp cutting edges, and the wind drives them with the speed of shotcorns discharged from a gun. It is impossible to hold up your head against them; they would very soon cut your cheeks into ribbons. How terrible a thing a blizzard is in the north-west of Canada will be shown by the following story, which is quite true:

In a certain part of the prairie a blizzard began to blow. The farmer who was living there knew from the “feel” of the atmosphere and the colour of the sky what was coming, and he hastened to prepare for it. He put down a large supply of hay before each of his horses and each of his cows, and made all weatherproof and safe in and about the stable, for a blizzard often lasts two or three days or longer. Then he carried into the house as much firewood as he could before the storm burst, and when at last it did come he was prepared for it. For two days and two nights it blew a

Canada

fierce ice hurricane, and during all that time the storm never slackened or abated for one single instant. But at the end of that time the farmer thought the blizzard was not so fierce as it had been ; so, taking his cap off the nail on the wall, he tied it under his chin, and, pulling on his big boots, prepared to go out to the stable to see how his horses and cows were getting on, and whether they had eaten up all their hay. Just as he had his hand on the latch of the door his little girl came suddenly into the kitchen, and, stretching out her arms, cried : “Daddy, me go. Me want to go. Daddy, take Lucy !”

The farmer hesitated. But it was only ten yards or so across to the stable, and the little one had been shut in so long, a change would do her good. He glanced at his wife to see if she agreed. “Fetch mammy’s shawl, then,” answered Lucy’s father. Little Lucy ran gleefully to fetch the shawl, and both her father and mother wrapped her carefully up in it, so that when the farmer picked her up in his arms to carry her out she looked more like a bundle of dark red clothing than like a living little girl.

The farmer was right ; the blizzard was nothing like so fierce, and he easily found his way across to the stable. He fed his horses and his cows, and satisfied himself that they were all safe and comfortable again, and opened the stable-door to go back to the house. But—the house had disappeared ; he was unable to see the smallest sign of it. The blizzard had come back again whilst he was in the stable, and it was now raging fiercer than ever.

A SETTLER'S FARMYARD

T. Moore Martin, R.C.A.

Fifty below Zero

However, he knew there was no help for it; get back to the house he must, otherwise his wife would be consumed with the keenest anxiety on his and Lucy's account, and she might perhaps be tempted to come out in search of him. Gathering the shawl, therefore, closer about his little Lucy, and pressing her tightly to him, he bent his head and plunged out into the furious hurricane of driving ice. After running for some seconds, he stopped to catch his breath, and judging he was near the kitchen-door, he stretched out his hand, feeling for the latch, or fastener. He could not find it. He swept his arm all round him as far as he was able to reach. No door anywhere. Then he knew that he had missed it. In the blinding, cutting snowstorm he had done what so often happens at such times and in such circumstances: he had failed to steer a straight course, and had gone beside the house.

Which way to turn? The farmer was in great perplexity. He did not know on which side of the house he was; in fact, he did not know where he was at all. He was just as likely to strike out into the open prairie and go away from home as he was to run against his own house-corner. However, he realized the danger of standing still: he might perish of cold, be frozen to death where he stood. Accordingly, throwing off the chill anxiety which was beginning to creep round his heart, he struck out again at a crouching half-run in the direction in which he fancied the house stood. Again he had to stop to recover his breath. He had not yet found the house. He was as far—or was he farther?—from safety as ever he was. A third time he

Canada

tried, and a fourth, and still without success. He was beginning to despair of ever reaching his own door again, when a faint sound caught his ear. It was—yes, it must be—his dog barking indoors. Yet what a long way off it seemed! On the other hand, the farmer knew it could not really be a very great distance away, because it was barely five minutes since he had left the stable, and from the way in which he had run he was confident he could not have travelled very far, even supposing he had kept in one straight line all the time. The cold was intense; the very marrow in his bones seemed to shrivel under the icy blast. Clutching his precious burden tighter in his arms, he once more tried to find his own house-door. To his unspeakable joy the dog still continued to bark at intervals, and the farmer followed the direction of the sound. After the lapse of a minute or so, his feet struck against some hard object lying on the ground, which he recognized as a certain post that had fallen down, and in an instant he knew where he was. Then it was a matter of but a few seconds for him to fumble and feel his way along by the broken fence to the house-corner, and from the house-corner to the door was only a few steps more. At last, to his delight—a delight which no words can describe—his fingers clutched the latch, and he was safe.

But when the farmer handed over the red shawl to his wife, and the wife unwrapped it, to take out her beloved little one—oh, agony! Lucy was dead! frozen to death in her father's arms!

Law and Order in Canada

CHAPTER VI

LAW AND ORDER IN CANADA

IN the older parts of the country, with the exception of the larger cities, crime is rare, justice is well administered, the ordinary forms of English law being followed; but the country has suffered in this respect from the fact that there have been criminals among the many emigrants arriving in recent years. One naturally expects that there will be lawlessness in the opening up of new countries, but certain wise laws have saved Canada from this evil. Many of the towns have passed laws prohibiting the sale of alcoholic liquors; it is illegal to sell liquor to Indians, as the Indian is dangerous when he gets "fire-water"; liquor may not be sold in any railway construction camp, or mining town, and the enforcement of this law has prevented much crime. The enforcement of the law is the duty of "licence inspectors," and they meet many queer adventures in the search for "blind pigs," as the places are called where liquor is illegally sold. At one place whisky was brought in, concealed in cans of coal-oil; at another, a shipment of Bibles on examination was found to be made of tin, and filled with the desired spirit. Another class of inspectors are the "game wardens," whose duty it is to see that the laws with regard to close seasons in fishing and hunting are observed. They travel about throughout the north-land, and when they find evidence of law-breaking they

Canada

seize nets, guns, game, fish, or furs, and see that large fines are imposed.

But Canadian reputation for law and justice owes more to that famous organization of guardians of the peace, the North-West Mounted Police, than to any other cause. This body of men was organized in 1873 for the preservation of order in the great North-West, which was then populated by Indian tribes and half-breeds, with very few white men. At present the force consists of 750 men, posted at ten different divisions, officered by a commissioner and assistant-commissioner, and in each division a superintendent and two inspectors. The full-dress uniform of the corps is a scarlet tunic with yellow facings, blue cloth breeches with yellow stripes, white helmet, and cavalry boots and overcoat. On service, fur coats and moccasins are worn in winter, and khaki with cowboy hats in summer. Each constable looks after his own horse—a cayuse or broncho about the size of a polo pony, worth about £12, with his regimental number branded on him, and good to lope all day and pick up his living, hobbled near his master's camp. The armament of the force consists of a carbine (.45—.75 Winchester) and a .44 Enfield revolver.

This is the force that guards the territory stretching from the Great Lakes to the Rockies, and from the forty-ninth parallel, the United States boundary, to the Arctic Ocean—half a continent; and so well have they done what seems an impossibility, that a man may walk from one end to the other unarmed and alone, and with greater security than he could in London from

Law and Order in Canada

Piccadilly to the Bank. The influence of the corps depends on the fact that they are absolutely fair, and that, whatever the cost or difficulty, they never give up till they have landed their man.

When Piapot—restless, quarrelsome, drink-loving Piapot—and his swarthy, hawk-faced following of Crees and Saultaux, hundreds of them, spread the circles of their many smoke-tanned tepees near the construction line of the Canadian Pacific Railway, beyond Swift Current, there was inaugurated the preliminary of a massacre, an Indian War, the driving out of the railway hands, or whatever other fanciful form of entertainment the fertile brain of Piapot might devise.

The Evil One might have looked down with satisfaction upon the assembly; there were navvies of wonderful and elastic moral construction; bad Indians with insane alcoholic aspirations; subservient squaws; and the keystone of the whole arch of iniquity—whisky. The railway management sent a remonstrance to the Powers. The Lieutenant-Governor issued an order; and two policemen—two plain, red-coated, blue-trousered policemen—rode forth carrying Her Majesty's commands. Not a brigade, nor a regiment, nor a troop, not even a company. Even the officer bearing the written order was but a sergeant. That was the force that was to move this turbulent tribe from the good hunting-grounds they had struck to a secluded place many miles away. It was like turning a king off his throne. Piapot refused to move, and treated the bearer of the Paleface Mother's message as only a blackguard

Canada

Indian can treat a man who is forced to listen to his insults without retaliating.

The sergeant calmly gave him fifteen minutes in which to commence striking camp. The result was fifteen minutes of abuse—nothing more. The young bucks rode their ponies at the police horses, and jostled the sergeant and his companion. They screamed defiance at him, and fired their guns under his charger's nose and close to his head, as they circled about in their pony spirit-war-dance. When the fifteen minutes were up, the sergeant threw his picket-line to the constable, dismounted, walked over to Chief Piapot's grotesquely painted tepee, and calmly knocked the key-pole out. The walls of the palace collapsed; the smoke-grimed roof swirled down like a drunken balloon about the ears of Piapot's harem. All the warriors rushed for their guns, but the sergeant continued methodically knocking key-poles out, and Piapot saw that the game was up. He had either got to kill the sergeant—stick his knife into the heart of the whole British nation by the murder of this unruffled soldier—or give in and move away. He chose the latter course, for Piapot had brains.

Again, after the killing of Custer, Sitting Bull became a more or less orderly tenant of Her Majesty the Queen. With 900 lodges he camped at Wood Mountain, just over the border from Montana. An arrow's flight from his tepees was the North-West Mounted Police post. One morning the police discovered six dead Saultaux Indians. They had been killed and scalped in the most approved Sioux fashion.

Law and Order in Canada

Each tribe had a trademark of its own in the way of taking scalps; some are broad, some are long, some round, some elliptical, some more or less square. These six Indians had been scalped according to the Sioux design. Also a seventh Saultaux, a mere lad and still alive, had seen the thing done. The police buried the six dead warriors, and took the live one with them to the police post. Sitting Bull's reputation was not founded on his modesty, and with characteristic audacity he came, accompanied by four minor chiefs and a herd of "hoodlum" warriors, and made a demand for the seventh Saultaux—the boy.

There were twenty policemen backing Sergeant McDonald; with the chief there were at least 500 warriors, so what followed was really an affair of prestige more than of force. When Sitting Bull arrived at the little picket-gate of the post, he threw his squat figure from his pony, and in his usual generous, impetuous manner, rushed forward and thrust the muzzle of his gun into Sergeant McDonald's stomach, as though he would blow the whole British nation into smithereens with one pull of his finger. McDonald was of the sort that takes things coolly; he was typical of the force. He quietly pushed the gun to one side, and told the five chiefs to step inside, as he was receiving that afternoon. When they passed through the little gate he invited them to stack their arms in the yard and come inside the shack and pow-wow. They demurred, but the sergeant was firm; finally the arms were stacked and the chiefs went inside to discuss matters with the police.

Canada

Outside the little stockade it was play-day in Bedlam. The young bucks rode, and whooped, and fired their guns; they disturbed the harmony of the afternoon tea, as the sergeant explained to Sitting Bull. "Send your men away," he told him.

The Sioux chief demurred again.

"Send them away," repeated the sergeant, "if you have any authority over them."

At a sign Sitting Bull and the chiefs made towards the door, but there were interruptions—red-coated objections. And the rifles of the chiefs were stacked in the yard outside. Sitting Bull, like Piapot, had brains; likewise was he a good general. He nodded approvingly at this *coup d'état*, and told one of the chiefs to go out and send the boys away.

When the young bucks had withdrawn to their camp, the sergeant persuaded Sitting Bull and the others to remain a little longer, chiefly by force of the red-coated arguments he brought to bear upon them.

"Tarry here, brothers," he said, "until I send Constable Collins and two others of my men to arrest the murderers of the dead Indians. The Saultaux are subjects of the Queen, and we cannot allow them to be killed for the fun of the thing. Also the boy told us who the murderers are."

Then Constable Collins—big Jack Collins, wild Irishman, and all the rest of it—went over to the Sioux camp, accompanied by two fellow-policemen, and arrested three of the slayers of the dead Indians. It was like going through the Inquisition for the fun of the thing. The Indians jostled and shoved them,

THE ROCKY MOUNTAINS. Fig. 7.

T. Mower Martin, R.C.A.

Law and Order in Canada

reviled them, and fired their pistols and guns about their ears, whirled their knives and tomahawks dangerously close, and indulged in every other species of torment their vengeful minds could devise. But big Jack and his comrades hung on to their prisoners, and steadily worked their way along to the post.

Not a sign of annoyance had escaped either of the constables up to the time a big Indian stepped up directly in front of Jack Collins and spat in his face. Whirra, whirroo! A big mutton-leg fist shot through the prairie air, and the Sioux brave, with broken nose, lay like a crushed moccasin at Jack's feet.

"Take that, you black baste!" he hissed, between his clenched teeth. "An' ye've made me disobey orders, ye foul fiend!"

Then he marched his prisoners into the post, and reported himself for misconduct for striking an Indian. The three prisoners were sent to Regina, and tried for murder. I do not know whether Jack was punished for his handiwork or not, though it is quite likely that he was strongly censured at least.

In 1896 a party of several hundred Crees, who had gone on a raid into Montana, were returned by the United States authorities, under guard of a cavalry regiment, and the Mounted Police were notified to meet them and take charge at the boundary. What was the amazement of the American officers to be met by a sergeant and two constables; but such was the influence of their uniform that the Indians meekly marched ahead of them back to their reserve. In 1907 a single constable followed an escaped convict and noted

Canada

desperado for over 2,000 miles of the pathless northern wilderness, and brought him back to stand trial. These are but samples of what the North-West Mounted Police have been doing for over thirty years for the fair name of Canada.

When the Strathcona Horse were organized for South African service, 300 members of the corps were mounted policemen ; the gallant commander was the commissioner, Lieutenant-Colonel Steels, and the whole Empire is familiar with their record there. Many of the members are "remittance men," the younger sons and often the prodigals of well-known English families, and not infrequently of noble birth. In recent years there has been added to their duties the care of the Yukon, and the maintenance of order in this great gold camp far up at the Arctic Circle has fully sustained their reputation.

CHAPTER VII

THE SHIP OF THE PRAIRIE

"ALL aboard!" Such is the commanding cry which rings out in a Canadian railway-station when a train is quite ready to start. "All aboard!" shouts the conductor as he walks briskly alongside the train. In climb the waiting passengers, and without further warning the big, ponderous engine begins to move ; and as it moves, the big bell which it carries begins to toll, and keeps on tolling until the train is well clear of the

The Ship of the Prairie

station. There is no string of guards and porters crying, "Take your seats, please!" and no ringing of a station bell, as in England. The conductor is the master of the train. Indeed, he is more like the captain of a ship, and wields almost as much authority over his passengers as does the captain of a big Atlantic liner. You will notice that his cry when the train is ready to start is one that would be appropriate to use to people intending to embark on a vessel. The camel in tropical countries is called the "ship of the desert." It would be just as suitable to call the Canadian train the "ship of the prairie," especially as many phrases are used with regard to trains that we are more accustomed to associate with travelling by sea. For instance, when a Canadian merchant sends away by train a quantity of timber or of potatoes, or even groceries, he always speaks of "shipping" them. Again, the men who are in charge of a train—namely, the engine-driver, the stoker, the conductor, the luggage-clerk (baggage-man), the post-office officials (mail-clerks), and the parcels official (express agent), are spoken of collectively as the "train crew."

The Canadian engine, which is a big, heavy thing, generally painted black, so that it has not the smart look of an English railway locomotive, carries a huge acetylene lamp fixed high up on the front of the funnel, and with this it can light up the track for many yards in front of it as it puffs along at night. When it wants to give a warning, it does not whistle in the shrill way an English railway locomotive does: it gives out an ear-splitting, hoarse, hollow-sounding

Canada

scream or roar that can be heard a long way off, and also rings the big "chapel" bell. And when it is entering a station, it keeps on clanging its bell until it comes to a dead standstill at the platform.

The through trains on the transcontinental railways carry three classes of passengers—colonist, tourist, and first-class, or "Pullman," as they are called, from the name of the great American firm which long made the Pullman or palace cars for all the railways in America. Those who travel by the latter live as luxuriously as if they were at an hotel; a dining-car accompanies them in which a full-course dinner is served; there are libraries, shower-baths, even barber's shops, on some of these trains, and each train is fitted with observation-cars with glass sides, from which one can view the scenery at fifty miles an hour. Besides this, the railways maintain fine hotels at all the places of interest, just as is done at home.

The conductor of the train not only does what the guard on an English train does, but he also performs the duties of ticket-examiner and booking- or ticket-clerk as well. Whilst the train is still travelling he walks through the cars, one after the other, and examines and punches the passengers' tickets; and if a passenger has not got a ticket, the conductor will give him one and take the money for it. This saves the railway company the expense of having ticket-collectors at every station. Another reason why the conductor performs these duties is that at many of the small stations there is no station-master and no booking-clerk. Except in certain of the largest towns, there are no porters at

The Ship of the Prairie

the railway-stations. In consequence of this, railway-travellers generally carry only a small portmanteau or valise in their hands. The general name for a handbag, portmanteau, or valise is "grip." Before setting out on a journey the traveller hands his heavy baggage over to the "baggage-master," who ties a strong cardboard label to it bearing a number and a letter of the alphabet and the name of the town the traveller is going to, and at the same time he gives a similar piece of cardboard, bearing exactly the same number and the same letter and the name of the town, to the passenger. When the passenger reaches the town he is going to, he goes to the baggage-office and presents his cardboard ticket, and the official gives up to him the trunk or box which bears the corresponding number and letter. This is called "checking baggage through."

The passenger coaches, known as "cars," on the Canadian railways are very different from the passenger carriages in England. You do not enter at doors in the sides, but you climb up to a platform at the end and enter from the platform. A gangway runs through the middle of the car from the one end to the other. In this way, even when the engine is running at full speed, you are able to travel all through the train, crossing from one car to the other by means of the platforms at the end of each. On each side of the gangway of the car are the seats, facing each other, and affording room for four passengers in each recess. At night the seats can be pulled out until they meet one another, and in that way they make a bed, on which

Canada

the porter places mattresses and bedclothes and around which he hangs curtains. About one-half of the passengers generally sleep, however, above the heads of those who lie on the seats. High up, all along the sides of each gangway, there are big, broad shelves, which can be let down at night, and pushed up again out of the way in the daytime. It is on these shelves that many of the passengers sleep. Each "shelf" will hold two people.

At each end of each car there are dressing and washing rooms, and on emigrant sleeping-cars a recess holds a small stove for cooking. In the early morning, on an emigrant or colonist train, quite a crowd of people gather round the door of their little dressing-room, waiting their turns to get in, for the room is very tiny, and will not hold more than three persons at a time, especially when one is a man trying to shave without cutting his chin, for very often the cars shake and rattle, and even lurch and jump. Every man comes in his shirt-sleeves, and carries his towel and hair-brush, his soap or his comb; and whilst they stand about waiting their turns, there is generally a good deal of good-natured gossiping and jesting, especially if the train shakes much, and they stumble against one another. On a Pullman, or first-class sleeping-car, however, the accommodation is much better, and one can wash and dress almost as comfortably as in a good hotel.

Nearly all Canadians are great travellers. The large towns are mostly situated wide apart, and to get from the one to the other you generally have to make long

The Ship of the Prairie

journeys. In all countries railways are important features; but in Canada, owing to the vast distances and the way in which the population live scattered over the immense territory, the railways are of especial importance. Frequently the railway is the first pioneer in opening up a district for settlement, being built to reach a wealthy mine or a petroleum-field, and as the railway penetrates mile after mile into the unoccupied valley, little towns spring up alongside it. In this way the hoarse bray of the railway-engine awakens the sleeping echoes of mountain glen or river valley before the sound of the settler's axe is heard or the smoke of the emigrant's camp-fire seen. The two biggest railways in Canada are the Canadian Pacific Railroad, known in short form as the C.P.R., and the Grand Trunk Pacific Railroad, or the G.T.R. Both these form a link, and a very important link, in the route between England on the one side and Japan, China, and Australia on the other.

In the Rocky Mountains and in the other ranges the gradients on the railways are necessarily very steep, one at the Kicking Horse Pass (so called from the figure of a great horse which can be seen in the rock on the side of the mountain) is 6 in 100. In rainy weather, and in the spring, when the frost loosens the soil, huge boulders may come sliding down and cover the track. As the track curves in all directions (near Glacier one can see four tracks side by side as it loops round to climb the mountain-side), it would be impossible for the engineer to see these obstructions in time to save his train, so the track is patrolled constantly by men

Canada

night and day. On the steep gradients there are switches which lead off from the main line and run up the mountain-side, so that a train rushing down the slope and running up on to one of these tracks soon loses its impetus and slows down. These traps are used to stop the train when there is danger ahead, the patrol opens the switch, which automatically sets a signal, so that the engineer knows what is coming, and the train loses its force up the steep switch instead of plunging into the abyss below. As you lie in your berth at night and watch the great shining spot of the searchlight on the front of the engine as it lights up mountain, crag, and deep defile 1,000 yards ahead, the clear whistle rings out in the night; anxiously you count one, two, three, four, and sink back relieved. "All right on the main line!" and you know that the lonely patrol man is faithful in the humble task on which the life of hundreds may depend.

In many parts of Canada the snowfall is very heavy, and causes the railways constant trouble, for if the wind blows it soon piles up, so that the trains cannot force their way through it. Of course it would take too long to shovel it out by hand, so gigantic snow-ploughs are used. These are pushed ahead of the engine, and send the snow flying to the fences on both sides of the track. Where it is very deep and frozen hard, a "rotatory low" is used, with a large boring machine attached to the front of it to cut its way into the drifts, and often from two to four engines may be needed to force it through the deepest cuts. In the mountain districts, where the track is exposed to snow slides, the

"THE SHIP OF THE PRAIRIE."

Allan Stewart.

The Ship of the Prairie

tracks are covered by great sheds of strong timber, over which the white avalanche can slide into the cañon below.

The history of the Canadian railways has thus been very different from that of the English railways, for these last were mostly built to connect the big towns together, and the towns existed before the railways were built.

There is also another great difference between the English and the Canadian railways. In the former country the men who built the railways were obliged to buy all the land they wanted to build them on. In the latter country—Canada—the land was given by the Government to those who constructed the railways; and not only that, but the Government paid them to build their lines by granting them many acres of land on each side of the track all the way through. This was because there were not enough people in the regions through which the railways were made to provide sufficient passengers and traffic to pay the expenses of running trains.

In the mountainous districts, especially in the Far West, the railways are often the principal highways. There are no other roads, and so people walk along the railway-lines. When a man tramps a long distance in this way he is said to "count the ties," for the cross-beams of wood on which the steel rails are laid are not called "sleepers," as they are in England, but they are called "ties." And it is usual for these ties to be looked after, over a distance of several miles, by a small gang of men called "section men." It is their

Canada

duty to keep the railway-track safe by cutting out old and worn-out ties, and putting new ones in their places. In lonely parts of the country the section-men's house, or "shack," is sometimes the only human dwelling to be found for many miles. The section-men generally go to and from their work on a machine called a "trolley," or hand-car, a sort of square wooden platform running on four wheels. The men stand on the platform and work two big handles up and down, very much as a man works a pump-handle, and by that means turn the cranks which make the wheels go round. "The speeder" is the name given to a smaller vehicle or machine, which runs on three wheels, one of them running at the end of a couple of iron rods, something like the outrigger on a surf-boat of Madras. The speeder is worked by one man, who propels it after the manner of one riding a bicycle. This is a very useful means of travelling when a doctor is summoned into the country and there is no train to be had for several hours; for on some of the Canadian lines there is only one train a day each way, the same set of engine and cars running up and down the line every day.

The goods trains are known as freight trains. The "cars" which run on them are very much bigger and heavier than the trucks on an English goods train, and can carry 20 to 50 tons each. When the cars are sent back empty, they are generally made up into trains of enormous length. As many as fifty-six have been counted in one train, so that the train itself is often more than a quarter of a mile long, and in the

Golden Wheat and the Big Red Apple

mountainous parts looks like a gigantic snake, as it winds, let us say, alongside a lake, following every curve and indentation of its shore.

“Through the gorge that gives the stars at noon-day clear—
Up the pass that packs the scud beneath our wheel—
Round the bluff that sinks her thousand fathom sheer—
Down the valley with our guttering brakes asqueal :
Where the trestle groans and quivers in the snow,
Where the many-shedded levels loop and twine,
Hear me lead my reckless children from below
Till we sing the song of Roland to the pine.

“So we ride the iron stallions down to drink,
Through the cañons to the waters of the west!”

KIPLING: *The Song of the Banjo.*

CHAPTER VIII

GOLDEN WHEAT AND THE BIG RED APPLE

THE most important product of the Dominion of Canada is wheat. Except for a little hay and oats, the big prairie provinces of Manitoba, Saskatchewan, and Alberta are especially noted for their production of wheat, which they yield in truly enormous quantities. In point of quality Canadian wheat ranks amongst the best in the world. But the three big prairie provinces are not the only ones that produce wheat; it is also grown in Ontario, as well as, in smaller quantity, in each of the other provinces.

As soon as the snow disappears in spring, the prairie farmer gets out his ploughs, and if he owns, as many of

Canada

the prairie farmers do, large tracts of land, his ploughs are worked by steam. In the North-West there are no fields and no fences, except, it may be, round the home paddock. In this case the ploughs set in and follow one another from one end of the farm to the other; and when they reach the boundary of the farm, they turn round and plough back again. Thus the furrow may be a quarter of a mile, half a mile, or even a mile long. The ploughing finished, the seed is sown. When harvest comes, the ripe corn is cut down by the reaping-machines, following one another in the same way as the ploughs. In many cases the wheat is threshed at the same time that it is cut, and the grain put, not into sacks, but loose straight into the waggons, which are built up like huge bins. The wheat is then hauled to the nearest town where there is an elevator or granary. Here it is graded, or separated into different sizes, by fine riddles or sieves driven by machinery, and the farmer is paid so much a bushel for his wheat, the price varying with the grade, or size and hardness and quality of the grain. The straw is very often burned, as the easiest way to get rid of it. If a North-West farmer has three good years in succession, he can, it is sometimes asserted, retire from business and live on a competency for the rest of his life.

After the harvest the railways of the prairie provinces are exceedingly busy carrying the wheat to the shipping ports, where it can be loaded into ships to be taken across the ocean. The greater part of this wheat is consumed in England and Scotland, and a great deal

Golden Wheat and the Big Red Apple

of it is put on board ship at Port Arthur and Fort William on the northern shore of Lake Superior, whence it goes all the rest of the way by water. A large portion of it is, however, ground into flour before ever it leaves Canada, and the flour is sent to make bread for boys and girls, not only in England and Scotland, but also in Australia, in China, and Japan.

In Alberta, just east of the Rocky Mountains, where the climate is milder than in the heart of the prairie provinces, a large number of cattle are reared and fed, and there a good deal of hay is cut, and sent over the mountains into British Columbia.

For many years the chief agency in opening up the North-West was the cattle-rancher. The life of the cowboy, though not so romantic as it is sometimes represented to be, has, nevertheless, its interesting side to the man who loves the free life of the open air. "The business of ranching has grown from a small beginning of the early days to be one of the great industries of the West. It began when the Mounted Police brought into Southern Alberta a couple of milch cows and a few yokes of oxen for their own use." This was about the year 1873. Three years later a member of the same force bought a small herd, but having no other way of providing for the animals, he turned them loose on the prairie to shift for themselves. There, although without shelter or provision for food, they survived the winter, escaping the wolves predatory Indians, and prairie fires. Nowadays, cattle are generally left out of doors on the prairies all the winter in Alberta. Here the winters are neither severe

Canada

nor prolonged. "The days are bright and cloudless, and the light snowfalls are neither frequent nor lasting. They vanish before the warm Chinook winds, and are followed by days of soft weather. There are cold snaps in January and the early part of February, but the winter breaks up early in March, and before April the prairies are spangled with flowers—false indigo, shooting stars, and violets, with roses, lupines, and vetches, following after—until the prairie is all aglow with wonderful colour."

In Alberta, as well as in the provinces of Eastern Canada, a good deal of cheese and butter are made. The farmers do not make it in their own dairies, but they take it to creameries and to cheese-factories, like those which are run on the co-operative principle in Ireland, Denmark, and other countries.

The principal town of the prairie provinces is Winnipeg, the capital of Manitoba, which has a good deal of the appearance of a brand-new, go-ahead American city. In 1881 its population was 6,000; twenty-five years later it reached 100,000. It has a very large volume of trade.

In the provinces of Nova Scotia and Ontario large quantities of fruit are grown and exported to England. In Nova Scotia apples are the fruit most extensively raised; the valleys of Annapolis and Cornwallis in that province are especially famous for their fine red apples. In Ontario the fruit-growing region is the peninsula which projects southwards between the great lakes. There apples are not the only fruit produced in large quantity; grapes and peaches are also grown on a large

Golden Wheat and the Big Red Apple

scale, grapes more especially in the neighbourhood of the famous Niagara Falls. But in recent years the distant western province of British Columbia has come rapidly to the front as a producer of fruit, especially of apples, cherries, peaches, and strawberries. These last, strawberries, as well as cherries, are sold principally in the towns of the prairie provinces. The apples are rapidly taking rank as amongst the best in the world. They are of magnificent colour, free from every form of disease or blemish, and travel well for long distances.

In December, 1907, an apple-show was held at New Westminster, at the mouth of the Fraser River, in British Columbia, where prizes were given (1) for the best display of apples, (2) for the five best packed boxes of apples, and (3) for the single best packed box. Out of these three events, British Columbia apples won two first prizes and one second, although she had for competitors some of the most expert growers in the United States. And again in December of the following year, at a great apple-show held at Spokane, in the American State of Washington, undoubtedly the biggest and most important apple-show ever held in any part of the world, British Columbia covered herself with glory. The prize-money amounted to no less than £7,000, and the separate prizes amounted to as much as £100. In this great show, at which expert fruit-growers from all over the United States, from Eastern Canada, from British Columbia, from England, Germany, and Norway, were pitted one against the other, British Columbia won several of the most important of the prizes, and on the whole, considering the amount of fruit she staged, won

Canada

a long way more than her proper proportion of prizes. The writer of this book was himself the proud winner of twelve prizes for apples at this great show. Altogether it is estimated that something like 400 tons of apples, all of them, of course, specially picked fruit, were shown on the tables of the Spokane apple-show. What a sight for a British schoolboy! The biggest apple in the show weighed close upon 2 pounds in weight!

The apples of Ontario and Nova Scotia are packed into light wooden barrels; those of British Columbia in oblong boxes holding 40 pounds. No matter what the size or the variety of the apples, all have to be packed in the one sized box. When well packed, with the apples all level and even, and beautifully coloured, as they nearly always are, a box of British Columbia apples is a perfectly lovely sight. And they are as good as they look. But even more appetizing and attractive is a box of Kootenay cherries, Kootenay being the name of the principal cherry-growing district of British Columbia. The boxes into which the cherries are packed are, of course, much smaller than the boxes into which the apples are packed. A cherry box holds only 8 pounds of fruit.

One of the most beautiful of all the beautiful sights on a fruit-ranch is the blossoming of the cherry-trees in May. The waxy white blossoms not only cover—literally and truly cover—the branches from end to end, but they also stick to the trunk and main limbs of the trees, much as the feathers muffle the legs of certain kinds of pullets.

The fruit-ranches in Kootenay, and many of those in

Canadian Timber

the even more famous Valley of Okanagan, occupy some of the most beautiful situations in the world, being strung along the feet of lofty rocky mountains, with a lake washing their lower margin. And how magnificently beautiful are these mountains and the deep, tranquil lakes which nestle in their arms!

CHAPTER IX

CANADIAN TIMBER

THE largest share of the natural wealth of Canada is derived from her unlimited acres and square miles of wheat-lands. Next in importance to her wheat is her timber. Considerably more than one-third of the total area of the Dominion is covered with forests. With the exception of the province of Prince Edward Island, all the older provinces are rich in valuable trees. British Columbia is said to have "the greatest compact reserve of timber in the world." The vast prairies of the North-West have never, since the white man set foot on the American continent, been at all well wooded, although to the north of the settled wheat-lands there is a forest region nearly fifty times as big as England, stretching from Labrador on the east to Yukon on the west.

Wood is consequently of vast importance to almost every man in Canada. In one way or another it figures in the daily life of almost every inhabitant of the

Canada

Dominion. The strange words, "M³ Shiplap and Rustic," are familiar to the eye and ear of every builder of a house; and who is there in Canada who does not at some time or other build a house, or help to build one? "M³" means "cubic feet." "Shiplap" and "rustic" are special cuts and pieces of timber used in house-building. Logs and lumber are therefore household words to the Canadian. As Dr. Fernow, head of the Forestry Department of the University of Toronto, puts it: "Our civilization is built on wood. From the cradle to the coffin in some shape or other it surrounds us as a conveyance or a necessity. . . . We are rocked in wooden cradles, play with wooden toys, sit on wooden chairs, . . . are entertained by music from wooden instruments, enlightened by information printed on wooden paper with black ink made from wood." More than one-half the people of Canada live in wooden houses; more than two-thirds use wood as fuel. Thousands of miles of railway rest on wooden ties, or sleepers. The waters of the Canadian lakes are daily churned by the wooden paddles of wooden steamboats; fleets of wooden vessels ply up and down the coasts. More than 300 years ago the French, who were the first settlers in Canada, began to cut in her forests spars and masts for the royal navy, and later the practice was followed by the British.

The long droning whine of the saw-mill is to-day one of the most familiar sounds beside the lakes and rivers of Canada. Down at the water's edge you may see the woodman "poying" the big logs to the foot

Canadian Timber

of the upward incline that feeds the saw-tables, skilfully guiding them so that the iron teeth of the endless gliding chain which runs up and down the incline may seize hold upon them and carry them up to the edge of the huge, whizzing, groaning, whining circular saw above. At the other end of the mill, or somewhere beside it, you will see the sawn wood stacked up in squares—planks of various widths and thicknesses.

If you turn away from the sawmill and wander alongside the river, you will see a perfect multitude of logs, thousands of them, held together inside a boom of logs, chained or ironed together, like a huge flock of sheep penned within a sheepfold. These immense masses of timber are floated down the streams in spring, when the snows, melting, flood the rivers with swift, eddying, and often turbulent freshets. Occasionally it happens that the stream grows so swift and violent that it causes the logs to burst the boom or log-linked enclosure within which they are confined. Then away career the logs down the bosom of the rebellious torrent, and the owner may esteem himself remarkably lucky if he recovers even a small proportion of them. The breaking of a boom in this way may therefore represent a loss of hundreds, and even thousands, of pounds. In some cases, where these lumber-rafts have to travel long distances, the men in charge of them live on the raft throughout the whole of their journey, which may last some weeks. If you want to read a fascinating story about the men who engage in this work, read "The Man from Glengarry," by the Canadian novelist, Ralph Connor.

Canada

If you travel up the stream until you reach one of its higher tributaries, and turn up beside the latter, you may eventually find yourself at one of the lumber-camps which feed the far-off saw-mill in the valley below. In a picturesque clearing in the forest you will see the low but comfortable log cabin and log stable; you will see the timber-slide, with a rill of water flowing down it to make the logs slide more easily as they are shot down into the tributary stream; you will hear the crack of the teamster's whip and his cheery cry as he urges on his horses—four, six, eight, or ten of them—straining at a rough sleigh on which rest the ends of one, two, three, four, or five big logs; you may hear the swish of the big, two-handled cross-cut saw, as the woodmen cut through the trunk of gigantic fir, cedar, or spruce, or the slow, resonant crash as the forest giant totters, falls, smashes prone to the earth; you may hear the ring of the woodmen's axes as they lop away its branches and strip off its bark.

The men who guide these big timber-booms down the broad, swift rivers of the Canadian forest-lands, and pilot them over the boiling rapids, are marvellously clever in keeping their balance on the unsteady, ever-rolling logs. A favourite pastime with them is log-rolling. Wearing boots for the purpose—boots shod with sharp steel spikes—they walk out, each man on a broad log, and set it rolling. Once the log is started, it begins to roll at an increasing speed. Faster and faster go the feet of the raftsmen; faster and faster spins the log. With arms outstretched and

Canadian Timber

every muscle tense, the raftsmen preserve his balance long after an ordinary landsman would have gone over—souse!—into the stream. That is indeed the fate which overtakes all of the competitors except one, and he—the man who preserves his balance the longest—is, of course, the winner of the game, the envied of his companions, the admired of all the lumber-jacks and their numerous friends. The cleverest men at this sport are the French-Canadians.

Nevertheless, all is not always peace and contentment in a Canadian forest. To say nothing of the wild beasts—*e.g.*, bear, lynx, mountain lion—which live in them, the actual trees of the forest are themselves a source of menace and danger to men. During the hot, dry days of summer an unheeded spark from a woodman's pipe, a red-hot cinder from a passing train, a neglected camp-fire—the ashes left unextinguished—are each enough to ignite the highly inflammable undergrowths of the forest; and once set alight, the moss which carpets the floor of the forest, the broken sticks which litter the ground from many a winter storm, the bushes, the dead trees, all catch up the flame, and after smouldering, it may be for weeks, the whole forest suddenly bursts into flame. If this happens when a strong wind is blowing, nothing hardly can save the town or settlement, the ranch or saw-mill, that may chance to lie on the side of the fire towards which the wind is blowing. And it is indeed not only a grand but also a terrible sight to stand and watch a large "bush"-fire raging over, say, a square mile or two on a mountain-side. You see the red flames

Canada

towering up like so many gigantic pillars of fire, now leaping up, now sinking down. As the fire appears to die down in one quarter, you see it break out with great and sudden fury in another, and then ere long it takes a fresh lease of life in the direction in which it first died down. A forest fire such as this advances with terrible swiftness, and woe to the houses which lie in its path! In the summer of 1908 the town of Fernie, a place of 5,000 to 6,000 inhabitants, situated in the Crow's Nest Pass of the Rocky Mountains, was almost completely blotted out and extinguished in the course of a few hours; and so sudden was the onset of the fire that the people had literally to flee for their very lives, leaving everything they possessed behind them, and even in some cases in their hurry and confusion losing touch with those who were near and dear to them. A bush-fire is an awful visitation. It also means a very serious loss of valuable timber, no matter where it occurs.

The maple, whose leaf in conjunction with the beaver is the national emblem of Canada, yields in the spring a very sweet sap, which is boiled down to produce a syrup or sugar of a very delicious flavour. Doubtless its qualities were learned from the Indians, and the earlier settlers in the woods depended on it altogether for sugar. Now it is prepared as a luxury. "Sugar-making weather," bright, clear days, with frosty nights, come in March. To the great delight of the children the trees are tapped by boring a small hole in the trunk, and affixing a small iron spout, which leads the sap to a pail. The rate at which it drops varies, but as much

Canadian Timber

as two gallons may be collected from a tree in a day. This is boiled in iron pots, hung over a fire in the woods, or in the up-to-date way in a large flat pan, till it thickens to syrup.

In the old days sugaring off was a great occasion; all the neighbouring boys and girls were asked in, and amid much jollification around the bright fire at night in the forest, the hot sugar was poured off on the snow, forming a delicious taffy, and all "dug in" at the cost of burnt fingers and tongue. Songs were sung, ghost-stories told, the girls were frightened by bears behind the trees, and this unique gathering broke up in groups of two or three, finding their way home in the moonlight through the maple wood.

The Canadian youth has many opportunities for a life in the wilds which all boys enjoy. In order to prevent the occurrence of the destructive forest-fires, fire-rangers are appointed throughout the whole of Northern Ontario, whose duty it is to patrol a certain part of the woods and see that no careless camper has left his fire smouldering when he strikes camp. The young men appointed for this duty are usually students from the colleges who are on their holidays; they work in pairs, and live in a tent pitched at some portage; they see no one but passing tourists or prospectors, and each day they walk over the trail and return—a certain stated distance. The rest of their time they have for fishing and other pleasures of life in the forest. They return in the autumn brown as Indians, and strong and healthy after the most enjoyable and useful of holidays.

Canada

CHAPTER X

WEALTH IN ROCK AND SAND

THE history of gold and silver has always been romantic and exciting, and Canada has furnished her full share of adventure and fortune, riches won in a day and lost in a night. All known minerals are found scattered here and there over the thousands of miles of north land. Besides the precious metals, the most important are coal, iron, nickel, and asbestos, and the deposits of the last two are much the most important in the world. Gold was first found by the Indians, who made ornaments of it; they found it in the sands of the rivers, and from there prospectors followed it to where it was hidden in ore in the mountains. The most famous deposits are in the Yukon, and no mining camp had a more exciting history than this, where working men staked claims that brought them a fortune and lost it in cards and dice overnight. But the Government saw that rights were respected, and soon banks were opened to keep the "dust," and the miner everywhere admits that he gets a "square deal" in Canada. At Cobalt it is said that the silver deposits were first found when a horse, pawing the rock with his iron shoe, uncovered the "cobalt bloom," the colour that there is the sign of silver. Another story is that a man picked up a stone to throw at a squirrel and found it so heavy that he examined it, to find it solid silver. If you went there you would be shown the famous "silver sidewalk"

Wealth in Rock and Sand

(pavement), 18 inches wide, and running for several hundred yards, of solid silver. It sounds like a tale from the "Arabian Nights."

Every night in the year for the last seventeen years, halfway up the side of a lofty mountain overhanging a beautiful lake in Western Canada, and opposite to one of the most progressive towns of the interior of the Dominion, a solitary light might be seen burning. The stranger naturally wonders what the light can mean in such a spot. The mountain-side consists entirely of bare rock, with a few trees growing out of the crevices. There is not a blade of grass, not a sign of any single thing that could be of the slightest use to any human being. What does that light mean, then, up on the steep and lonely mountain-side? It does not move. It is always stationary, always visible, in exactly the same place, and always burning in exactly the same way. What does it mean?

If you address your inquiry to one of the older residents in the town opposite, he will tell you: "Oh, that's Coal-Oil Johnnie's light."

"But who is Coal-Oil Johnnie?" you at once ask again.

"Coal-Oil Johnnie's a half-crazy miner, who lives up there and works a mine."

"What sort of a mine?"

"A gold-mine."

"But is it really a gold-mine? And is he working up there all by himself?"

"Sure," replies your informant, in the word that is sterling Canadian for "Yes, certainly."

Canada

“And does he never come down? Does he always live by himself?”

Then you will be told all that is known about Coal-Oil Johnnie—namely, that he is slightly affected in his mind, that for seventeen years he has with unwavering perseverance worked away at a gold-bearing vein, worked in solitude, doggedly, perseveringly, drilling, cutting, and blasting a tunnel to wealth and fortune, which he implicitly believes is locked fast in the granite heart of the mountain.

Then will come your next question: “But why do you call him *Coal-Oil* Johnnie?”

“Oh, that’s because, when he wants money to buy himself bread or more dynamite for blasting, he comes down into the town, and peddles round coal-oil to people’s houses.”

“Coal-oil! That’s what they call petroleum in England, isn’t it?”

“Sure.”

Now, Coal-Oil Johnnie has not yet found his fortune, but who knows how soon he may do so? Scores of other men have worked away with the same faith and the same hope, and have reaped the rewards they have toiled for in a much shorter time than Coal-Oil Johnnie has devoted to the one great object of *his* life. And yet others have laboured longer, and are still living on the faith, hope, and perseverance that is in them.

An ordinary Italian labourer, who came out to Canada and found employment in a gold-mine, worked on there until the mine was given up as being ex-

Wealth in Rock and Sand

hausted. But Pietro Lavoro was of a different opinion. After a while he went to the owners and asked them to grant him a lease of the mine. They agreed. Shouldering his pick, therefore, and lashing his tent and axe, his rock-drills, his miner's hammer, and some sticks of dynamite, as well as a bag of flour and a case or two of tinned meat, upon a small hand-sleigh—the whole of his fortune, in fact—Pietro set off to trudge up the mountain-side, and for several hours toiled along the steep trail leading to the Auro Rosso mine. At the end of two years Pietro Lavoro was a wealthy man. He had a big mining camp up at the Auro Rosso, and over forty men were employed in getting out the ore. At the bank down in the town below there was a sum of \$50,000 standing to his credit, and packed in bags, close to the entrance to the gallery that pierced the mountain, was sufficient ore to yield him another \$50,000. Pietro is only waiting for the snow to come to "raw-hide" the ore down to the lake, that he may get it transported to the smelter, where the gold will be separated for him from the stone.

The ore from which the gold is extracted is packed into bags each about a foot long, and weighing two or three hundredweight. The way these heavy bags are taken down the steep mountain-side, where it is utterly impossible for a vehicle on wheels to move, is to pack them into a bullock's raw hide spread out on the ground. The corners are then gathered up and tied together. After that the hide, harnessed to horses, is dragged down over the frozen snow. In that way

Canada

a horse is able to take down a much larger quantity of ore than it could possibly carry on its back, and with much greater safety to itself. This is called "raw-hiding."

An even greater degree of faith and hope and perseverance was shown by the man who laboured for nine years at the opening up and development of another mine, working, not with his own hands, but in directing the systematic construction of galleries, the erection of stamp-mills, and the building of all the other appurtenances of a scientifically-equipped and up-to-date mine. This man risked very much more than the other—than Pietro Lavoro—namely, a large amount of capital. But at the end of nine years he, too, reaped his reward, for he sold his mine as a going concern to a party of American capitalists for a goodly sum.

All the three mines thus far spoken of are mines cut into the solid rock, and the hard stone has to be crushed in powerful stamping-mills and roasted in smelters before the precious metal can be extracted. There are mines of this description in both the east and the west of Canada. But gold is also obtained from a different source—namely, from the sands of rivers, out of which it is got by a process of washing the sand, or "dirt" as the miners call it. In the course of the washing, the gold, which is heavier than the sand, sinks to the bottom of the wooden trough, or rocker, or other receptacle, in which the gold-bearing sands are sluiced.

Two rivers of Western Canada have been especially

Wealth in Rock and Sand

famous for yielding gold in this way. One is the Fraser and the other is the Yukon. The discovery of gold in the sands of the former led to a wild miners' rush in 1858, and that was followed, three years later, by an equally mad rush into the neighbouring district of Caribou, in British Columbia ; but in both cases the fever abated in the course of a year or two, after the gold-bearing sands had all been worked over. The rush to the Yukon was, perhaps, even greater than either of these, notwithstanding that the hardships which had to be encountered were immeasurably greater. The gold-fields of the Yukon, known as Klondyke, are situated near the Arctic Circle, many hundreds of miles from the settled abodes of civilization, and in a part of the world where the winter cold is of appalling severity. Except for a limited amount of garden produce, food, and indeed every kind of supplies, have to be transported many hundreds of miles.

Gold is not, however, the only mineral of value that is obtained from the bowels of the earth in Canada. Very many of the other metals which are prized by man are also extracted, such as silver, lead, zinc, copper, coal, and iron. The Cobalt silver-mines in Northern Ontario and those of the Slocan district of British Columbia are equally famous. Coal is yielded at Nanaimo, on Vancouver Island, at Fernie, Michel, and other places in the Crow's Nest Pass of the Rocky Mountains, and in Nova Scotia and New Brunswick.

At the fairs and annual festivals, which are a prominent institution of both American and Canadian towns

Canada

and cities of the West, a good deal of interest centres round the competition known as rock-drilling. This is carried on by sets of two men, both expert miners. The task the two men set themselves is to drive their rock-drills as far as ever they can into a solid piece of rock in the course of fifteen minutes. One man holds the rock-drill, whilst the other smites it with a big miner's hammer. At the end of each minute the two men change places, so that the man who held the drill the first minute wields the hammer in the second, and his mate, who wielded the hammer during the first minute, gets a rest during the second, whilst he is in his turn holding the drill. And terribly hard work it is, for the hammerman smites with all his might, and his blows fall like lightning. At the end of the contest both men are generally dripping with perspiration. And no wonder! when in the space of fifteen minutes two men such as these will drive their drills, as they really do, no less than 1 yard deep into a solid block of granite, or at the rate of over 2 inches in each minute. A marvellous exhibition, not merely of muscular strength, but also of skill and quickness! And truly it is a wonderful sight to see with what rapidity the men change places again and again, without appearing to miss a single stroke of the ponderous hammer.

Spoils of Sea and Wood

CHAPTER XI

SPOILS OF SEA AND WOOD

“You often hear tall stories of the way the salmon swarm in the Fraser River,” remarked an old frontiersman one day to a “new chum” recently arrived in Canada from England. “Those stories are often dished up to suit a palate that is just waiting to be tickled with cayenne but they are not altogether fiction.”

The new chum, having still “tender feet,” hesitated about putting his foot in, and merely looked the inquiry which he was unable to conceal.

“Well, you may believe me or not, sir, but it is God’s truth that I once saw a man standing on the bank of the river at ——,” and he named a village near New Westminster in the delta of the Fraser, “and he was flinging the salmon out on the bank with an ordinary hay-fork, and he was working so that the sweat rolled off him.”

“But what did he want so many fish for as that? Surely he could not eat them all?”

“No, sir; his meadow was in want of fertilization, and fish manure, even when it consists of the carcasses of salmon, is not to be despised.”

Other stories about the enormous numbers of salmon in the Fraser River of British Columbia tell how the fish are so crowded together that it is impossible for a man to thrust his hand in between them, and how they form such a solid mass that it almost looks as if you

Canada

could walk across the big broad river on their backs, and could reach the opposite bank dryshod.

The tinned salmon that is such a familiar object in grocers' shops is captured, killed, cooked, and sealed down in those tins in big factories called "canneries," which stand pretty thick beside the river in certain parts of the lower course of the Fraser.

On the eastern side of Canada, again, off the coasts of Nova Scotia, Newfoundland (which, by the way, is an independent colony, and does not yet form part of the Dominion of Canada), Cape Breton, and Prince Edward Island, there is a large population of hardy fisher-folk, who for generations have fished for cod on the inexhaustible "banks of Newfoundland." And even before their ancestors settled on American soil the hardy fishermen from Brittany, in France, and from the Basque country on the borders of France and Spain, used to dare the perils of the stormy Atlantic that they might go and reap the silvery harvest of the sea in the same fish-teeming waters. And for over 300 years great fleets of fishing-boats from both Europe and the maritime provinces of Canada have continued to brave the terrors and perils of the deep in pursuit of cod, mackerel, lobsters, herring, and haddock.

The earliest Europeans, or white men, to penetrate into the wilds of the Canadian backwoods were the *coureurs de bois*—that is, hunters and trappers of French, or mixed French and Indian, descent, who collected furs to sell to the trading companies of the

Spoils of Sea and Wood

French. These bodies had factories along the Lower St. Lawrence. In the early days—that is to say, for a couple of hundred years after the French settled colonists in Canada—the principal fair for the trade in furs was Montreal. There every spring a crowd of trappers and hunters brought the bales of furs which they had stripped off beaver, bear, or fox, musk-rat or racoon, and handed them over in barter to the agents of the autocratic fur-trading company; and at the same time large fleets of canoes came paddling down the St. Lawrence and the Ottawa rivers, bringing whole boatloads of furs which the Indians had collected all along the Great Lakes, and even from the distant Ohio River, and the great plains of the West.

Who does not know the haunting melody of the “Canadian Boat-Song”?—

“Faintly as tolls the evening chime,
Our voices keep tune and our oars keep time.
Soon as the woods on the shores grow dim,
We'll sing at St. Anne's our parting hymn.
Row, brothers, row! The stream runs fast;
The rapids are near, and the daylight's past.”

You can easily hear the swing of the oars, and catch the slight melancholy of the memory-haunting lilt as the singers keep time to the swaying of their bodies! And you can see the round rosy face of the big, burly, boyish-looking *coureur de bois*, or “runner of the woods,” suddenly blanch, whilst his big black eyes grow bigger than ever, as he imagines he sees the weird flying canoe of some reckless woodsman who has sold his soul to the Evil One in return for the power

Canada

of being able to make his fragile birch-bark canoe rise, as it were, on invisible wings into the air, and so speed along without paddle or punting-pole.

Now, whilst the French collected furs through the country of the Great Lakes, and from the wide regions to the west and south of them, the English, through the Hudson Bay Company, claimed a similar monopoly of the profitable fur trade farther north. And not only did they claim and maintain their supremacy as the sole fur-trading company in the North-West, they eventually grew so powerful that they carried on a regular system of government, administering the laws and punishing offenders.

Throughout all the north and west, in the towns and often in far isolated districts, we find the stores or trading-posts of the Hudson's Bay Company. This is the last of the great proprietary corporations, which at one time were so lavishly treated by European Sovereigns to privileges of unknown extent and value. The company was formed in 1670 by Prince Rupert, a cousin of Charles II., and certain associates, with proprietorship, sovereignty, and permission to trade in what was called "Rupert's Land," or all within Hudson Strait. For two centuries and a half they have carried on business, and the volume of trade at present is greater than ever before. They buy furs almost entirely, but sell everything that man desires.

Waterways

CHAPTER XII

WATERWAYS

ONE of the most remarkable features of Canada is the great number of lakes and rivers of all sizes, which interlace the land from east to west and north to south. Generally speaking, the country is divided into three great basins, the St. Lawrence and the Great Lakes, the Prairie, and the Pacific Slope.

The great lakes, five in number, form a chain of connected fresh-water seas leading to the Atlantic through the St. Lawrence River, and into them empty a great number of rivers and streams. The greatest of the lakes and farthest west is Superior, 380 miles long. It empties into Lake Huron by the St. Mary's River, where is situated the famous Sault Sainte Marie Rapids, and the town commonly known as the "Soo." Here the river is harnessed, and made to turn the wheels for large pulp and paper mills, while the vessels pass through canals, one on the Canadian and one on the American side.

Lake Michigan is wholly in the United States, and after passing Lake Huron, which is 250 miles long, we traverse the St. Clair River, Lake St. Clair, the smallest of the series, and the Detroit River, which brings us into Lake Erie, a large but rather shallow lake, with many important towns and cities on its shores. It is drained into Lake Ontario by the Niagara River, that broad and swift-flowing stream which, after careering

Canada

down a long course of rapids, plunges over the world-famed Falls, 160 feet, to the rocks below, while the rainbow-tinted spray rises to a height from which it is seen for many miles. The white water hurries along, and rushes headlong through a narrow gorge of rock in a tempestuous rapid, then sweeps round the great basin of the whirlpool to hurry along to Lake Ontario, gradually calming itself as it flows. Famous as is the great cataract, the river has another claim to our interest, for here mankind has laid his heaviest burdens on Nature's shoulder, and day and night the angry river turns the wheels which produce 400,000 horse-power, and light the towns and draw the street-cars for a radius of a hundred miles. Navigation goes on between the two lakes by the Welland Canal, which has twenty-seven locks.

Lake Ontario empties the water of all this great chain by the St. Lawrence River ; at its beginning are the Thousand Islands, a summer resort of wondrous beauty, which wealthy citizens from Canada and the United States have made into a fairyland. The mighty St. Lawrence, in its course to the sea, has several rapids, where canals have been built ; but passenger vessels "shoot" the rapids on their way to Montreal, where is the head of ocean navigation. This waterway, 2,200 miles in length, is unparalleled in the world, and provides the natural highway for the commerce of the Continent. An endless procession of great iron vessels, in tows of three or four, drawn by one large steam barge, passes down the lakes laden with wheat, iron, coal, or timber. Beautifully equipped

Waterways

passenger vessels ply between the ports, offering trips from two hours to a week in duration, while the white sails of the fleets of many a yacht club are to be seen through the summer months.

The central, or prairie, basin has a large number of rivers, of which the best known are the Saskatchewan and the Assiniboine, running east to empty through the Nelson River into Hudson Bay, and the Peace, and the Mackenzie, which drain a number of large lakes to the Arctic Ocean. On the Pacific Slope are the Frazer and the Columbia, noted for the great salmon fisheries, and the gold found among their sands. When the salmon are running—that is, coming up the river—one sees the whole river bright with the gleam of their scales, and in shallow places even the flow of the water is impeded. Ten million fish are canned each year.

Curiously enough, all these water basins are connected, and in the early days, before the railway was dreamed of, Sir Alexander Mackenzie, a famous explorer, from whom the great Mackenzie River takes its name, traced out the water-route from the head of Lake Superior via the Saskatchewan and the Mackenzie River to the Arctic Ocean. When we trace up the Saskatchewan, we find it beginning in the Rockies in one branch of a little stream; the other branch runs west to the Pacific by the Columbia River. With the hand, one can direct the water now to the setting, now to the rising, sun. The drops beginning together reach the ocean thousands of miles apart. This is known as the "Great Divide." Though the coming

Canada

of the steam-engine has made this route of little value, still the hunter or tourist may trace his sinuous path for weeks or months over this silver network.

CHAPTER XIII

FIGHTING THE IROQUOIS INDIANS

THE earliest white inhabitants of Canada, who have remained and helped to build up the Canadian nation, were settlers from France. There were, indeed, earlier arrivals from Europe, but they did not make anything like a permanent settlement. These were certain adventurous Norsemen who sailed out from Iceland in the year 1000, or even a little earlier, and returned with tales of a fertile country which they had discovered somewhere across the Western sea, and to which they gave the name of Vinland (which means the "Land of Wine"), but a country inhabited by Skrællings, which may be interpreted as meaning "Wicked Men." This Land of Wine is supposed to have been what is now Nova Scotia, or the country to the south-west of it, and the Wicked Men are believed to have been American Indians, who gave the hardy Icelanders a hostile reception, so that they did not obtain any real footing in the country.

The intrepid leaders of the earliest adventurers from France who attempted to establish themselves permanently in what is now Canada were a Breton sailor named Jacques Cartier, who set sail from St. Malo in April, 1534, and Samuel de Champlain, who, towards

Fighting the Iroquois Indians

the close of the same century, and well on into the next, spent nearly forty years in devoted labour for the planting of a French colony on the banks of the St. Lawrence, founding the city of Quebec, exploring the rivers and lakes which help to make the great river the magnificent stream it is, assisting the Huron Indians to fight their inveterate foes, the intrepid and brave Iroquois, and striving to convert the Indians to the faith of Christ by sending French Catholic missionaries in amongst them.

For many a long year, however, the new colony, weak and scattered, had to wage a harassing war against the fierce red men—to wit, the Five Nations of the Iroquois. The stirring history of this frontier warfare is braided with many a tale of bravery, many an heroic episode. But of all the great deeds of this long, persistent struggle none shines with a more radiant glory than the self-sacrifice of Adam Dollard, or Daulac, the lord of the Manor of Des Ormeaux, and commander of the garrison of Montreal.

For more than twenty years the Iroquois had waged unrelenting war upon the colonists. These last were few in number, and were only able to hold their ground at all in the vicinity of the three fortified posts of Quebec, Three Rivers, and Montreal. Outside their stockades and away from these three fortified posts there was no certainty of safety. Everywhere lurked the Iroquois. Mercy they had none; fiendish they were in their cruelty, and never for an instant did they grant the sorely harassed settlers the least rest or freedom from attack. In fact, they were become a veritable

Canada

scourge, and a sort of universal panic seized the people. At last intelligence was brought by a friendly Indian of the tribe of the Hurons that a force of 1,200 Iroquois were setting out to swoop down upon Montreal and Quebec with the object of destroying the forts and utterly wiping out the French settlements. When the tidings came to the ears of Dollard, the young commandant of the garrison of Montreal, he was instantly fired with the Crusader's enthusiasm. He conceived the idea of dedicating himself, as Leonidas, the King of ancient Sparta, did, for the good of his country. He called for volunteers to go out with him and waylay the Iroquois on the Ottawa River, and there fight them to the bitter death.

Sixteen of the young men of Montreal caught Dollard's enthusiasm. They sought and obtained the Governor's consent, made their wills, solemnly dedicated themselves in the cathedral to the sacrifice they were willing to make of their lives, received the Sacrament, and bound themselves by oath to fight the Iroquois to the death, and to accept no quarter.

Having said adieu to their friends, they embarked in their canoes, and paddled downstream until they came to the mouth of the Ottawa. Turning into this river, they came, about May 1, 1660, to the formidable rapids called the Long Sault, where their further advance was stopped. Here they resolved to await the foe, more especially as among the bushes that stretched down to the shore was a palisade fort, which had been made the autumn before by a band of friendly Algonquin Indians. The palisade was, however, in ruins. The first task

THE IROQUOIS ATTACKING DOLLARD'S STOCKADE. Page 75.

Henry Sandham.

Fighting the Iroquois Indians

of the young Frenchmen was therefore to repair it. Whilst they were engaged upon this task, they were joined by forty Huron Indians and four Algonquins. During the second afternoon after their landing, their scouts brought in the intelligence that two Iroquois canoes were shooting the Sault. As soon as the Iroquois reached the foot of the rapids they were received with a volley, which killed some of them. But one or two escaped, and hastened to report the disaster to the vanguard of the Iroquois braves—namely, a band of 200 who were paddling along the upper reaches of the river above the rapids.

Very soon Dollard and his companions saw a large fleet of the enemy's canoes racing down the rapids, and filled with savage Iroquois all thirsting for revenge. The first attack of the Indians was easily beaten back. They had looked for an easy conquest, and attacked in only a half-hearted manner. Then they set to work to build a rude fort for themselves. This gave the little garrison further time in which to strengthen their own defences. This work was still uncompleted when the Iroquois advanced to the attack a second time. They had seized the canoes of the allied French, Hurons, and Algonquins, and having broken them to pieces and set them on fire, now rushed forward and piled the blazing slabs of birch bark against the palisade. But they were met by such a withering volley from the sixty rifles that they were staggered, and glad to retreat.

A third time they made the attempt to rush Dollard's palisaded enclosure, but a third time they were driven

Canada

back, leaving a large number of slain, and amongst them one of their most important chiefs. This daunted their spirits, and they hastily sent off for reinforcements.

In the meantime, until the reinforcements came up, which they did on the fifth day, the first band of Iroquois kept up an unceasing fire and constant menace of attack. In this way they gradually wore out the little garrison, who dare not sleep, who were unable to get water from the river, and were at last even in want of food.

Now, among the Iroquois were several Hurons, renegades from their own tribe. These men now tried to win over the Hurons who were fighting with Dollard, and at last hunger and thirst so told upon the latter that they all slipped away and deserted the young Frenchman except one man, their chief. He and the four Algonquins stood firm and loyal.

On the fifth day the yells of the fierce Iroquois and the firing of muskets told the doomed defenders of the palisade that the expected reinforcements had arrived. The Iroquois, having learnt from the Huron deserters how small in numbers the little garrison was, now made sure of an easy victory. Ostentatiously they advanced to the attack, but the result was the same as before. They were forced to fall back before the persistent and well-directed fire of the defenders.

Three days more were spent in this way, the Iroquois attacking from time to time, but always falling back before the steady fire of the heroic colonists. Dollard and his companions fought and prayed by turns, and

Fighting the Iroquois Indians

hungered, thirsted, and snatched fragments of broken sleep, and were wellnigh utterly worn out by fatigue and exhaustion. At last the spirit of the Iroquois began to quail. Some talked of abandoning the attack, but others grew all the fiercer in their desire for revenge, while their pride revolted at the thought of so many warriors being beaten by so few of the hated palefaces. In the conflicting councils the authority of the latter party prevailed. It was resolved that, before finally abandoning the attack, they should make a general assault, and volunteers were called for to lead the attack. To protect themselves against the deadly fire of the little garrison they made large wooden shields 4 or 5 feet high, and capable of covering each three or four men. Under cover of these shields the volunteers were able to rush close up to the palisades, which they immediately began to hack to pieces with their hatchets.

Now, in anticipation of some such eventuality as this, Dollard had filled a large, wide-mouthed blunderbuss with gunpowder and plugged up the muzzle. Igniting the fuse which he had inserted into this home-made "hand-grenade," Dollard tried to throw it over the palisade amongst the Iroquois. But it was too heavy for him, and catching on the top of one of the pointed palisades, it fell back among his own friends, and killed or wounded several of them and nearly blinded others. In the confusion arising out of this mishap the Iroquois succeeded in effecting a breach in the palisade. Dollard and his followers rushed to meet the inpouring foe, and slashing, striking, stabbing at them with the energy of despair, succeeded in holding

Canada

them momentarily in check. But the Iroquois broke through at a second place, and poured a volley into the devoted band of Frenchmen, and Dollard fell ; broke through a third breach, broke through a fourth, and—all was soon over. The young French heroes, refusing to cease fighting, refusing to accept quarter, bleeding, staggering, half demented with exhaustion, weakness, and hopeless despair, were shot down to a man. Not one was left on his feet.

This brave and stubborn fight proved to be the salvation of the French settlements strung along the St. Lawrence. The Iroquois, although they were the victors, were so thoroughly disheartened that they turned their canoes about and paddled back by the way they had come, and for many a day the white men had rest from their attacks.

Thirty-two years later, in the autumn, when the woods were beginning to shed their leaves, and the men were gathering in the last lingering remnants of their harvest, another heroic deed was done, which still lives fresh and green in Canadian song and story. Twenty miles from Montreal, on the south bank of the River St. Lawrence, was the blockhouse of Verchères, enclosed within a palisade of palings. The lord of the manor was absent from home, and within the blockhouse the only persons were Madeline, the daughter of the lord of the manor, a girl of fourteen, her two little brothers, one of them twelve years of age, the other younger, and two old men-servants. The rest of the men were at work in the fields, outside the stockade, and at some distance from it.

Fighting the Iroquois Indians

It was a beautiful morning, and Madeline, attended by one of the old men, started out for the river. But before she had advanced very far her quick young eyes caught sight of a band of painted savages approaching the farm. She at once started to run back to the stockade, at the same time shouting a warning to the harvesters in the fields. And she had barely time to get within the shelter of the palisade and close the gates when the Iroquois were upon it. Both the men-servants were old soldiers, and as soon as the gate of the stockade was closed one of them went straight to the powder-magazine, intending to blow up himself and all who were inside the stockade, to prevent them from falling into the hands of the ruthless red men. Death by their own hands would, he was convinced, be preferable to torture and a horrible death at the hands of the savages. But Madeline Verchères thought there was a third alternative, and she checked the old man, and prevented him from blowing up the magazine.

Being herself animated by the loftiest and stanchest courage, she made her little garrison promise to obey her, and then proceeded to give to each a fixed and definite duty to perform. The fort possessed one cannon. This Madeline bade one of the old soldiers discharge at the enemy. The report alarmed them, but did not drive them away.

Almost immediately after this the beleaguered garrison saw a canoe approaching on the river. Madeline at once guessed that the occupants were women friends of her own. As there was no one else to go down to the water's edge to meet them, Madeline determined

Canada

to go herself, for the two old men could not be spared from the defence of the stockade. The Indians, seeing the young girl going down to the river alone, were afraid to attack her, for they suspected a trap or stratagem of war. Madeline was therefore able to get her friends safely within the stockade.

But though there was no stratagem in this act, there was stratagem in the method of defence which Madeline adopted. She took care to have a relay of sentinels, challenging each other at stated intervals and at stated places ; she made signals, which the Indians were able to see, as though issuing orders to a full garrison ; she practised every device she could think of to deceive the enemy into the belief that the defenders were a numerous and undaunted band. And for a whole week this brave-hearted girl, with two old men, two little boys, and three or four women, kept a whole band of fierce and remorseless Iroquois successfully at bay. At the end of that time help, summoned by the escaped harvesters of the manor, arrived from Montreal, and the little beleaguered garrison was relieved.

CHAPTER XIV

THE HABITANT OF THE ST. LAWRENCE SHORE

THE earliest white settlers on the shores of the St. Lawrence came from France, and the country of their adoption was known as New France. To this very day, not only the language, but the manner of life and most of the social institutions of the province of

The Habitant of St. Lawrence Shore

Quebec, are still emphatically French. And yet the French-Canadians, despite their passionate devotion to their race and their language, their religious creed (Roman Catholicism), and the customs and manners of their ancestors, manifest an irreproachable loyalty to the British Crown. When, soon after the middle of the seventeenth century, the new country was first settled, the land was granted by the King of France to French gentlemen, who became known as seigneurs, or lords of the manor. In return for these grants the seigneurs paid homage to the French King, and bound themselves by an oath to fight for him in time of need. They were also bound to have their land cleared of trees within a given time, otherwise the seigneurie was to be taken away from them again. The seigneur in his turn granted slices of his lands to humbler arrivals from France—emigrants, as we should call them nowadays, though they called themselves, and are known to history as, “habitants.” Their relation to their seigneur was something like that of medieval vassals to their feudal lord.

Now, in the early days these habitants, or emigrants, were mostly single young men, and naturally, when they settled down on the farms, which they rented from this or the other seigneur, they soon found that they required each a wife to help them in their work, and to cook and stitch for them; but young women were scarce in the colony. Accordingly, the French King, with the view of meeting this want, used every year to send out one or two shiploads of young girls as wives for the habitants. About the time the “bride

Canada

ships" were expected the young men of the settlements, dressed in their Sunday best, used to repair to Quebec, where the ships landed. There, entering the great hall of the convent of the Ursuline nuns, where the girls were gathered, they each picked out a bride, led her straightway before the priest, and were married without an instant's delay.

The habitant of the present day is, as a rule, happy and contented with his lot, with a great reverence for the customs and habits of his forefathers, and an unwavering devotion to his church. He is fond of society, and loves the dance and the song. His leaning is manifested in the arrangement of the farms in his part of the country. As you steam down the great River St. Lawrence, you cannot help noticing how the farms in what was once New France are laid out in long narrow strips, nearly a mile in length, and all coming down to the river shore. Along these stand the houses, all near the river and pretty close one to another. Here the people grow tobacco, vegetables, and fruit, especially the famous Snow-apple, also known as "Fameuse," with a bright red skin and snow-white flesh. French Canada is also noted for its breed of horses.

The present Prime Minister of the Dominion of Canada, Sir Wilfrid Laurier, one of the ablest and most eloquent men in the whole of the British Empire, is a native of French Canada. He has governed the destinies of the Dominion for fully twelve years without a break, for it was in 1896 that he first became Prime Minister of Canada.

High above the great St. Lawrence stands the city of

MONTREAL AND THE RIVER ST. LAWRENCE. *Page 41.*

T. Mower Martin, R.C.A.

The Habitant of St. Lawrence Shore

Quebec, which was founded by the French explorer and colonial leader, Champlain, in 1608, over 300 years ago. The city is built partly at the edge of the river and partly on the summit and slope of a bold cliff overhanging the stream. On this higher ground is the citadel, occupying the site of the early fort, which was one of the principal defences of the first settlers during the whole of the stormy period of the Iroquois wars. It was here, too, that the heroic Wolfe, the British General of George III.'s day, defeated the no less heroic French leader Montcalm. Quebec is the seat of Laval University, the most famous centre of Roman Catholic learning in Canada.

Higher up the river, too, is Montreal, the largest city in the whole of the Dominion. In early days it was the chief centre of the fur trade, and, like Quebec, a bulwark against the invading tides of the Iroquois. To-day it is the principal commercial city of Canada and the seat of varied manufactures. Here, again, is a large and famous University, a seat of Protestant learning—namely, McGill University. Montreal has also won fame for herself by her magnificent and merry winter carnival and her great palace built of ice.

The capital of Canada is, however, neither Quebec nor Montreal, nor is it Toronto, the second largest city in the Dominion and capital of the province of Ontario, as well as the seat of several affiliated Universities, and an important manufacturing centre. The place where the Parliament of Canada meets, and, consequently, the capital of the country, is Ottawa, on the river of the same name 116 miles by

Canada

rail west of Montreal. As a city it is famous for its beautiful and imposing public buildings, the most stately of them all being the Houses of Parliament.

CHAPTER XV

THE HOME OF EVANGELINE

ONE day in the year 1755 consternation and dismay invaded every heart in what is now Nova Scotia, the large peninsula on the east of Canada that fronts the fierce Atlantic gales, and bears the full brunt of their fury without murmur or groan. At that time the inhabitants were nearly all, like those of Quebec and the St. Lawrence shore, descendants of people who came from France, more especially from Brittany and Normandy. Originally the country was called Acadia. It was James I. of England who changed that name to Nova Scotia, which is Latin, and means "New Scotland." But though the name of the country was changed, the people had not changed. They, like the habitants of the St. Lawrence shore, clung tenaciously to the customs and habits of their forefathers, and grew up in each successive generation with a passionate devotion for their mother-tongue, and a no less deep love for the land of their birth, *Acadie*.

The cause of the intense sorrow, rage, and despair which seized the inhabitants of this happy and prosperous community on the day mentioned was a proclamation of the British Governor. The countries of France and England had long been at war together,

The Home of Evangeline

and for many years hostilities had waged with more or less bitterness between the colonists of the two countries settled in America. The Acadians were accused of having lent assistance in provisions and ammunition to the French at the siege of Beauséjour. It was resolved to punish them for their disloyal conduct, for they were at that time subjects of the King of England. Accordingly, all the men were suddenly seized and put into prison, and the women and children were ordered to gather, with their household effects, on the seashore. Then, despite their weeping and their grief, they were put on board the vessels of war, and taken away to the other British colonies in America all the way from the New England States to Jamaica. It is the fate of certain villagers of Grand Pré, who were taken away from their homes at this time, that Longfellow tells us about in his beautiful poem of "Evangeline."

"In the Acadian land, on the shores of the Basin of Minas,
Distant, secluded, still, the little village of Grand-Pré
Lay in the fruitful valley. Vast meadows stretched to the eastward,
Giving the village its name, and pasture to flocks without number.
Dikes, that the hands of the farmer had raised with labour
incessant,
Shut out the turbulent tides ; but at stated seasons the flood-gates
Opened, and welcomed the sea to wander at will o'er the meadows.
West and south there were fields of flax, and orchards, and
cornfields,
Spreading afar and unfenced o'er the plain ; and away to the
northward
Blomidon rose, and the forests old, and aloft on the mountains
Sea-fogs pitched their tents, and mists from the mighty Atlantic
Looked on the happy valley, but ne'er from their station descended.

Canada

There, in the midst of its farm, reposed the Acadian village.
Strongly built were the houses, with frames of oak and of chestnut.
Such as the peasants of Normandy built in the reign of the
Henries.

Thatched were the roofs, with dormer windows; and gables
projecting

Over the basement below protected and shaded the door-way.

There in the tranquil evenings of summer, when brightly the
sunset

Lighted the village street, and gilded the vanes on the chimneys,
Matrons and maids sat in snow-white caps and in kirtles
Scarlet and blue and green, with distaffs spinning the golden
Flax for the gossiping looms, whose noisy shuttles within doors
Mingled their sound with the whir of the wheels and the songs
of the maidens.

Solemnly down the street came the parish priest, and the children
Paused in their play to kiss the hand he extended to bless them.

Reverend walked he among them; and up rose matrons and maidens,
Hailing his slow approach with words of affectionate welcome.

Then came the labourers home from the field, and serenely the
sun sank

Down to his rest, and twilight prevailed. Anon from the belfry
Softly the Angelus sounded, and over the roofs of the village
Columns of pale blue smoke, like clouds of incense ascending,
Rose from a hundred hearths, the homes of peace and contentment.
Thus dwelt together in love these simple Acadian farmers—
Dwelt in the love of God and of man."

No wonder, then, there was lamentation and weeping
and woe when these poor people were torn so cruelly
away from the homes where they had been so happy!
Where, indeed, can you find a more beautiful picture
of human happiness, peace, and contentment than this
Acadian village of Grand-Pré?

A few years later the places of these unfortunate
Acadians were taken by strangers from the British

Redskin, Eskimo, and Chink

colonies farther south and from the Motherland. Those from the south were people who refused to join the Americans when they declared their independence of Britain, and for this reason they are known in history as the United Empire Loyalists.

CHAPTER XVI

REDSKIN, ESKIMO, AND CHINK

ONE day two gentlemen were driving by the side of a small but beautiful inland lake, when they met a little, shrivelled old man, with a forward tilt of the body, a lurching, shuffling gait, and a parchment-like wrinkled skin. Met! Yes, but when the odd-looking little man caught sight of the rig or vehicle approaching, he hastily turned off the road, and passed the conveyance at a good distance away. Yet as he passed he never once lifted his head.

This behaviour excited the curiosity of one of the gentlemen, a stranger, and he asked his companion: "Who's that odd-looking figure?"

"Ah! I don't wonder at your asking that? He's an old Indian. For years he has haunted the shores of this lake. Every summer he has attacks of fever or some such illness, and when he feels them coming on he goes away from the reserve in which his own people live and makes himself a hut of the branches of trees beside the lake, in a lonely spot where nobody can see him, and there he remains until he recovers,

Canada

and never speaks to a single individual all the time he is here.”

Now, this poor old Indian is typical of his race. The Indian, the glorified Redskin of Fenimore Cooper as well as the fierce Indian of the Western Plains, whom Mayne Reid has made familiar to English readers, is rapidly dying out. As a race, the North American Indian is as decrepit, as sad, and as dejected a creature as the poor old man who sought healing beside the lake. In Canada the Indians are fairly numerous in certain parts ; but they are very little seen in the cities and towns of the white man. You may catch a fleeting glimpse of one or two at some wayside station, come to offer moccasins, gloves, purses, deer's horns, or other curios for sale to the passing traveller ; but it is not until the Indian is spoken to that the traveller hears the sound of his voice, and even then the native may not open his lips, but will content himself with using the language of signs.

The Indians nearly all live in “reserves”—that is, tracts of land which the Government gives to them, and off which it keeps all white men. The reserve is meant for the Indian alone, and he is allowed to till it and do what he pleases with it. The Government also gives him help in providing him with food. The Indians do, however, make a little by hunting, earning bounties on the slaying of harmful wild beasts, or selling venison and deer's horns to white settlers. Then, again, in certain districts they help to gather strawberries in the middle of the summer, and in other districts pick hops towards the autumn, or fall, as the

Redskin, Eskimo, and Chink

Canadians call that season. The full phrase—which, however, is never used—would be “the season of the fall of the leaf.”

A missionary who laboured in the Far North of Canada once astonished, and yet deeply interested, a small company of listeners by describing his own strange wedding.

“After we came out of church,” he said, “we both got ready for our honeymoon journey. When we were dressed, you could hardly have told the bride from the bridegroom. We were both wrapped up in furs from top to toe, so that the only part of our persons which could be seen was just round the eyes, and over the eyes we both wore large coloured goggles, to protect them against the dazzling snows.

“Well, we got into our sleigh, wrapped our fur aprons and rugs well round us, said good-bye to our nearest white neighbours, and after I had gathered up the reins and cracked my long whip over our team of fourteen dogs, off we started on our 200 mile drive !”

The people this devoted couple were going to live and work amongst were the Eskimo, a people who live all the year round amongst the Arctic snow and ice. These folk are another, though not a very numerous, element in the population of Canada.

Besides these two races—the Redskins and the Eskimo—there are two, or rather three, other races now dwelling in Canada who have not white skins. These are Hindus, Chinese, and Japanese. They are found chiefly in the West, in the province of British Columbia. The people of that province object strongly to the

Canada

presence of all three races, and if only they were able to do it, they would sweep every man Jack of them into the ocean.

At first the Chinese came into the province without restriction, and they began to arrive in such large numbers that the Government of the province grew alarmed. With the view of checking them, the authorities imposed a head-tax on every Chinaman who landed, and went on increasing the amount until it reached no less a sum than £100 per head. This large tax is paid for the Chinese immigrants by wealthy fellow-countrymen already settled in the country, and known as *tyees*. These men determine the wages at which the immigrants shall work, and then they themselves pocket a certain proportion of each man's wages. The slang names for a Chinaman are Chink and Celestial.

Again, both the Japanese and the Hindus began to arrive in much larger numbers than the white men of the province liked, and in some large towns the dislike to them culminated in riots and fierce attacks upon them, especially upon the Japanese in Vancouver.

At last the Government of Canada succeeded in securing a promise from the Government of Japan that not more than a certain number of Japs should be permitted to land in Canada every year. The Hindus the provincial authorities were not able to prevent from coming, or even to restrict their numbers. They, too, were British subjects, and consequently free to come and go in any and all parts of the British Empire.
